-- Traffic matrix tables from destination to source

nlMatrixDSTable OBJECT-TYPE

  SYNTAX      SEQUENCE OF NlMatrixDSEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "A list of traffic matrix
 entries that collect statistics for
      conversations between two network-level addresses.  This table
      is indexed first by the destination address and then by the
      source address to make it convenient to collect all
      conversations to a particular address.

      The probe will populate this table for all network layer
      protocols in the protocol directory table whose value of
      protocolDirMatrixConfig is equal to supportedOn(3), and
      will delete any entries whose protocolDirEntry is deleted or
      has a protocolDirMatrixConfig value of supportedOff(2).

      The probe will add to this table all pairs of addresses
      seen in all packets with no MAC errors and will increment
      octet and packet counts in the table for all packets with no
      MAC errors.

      Further, this table will only contain entries that have a
      corresponding entry in the nlMatrixSDTable with the same
      source address and destination
 address."
  ::= { nlMatrix 3 }

nlMatrixDSEntry OBJECT-TYPE
  SYNTAX      NlMatrixDSEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "A conceptual row in the nlMatrixDSTable.

      The hlMatrixControlIndex value in the index identifies the
      hlMatrixControlEntry on whose behalf this entry was created.
      The protocolDirLocalIndex value in the index identifies the
      network-layer protocol of the nlMatrixDSSourceAddress and
```

```
      nlMatrixDSDestAddress.

      An example of the indexing of this table is
      nlMatrixDSPkts.1.783495.18.4.128.2.6.7.4.128.2.6.6.

      Note that some combinations of index values may result in an
      index that exceeds 128 sub-identifiers in length, which exceeds
      the maximum for the SNMP protocol.  Implementations should take
      care to avoid such combinations."

  SYNTAX     INTEGER {
                nlMatrixTopNPkts(1),
                nlMatrixTopNOctets(2),
                nlMatrixTopNHighCapacityPkts(3),
                nlMatrixTopNHighCapacityOctets(4)
              }
  MAX-ACCESS read-create
```

```
  STATUS     current
  DESCRIPTION
      "The variable for each nlMatrix[SD/DS] entry that the
      nlMatrixTopNEntries are sorted by, as well as a control
      for the table that the results will be reported in.

      This object may not be modified if the associated
      nlMatrixTopNControlStatus object is equal to active(1).

      If this value is less than or equal to 2, when the report
      is prepared, entries are created in the nlMatrixTopNTable
      associated with this object.
      If this value is greater than or equal to 3, when the report
      is prepared, entries are created in the
      nlMatrixTopNHighCapacityTable associated with this object."
  ::= { nlMatrixTopNControlEntry 3 }

nlMatrixTopNControlTimeRemaining OBJECT-TYPE
  SYNTAX     Integer32 (0..2147483647)
  MAX-ACCESS read-create
  STATUS     current
  DESCRIPTION
      "The number of seconds left
 in the report currently
      being collected.  When this object is modified by
      the management station, a new collection is started,
      possibly aborting a currently running report.  The
      new value is used as the requested duration of this

      report and is immediately loaded into the associated
      nlMatrixTopNControlDuration object.

      When the report finishes, the probe will automatically
      start another collection with the same initial value
      of nlMatrixTopNControlTimeRemaining.  Thus, the management
      station may simply read the resulting reports repeatedly,
      checking the startTime and duration each time to ensure that a
      report was not missed or that the report parameters were not
      changed.

      While the value of this object is non-zero, it decrements
      by one per second until it reaches zero.  At the time
      that this object decrements to zero, the report is made
      accessible
 in the nlMatrixTopNTable, overwriting any report
      that may be there.
```

When this object is modified by the management station, any
associated entries in the nlMatrixTopNTable shall be deleted.

(Note that this is a different algorithm than the one used
in the hostTopNTable)."

-- Application Layer Matrix Group
--
-- Counts the amount of traffic, by protocol, sent between each pair
-- of network addresses discovered by the probe.
-- Implementation of this group requires implementation of the Network
-- Layer Matrix Group.

alMatrixSDTable OBJECT-TYPE
SYNTAX SEQUENCE OF AlMatrixSDEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"A list of application traffic matrix entries that collect
statistics for conversations of a particular protocol between
two network-level addresses. This table is indexed first by
the source address and then by the destination address to make
it convenient to collect all statistics from a particular
address.

The probe will populate
this table for all protocols in the
protocol directory table whose value of

protocolDirMatrixConfig is equal to supportedOn(3), and
will delete any entries whose protocolDirEntry is deleted or
has a protocolDirMatrixConfig value of supportedOff(2).

The probe will add to this table all pairs of addresses for
all protocols seen in all packets with no MAC errors and will
increment octet and packet counts in the table for all packets
with no MAC errors. Further, entries will only be added to
this table if their address pair exists in the nlMatrixSDTable
and will be deleted from this table if the address pair is
deleted from the nlMatrixSDTable."

alMatrixTopNControlTimeRemaining OBJECT-TYPE
  SYNTAX     Integer32 (0..2147483647)
  MAX-ACCESS read-create
  STATUS     current
  DESCRIPTION
     "The number of seconds left in the report currently
     being collected.  When this object is modified by
     the management station, a new collection is started,
     possibly aborting a currently running report.  The
     new value is used as the requested duration of this
```

report and is immediately loaded into the associated
alMatrixTopNControlDuration object.

When the report finishes, the probe will automatically
start another collection with the same initial value
of alMatrixTopNControlTimeRemaining. Thus, the management
station may simply read the resulting reports repeatedly,
checking the startTime and duration each time to ensure that a
report was not missed or that the report parameters were not
changed.

While the value
of this object is non-zero, it decrements
by one per second until it reaches zero. At the time

that this object decrements to zero, the report is made
accessible in the alMatrixTopNTable, overwriting any report
that may be there.

When this object is modified by the management station, any
associated entries in the alMatrixTopNTable shall be deleted.

(Note that this is a different algorithm than the one used
in the hostTopNTable)."

    ::= { alMatrixTopNEntry 9 }

--
-- User History Collection Group (usrHistory)
--
-- The usrHistory group combines mechanisms seen in the alarm and
-- history groups to provide user-specified history collection,
-- utilizing two additional control tables and one additional data
-- table.  This function has traditionally been done by NMS
-- applications, via periodic polling.  The usrHistory group allows
-- this task to be offloaded to an RMON probe.
--
-- Data (an ASN.1 INTEGER based object) is collected in the same
-- manner as any history data table (e.g., etherHistoryTable) except
-- that the user specifies the MIB instances to be collected.  Objects
-- are collected in bucket-groups, with the intent that all MIB
-- instances in the same bucket-group are collected as atomically as
-- possible by the RMON probe.
--
-- The usrHistoryControlTable is a one-dimensional read-create table.
-- Each row configures
    a collection of user history buckets, much
-- the same as a historyControlEntry, except that the creation of a
-- row in this table will cause one or more associated instances in
-- the usrHistoryObjectTable to be created.  The user specifies the
-- number of bucket elements (rows in the usrHistoryObjectTable)
-- requested, as well as the number of buckets requested.
--
-- The usrHistoryObjectTable is a 2-d read-write table.
-- Each row configures a single MIB instance to be collected.
-- All rows with the same major index constitute a bucket-group.
--
-- The usrHistoryTable is a 3-d read-only table containing
```

```
-- the data of associated usrHistoryControlEntries.  Each
-- entry represents the value of a single MIB instance
-- during a specific sampling interval (or the rate of
-- change during the interval).
--
-- A sample value is stored in two objects - an absolute value and
-- a status object.  This allows numbers from -(2G-1) to +4G to be
-- stored.  The status object also indicates
 whether a sample is
-- valid.  This allows data collection to continue if periodic
-- retrieval of a particular instance fails for any reason.
--
-- Row Creation Order Relationships
--
-- The static nature of the usrHistoryObjectTable creates
-- some row creation/modification issues.  The rows in this
-- table need to be set before the associated
-- usrHistoryControlEntry can be activated.
--
-- Note that the usrHistoryObject entries associated with a
-- particular usrHistoryControlEntry are not required to
-- be active before the control entry is activated.  However,
-- the usrHistory data entries associated with an inactive
-- usrHistoryObject entry will be inactive (i.e.,
-- usrHistoryValStatus == valueNotAvailable).

     "The requested number of discrete time intervals
     over which data is to be saved in the part of the
     usrHistoryTable associated with this usrHistoryControlEntry.
```

When this object is created or modified, the probe
should set usrHistoryControlBucketsGranted as closely to
this object as possible for the particular probe
implementation and available resources."
DEFVAL { 50 }

::= { usrHistoryControlEntry 3 }

usrHistoryControlBucketsGranted OBJECT-TYPE
SYNTAX Integer32 (1..65535)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The number of discrete sampling intervals
over which data shall be saved in the part of
the usrHistoryTable associated with this
usrHistoryControlEntry.

When the associated usrHistoryControlBucketsRequested
object is created or modified, the probe should set
this object as closely to the requested value as
possible for the particular probe implementation and
available resources. The probe must not lower this
value except as a result of a modification to the associated
usrHistoryControlBucketsRequested object.

The associated usrHistoryControlBucketsRequested object
should be set before or at the same time as this object
to allow the probe to accurately estimate the resources
required for this usrHistoryControlEntry.

There will be times when the actual number of buckets
associated with this entry is less than the value of
this object. In this case, at the end of each sampling
interval, a new bucket will be added to the usrHistoryTable.

When the number of buckets reaches the value of this object
and a new bucket is to be added to the usrHistoryTable,
the oldest bucket associated with this usrHistoryControlEntry
shall be deleted by the agent so that the new bucket can be
added.

When the value of this object changes to a value less than
the current value, entries are deleted from the
usrHistoryTable associated with

this usrHistoryControlEntry.

Enough of the oldest of these entries shall be deleted by the agent so that their number remains less than or equal to the new value of this object.

When the value of this object changes to a value greater than the current value, the number of associated usrHistory entries may be allowed to grow."

usrHistoryObjectVariable OBJECT-TYPE
  SYNTAX OBJECT IDENTIFIER
  MAX-ACCESS read-create
  STATUS current
  DESCRIPTION
     "The object identifier of the particular variable to be

     sampled.

     Only variables that resolve to an ASN.1 primitive type of
     Integer32 (Integer32, Counter, Gauge, or TimeTicks) may be
     sampled.

     Because SNMP access control is articulated entirely in terms
     of the contents of MIB views, no access control mechanism

 exists that can restrict the value of this object to identify
     only those objects that exist in a particular MIB view.
     Because there is thus no acceptable means of restricting the
     read access that could be obtained through the user history
     mechanism, the probe must only grant write access to this
     object in those views that have read access to all objects on
     the probe.  See USM [RFC3414] and VACM [RFC3415] for more
     information.

     During a set operation, if the supplied variable name is not
     available in the selected MIB view, a badValue error must be
     returned.

     This object may not be modified if the associated
     usrHistoryControlStatus object is equal to active(1)."

this sample was measured."
::= { usrHistoryEntry 3 }

usrHistoryAbsValue OBJECT-TYPE
SYNTAX Gauge32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The absolute value (i.e., unsigned value) of the

user-specified statistic during the last sampling period. The
value during the current sampling period is not made available
until the period is completed.

To obtain the true value for this sampling interval, the
associated instance of usrHistoryValStatus must be checked,
and usrHistoryAbsValue adjusted as necessary.

If the MIB instance could not be accessed during the sampling
interval, then this object will have a value of zero, and the
associated instance of usrHistoryValStatus will be set to
'valueNotAvailable(1)'.

The access control check prescribed in the definition of
usrHistoryObjectVariable SHOULD be checked for each sampling
interval. If this check determines that access should not be
allowed, then this object will have a value of zero, and the
associated instance of usrHistoryValStatus will be set to
'valueNotAvailable(1)'."

-- The Probe Configuration Group
--
-- This group controls the configuration of various operating
--
 parameters of the probe.

ControlString ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
     "This data type is used to communicate with a modem or a

     serial data switch.  A ControlString contains embedded
     commands to control how the device will interact with the
     remote device through the serial interface.  Commands are
     represented as two-character sequences beginning with
     the '^' character.

     The following commands are recognized by the device (note
     that command characters are case sensitive):
```

^s Send string that follows, which is terminated by the next command or the end of string.

^c Delay for the number of seconds that follows. Toss out any data received rather than store it in a buffer for parsing.

^t Set timeout to the value represented by the decimal digits that follow. The default timeout is 20

seconds. Note that this timeout may be overridden by a smaller serialTimeout configured for the associated serial interface (see serialConfigTable).

^w Wait for the reply string that follows, which is terminated by the next command or the end of string. Partial and case-insensitive matching is applied, i.e., if the reply string (any case combination) is found anywhere in the received string, then the a match is found. If the current timeout elapses without a match, then the remaining control string is ignored.

^! The ^ character.

^d Delay the number of seconds specified by the decimal digits that follow.

^b Send break for the number of milliseconds specified by the decimal digits that follow. If no digits follow, break will be enforced for 250 milliseconds by default.

The following ASCII control characters may be inserted into the '^s' send string or the '^w' reply string:

^@ 0x00
^A 0x01
..
^M 0x0D
..
^Z 0x1A
^[0x1B
^ 0x1C
^] 0x1D
^^ 0x1E
^_ 0x1F

Binary data may also be inserted into the data stream. The control sequence for each byte of binary data is ^0x##, where ## is the hexadecimal representation of the data byte. Two ASCII characters (0-9, a-f, A-F) must follow the '^0x' control prefix. For example, '^0x0D^0x0A' is interpreted as a

```
      carriage return followed by a line feed."

     "When this object is set to a non-zero value, the filter that
     it is associated with performs the following operations on
     every packet:

     1) If the packet doesn't match the protocol directory entry
        identified by this object, discard the packet and exit
        (i.e., discard the packet if it
 is not of the identified
        protocol).

     2) If the associated filterProtocolDirLocalIndex is non-zero
        and the packet doesn't match the protocol directory
        entry identified by that object, discard the packet and
        exit.
     3) If the packet matches, perform the regular filter
        algorithm as if the beginning of this named protocol is
        the beginning of the packet, potentially applying the
        filterOffset value to move further into the packet."

-- ****************************************************************
-- snaNode group
--
-- It contains Managed Objects related to any type of Node and
-- some specific objects for Node Type 2.0.
-- ****************************************************************

-- ****************************************************************
-- The following table contains generic Node configuration
-- parameters.
-- ****************************************************************

snaNodeAdminTable OBJECT-TYPE
      SYNTAX  SEQUENCE OF SnaNodeAdminEntry
       MAX-ACCESS  not-accessible
      STATUS  current
      DESCRIPTION
            "This table contains objects which describe the
            configuration parameters for an SNA Node.  Link
            specific configuration objects are contained in
            a separate MIB module (e.g., SNA DLC MIB)
            corresponding to the link type.
            The table snaNodeAdminLinkTable contains objects
            which identify the relationship between node instances
            and link instances.

            The entries (i.e., rows) in this table can be created
            by either an Agent or a Management Station.
            The Management Station can do this through setting
            the appropriate value in the snaNodeAdminRowStatus.

            The snaNodeAdminRowStatus object describes the
            status of an entry and is used to change the status
            of an entry.  The entry is deleted
 by an Agent based
            on the value of the snaNodeAdminRowStatus.
```

```
            The snaNodeAdminState object describes the desired
            operational state of a Node and is used to change the
            operational state of a Node.  For example, such
            information may be obtained from a configuration file.

            How an Agent or a Management Station obtains the
            initial value of each object at creation time is an
            implementation specific issue.

            For each entry in this table, there is a corresponding
            entry in the snaNodeOperTable.
            While the objects in this table describe the desired
            or configured operational values of the SNA Node, the
            actual runtime values are contained in
            snaNodeOperTable."

            this Node.  Note that there is no format type 2.

            A write operation to this object will
            not change the operational value reflected
            in snaNodeOperAdminXidFormat until the Node has
            been re-activated (e.g., after the next initialization
            of the SNA services)."
        ::= { snaNodeAdminEntry 4 }

snaNodeAdminBlockNum OBJECT-TYPE
        SYNTAX  DisplayString (SIZE(3))
        MAX-ACCESS  read-create
        STATUS
  current
        DESCRIPTION
            "The value indicates the block number for this Node
            instance.  It is the first 3 hexadecimal digits of the
            SNA Node id.

            A write operation to this object will
```

```
            not change the operational value reflected
            in snaNodeOperBlockNum until the Node has
            been re-activated (e.g., after the next initialization
            of the SNA services)."
        ::= { snaNodeAdminEntry 5 }

snaNodeAdminIdNum OBJECT-TYPE
        SYNTAX  DisplayString (SIZE(5))
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "The value indicates the ID number for this Node
            instance.  This is the last 5 hexadecimal digits of
            the SNA Node id.

            A write operation to this object will
            not change the operational value reflected
            in snaNodeOperIdNum until the Node has
             been re-activated (e.g., after the next initialization
            of the SNA services)."
        ::= { snaNodeAdminEntry 6 }

snaNodeAdminEnablingMethod OBJECT-TYPE
        SYNTAX  INTEGER {
            other (1),
            startup (2),
            demand (3),
            onlyMS (4)
            }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "The value indicates how the Node should be
            activated for the first time.
            The values have the following meanings:

            other (1)  - may be used for proprietary methods
              not listed in this enumeration,
            startup (2) - at SNA services' initialization time
              (this is the default),
            demand (3) - only when LU is requested by application,
                    or
            onlyMS (4) - by a Management Station only.

            A  write operation
     to this object may immediately
            change the operational value reflected
            in snaNodeOperEnablingMethod depending
```

```
            on the Agent implementation.  If the Agent
            implementation accepts immediate changes, then the
            behavior of the Node changes immediately and not only
            after the next system startup of the SNA services.
            An immediate change may only apply when the
            current value 'demand (3)' is changed to 'onlyMS (4)'
            and vice versa."
        ::= { snaNodeAdminEntry 7 }

snaNodeAdminLuTermDefault OBJECT-TYPE
      SYNTAX  INTEGER {
            unbind (1),
            termself (2),
            rshutd (3),
            poweroff(4)
            }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "The value indicates the desired default method
            used to deactivate LUs for this Node
             For LU6.2s, 'unbind(1)' is the only valid value.

            unbind(1) -   terminate the LU-LU session by sending
                  an SNA UNBIND request.
            termself(2) - terminate the LU-LU session by sending
                  an SNA TERM-SELF (Terminate Self) request on
                  the SSCP-LU session. The SSCP will inform the
                  remote session LU partner to send an UNBIND
                  request to terminate the session.
            rshutd(3) -   terminate the LU-LU session by sending
                  an SNA RSHUTD (Request ShutDown) request to
                  the remote session LU partner. The remote LU
                  will then send an UNBIND request to terminate
                  the session.
            poweroff(4) - terminate the LU-LU session by sending
                  either an SNA LUSTAT (LU Status) request on
                  the LU-LU
 session or an SNA NOTIFY request on
                  the SSCP-LU session indicating that the LU has
                  been powered off. Sending both is also
                  acceptable. The result should be that the
                  remote session LU partner will send an UNBIND
                  to terminate the session.

            The default behavior indicated by the value of this
            object may be overridden for an LU instance. The
            override is performed by setting the snaLuAdminTerm
```

```
            object instance in the snaLuAdminTable to the desired
            value.

            A write operation to this object may immediately
            change the operational value reflected
            in snaNodeOperLuTermDefault depending
            on the Agent implementation."

snaNodeAdminState OBJECT-TYPE
        SYNTAX  INTEGER {
            inactive (1),
            active (2)
            }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "The value indicates the desired operational
             state of the SNA Node. This object is used
             by the Management Station to
             activate or deactivate the Node.
```

If the current value in snaNodeOperState is
'active (2)', then setting this object to
'inactive (1)' will initiate the Node shutdown
process using the method indicated
by snaNodeOperStopMethod.

If the current value in snaNodeOperState is
'inactive (1)', then setting this object to
'active (2)'
will initiate the
Node's activation.

A Management Station can always set this object to
'active (2)' irrespective of the value in the
snaOperEnablingMethod."
::= { snaNodeAdminEntry 12 }

snaNodeAdminRowStatus OBJECT-TYPE
SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object is used by a Management Station to
create or delete the row entry in the
snaNodeAdminTable following
the RowStatus textual convention.

Upon successful creation of
the row, an Agent automatically creates a
corresponding entry in the snaNodeOperTable with
snaNodeOperState equal to 'inactive (1)'.

Row deletion can be Management Station or Agent
initiated:
(a) The Management
Station can set the value to
'destroy (6)' only when the value of
snaNodeOperState of this Node instance is
'inactive (1)'. The Agent will then delete the rows
corresponding to this Node instance from the
snaNodeAdminTable and the snaNodeOperTable.
(b) The Agent detects that a row is in the
'notReady (3)' state for greater than a
default period of 5 minutes.
(c) All rows with the snaNodeAdminRowStatus object's
value of 'notReady (3)' will be removed upon the
next initialization of the SNA services."

        DESCRIPTION
           "The value identifies the default method used to
```

deactivate LUs for this Node.
For LU6.2s, 'unbind(1)' is the only valid value.

unbind(1) - terminate the LU-LU session by sending an SNA UNBIND request.
termself(2) - terminate the LU-LU session by sending an SNA TERM-SELF (Terminate Self) request on the SSCP-LU session. The SSCP will inform
the
remote session LU partner to send an UNBIND request to terminate the session.
rshutd(3) - terminate the LU-LU session by sending an SNA RSHUTD (Request ShutDown) request to the remote session LU partner. The remote LU will then send an UNBIND request to terminate the session.
poweroff(4) - terminate the LU-LU session by sending either an SNA LUSTAT (LU Status) request on the LU-LU session or an SNA NOTIFY request on the SSCP-LU session indicating that the LU has been powered off. Sending both is also acceptable. The result should be that the remote session LU partner will send an UNBIND to terminate the session.

This object
describes the default behavior for this
Node; however, it is possible that for a specific LU the behavior indicated by the snaLuOperTerm object is different."

snaNodeLinkAdminRowStatus OBJECT-TYPE
        SYNTAX  RowStatus
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "This object is used by a
 Management Station to
             create or delete the row entry in the
             snaNodeLinkAdminTable.
             To activate a row, a Management Station sets the value
             to 'active (1)' or 'notReady (3)'.  Upon successful
             creation of the row, the Agent automatically creates
             a corresponding entry in the snaNodeLinkOperTable.

             Row deletion can be Management Station or Agent
             initiated:
             (a) The Management Station can set the value to
             'destroy (6)' only when the value of
             snaNodeLinkOperState of this Link
             instance is 'inactive (1)'. The Agent will then
             delete the row corresponding to this Link
             instance from snaNodeLinkOperTable and
             from snaNodeLinkAdminTable.
             (b) The Agent detects that a row is in the
             'notReady (3)' state for greater than a

   default period of 5 minutes.
             (c) The Agent will not include a row with RowStatus=
             'notReady (3)', after SNA system re-initialization
              (e.g., reboot)."

attributes
model4B(7) - Model 4 (43 rows x 80 cols) with extended
attributes
model5A(8) - Model 5 (27 rows x 132 cols) with base
attributes
model5B(9) - Model 5 (27 rows x 132 cols) with

```
                extended attributes
            dynamic(10) - Screen size determine with
 BIND and Read
                                Partition Query.

            In case this LU is not Type 2, then this object
            should contain the invalid(1) value."
        ::= { snaLuAdminEntry 7 }

 snaLuAdminTerm OBJECT-TYPE
        SYNTAX  INTEGER {
            unbind (1),
            termself (2),
            rshutd (3),
            poweroff (4)
            }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "This value identifies the desired method for
            deactivation of this LU. This value overrides the
            default method (snaNodeOperLuTermDefault) for this
            Node.  For LU 6.2, only the value 'unbind (1)'
            applies.

            unbind(1) -   terminate the LU-LU session by sending
                an SNA UNBIND request.
            termself(2) - terminate the LU-LU session by sending
                an SNA TERM-SELF
 (Terminate Self) request on
                the SSCP-LU session. The SSCP will inform the
                remote session LU partner to send an UNBIND
                request to terminate the session.
            rshutd(3) -   terminate the LU-LU session by sending
                an SNA RSHUTD (Request ShutDown) request to
                the remote session LU partner. The remote LU
                will then send an UNBIND request to terminate
                the session.
            poweroff(4) - terminate the LU-LU session by sending
                either an SNA LUSTAT (LU Status) request on
                the LU-LU session or an SNA NOTIFY request on
                the SSCP-LU session indicating that the LU has
                been powered off. Sending both is also
                acceptable. The result should be that the
                remote session LU partner
 will send an UNBIND
                to terminate the session.
```

```
            A write operation to this object may immediately
            change the operational value reflected
            in snaLuOperTerm depending
            on the Agent implementation."

snaLuAdminRowStatus OBJECT-TYPE
        SYNTAX  RowStatus
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "This object is used by a Management Station to
            create or delete the row entry in the
            snaLuAdminTable.
            To activate a row, the Management Station sets the
            value to 'active (1)' or 'notReady (3)'.
            Upon successful creation of the row, the Agent
            automatically creates a corresponding entry in the
            snaLuOperTable with snaLuOperState equal to
            'inactive (1)'.
            Row deletion can be Management Station
 or Agent
            initiated:
            (a) The Management Station can set the value to
            'destroy (6)' only when the value of snaLuOperState
            of this LU instance is 'inactive (1)'. The Agent will
            then delete the row corresponding to this LU
            instance from snaLuAdminTable and
            from snaLuOperTable.
            (b) The Agent detects that a row is in the
            'notReady (3)' state for greater than a
            default period of 5 minutes.
            (c) The Agent will not create a row with RowStatus
            equal to 'notReady (3)', after SNA system
            re-initialization (e.g., reboot)."

        MAX-ACCESS  read-only
        STATUS  current
        DESCRIPTION
            "The value indicates the current operational state of
            the session.

              'unbound (1)' - session has been  unbound;
```

```
                in this state it will be removed from the
                session table by the Agent.

            'pendingBind (2)' - this state has different
                meanings for dependent and independent LUs;
                for dependent LU - waiting for BIND from
                the host, for independent LU - waiting for
                BIND response.  When a session enters this
                state, the corresponding entry in the

             session table is created by the Agent.

            'bound (3)' - session has been successfully bound.

            'pendingUnbind (4)' - session enters this state
                when an UNBIND is sent and before the
                rsp(UNBIND) is received."

        shall attempt to set this as close as possible to the
        associated mdmLineCapabilitiesEnableRequested value.  The
        agent shall make this determination in an implementation-
        specific manner that may take into account the configuration
        of other capabilities or other considerations.  The modem
        will choose in an implementation-specific manner between
        multiple mutually-exclusive capabilities that each have the
        same (non-disabled) value.  However, the modem must prefer
         all capabilities with a value of 'preferred(3)' over all
        capabilities with a value of 'optional(2)'.

        In other words, if there are one or more mutually-exclusive
        capabilities (e.g. V.32 and V.32bis) that are set to
        `preferred', the agent must choose one in an
        implementation-specific manner.  Otherwise, if there are one
        or more mutually-exclusive capabilities that are set to
        `optional', the agent must choose one in an implementation-
        specific manner."

STATUS      current
DESCRIPTION

        "Indicates the reason that the last connection or attempt
        failed. The meaning of each reason code is explained below.

          unknown:
        This code means the failure reason is unknown or
        there has been no previous call.

          other:
        This code used when no other code is applicable.
         Additional vendor information may be available
        elsewhere.

          managementCommand:
        A management command terminated the call.  These
        commands include escaping to command mode, initiating
        dialing, restoring lines, and disconnecting.

          inactivityTimeout:
        The call was terminated because it was inactive for
        at the minimum duration specified.

          mnpIncompatibility:
        The modems are unable to resolve MNP protocol
        differences.

          protocolError:
```

An error occured in one of protocol in use. Further
information is required to determine in which
protocol the error occurred, and the exact nature of
the error.

powerLoss:
The modem lost power and disconnected the call.

equipmentFailure:
The modem equipment failed.

dtrDrop:

DTR has been turned off while the modem is to
disconnect on DTR drop. (Ref: V.58 cct108TurnedOff)

noDialTone:
If the modem is to monitor for call progress tones,
but the modem has failed to detect dial tone while
attempting to dial a number.

lineBusy:
Busy signal is detected while busy signal detection
is enabled, or while the 'W' or '@' dial modifier is
used. (Ref: V.58 engagedTone)

noAnswer:
The call was not answered.

voiceDetected:
A voice was detected on the call.

carrierLost:
Indicates that the modem has disconnected due to
detection of loss of carrier. In TIA-602, the S10
register determines the time that loss of carrier
must be detected before the modem disconnects.

trainingFailed:
Indicates that the modems did
not successfully train
and reach data mode on the previous connection.

faxDetected:
A fax was detected on the call."

IANAItuProbableCause ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"ITU-T probable cause values. Duplicate values defined in
X.733 are appended with X733 to ensure syntactic uniqueness.
Probable cause value 0 is reserved for special purposes.

The Internet Assigned Number Authority (IANA) is responsible
for the assignment of the enumerations in this TC.
IANAItuProbableCause value of 0 is reserved for special
purposes and MUST NOT be assigned.

Values of IANAItuProbableCause in the range 1 to 1023 are
reserved
for causes that correspond to ITU-T probable cause.

All other requests for new causes will be handled on a
first-come, first served basis and will be assigned
enumeration values starting with 1025.

Request should come in the form of well-formed
SMI [RFC2578] for enumeration names that are unique and
sufficiently descriptive.

```
          While some effort will be taken to ensure that new probable
          causes do not conceptually duplicate existing probable
          causes it is acknowledged that the existence of conceptual
          duplicates in the starting probable cause list is an known
          industry reality.

          To aid IANA in the administration of probable cause names
          and values, the OPS Area Director will appoint one or more
          experts to help review requests.

          See http://www.iana.org"

sysObjectID
 OBJECT-TYPE
   SYNTAX      OBJECT IDENTIFIER
   MAX-ACCESS  read-only
   STATUS      current
   DESCRIPTION
         "The vendor's authoritative identification of the
         network management subsystem contained in the entity.
         This value is allocated within the SMI enterprises
         subtree (1.3.6.1.4.1) and provides an easy and
         unambiguous means for determining `what kind of box' is
         being managed.  For example, if vendor `Flintstones,
         Inc.' was assigned the subtree 1.3.6.1.4.1.424242,
         it could assign the identifier 1.3.6.1.4.1.424242.1.1
         to its `Fred Router'."
   ::= { system 2 }

sysUpTime OBJECT-TYPE

   SYNTAX      TimeTicks
   MAX-ACCESS  read-only
   STATUS      current
   DESCRIPTION
         "The time (in hundredths of a second) since the
         network management portion of the system was last
         re-initialized."
   ::= { system 3 }

sysContact OBJECT-TYPE
    SYNTAX      DisplayString (SIZE (0..255))
   MAX-ACCESS  read-write
   STATUS      current
   DESCRIPTION
         "The textual identification of the contact person for
         this managed node, together with information on how
         to contact this person.  If no contact information is
         known, the value is the zero-length string."
   ::= { system 4 }

sysName OBJECT-TYPE
   SYNTAX      DisplayString (SIZE (0..255))
   MAX-ACCESS  read-write
   STATUS      current
   DESCRIPTION
         "An administratively-assigned name for this managed
         node.  By convention, this is the node's fully-qualified
```

```
        domain name.  If the name is unknown, the value is
        the zero-length string."
  ::= { system 5 }

sysLocation OBJECT-TYPE
  SYNTAX      DisplayString (SIZE (0..255))
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
        "The physical location of this node (e.g., 'telephone
        closet,
 3rd floor').  If the location is unknown, the
        value is the zero-length string."
  ::= { system 6 }

sysServices OBJECT-TYPE
  SYNTAX      INTEGER (0..127)
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
        "A value which indicates the set of services that this
        entity may potentially offer.  The value is a sum.

        This sum initially takes the value zero. Then, for
        each layer, L, in the range 1 through 7, that this node
        performs transactions for, 2 raised to (L - 1) is added
        to the sum.  For example, a node which performs only
        routing functions would have a value of 4 (2^(3-1)).
        In contrast, a node which is a host offering application
        services would have a value of 72 (2^(4-1) + 2^(7-1)).
        Note that in the context of the Internet suite of
        protocols, values should be calculated accordingly:

            layer      functionality
              1        physical (e.g., repeaters)
              2        datalink/subnetwork (e.g., bridges)
              3        internet (e.g., supports the IP)
              4        end-to-end  (e.g., supports the TCP)
              7        applications (e.g., supports the SMTP)

        For systems including OSI protocols, layers 5 and 6
        may also be counted."

SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that

the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value."
::= { snmp 4 }

snmpInBadCommunityUses OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which

represented an SNMP operation that was not allowed for
the SNMP community named in the message. The precise
conditions under which this counter is incremented
(if at all) depend on how the SNMP entity implements
its access control mechanism and how its applications
interact with that access control mechanism. It is
strongly RECOMMENDED that the documentation for any
access control mechanism which is used to control access
to and visibility of MIB instrumentation specify the
precise conditions that contribute to this value."
::= { snmp 5 }

usmDHKeyConformance OBJECT IDENTIFIER ::= { snmpUsmDHObjectsMIB 2 }

-- Textual conventions

DHKeyChange ::=         TEXTUAL-CONVENTION
  STATUS             current
  DESCRIPTION
     "Upon initialization, or upon creation of a row containing an
  object of this type, and after any successful SET of this value, a
  GET of this value returns 'y' where y = g^xa MOD p, and where g is
  the base from usmDHParameters, p is the prime from
  usmDHParameters, and xa is a new random integer selected by the
  agent in the interval 2^(l-1) <= xa < 2^l < p-1.  'l' is the
  optional privateValueLength from usmDHParameters in bits.  If 'l'
  is omitted,
 then xa (and xr below) is selected in the interval 0
  <= xa < p-1.  y is expressed as an OCTET STRING 'PV' of length 'k'
  which satisfies

          k
      y =  SUM   2^(8(k-i)) PV'i
          i=1

      where PV1,...,PVk are the octets of PV from first to last, and
      where PV1 <> 0.

  A successful SET consists of the value 'y' expressed as an OCTET
  STRING as above concatenated with the value 'z'(expressed as an
  OCTET STRING in the same manner as y) where z = g^xr MOD p, where
  g, p and l are as above, and where xr is a new random integer
  selected by the manager in the interval 2^(l-1) <= xr < 2^l <
  p-1. A SET to an object of this type will fail with the error
  wrongValue if the current 'y' does not match the 'y' portion of
  the value of the varbind for the object. (E.g. GET yout, SET
```

```
  concat(yin, z), yout <> yin).

  Note that the private values xa and xr are never transmitted from
  manager to device or vice versa, only the values
 y and z.
  Obviously, these values must be retained until a successful SET on
  the associated object.

  The shared secret 'sk' is calculated at the agent as sk = z^xa MOD
  p, and at the manager as sk = y^xr MOD p.

  Each object definition of this type MUST describe how to map from
  the shared secret 'sk' to the operational key value used by the
  protocols and operations related to the object.  In general, if n
  bits of key are required, the author suggests using the n
  right-most bits of the shared secret as the operational key value."

  DESCRIPTION
     "The public Diffie-Hellman parameters for doing
 a Diffie-Hellman
  key agreement for this device.  This is encoded as an ASN.1
  DHParameter per PKCS #3, section 9.  E.g.

     DHParameter ::= SEQUENCE {
       prime   INTEGER,   -- p
       base    INTEGER,   -- g
       privateValueLength  INTEGER OPTIONAL }

  Implementors are encouraged to use either the values from
  Oakley Group 1  or the values of from Oakley Group 2 as specified
  in RFC-2409, The Internet Key Exchange, Section 6.1, 6.2 as the
  default for this object.  Other values may be used, but the
  security properties of those values MUST be well understood and
  MUST meet the requirements of PKCS #3 for the selection of
  Diffie-Hellman primes.
```

```
      In addition, any time usmDHParameters changes, all values of
    type DHKeyChange will change and new random numbers MUST be
    generated by the agent for each DHKeyChange object."

usmDHKickstartTable OBJECT-TYPE
SYNTAX SEQUENCE OF UsmDHKickstartEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"A table of mappings between zero or more Diffie-Helman key
agreement values and entries in the usmUserTable. Entries in this
table are created by providing the associated device with a
Diffie-Helman public value and a usmUserName/usmUserSecurityName
pair during initialization. How these values are provided is
outside the scope of this MIB, but could be provided manually, or
through a configuration file. Valid public value/name pairs
result
in the creation of a row in this table as well as the
creation of an associated row (with keys derived as indicated) in
the usmUserTable. The actual access the related usmSecurityName
has is dependent on the entries in the VACM tables. In general,
an implementor will specify one or more standard security names
and will provide entries in the VACM tables granting various
levels of access to those names. The actual content of the VACM
table is beyond the scope of this MIB.

Note: This table is expected to be readable without authentication
using the usmUserSecurityName 'dhKickstart'. See the conformance
statements for details."
::= { usmDHKickstartGroup 1 }

usmDHKickstartEntry OBJECT-TYPE
SYNTAX UsmDHKickstartEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION

"An entry in the usmDHKickstartTable. The agent SHOULD either
delete this entry or mark it as inactive upon a successful SET of
any of the KeyChange-typed objects in the usmUserEntry or upon a
successful SET of any of the DHKeyChange-typed objects in the
usmDhKeyChangeEntry where the related usmSecurityName (e.g. row of
usmUserTable or row of ushDhKeyChangeTable) equals this entry's
usmDhKickstartSecurityName. In otherwords, once you've changed
one or more of the keys for a row in usmUserTable with a
particular security name, the row in this table with that same
security name is no longer useful or meaningful."

  ::= { usmDHKickstartEntry 2 }

usmDHKickstartMgrPublic OBJECT-TYPE
  SYNTAX      OCTET STRING
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION

     "The manager's Diffie-Hellman public value for this row.  Note
  that this value is not set via the SNMP agent, but may be set via
  some out of band
 method, such as the device's configuration file.
  The manager calculates this value in the same manner and using the
  same parameter set as the agent does.  E.g. it selects a random
  number 'r', calculates y = g^r mod p and provides 'y' as the
  public number expressed as an OCTET STRING.  See
  usmDHKickstartMyPublic for details.

  When this object is set with a valid value during initialization,
  a row is created in the usmUserTable with the following values:

  usmUserEngineID            localEngineID
  usmUserName                [value of usmDHKickstartSecurityName]
  usmUserSecurityName        [value of usmDHKickstartSecurityName]
  usmUserCloneFrom           ZeroDotZero
  usmUserAuthProtocol        usmHMACMD5AuthProtocol
  usmUserAuthKeyChange       -- derived from set value
  usmUserOwnAuthKeyChange    -- derived from set value
  usmUserPrivProtocol        usmDESPrivProtocol
  usmUserPrivKeyChange       -- derived from set value
   usmUserOwnPrivKeyChange   -- derived from set value
  usmUserPublic              "
  usmUserStorageType         permanent
```

usmUserStatus active

A shared secret 'sk' is calculated at the agent as sk =
mgrPublic^r mod p where r is the agents random number and p is the
DH prime from the common parameters. The underlying privacy key
for this row is derived from sk by applying the key derivation
function PBKDF2 defined in PKCS#5v2.0 with a salt of 0xd1310ba6,
and iterationCount of 500, a keyLength of 16 (for
usmDESPrivProtocol), and a prf (pseudo random function) of
'id-hmacWithSHA1'. The underlying authentication key for this row
is derived from sk by applying the key derivation function PBKDF2
with a salt of 0x98dfb5ac , an interation count of 500, a
keyLength of 16 (for usmHMAC5AuthProtocol), and a prf of
'id-hmacWithSHA1'. Note: The salts are the first two words in the
ks0 [key schedule 0] of the BLOWFISH
cipher from 'Applied
Cryptography' by Bruce Schnier - they could be any relatively
random string of bits.

The manager can use its knowledge of its own random number and the
agent's public value to kickstart its access to the agent in a
secure manner. Note that the security of this approach is
directly related to the strength of the authorization security of
the out of band provisioning of the managers public value
(e.g. the configuration file), but is not dependent at all on the
strength of the confidentiality of the out of band provisioning
data."

    DESCRIPTION
      "The MIB module for managing the new Ethernet OAM features
      introduced by the Ethernet in the First Mile taskforce (IEEE
      802.3ah).  The functionality presented here is based on IEEE
      802.3ah [802.3ah], released in October, 2004.  [802.3ah] was
      prepared as an addendum to the standing version of IEEE 802.3
```

[802.3-2002]. Since then, [802.3ah] has been merged into the base IEEE 802.3 specification in [802.3-2005].

In particular, this MIB focuses on the new OAM functions introduced in Clause 57 of [802.3ah]. The OAM functionality of Clause 57 is controlled by new management attributes introduced in Clause 30 of [802.3ah]. The OAM functions are not specific to any particular Ethernet physical layer, and can be generically applied to any Ethernet interface of [802.3-2002].

An Ethernet OAM protocol data unit is a valid Ethernet frame with a destination MAC address equal to the reserved MAC address for Slow Protocols (See 43B of [802.3ah]), a lengthOrType field equal to the reserved type for Slow Protocols, and a Slow Protocols subtype equal to that of the subtype reserved for Ethernet OAM. OAMPDU is used throughout this document as an abbreviation for Ethernet OAM protocol data unit.

The following reference is used throughout this MIB module:

[802.3ah] refers to:
IEEE Std 802.3ah-2004: 'Draft amendment to - Information technology - Telecommunications and information exchange between systems - Local and metropolitan area networks - Specific requirements - Part 3: Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications - Media Access Control Parameters, Physical Layers and Management Parameters for subscriber access networks', October 2004.

[802.3-2002] refers to:
IEEE Std 802.3-2002:
'Information technology - Telecommunications and information exchange between systems - Local and metropolitan area networks - Specific requirements - Part 3: Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications - Media Access Control Parameters, Physical Layers and Management Parameters for subscriber access networks', March 2002.

[802.3-2005] refers to:

              enabled(1),
```

```
            disabled(2)
          }
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
    "This object is used to provision the default administrative
    OAM mode for this interface.  This object represents the
    desired state of OAM for this interface.

    The dot3OamAdminState always starts in the disabled(2) state
    until an explicit management action or configuration
    information retained by the system causes a transition to the
    enabled(1) state.  When enabled(1), Ethernet OAM will attempt
    to operate over this interface.
    "
  REFERENCE   "[802.3ah], 30.3.6.1.2"
  ::= { dot3OamEntry 1 }

dot3OamOperStatus OBJECT-TYPE
  SYNTAX      INTEGER {
              disabled(1),
              linkFault(2),
              passiveWait(3),
              activeSendLocal(4),
              sendLocalAndRemote(5),
              sendLocalAndRemoteOk(6),
              oamPeeringLocallyRejected(7),
               oamPeeringRemotelyRejected(8),
              operational(9),
              nonOperHalfDuplex(10)
            }
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
    "At initialization and failure conditions, two OAM entities on

    the same full-duplex Ethernet link begin a discovery phase to
    determine what OAM capabilities may be used on that link.  The
    progress of this initialization is controlled by the OA
    sublayer.

    This value is always disabled(1) if OAM is disabled on this
    interface via the dot3OamAdminState.

    If the link has detected a fault and is transmitting OAMPDUs
    with a link fault indication, the value is linkFault(2).
```

Also, if the interface is not operational (ifOperStatus is not up(1)), linkFault(2) is returned. Note that the object ifOperStatus may not be up(1) as a result of link failure or administrative
action (ifAdminState being down(2) or testing(3)).

The passiveWait(3) state is returned only by OAM entities in passive mode (dot3OamMode) and reflects the state in which the OAM entity is waiting to see if the peer device is OA capable. The activeSendLocal(4) value is used by active mode devices (dot3OamMode) and reflects the OAM entity actively trying to discover whether the peer has OAM capability but has not yet made that determination.

The state sendLocalAndRemote(5) reflects that the local OA entity has discovered the peer but has not yet accepted or rejected the configuration of the peer. The local device can, for whatever reason, decide that the peer device is unacceptable and decline OAM peering. If the local OAM entity rejects the peer OAM entity, the state becomes oamPeeringLocallyRejected(7). If the OAM peering is allowed by the local device, the state moves
to
sendLocalAndRemoteOk(6). Note that both the sendLocalAndRemote(5) and oamPeeringLocallyRejected(7) states fall within the state SEND_LOCAL_REMOTE of the Discovery state diagram [802.3ah, Figure 57-5], with the difference being whether the local OAM client has actively rejected the peering or has just not indicated any decision yet. Whether a peering decision has been made is indicated via the local flags field in the OAMPDU (reflected in the aOAMLocalFlagsField of 30.3.6.1.10).

If the remote OAM entity rejects the peering, the state becomes oamPeeringRemotelyRejected(8). Note that both the sendLocalAndRemoteOk(6) and oamPeeringRemotelyRejected(8) states fall within the state SEND_LOCAL_REMOTE_OK of the Discovery state diagram [802.3ah, Figure 57-5], with the difference being whether the remote OAM client has rejected

the peering or has just not yet decided. This
is indicated
via the remote flags field in the OAMPDU (reflected in the aOAMRemoteFlagsField of 30.3.6.1.11).

```
    When the local OAM entity learns that both it and the remote
    OAM entity have accepted the peering, the state moves to
    operational(9) corresponding to the SEND_ANY state of the
    Discovery state diagram [802.3ah, Figure 57-5].

    Since Ethernet OAM functions are not designed to work
    completely over half-duplex interfaces, the value
    nonOperHalfDuplex(10) is returned whenever Ethernet OAM is
    enabled (dot3OamAdminState is enabled(1)), but the interface
    is in half-duplex operation.
    "
  REFERENCE   "[802.3ah], 30.3.6.1.4, 30.3.6.1.10, 30.3.6.1.11"
  ::= { dot3OamEntry 2 }

 dot3OamMode OBJECT-TYPE
  SYNTAX      INTEGER {
                passive(1),
                active(2)
              }
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
    "This object configures
the mode of OAM operation for this
    Ethernet-like interface.  OAM on Ethernet interfaces may be in
    'active' mode or 'passive' mode.  These two modes differ in
    that active mode provides additional capabilities to initiate
    monitoring activities with the remote OAM peer entity, while
    passive mode generally waits for the peer to initiate OA
    actions with it.  As an example, an active OAM entity can put
    the remote OAM entity in a loopback state, where a passive OA
    entity cannot.

    The default value of dot3OamMode is dependent on the type of
    system on which this Ethernet-like interface resides.  The
    default value should be 'active(2)' unless it is known that
    this system should take on a subservient role to the other
    device connected over this interface.

    Changing this value results in incrementing the configuration
    revision field of locally generated OAMPDUs (30.3.6.1.12) and
    potentially
re-doing the OAM discovery process if the
    dot3OamOperStatus was already operational(9).

  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
    "The OAM functions supported on this Ethernet-like interface.
    OAM consists of separate functional sets beyond the basic
    discovery process that is always required.  These functional
    groups can be supported independently by any implementation.
    These values are communicated to the peer via the local
    configuration field of Information OAMPDUs.
```

```
    Setting 'unidirectionalSupport(0)' indicates that the
OA

    entity supports the transmission of OAMPDUs on links that are
    operating in unidirectional mode (traffic flowing in one
    direction only).  Setting 'loopbackSupport(1)' indicates that
    the OAM entity can initiate and respond to loopback commands.
    Setting 'eventSupport(2)' indicates that the OAM entity can
    send and receive Event Notification OAMPDUs.  Setting
    'variableSupport(3)' indicates that the OAM entity can send
    and receive Variable Request and Response OAMPDUs.

dot3OamLoopbackTable OBJECT-TYPE
SYNTAX SEQUENCE OF Dot3OamLoopbackEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"This table contains controls for the loopback state of the local link as well as indicates the status of the loopback function. There is one entry in this table for each entry in dot3OamTable that supports loopback functionality (where dot3OamFunctionsSupported includes the loopbackSupport bit set).

Loopback can be used to place the remote OAM entity in a state where every received frame (except OAMPDUs) is echoed back

```
  over the same interface on which they were received.  In this
    state, at the remote entity, 'normal' traffic is disabled as
    only the looped back frames are transmitted on the interface.
    Loopback is thus an intrusive operation that prohibits normal
    data flow and should be used accordingly.
    "
  ::= { dot3OamObjects 3 }

dot3OamLoopbackEntry OBJECT-TYPE
  SYNTAX      Dot3OamLoopbackEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
    "An entry in the table, containing information on the loopback
    status for a single Ethernet-like interface.  Entries in the
    table are automatically created whenever the local OAM entity
    supports loopback capabilities.  The loopback status on the
    interface can be determined from the dot3OamLoopbackStatus
    object.
    "
  INDEX       { ifIndex }
  ::= { dot3OamLoopbackTable 1 }

Dot3OamLoopbackEntry ::=

  SEQUENCE {
    dot3OamLoopbackStatus
          INTEGER,
    dot3OamLoopbackIgnoreRx          INTEGER
  }

dot3OamLoopbackStatus OBJECT-TYPE
  SYNTAX      INTEGER {
              -- all values, except where noted, can be read
              -- but cannot be written
              noLoopback (1),

              -- initiatingLoopback can be read or written
              initiatingLoopback (2),
              remoteLoopback (3),

              -- terminatingLoopback can be read or written
              terminatingLoopback (4),
              localLoopback (5),
              unknown (6)
```

}
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"The loopback status of the OAM entity. This status is
determined by a combination of the local parser and
multiplexer states, the remote parser and multiplexer states,
as well as by the actions of the local OAM client. When
operating in normal mode
with no loopback in progress, the
status reads noLoopback(1).

The values initiatingLoopback(2) and terminatingLoopback(4)
can be read or written. The other values can only be read -
they can never be written. Writing initiatingLoopback causes
the local OAM entity to start the loopback process with its
peer. This value can only be written when the status is
noLoopback(1). Writing the value initiatingLoopback(2) in any
other state has no effect. When in remoteLoopback(3), writing
terminatingLoopback(4) causes the local OAM entity to initiate
the termination of the loopback state. Writing
terminatingLoopack(4) in any other state has no effect.

If the OAM client initiates a loopback and has sent a
Loopback OAMPDU and is waiting for a response, where the local
parser and multiplexer states are DISCARD (see [802.3ah,
57.2.11.1]), the status is 'initiatingLoopback'. In this

case, the local OAM entity has yet to receive any
acknowledgment that the remote OAM entity has received its
loopback command request.

If the local OAM client knows that the remote OAM entity is in
loopback mode (via the remote state information as described
in [802.3ah, 57.2.11.1, 30.3.6.1.15]), the status is
remoteLoopback(3). If the local OAM client is in the process
of terminating the remote loopback [802.3ah, 57.2.11.3,
30.3.6.1.14] with its local multiplexer and parser states in
DISCARD, the status is terminatingLoopback(4). If the remote
OAM client has put the local OAM entity in loopback mode as
indicated by its local parser state, the status is
localLoopback(5).

The unknown(6) status indicates that the parser and
multiplexer combination is unexpected. This status may be

```
    returned if the OAM loopback is in a transition state but
    should not persist.

The values of this attribute correspond to the following
    values of the local and remote parser and multiplexer states.

     value           LclPrsr   LclMux    RmtPrsr   RmtMux
     noLoopback        FWD       FWD       FWD       FWD
     initLoopback    DISCARD   DISCARD     FWD       FWD
     rmtLoopback     DISCARD     FWD      LPBK    DISCARD
     tmtngLoopback   DISCARD   DISCARD    LPBK    DISCARD
     lclLoopback       LPBK    DISCARD   DISCARD     FWD
     unknown           ***   any other combination   ***

  ::= { dot3OamLoopbackEntry 1 }

 dot3OamLoopbackIgnoreRx OBJECT-TYPE
  SYNTAX      INTEGER { ignore(1), process(2) }
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
    "Since OAM loopback is a disruptive operation (user traffic
    does not pass), this attribute provides a mechanism to provide
    controls
over whether received OAM loopback commands are
    processed or ignored.  When the value is ignore(1), received
    loopback commands are ignored.  When the value is process(2),
    OAM loopback commands are processed.  The default value is to
    ignore loopback commands (ignore(1)).

SYNTAX Counter32
UNITS "frames"
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"A count of the number of frames that were dropped by the OA
multiplexer. Since the OAM multiplexer has multiple inputs
and a single output, there may be cases where frames are
dropped due to transmit resource contention. This counter is
incremented whenever a frame is dropped by the OAM layer.
Note that any Ethernet frame, not just OAMPDUs, may be dropped
by the OAM layer. This can occur when an OAMPDU takes
precedence over a 'normal' frame resulting in the 'normal'
frame being dropped.

When this counter

is incremented, no other counters in this
MIB are incremented.

Discontinuities of this counter can occur at re-initialization
of the management system, and at other times as indicated by
the value of the ifCounterDiscontinuityTime.

--

dot3OamEventConfigTable OBJECT-TYPE
SYNTAX SEQUENCE OF Dot3OamEventConfigEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"Ethernet OAM includes the ability to generate and receive
Event Notification OAMPDUs to indicate various link problems.
This table contains the mechanisms to enable Event

Notifications and configure the thresholds to generate the
standard Ethernet OAM events. There is one entry in the table
for every entry in
dot3OamTable that supports OAM events
(where dot3OamFunctionsSupported includes the eventSupport
bit set). The values in the table are maintained across
changes to dot3OamOperStatus.

The standard threshold crossing events are:
- Errored Symbol Period Event. Generated when the number of
symbol errors exceeds a threshold within a given window
defined by a number of symbols (for example, 1,000 symbols
out of 1,000,000 had errors).
- Errored Frame Period Event. Generated when the number of
frame errors exceeds a threshold within a given window
defined by a number of frames (for example, 10 frames out
of 1000 had errors).
- Errored Frame Event. Generated when the number of frame
errors exceeds a threshold within a given window defined
by a period of time (for example, 10 frames in 1 second
had errors).
- Errored Frame Seconds

```
Summary Event.  Generated when the
        number of errored frame seconds exceeds a threshold within
        a given time period (for example, 10 errored frame seconds
        within the last 100 seconds).  An errored frame second is
        defined as a 1 second interval which had >0 frame errors.
     There are other events (dying gasp, critical events) that are
     not threshold crossing events but which can be
     enabled/disabled via this table.
     "

  DESCRIPTION
    "The two objects dot3OamErrSymPeriodWindowHi and
    dot3OamErrSymPeriodWindowLo together form an unsigned 64-bit
    integer representing the number of symbols over which this
    threshold event is defined.  This is defined as

  dot3OamErrSymPeriodWindow = ((2^32)*dot3OamErrSymPeriodWindowHi)
                            + dot3OamErrSymPeriodWindowLo
```

```
    If dot3OamErrSymPeriodThreshold symbol errors
occur within a
    window of dot3OamErrSymPeriodWindow symbols, an Event
    Notification OAMPDU should be generated with an Errored Symbol
    Period Event TLV indicating that the threshold has been
    crossed in this window.

    The default value for dot3OamErrSymPeriodWindow is the number
    of symbols in one second for the underlying physical layer.

 dot3OamEventLogTable OBJECT-TYPE
  SYNTAX       SEQUENCE OF Dot3OamEventLogEntry
  MAX-ACCESS   not-accessible
  STATUS       current
  DESCRIPTION
    "This table records
a history of the events that have occurred
    at the Ethernet OAM level.  These events can include locally
    detected events, which may result in locally generated
    OAMPDUs, and remotely detected events, which are detected by
    the OAM peer entity and signaled to the local entity via

    Ethernet OAM.  Ethernet OAM events can be signaled by Event
    Notification OAMPDUs or by the flags field in any OAMPDU.

    This table contains both threshold crossing events and
    non-threshold crossing events.  The parameters for the
    threshold window, threshold value, and actual value
    (dot3OamEventLogWindowXX, dot3OamEventLogThresholdXX,
    dot3OamEventLogValue) are only applicable to threshold
    crossing events, and are returned as all F's (2^32 - 1) for
    non-threshold crossing events.

    Entries in the table are automatically created when such
    events are detected.  The size of the table is implementation
    dependent.
 When the table reaches its maximum size, older
    entries are automatically deleted to make room for newer
    entries.

          }
  STATUS  current
  DESCRIPTION

"A dot3OamThresholdEvent notification is sent when a local or
    remote threshold crossing event is detected.  A local
    threshold crossing event is detected by the local entity,
    while a remote threshold crossing event is detected by the
    reception of an Ethernet OAM Event Notification OAMPDU
    that indicates a threshold event.

    This notification should not be sent more than once per
    second.

    The OAM entity can be derived from extracting the ifIndex from
    the variable bindings.  The objects in the notification
    correspond to the values in a row instance in the
    dot3OamEventLogTable.

    The management entity should periodically check
    dot3OamEventLogTable to detect any missed events."

-- sysApplInstalled Group
-- This group provides information about application
packages
-- that have been installed on the host computer.  The group
-- contains two tables.  The first, the sysApplInstallPkgTable,
-- describes the application packages, the second, the
-- sysApplInstallElmtTable, describes the constituent elements
-- (files and executables) which compose an application package.

--
-- In order to appear in this group, an application and its
-- component files must be discoverable by the system itself,
-- possibly through some type of software installation mechanism
-- or registry.

-- sysApplInstallPkgTable
-- The system installed application packages table provides
-- information on the software packages installed on a system.
-- These packages may consist of many different files including
-- executable and non-executable files.

            }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
      "An operator assigned value used in the determination of
      application status. This value is used by the agent to
      determine both the mapping of started processes to the
      initiation of an application, as well as to allow for a
      determination of application health. The default value,
      unknown(5), is used when an operator has not yet assigned
      one of the other values.  If unknown(5) is set, bits
      1 - 4 have no meaning.  The possible values are:

            executable(0),
              An application may have one or
              more executable elements.  The rest of the
              bits have no meaning if the element is not
              executable.
```

exclusive(1),
Only one copy of an exclusive element may be
running per invocation of the running
application.
primary(2),
The primary executable. An application can
have one, and only one element that is designated
as the primary executable. The execution of
this element constitutes an invocation of
the application. This is used by the agent
implementation to determine the initiation of
an application. The primary executable must
remain running long enough for
the agent
implementation to detect its presence.
required(3),
An application may have zero or more required
elements. All required elements must be running
in order for the application to be judged to be
running and healthy.
dependent(4),
An application may have zero or more
dependent elements. Dependent elements may
not be running unless required elements are.
unknown(5)
Default value for the case when an operator
has not yet assigned one of the other values.
When set, bits 1, 2, 3, and 4 have no meaning.

sysApplInstallElmtRole is used by the agent implementation
in determining the initiation of an application, the
current state of a running application (see
sysApplRunCurrentState), when an application invocation is
no longer running, and the exit status of a terminated
application invocation (see sysApplPastRunExitState)."

    DESCRIPTION
        "Part of the index for this table. An arbitrary
        integer used only for indexing purposes. Generally
        monotonically increasing from 1 as new applications are
        started on the host, it uniquely identifies application
```

invocations.

The numbering for this index increases by 1 for each INVOCATION of an application, regardless of which installed application package this entry represents a running instance of.

An example of the indexing for a couple of entries is shown below.

:
sysApplRunStarted.17.14
sysApplRunStarted.17.63
sysApplRunStarted.18.13
:

In this example, the agent has observed 12 application invocations when the application represented by entry 18 in the sysApplInstallPkgTable is invoked. The next invocation detected by the agent is an invocation of installed application package 17. Some time later, installed application 17 is invoked a second time.

NOTE: this index is not intended to reflect a real-time (wall clock time) ordering of application invocations; it is merely intended to uniquely identify running instances of applications. Although the sysApplInstallPkgIndex is included in the INDEX clause for this table, it serves only to ease searching of this table by installed application and does not contribute to uniquely identifying table entries."

-- reaches a maximum as determined by the sysApplPastRunMaxRows,
-- or when an entry has aged to exceed a time limit as set be
-- sysApplPastRunTblTimeLimit.
--
-- When aging out entries, the oldest entry, as determined by

-- the value of sysApplPastRunTimeEnded, will be removed first.

sysApplPastRunTable OBJECT-TYPE
SYNTAX SEQUENCE OF SysApplPastRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"A history of the applications that have previously run
on the host
computer. An entry's information is moved to
this table from the sysApplRunTable when the invoked
application represented by the entry ceases to be running.

An agent implementation can determine that an application
invocation is no longer running by evaluating the running
elements of the application instance and their Roles as
defined by sysApplInstallElmtRole. Obviously, if there
are no running elements for the application instance,
then the application invocation is no longer running.

```
        If any one of the REQUIRED elements is not running,
        the application instance may be in the process of exiting.
        Most agent implementations will wait until a second internal
        poll has been completed to give the system time to either
        restart partial failures or to give all elements time to
        exit.  If, after the second poll, there are REQUIRED
        elements that
are not running, then the application
        instance may be considered by the agent implementation
        to no longer be running.

        Entries remain in the sysApplPastRunTable until they
        are aged out when either the table size reaches a maximum
        as determined by the sysApplPastRunMaxRows, or when an entry
        has aged to exceed a time limit as set by
        sysApplPastRunTblTimeLimit.

        Entries in this table are indexed by sysApplInstallPkgIndex,
        sysApplPastRunIndex to facilitate retrieval of all past
        run invocations of a particular installed application."

-- remain in the table until the process terminates.
--
-- The table
is indexed by sysApplElmtRunInstallPkg,
-- sysApplElmtRunInvocID, and sysApplElmtRunIndex to make it easy
-- to locate all running elements of a particular invoked application
-- which has been installed on the system.

sysApplElmtRunTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF SysApplElmtRunEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
        "The table describes the processes which are
        currently executing on the host system. Each entry
        represents a running process and is associated with
        the invoked application of which that process is a part, if
        possible.  This table contains an entry for every process
        currently running on the system, regardless of whether its
        'parent' application can be determined.  So, for example,
        processes like 'ps' and 'grep' will have entries though they
        are not associated with an installed application package.

        Because
a running application may involve
        more than one executable, it is possible to have
        multiple entries in this table for each application.
        Entries are removed from this table when the process
        terminates.
        The table is indexed by sysApplElmtRunInstallPkg,
        sysApplElmtRunInvocID, and sysApplElmtRunIndex to
        facilitate the retrieval of all running elements of a
        particular invoked application which has been installed on

   ::= { sysApplElmtRunEntry 12 }

-- sysApplElmtPastRunTable
-- The sysApplElmtPastRunTable maintains a history of
-- processes which have previously executed on
-- the host as part of an application. Upon termination
-- of a process, the entry representing the process is removed from
-- the sysApplElmtRunTable and a corresponding entry is created in
-- this table provided that the process was part of an
-- identifiable application.  If the process could not be associated

-- with an invoked application, no corresponding entry is created.
-- Hence, whereas the sysApplElmtRunTable contains an entry for
-- every process currently executing on the system, the
-- sysApplElmtPastRunTable only contains entries for processes
-- that previously executed as part of an invoked application.
--
-- Entries
```

```
remain in this table until they are aged out when
-- either the number of entries in the table reaches a
-- maximum as determined by sysApplElmtPastRunMaxRows, or
-- when an entry has aged to exceed a time limit as set by
-- sysApplElmtPastRunTblTimeLimit.  When aging out entries,
-- the oldest entry, as determined by the value of
-- sysApplElmtPastRunTimeEnded, will be removed first.
--
-- The table is indexed by sysApplInstallPkgIndex (from the
-- sysApplInstallPkgTable), sysApplElmtPastRunInvocID, and
-- sysApplElmtPastRunIndex to make it easy to locate all
-- previously executed processes of a particular invoked application
-- that has been installed on the system.

sysApplElmtPastRunTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF SysApplElmtPastRunEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "The table describes the processes which have previously
      executed on the host system as part of an application.
       Each entry represents a process which has previously
      executed and is associated with the invoked application
      of which it was a part.  Because an invoked application
      may involve more than one executable, it is possible
      to have multiple entries in this table for
      each application invocation. Entries are added
      to this table when the corresponding process in the
      sysApplElmtRun Table terminates.

      Entries remain in this table until they are aged out when
      either the number of entries in the table reaches a
      maximum as determined by sysApplElmtPastRunMaxRows, or
      when an entry has aged to exceed a time limit as set by
      sysApplElmtPastRunTblTimeLimit.  When aging out entries,
      the oldest entry, as determined by the value of
      sysApplElmtPastRunTimeEnded, will be removed first.

      The table is indexed by sysApplInstallPkgIndex (from the
       sysApplInstallPkgTable), sysApplElmtPastRunInvocID,
      and sysApplElmtPastRunIndex to make it easy to locate all
      previously executed processes of a particular invoked
      application that has been installed on the system."

-- sysApplMap Group
-- This group contains a table, the sysApplMapTable,
-- whose sole purpose is to provide a 'backwards'
-- mapping so that, given a known sysApplElmtRunIndex
-- (process identification number), the corresponding invoked
-- application (sysApplRunIndex), installed element
-- (sysApplInstallElmtIndex), and installed application
-- package (sysApplInstallPkgIndex) can be quickly determined.
--
-- The table will contain one entry for each process
-- currently running on the system.
--
-- A backwards mapping is extremely useful since the tables
-- in this MIB module are typically indexed with the
-- installed application package (sysApplInstallPkgIndex)
-- as the primary key, and on down
as required by the
-- specific table, with the process ID number (sysApplElmtRunIndex)
-- being the least significant key.
--
-- It is expected that management applications will use
-- this mapping table by doing a 'GetNext' operation with
-- the known process ID number (sysApplElmtRunIndex) as the partial
-- instance identifier.  Assuming that there is an entry for
-- the process, the result should return a single columnar value,
-- the sysApplMapInstallPkgIndex, with the sysApplElmtRunIndex,
-- sysApplRunIndex, and sysApplInstallElmtIndex contained in the
-- instance identifier for the returned MIB object value.
--
```

```
-- NOTE: if the process can not be associated back to an
-- invoked application installed on the system, then the
-- value returned for the columnar value sysApplMapInstallPkgIndex
-- will be '0' and the instance portion of the object-identifier
-- will be the process ID number (sysApplElmtRunIndex) followed

-- by 0.0.

sysApplMapTable
OBJECT-TYPE
   SYNTAX      SEQUENCE OF SysApplMapEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
       "The sole purpose of this table is to provide a
       'backwards' mapping so that, given a known
       sysApplElmtRunIndex (process identification number),
       the corresponding invoked application (sysApplRunIndex),
       installed element (sysApplInstallElmtIndex), and
       installed application package (sysApplInstallPkgIndex)
       can be quickly determined.

       This table will contain one entry for each process
       that is currently executing on the system.

       It is expected that management applications will use
       this mapping table by doing a 'GetNext' operation with
       the known process ID number (sysApplElmtRunIndex) as the
       partial instance identifier.  Assuming that there is an
       entry for the process, the result should return a single
       columnar
value, the sysApplMapInstallPkgIndex, with the
       sysApplElmtRunIndex, sysApplRunIndex, and
       sysApplInstallElmtIndex contained in the instance identifier
       for the returned MIB object value.

       NOTE: if the process can not be associated back to an
       invoked application installed on the system, then the
       value returned for the columnar value
       sysApplMapInstallPkgIndex will be '0' and the instance
       portion of the object-identifier will be the process ID
       number (sysApplElmtRunIndex) followed by 0.0."

sysApplMapInstallPkgIndex OBJECT-TYPE
    SYNTAX      Unsigned32 (0..'ffffffff'h)
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "The value of this object identifies the installed
        software package for the application of which this
        process is a part.  Provided that the process's 'parent'
        application can be determined, the value of this object
        is the same value as the sysApplInstallPkgIndex for the
        entry in the sysApplInstallPkgTable that corresponds
        to the installed application of which this process
        is a part.
```

```
        If, however, the 'parent' application cannot be
        determined, (for example the process is not part
        of a particular installed application), the value
        for this object is then '0', signifying that this

 process cannot be related back to an application,
        and in turn, an installed software package."

IANAItuProbableCause ::= TEXTUAL-CONVENTION
```

STATUS current
DESCRIPTION
"ITU-T probable cause values. Duplicate values defined in
X.733 are appended with X733 to ensure syntactic uniqueness.
Probable cause value 0 is reserved for special purposes.

The Internet Assigned Number Authority (IANA) is responsible
for the assignment of the enumerations in this TC.
IANAItuProbableCause value of 0 is reserved for special
purposes and MUST NOT be assigned.

Values of IANAItuProbableCause in the range 1 to 1023 are
reserved for causes that correspond to ITU-T probable cause.

All other requests for new causes will be handled on a
first-come, first served basis and will be assigned
enumeration values starting with 1025.

Request should come in the form of well-formed

SMI [RFC2578] for enumeration names that are unique and
sufficiently descriptive.

While some effort will be taken to ensure that new probable
causes do not conceptually duplicate existing probable
causes it is acknowledged that the existence of conceptual
duplicates in the starting probable cause list is an known
industry reality.

To aid IANA in the administration of probable cause names
and values, the OPS Area Director will appoint one or more
experts to help review requests.

See http://www.iana.org"

-- The following pktcMtaDevBase group describes the base MTA objects
--

pktcMtaDevResetNow  OBJECT-TYPE
  SYNTAX      TruthValue
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
     " This object controls the MTA software reset.
       Reading this object always returns 'false'.  Setting this
       object to 'true' causes the device to reset immediately
       and the following actions to occur:
          1.  All connections (if present) are flushed locally.
          2.  All current actions such as ringing immediately
              terminate.
          3.  Requests for signaling notifications, such as
              notification based on digit map recognition, are
              flushed.
          4.  All endpoints are disabled.
          5.  The provisioning flow is started at step MTA-1.

    If a value is written into an instance of
       pktcMtaDevResetNow, the agent MUST NOT retain the supplied
       value across MTA re-initializations or reboots."

STATUS current
DESCRIPTION
" This object contains the MTA Admin Status of this device.
If this object is set to 'true', the MTA is
administratively enabled, and the MTA MUST be able to
interact with the PacketCable entities, such as CMS,
Provisioning Server, KDC, and other MTAs and MGs on all
PacketCable interfaces.
If this object is set to 'false', the MTA is
administratively
disabled, and the MTA MUST perform the
following actions for all endpoints:
- Shut down all media sessions, if present.
- Shut down Network Control Signaling (NCS)
signaling by following the Restart in
Progress procedures in the PacketCable NCS
specification.
The MTA must execute all actions required to
enable or disable the telephony services for all
endpoints immediately upon receipt of an SNMP SET
operation.

Additionally, the MTA MUST maintain the SNMP Interface
for management and also the SNMP Key management interface.
Also, the MTA MUST NOT continue Kerberized key management
with CMSes until this object is set to 'true'.
Note: MTAs MUST renew the CMS Kerberos tickets according
to the PacketCable Security or IPCablecom Specification.
If a value is written into an instance
of
pktcMtaDevEnabled, the agent MUST NOT retain the supplied
value across MTA re-initializations or reboots."

    STATUS      current
    DESCRIPTION
        " This object indicates the completion state of the MTA
        device provisioning process.

        pass:
        If the configuration file could be parsed successfully
        and the MTA is able to reflect the same in its
        MIB, the MTA MUST return the value 'pass'.

        inProgress:
        If the MTA is in the process of being provisioned,
```

the MTA MUST return the value 'inProgress'.

failConfigFileError:
If the configuration file was in error due to incorrect values in the mandatory parameters, the MTA MUST reject the configuration file, and the MTA MUST return the value

'failConfigFileError'.

passWithWarnings:
If the configuration file had proper values for all the mandatory parameters but has errors in any of the optional parameters (this includes any vendor-specific Object Identifiers (OIDs) that are incorrect or not known to the MTA), the MTA MUST return the value 'passWithWarnings'.

passWithIncompleteParsing:
If the configuration file is valid but the MTA cannot reflect the same in its configuration (for example, too many entries caused memory exhaustion), it must accept the CMS configuration entries related, and the MTA MUST return the value 'passWithIncompleteParsing'.

failureInternalError:
If the configuration file cannot be parsed due to an Internal error, the MTA MUST return the value 'failureInternalError'.

failureOtherReason:
If the MTA cannot accept the configuration file for any other reason than the ones stated above, the MTA MUST return the value 'failureOtherReason'.

When a final SNMP INFORM is sent as part of Step 25 of the MTA Provisioning process, this parameter is also included in the final INFORM message."

   }

pktcMtaDevErrorOidIndex  OBJECT-TYPE
   SYNTAX      Unsigned32 (1..1024)
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      " This object is the index of the MTA configuration error
        table.  It is an integer value that starts at value '1'
```

and is incremented for each encountered configuration
file error or warning.

The maximum number of errors or warnings that can be
recorded in the pktcMtaDevErrorOidsTable is set to 1024 as
a configuration file is usually validated by operators
before deployment. Given the possible number of
configuration parameter assignments in the MTA
configuration file, 1024 is perceived as a sufficient
limit even with future extensions.

If the number of the errors in the configuration
file
exceeds 1024, all errors beyond the 1024th one MUST
be ignored and not be reflected in the
pktcMtaDevErrorOidsTable."

::= {pktcMtaDevErrorOidsEntry 1}

pktcMtaDevErrorOid OBJECT-TYPE
SYNTAX SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
" This object contains a human readable representation
(character string) of the OID corresponding to the
configuration file parameter that caused the particular
error.
For example, if the value of the pktcMtaDevEnabled object
in the configuration file caused an error, then this
object instance will contain the human-readable string of
'1.3.6.1.2.1.140.1.1.6.0'.
If the MTA generated an error because it was not able
to recognize a particular OID, then this object
instance would contain an empty value (zero-length
string).
For example,
if the value of an OID in the configuration
file was interpreted by the MTA as being 1.2.3.4.5, and if
the MTA was not able to recognize this OID as a valid one,
this object instance will contain a zero-length string.

If the number of errors in the configuration file exceeds
1024, then for all subsequent errors, the
pktcMtaDevErrorOid of the table's 1024th entry MUST

contain a human-readable representation of the
pktcMtaDevErrorsTooManyErrors object; i.e., the string
'1.3.6.1.2.1.140.1.1.4.1.0'.
Note that the syntax of this object is SnmpAdminString
instead of OBJECT IDENTIFIER because the object value may
not be a valid OID due to human or configuration tool
encoding errors."

::= {pktcMtaDevErrorOidsEntry 2}

pktcMtaDevErrorValue OBJECT-TYPE
SYNTAX SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
" This
object contains the value of the OID corresponding to
the configuration file parameter that caused the error.
If the MTA cannot recognize the OID of the
configuration parameter causing the error, then this
object instance contains the OID itself as interpreted
by the MTA in human-readable representation.
If the MTA can recognize the OID but generate an error due
to a wrong value of the parameter, then the object

instance contains the erroneous value of the parameter as
read from the configuration file.
In both cases, the value of this object must be
represented in human-readable form as a character string.
For example, if the value of the pktcMtaDevEnabled object
in the configuration file was 3 (invalid value), then the
pktcMtaDevErrorValue object instance will contain the
human-readable (string) representation of value '3'.

Similarly, if the OID in the configuration file has been
interpreted by the MTA as being 1.2.3.4.5 and the MTA
cannot recognize this OID as a valid one, then this
pktcMtaDevErrorValue object instance will contain human
readable (string) representation of value '1.2.3.4.5'.

If the number of errors in the configuration file exceeds
1024, then for all subsequent errors, the
pktcMtaDevErrorValue of the table's 1024th entry MUST
contain a human-readable representation of the
pktcMtaDevErrorsTooManyErrors object; i.e., the string
'1.3.6.1.2.1.140.1.1.4.1.0'."

::= {pktcMtaDevErrorOidsEntry 3}

pktcMtaDevErrorReason OBJECT-TYPE
SYNTAX SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
" This object indicates the reason for the error or warning,
as per the MTA's interpretation, in human-readable form.
For example:

'VALUE NOT IN RANGE', 'VALUE DOES NOT MATCH TYPE',
'UNSUPPORTED VALUE', 'LAST 4 BITS MUST BE SET TO ZERO',
'OUT OF MEMORY - CANNOT STORE'.
This object may also contain vendor specific errors for
private vendor OIDs and any proprietary error codes or
messages that can help diagnose configuration errors.

If the number of errors in the configuration file exceeds
1024, then for all subsequent errors, the
pktcMtaDevErrorReason of the table's 1024th entry MUST
contain a human-readable string indicating the reason
for an error; for example,
'Too many errors in the configuration file'."

    STATUS      current
    DESCRIPTION
```

" This object contains the Internet Address of the Time
Server used by an S-MTA for Time Synchronization. The type
of this address is determined by the value of the
pktcMtaDevTimeServerAddressType object.
When the latter has the value 'ipv4(1)', this object
contains the IP address of the Time Server used for Time
Synchronization.
In the case of an S-MTA, this object must be
populated with a value other than 0.0.0.0 as obtained
from DHCP option 4. The protocol by which the time of day
MUST be retrieved is defined in RFC 868.
In the case of an E-MTA, this object must contain a
value of 0.0.0.0 if the address type is 'ipv4(1)' since
an E-MTA does not use the Time Protocol for time
synchronization (an E-MTA uses the time retrieved by the
DOCSIS cable modem).
The behavior of this object when the value of
pktcMtaDevTimeServerAddressType is other than 'ipv4(1)'
is not presently specified, but it may be specified in
future versions of this MIB module.
If a value is written into an instance of

MAX-ACCESS read-write
STATUS current
DESCRIPTION
" This object specifies the MTA device configuration file
information, including the access method, the server name,
and the configuration file name. The value of this object
is the Uniform Resource Locator (URL)
of the configuration
file for TFTP or HTTP download.
If this object value is a TFTP URL, it must be formatted
as defined in RFC 3617.
If this object value is an HTTP URL, it must be formatted
as defined in RFC 2616.
If the MTA SNMP Enrollment mechanism is used, then the MTA
must download the file provided by the Provisioning Server

```
        during provisioning via an SNMP SET on this object.
        If the MTA SNMP Enrollment mechanism is not used, this
        object MUST contain the URL value corresponding to the
        'siaddr' and 'file' fields received in the DHCP ACK to
        locate the configuration file: the 'siaddr' and 'file'
        fields represent the host and file of the TFTP URL,
        respectively.  In this case, the MTA MUST return an
        'inconsistentValue' error in response to SNMP SET
        operations.
        The MTA MUST return a zero-length string if the server
         address (host part of the URL) is unknown.
        If a value is written into an instance of
        pktcMtaDevConfigFile, the agent MUST NOT retain the
        supplied value across MTA re-initializations or reboots."

pktcMtaDevSnmpEntity  OBJECT-TYPE
    SYNTAX      SnmpAdminString
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
       " This object contains the FQDN of the SNMP entity of the
        Provisioning Server.  When the MTA SNMP Enrollment
        Mechanism is used, this object represents the server that
        the MTA communicates with, that it receives the
        configuration file URL from, and that it sends the
        enrollment notification to.  The SNMP entity is also the
        destination entity for all the provisioning
        notifications.  It
 may be used for post-provisioning
        SNMP operations.  During the provisioning phase, this
        SNMP entity FQDN is supplied to the MTA via DHCP option
        122, sub-option 3, as defined in RFC 3495.  The MTA must
        resolve the FQDN value before its very first network
        interaction with the SNMP entity during the provisioning
        phase."

    REFERENCE
       " PacketCable MTA Device Provisioning Specification;
        RFC 3495, DHCP Option for CableLabs Client Configuration."

pktcMtaDevProvConfigHash  OBJECT-TYPE
    SYNTAX      OCTET STRING (SIZE(20))
```

```
  MAX-ACCESS  read-write
  STATUS      current

  DESCRIPTION
     " This object contains the hash value of the contents of the
       configuration file.
       The authentication algorithm is Secure Hashing Algorithm
       1 (SHA-1), and the length is 160 bits.  The hash
       calculation MUST follow the requirements defined in the

       PacketCable Security Specification.  When the MTA SNMP
       Enrollment mechanism is used, this hash value is
       calculated and sent to the MTA prior to sending the
       config file.  This object value is then provided by the
       Provisioning server via an SNMP SET operation.
       When the MTA SNMP Enrollment mechanism is not in use, the
       hash value is provided in the configuration file itself,
       and it is also calculated by the MTA.  This object value
       MUST represent the hash value calculated by the MTA.
       When the MTA SNMP Enrollment mechanism is not in use, the
       MTA must reject all SNMP SET operations on this object and
       return an 'inconsistentValue' error.
       If a value is written into an instance of
       pktcMtaDevProvConfigHash, the agent MUST NOT retain the
       supplied value across MTA re-initializations or reboots."
  REFERENCE
     " PacketCable MTA Device Provisioning
 Specification;
       PacketCable Security Specification."
  ::= { pktcMtaDevServer 11 }

pktcMtaDevProvConfigKey  OBJECT-TYPE
  SYNTAX      OCTET STRING (SIZE(32))
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
     " This object contains the key used to encrypt/decrypt
       the configuration file when secure SNMPv3 provisioning
       is used.
       The value of this object is provided along with the
       configuration file information (pktcMtaDevConfigFile)
       and hash (pktcMtaDevProvConfigHash) by the Provisioning
       Server via SNMP SET once the configuration file has been
       created, as defined by the PacketCable Security
       specification.
```

The privacy algorithm is defined by the
pktcMtaDevProvConfigEncryptAlg MIB object. The
MTA requirements related to the privacy algorithm are
defined in the PacketCable Security Specification.

If this object is set at
any other provisioning step than
that allowed by the PacketCable MTA Device

Provisioning Specification, the MTA SHOULD return
an 'inconsistentValue' error.
This object must not be used in non secure provisioning
mode. In non-secure provisioning modes, the MTA SHOULD
return an 'inconsistentValue' in response to SNMP SET
operations, and the MTA SHOULD return a zero-length
string in response to SNMP GET operations.
If a value is written into an instance of
pktcMtaDevProvConfigKey, the agent MUST NOT retain the
supplied value across MTA re-initializations or reboots."

pktcMtaDevProvSolicitedKeyTimeout OBJECT-TYPE
SYNTAX Unsigned32 (0..180)
UNITS "seconds"
MAX-ACCESS read-write
STATUS current
DESCRIPTION
" This object defines a Kerberos Key Management timer on the
MTA. It is the time period during which the MTA saves the
nonce and Server Kerberos Principal Identifier to match an
AP Request and its associated AP Reply response from the
Provisioning Server.

```
        After the timeout has been exceeded, the client discards
        this (nonce, Server Kerberos Principal Identifier) pair,
        after which it will no longer accept a matching AP Reply.
        This timer only applies when the Provisioning Server
        initiated key management for SNMPv3 (with a
        Wake
 Up message).
        If this object is set to a zero value, the MTA MUST return
        an 'inconsistentValue' in response to SNMP SET operations.
        This object should not be used in non-secure provisioning
        modes.  In non-secure provisioning modes, the MTA MUST
        return an 'inconsistentValue' in response to SNMP SET
        operations, and the MTA MUST return a zero value in

        response to SNMP GET operations.
        If a value is written into an instance of
        pktcMtaDevProvSolicitedKeyTimeout, the agent MUST NOT
        retain the supplied value across MTA re-initializations
        or reboots."
   DEFVAL { 3 }
   ::= { pktcMtaDevServer 14 }

--================================================================
--
--  Unsolicited key updates are retransmitted according to an
--  exponential back-off mechanism using two timers and a maximum
--  retry counter for AS replies.
--  The initial retransmission timer value is the nominal
 timer
--  value (pktcMtaDevProvUnsolicitedKeyNomTimeout).  The
--  retransmissions occur with an exponentially increasing interval
--  that caps at the maximum timeout value
--  (pktcMtaDevProvUnsolicitedKeyMaxTimeout).
--  Retransmissions stop when the maximum retry counter is reached
--  (pktcMtaDevProvUnsolicitedKeyMaxRetries).
--  For example, with values of 3 seconds for the nominal
--  timer, 100 seconds for the maximum timeout, and 8 retries max,
--  and with an exponential value of 2, this results in
--  retransmission intervals will be 3 s, 6 s, 12 s, 24 s, 48 s,
--  96 s, 100 s, and 100 s;
--  retransmissions then stop because the maximum number of
--  retries (8) has been reached.
--
--================================================================
--
--  Timeouts for unsolicited key management updates are only
```

```
-- pertinent before the first SNMPv3 message is sent between the
-- MTA and the Provisioning Server and before the configuration
-- file is loaded.
--

--================================================================
--
--   Informative Procedures for Setting up Security Associations
--

--   A Security Association may be set up either via configuration or
--   via NCS signaling.
--
--   I.   Security association setup via configuration.
--
--   The realm must be configured first.  Associated with the realm
--   is a KDC.  The realm table (pktcMtaDevRealmTable)
 indicates
--   information about the realm (e.g., name, organization name) and
```

```
-- parameters associated with KDC communications (e.g., grace
-- periods, AS Request/AS Reply adaptive back-off parameters).
--
-- Once the realm is established, one or more CMS(es) may be
-- defined in the realm.  Associated with each CMS
-- entry in the pktcMtaDevCmsTable is an explicit reference
-- to a Realm via the realm name (pktcMtaDevCmsKerbRealmName),
-- the FQDN of the CMS, and parameters associated with IPSec
-- key management with the CMS (e.g., clock skew, AP Request/
-- AP Reply adaptive back-off parameters).
--
-- II.  Security association setup via NCS signaling.
--
-- The procedure of establishing the Security Associations
-- for NCS signaling is described in the PacketCable Security
-- specification.
-- It involves the analysis of the pktcNcsEndPntConfigTable row
-- for the corresponding endpoint number and the correlation of
-- the CMS FQDN from this row
 with the CMS Table and
-- consequently, with the Realm Table.  Both of these tables
-- are defined below.  The pktcNcsEndPntConfigTable is defined in
-- the IP over Cable Data Network (IPCDN)
-- NCS Signaling MIB [NCSSIGMIB].
--
-- III.  When the MTA receives wake-up or re-key messages from a
-- CMS, it performs key management based on the corresponding
-- entry in the CMS table.  If the matching CMS entry does not
-- exist, it must ignore the wake-up or re-key messages.
--
--================================================================
--================================================================
--
-- pktcMtaDevRealmTable
--
-- The pktcMtaDevRealmTable shows the KDC realms.  The table is
-- indexed with pktcMtaDevRealmIndex.  The Realm Table contains the
-- pktcMtaDevRealmName in conjunction with any server that needs
-- a Security Association with the MTA.  Uppercase must be used
-- to compare the pktcMtaDevRealmName content.
--

pktcMtaDevRealmAvailSlot
```

```
  OBJECT-TYPE
  SYNTAX      Unsigned32 (0..64)
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
     " This object contains the index number of the first
       available entry in the realm table (pktcMtaDevRealmTable).
       If all the entries in the realm table have been assigned,
       this object contains the value of zero.
       A management station should create new entries in the
       realm table, using the following procedure:

       First, issue a management protocol retrieval operation
       to determine the value of the first available index in the
       realm table (pktcMtaDevRealmAvailSlot).

       Second, issue a management protocol SET operation
       to create an instance of the pktcMtaDevRealmStatus
       object by setting its value to 'createAndWait(5)'.

       Third, if the SET operation succeeded, continue

  modifying the object instances corresponding to the newly
       created conceptual row, without fear of collision with
       other management stations.  When all necessary conceptual
       columns of the row are properly populated (via SET
       operations or default values), the management station may
       SET the pktcMtaDevRealmStatus object to 'active(1)'."

    SYNTAX      Unsigned32 (1..600)
    UNITS       "seconds"
    MAX-ACCESS  read-create
    STATUS      current
    DESCRIPTION
      " This object specifies the maximum time the MTA will
        attempt to perform the exponential back-off algorithm.
        This timer only applies when the MTA initiated key
        management.  If the DHCP option code 122, sub-option 4, is
        provided to the MTA, it overwrites this value.

        Unsolicited key updates are retransmitted according to an
        exponential back-off mechanism using two timers and a
        maximum retry counter for AS replies.
        The initial retransmission timer value is the nominal
        timer value (pktcMtaDevRealmUnsolicitedKeyNomTimeout).  The
        retransmissions occur with an exponentially increasing
        interval that caps at the maximum timeout value
        (pktcMtaDevRealmUnsolicitedKeyMaxTimeout).
         Retransmissions stop when the maximum retry counter is
        reached (pktcMatDevRealmUnsolicitedMaxRetries).

        For example, with values of 3 seconds for the nominal
        timer, 20 seconds for the maximum timeout, and 5 retries
        max, retransmission intervals will be 3 s, 6 s,
        12 s, 20 s, and 20 s, and retransmissions then stop because
        the maximum number of retries has been reached."

  STATUS      current
  DESCRIPTION
     " This object specifies the initial timeout value
       for the AS-REQ/AS-REP exponential back-off and retry
       mechanism.  If the DHCP option code 122, sub-option 4, is
       provided to the MTA, it
overwrites this value.
       This value should account for the average roundtrip
       time between the MTA and the KDC, as well as the
       processing delay on the KDC.

       Unsolicited key updates are retransmitted according to an
       exponential back-off mechanism using two timers and a
       maximum retry counter for AS replies.
       The initial retransmission timer value is the nominal
       timer value (pktcMtaDevRealmUnsolicitedKeyNomTimeout).  The
       retransmissions occur with an exponentially increasing
       interval that caps at the maximum timeout value
       (pktcMtaDevRealmUnsolicitedKeyMaxTimeout).
       Retransmissions stop when the maximum retry counter is
       reached (pktcMatDevRealmUnsolicitedMaxRetries).

       For example, with values of 3 seconds for the nominal
       timer, 20 seconds for the maximum timeout, and 5 retries
       max, in retransmission intervals will be 3 s, 6 s,

    12 s, 20 s, and 20 s; retransmissions then stop because

--================================================================

pktcMtaDevCmsAvailSlot   OBJECT-TYPE
  SYNTAX      Unsigned32 (0..128)
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION

      " This object contains the index number of the first
        available entry in the CMS table (pktcMtaDevCmsTable).
        If all the entries in the CMS table have been assigned,
        this object contains the value of zero.
        A management station should create new entries in the
        CMS table, using the following procedure:

        First, issue a management protocol retrieval operation

 to determine the value of the first available index in the
        CMS table (pktcMtaDevCmsAvailSlot).

        Second, issue a management protocol SET operation
        to create an instance of the pktcMtaDevCmsStatus
        object by setting its value to 'createAndWait(5)'.

        Third, if the SET operation succeeded, continue
        modifying the object instances corresponding to the newly
        created conceptual row, without fear of collision with
        other management stations.  When all necessary conceptual
        columns of the row are properly populated (via SET
        operations or default values), the management station may
        SET the pktcMtaDevCmsStatus object to 'active(1)'."

                    invalidateAllCmsOnReboot (1)
                }
    MAX-ACCESS   read-write
    STATUS    current
    DESCRIPTION
       " This object defines a Kerberos Ticket Control Mask that
        instructs the MTA to invalidate the specific Application
```

```
        Server Kerberos ticket(s) that are stored locally in the
        MTA NVRAM (non-volatile or persistent memory).
        If the MTA does not store Kerberos tickets in NVRAM, it
        MUST ignore setting of this object and MUST report a BITS
        value of zero when the object is read.
        If the MTA supports Kerberos tickets storage in NVRAM, the
        object value is encoded as follows:
        - Setting the invalidateProvOnReboot bit (bit 0) to 1
          means that the MTA MUST invalidate
 the Kerberos
          Application Ticket(s) for the Provisioning Application
          at the next MTA reboot if secure SNMP provisioning mode
          is used.  In non-secure provisioning modes, the MTA MUST
          return an 'inconsistentValue' in response to SNMP SET
          operations with a bit 0 set to 1.
        - Setting the invalidateAllCmsOnReboot bit (bit 1) to 1
          means that the MTA MUST invalidate the Kerberos
          Application Ticket(s) for all CMSes currently assigned
          to the MTA endpoints.
        If a value is written into an instance of
        pktcMtaDevResetKrbTickets, the agent MUST retain the
        supplied value across an MTA re-initialization or

OBJECT pktcMtaDevRealmOrgName
SYNTAX LongUtf8String (SIZE (1..384))
DESCRIPTION

"The Organization Name field in X.509 certificates
can contain up to 64 UTF-8 encoded characters,
as defined in RFCs 3280 and 4630. Therefore, compliant
devices are only required to support Organization
Name values of up to 64 UTF-8 encoded characters.
Given that RFCs 3280 and 4630 define the UTF-8 encoding,
compliant devices must support a maximum size of 384
octets for pktcMtaDevRealmOrgName. The calculation of
384 octets comes from the RFC 3629 UTF-8 encoding
definition whereby the UTF-8 encoded characters
are encoded as sequences of 1 to 6 octets,
assuming that code points as high as 0x7fffffff
might be used. Subsequent versions of Unicode and ISO
10646 have limited the upper bound to 0x10ffff.

Consequently, the current version of UTF-8, defined in
RFC 3629, does not require more than four octets to
encode a valid code point."

SYNTAX PktcMtaDevProvEncryptAlg

```
        DESCRIPTION
            "An implementation is only required to support
        values of none(0) and des64Cbcmode(1).
        An IV of zero is used to encrypt
in des64Cbcmode, and
        the length of pktcMtaDevProvConfigKey is 64 bits, as
        defined in the PacketCable Security specification.
        Other encryption types may be defined in future
        versions of this MIB module."

    OBJECT pktcMtaDevRealmOrgName
        SYNTAX LongUtf8String (SIZE (1..384))
        DESCRIPTION
            "The Organization Name field in X.509 certificates
        can contain up to 64 UTF-8 encoded characters, as
        defined in RFCs 3280 and 4630.  Therefore, compliant
        devices are only required to support Organization
        Name values of up to 64 UTF-8 encoded characters.
        Given that RFCs 3280 and 4630 define the UTF-8 encoding,
        compliant devices must support a maximum size of 384
        octets for pktcMtaDevRealmOrgName.  The calculation of
        384 octets comes from the RFC 3629 UTF-8 encoding
        definition whereby the UTF-8 encoded
characters
        are encoded as sequences of 1 to 6 octets,
        assuming that code points as high as 0x7fffffff
        might be used.  Subsequent versions of Unicode and ISO
        10646 have limited the upper bound to 0x10ffff.
        Consequently, the current version of UTF-8, defined in
        RFC 3629 does not require more than four octets to
        encode a valid code point."

-- Textual Conventions

TenthdBm ::= TEXTUAL-CONVENTION
DISPLAY-HINT "d-1"
STATUS current
DESCRIPTION
"This TEXTUAL-CONVENTION represents power levels that are
normally expressed in dBm. Units are in tenths of a dBm;
for example, -13.5 dBm will be represented as -135."

SYNTAX Integer32

PktcCodecType ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
" This TEXTUAL-CONVENTION defines various types of codecs

that MAY be supported. The description for each
enumeration is listed below:

Enumeration Description
other a defined codec not in the enumeration
unknown a codec not defined by the PacketCable
Codec Specification
g729 ITU-T Recommendation G.729
reserved for future use
g729E ITU-T Recommendation G.729E
pcmu Pulse Code Modulation u-law (PCMU)
g726at32 ITU-T Recommendation G.726-32 (32 kbit/s)
g728 ITU-T Recommendation G.728
pcma Pulse Code Modulation a-law (PCMA)
g726at16 ITU-T Recommendation G.726-16 (16 kbit/s)
g726at24 ITU-T Recommendation G.726-24 (24 kbit/s)
g726at40 ITU-T Recommendation G.726-40 (40 kbit/s)
ilbc IETF Internet low-bit rate codec
bv16 Broadcom BroadVoice16

The list of codecs is consistent with the IETF
Real-Time Transport Protocol (RTP) Profile registry and

the RTP Map Parameters Table in PacketCable Audio/Video
Codecs Specification [PKT-SP-CODEC]. The literal codec
name for each codec is listed below:

Codec Literal Codec Name
g729 G729
g729E G729E
pcmu PCMU
g726at32 G726-32
g728 G728
pcma PCMA
g726at16 G726-16
g726at24 G726-24
g726at40 G726-40
ilbc iLBC
bv16 BV16

```
        The literal codec name is the second column of the table
        with codec RTP Map Parameters.  The Literal Codec Name Column
        contains the codec name used in the local connection
        options (LCO) of the NCS messages create connection

    (CRCX)/modify connection (MDCX) and is also used to
        identify the codec in the Call Management System (CMS)
        Provisioning Specification.  The RTP Map Parameter column of
        the Table contains the string used in the media attribute
        line (a=) of the session description protocol (SDP)
        parameters in NCS messages."

PktcRingCadence   ::= TEXTUAL-CONVENTION
    STATUS        current
    DESCRIPTION
        "This object provides an encoding scheme for ring

        cadences, including repeatability
 characteristics.  All
        fields in this object MUST be encoded in network-byte
        order.

        The first three higher-order octets are reserved.  The
        octets that follow are used to encode a 'bit-string', with
        each bit corresponding to 50 milliseconds.  A bit value of
        '1' indicates the presence of a ring-tone, and a bit value
        of '0' indicates the absence of a ring-tone, for that
        duration (50 ms) (Note: A minimum number of octets
        required to encode the bit-string MUST be used).
```

```
        The first two of the reserved octets MUST indicate the
        length of the encoded cadence (in bits) and MUST range
        between 1 and 264.  (Note: The length in bits MUST also be
        consistent with the number of octets that encode the
        cadence).  The MTA MUST ignore any unused bits in the last
        octet, but MUST reflect the value as provided on
        subsequent SNMP GETs.

        The
 third of the reserved octets indicates 'repeatability'
        and MUST be either 0x80 or 0x00 -- the former value
        indicating 'non-repeatability', and the latter indicating
        'repeatability'.

        The MTA MUST reject attempts to set a value that violates
        any of the above requirements."

   SYNTAX  OCTET STRING (SIZE(4..36))

PktcSigType     ::= TEXTUAL-CONVENTION
   STATUS       current
   DESCRIPTION
      " This object lists the various types of signaling that may
        be supported:

--
pktcSigDevCodecTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF PktcSigDevCodecEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
      " This table describes the MTA-supported codec types.  An MTA
       MUST populate this table with all possible combinations of
       codecs it supports for simultaneous operation.  For example,
       an MTA with two endpoints may be designed with a particular
       Digital Signal Processing (DSP) and memory architecture that
       allows it to support the following fixed combinations of
       codecs for simultaneous operation:

       Codec Type     Maximum Number of Simultaneous Codecs
       PCMA                    3

       PCMA                    2
       PCMU                    1

       PCMA                    1

       PCMU                    2

       PCMU                    3

       PCMA                    1
       G729                   1

       G729                   2

       PCMU                    1
       G729                   1

       Based on this example, the entries
 in the codec table
       would be:

        pktcSigDev       pktcSigDev       pktcSigDev
       CodecComboIndex    CodecType        CodecMax
            1             pcma             3
            2             pcma             2
            2             pcmu             1
```

```
            3           pcma          1
            3           pcmu          2
            4           pcmu          3
            5           pcma          1
            5           g729          1
            6           g729          2
            7           pcmu          1
            7           g729          1

        An operator querying this table is able to determine all
        possible codec combinations the MTA is capable of
        simultaneously supporting.

               lrAsETS(4),
               lrETS(5)
               }
  MAX-ACCESS read-write
  STATUS current
  DESCRIPTION
     " For on-hook caller id, pktcSigDevCidMode selects the method
       for representing and signaling caller identification.  For
       the duringRingingETS method, the Frequency Shift Keying
       (FSK) or the Dual-Tone Multi-Frequency (DTMF) containing
       the caller identification information is sent between the
       first and second ring pattern.

       For the dtAsETS,rpAsETS, lrAsETS and lrETS
       methods, the FSK or DTMF containing the caller id
       information is sent before the first ring pattern.

       For the dtAsETS method, the FSK or DTMF is sent after the
       Dual
 Tone Alert Signal.  For the rpAsETS method, the FSK or
       DTMF is sent after a Ring Pulse.

       For the lrAsETS method, the Line Reversal occurs first,
       then the Dual Tone Alert Signal, and, finally, the FSK or
       DTMF is sent.

       For the lrETS method, the Line Reversal occurs first,
       then the FSK or DTMF is sent.

       The value of this MIB object MUST NOT persist across MTA
       reboots."

  DESCRIPTION
     " For visual message waiting indicator (VMWI),
       pktcSigDevVmwiMode selects the alerting signal method.  For
       the dtAsETS, rpAsETS, lrAsETS, osi, and lrETS methods,
       the FSK containing the VMWI information is sent after an
       alerting signal.

       For the dtAsETS method,
 the FSK, or DTMF
       is sent after the Dual Tone Alert Signal.  For the rpAsETS
       method, the FSK or DTMF is sent after a Ring Pulse.

       For the lrAsETS method, the Line Reversal occurs first,
       then the Dual Tone Alert Signal, and, finally, the FSK or
       DTMF is sent.

       For the OSI method, the FSK or DTMF is sent after the Open
       Switching Interval.

       For the lrETS method, the Line Reversal occurs first,
       then the FSK or DTMF is sent.

       The value of this MIB object MUST NOT persist across MTA
       reboots."

    MAX-ACCESS   not-accessible
    STATUS       current
    DESCRIPTION
       "Cadence rings are defined by the telco governing
        body for each country.  The MTA must be able to support
        various ranges of cadence patterns and cadence periods.
        The
   MTA will be able to support country-specific
        provisioning of the cadence and idle period.  Each
        cadence pattern will be assigned a unique value ranging
        from 0-127 (inclusive) corresponding to the value of x,
        where x is the value sent in the cadence ringing (cr)
        signal cr(x), requested per the appropriate NCS
        message, and defined in the E package.  The MTA will derive
        the cadence periods from the ring cadence table entry, as
        provisioned by the customer.  The MTA is allowed to provide
        appropriate default values for each of the ring cadences.
        This table only needs to be supported when the MTA
        implements the E package."

pktcSigDevToneTable    OBJECT-TYPE
   SYNTAX       SEQUENCE OF PktcSigDevToneEntry
   MAX-ACCESS   not-accessible
   STATUS       current
   DESCRIPTION
      " The Tone Table defines the composition of tones and
        various tone operations.

        The definition of the tones callWaiting1 through
        callWaiting4 in this table MUST only contain the
        audible tone itself; the delay between tones or the value
        of the tone repeat count are not applicable for the call
        waiting tones.
```

```
        The delay between tones or the repeat count is controlled
        by the objects pktcSigEndPntConfigCallWaitingDelay and
        pktcSigEndPntConfigCallWaitingMaxRep.  If the
        pktcSigDevToneType is set to either
    of the values
        callWaiting1, callWaiting2, callWaiting3, or callWaiting4,
        then the value of the pktcSigDevToneWholeToneRepeatCount
        object indicates that the particular frequency group is
        applicable, as a repeatable part of the tone, based on the
        value of the MIB object
        pktcSigDevToneWholeToneRepeatCount.

        The MTA MUST make sure that, after the provisioning
        cycle, the table is fully populated (i.e., for each
        possible index, an entry MUST be defined) using
        reasonable defaults for each row that was not defined
        by the provisioning information delivered via MTA
        Configuration.

        The frequency composition of each tone is defined by the
        pktcSigDevMultiFreqToneTable.  For each tone type defined
        in pktcSigDevToneTable, the MTA MUST populate at least
        one entry in the pktcSigDevMultiFreqToneTable.

        For each particular value of pktcSigDevToneType,
    the
        pktcSigDevToneTable table can define non-repeating and
        repeating groups of the frequencies defined by the
        pktcSigDevMultiFreqToneTable, such that each group is
        represented by the set of the consecutive rows
        (frequency group) in the pktcSigDevMultiFreqToneTable.

        Objects in this table do not persist across MTA reboots.
        For tones with multiple frequencies refer to the MIB table
        pktcSigDevMultiFreqToneTable."

  STATUS       current
  DESCRIPTION
```

"This is the repeat count,
which signifies how many times
to repeat the entire on-off cadence sequence. Setting this
object may result in a cadence duration longer or shorter
than the overall signal duration specified by the time out
(TO) object for a particular signal. If the repeat count
results in a longer tone duration than the signal duration
specified by the TO, the tone duration defined by the
TO object for a particular signal always represents
the overall signal duration for a tone. In this case, the
tone duration repeat count will not be fully exercised, and
the desired tone duration will be truncated per the TO
setting. If the repeat count results in a shorter tone
duration than the signal duration specified by the TO, the
tone duration defined by the repeat count takes precedence
over the TO and will end the signal event. In this case,

the TO represents a
time not to be exceeded for the signal.
It is recommended to ensure proper telephony signaling so that
the TO duration setting should always be longer than the
desired repeat count-time duration."
::={ pktcSigDevToneEntry 4 }

pktcSigDevToneSteady OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This MIB object represents the steady tone status. A value
of 'true(1)' indicates that the steady tone is applied, and
a value of 'false(2)' indicates otherwise.
Devices must play out the on-off cadence sequence for
the number of times indicated by the MIB object
'pktcSigDevToneWholeToneRepeatCount' prior to applying the
last tone steadily, indefinitely. If the MIB table
'pktcSigDevToneTable' contains multiple rows with this
Object set to a value of 'true(1)', the steady tone is
applied to the last repeating frequency
group of the tone.

Setting this MIB object may result in a tone duration that is
longer or shorter than the overall signal duration
specified by the time out (TO) MIB object for a particular
signal. If the repeat count results in a longer tone
duration than the signal duration specified by the TO, the

tone duration defined by the TO object for a particular signal always represents the overall signal duration for a tone. In this case, the tone duration repeat count will not be fully exercised, and the desired tone duration will be truncated per the TO setting. If the repeat count results in a shorter tone duration than the signal duration specified by the TO, the tone duration defined by the repeat count takes precedence over the TO and will end the signal event. In this case, the TO represents a time not to be exceeded for the signal.

It is recommended to ensure proper telephony signaling that The TO duration setting should always be longer than the desired repeat count-time duration, plus the desired maximum steady tone period."

    STATUS       current
    DESCRIPTION
    "This MIB object provides directive on the
     modulation or summation of the frequencies
     involved in the tone.

     It is to be noted that while summation can
     be done without any constraint on the number
     of frequencies, the modulation (amplitude)
     holds good only when there are two frequencies
     (first and second).
```

```
      Thus:
       - If the mode is set to a value of
         'firstModulatedBySecond(1)', the first frequency
         MUST be modulated by the second, and the remaining
         frequencies (third and fourth) ignored.  The
         percentage
of amplitude modulation to be applied
         is defined by the MIB object
         pktcSigDevToneFreqAmpModePrtg.

       - If the mode is set to a value of
         'summation(2)', all the frequencies MUST be
         summed without any modulation.

    ::={ pktcSigDevMultiFreqToneEntry 7}

pktcSigDevToneDbLevel    OBJECT-TYPE
   SYNTAX       TenthdBm (-250..-110)
   UNITS
     "1/10 of a dBm"
   MAX-ACCESS   read-only

   STATUS       current
   DESCRIPTION
      "This MIB object contains the decibel level for each
       analog signal (tone) that is locally generated
       (versus in-band supervisory tones) and sourced to
       the a-b terminals (TE connection point).  Each tone
       in itself may consist of multiple frequencies, as
       defined by the MIB table pktcSigDevMultiFreqToneTable.
```

```
        This MIB object reflects the desired level at
        the Telco (POTS) a-b (T/R) terminals, including the
        effect of any MTA receiver gain (loss).  This is required
        so that locally generated tones are consistent with
        remotely generated in-band tones at the a-b terminals,
        consistent with user expectations.

        This MIB object must be set for each tone.
        When tones are formed by combining multi-frequencies,
        the level of each frequency
shall be set so as to result
        in the tone level specified in this object at the a-b
        (T/R) terminals.

        The wide range of levels for this Object is required
        to provide signal-generator levels across the wide
        range of gains (losses) -- but does not imply the entire
        range is to be achievable given the range of gains (losses)
        in the MTA."

```
 pktcSigDevToneFreqRepeatCount OBJECT-TYPE
    SYNTAX       Unsigned32(0..5000)
    MAX-ACCESS   read-only
    STATUS       current
    DESCRIPTION
    "This MIB object indicates the number of times
    to repeat the cadence cycle represented by the
    on/off durations (refer to the MIB objects
    pktcSigDevToneFreqOnDuration and
    pktcSigDevToneFreqOffDuration).

    Setting this object may result in a tone duration that is
    longer or shorter than the overall signal duration
    specified by the time out (TO) object for the
    corresponding tone type.  If the value of this MIB
    Object indicates a longer duration than that
    specified by the TO, the latter overrules
the former,
    and the desired tone duration will be truncated according
    to the TO.

    However, if the repeat count results in a shorter
    tone duration than the signal duration specified by
    the TO, the tone duration defined by the repeat count
    takes precedence over the TO and will end the signal
    event.  In this case, the TO represents a time not to
    be exceeded for the signal.  It is recommended, to
    ensure proper telephony signaling, that the TO
    duration setting should always be longer than the
    desired repeat count-time duration.  A value of zero
    means the tone sequence is to be played once but not
    repeated."

   STATUS        current
   DESCRIPTION
      " This table describes the information pertaining to each
        endpoint of the MTA.  All entries in this table represent
        the provisioned endpoints provisioned with the information
        required by the MTA to maintain the NCS protocol
        communication with the CMS.  Each endpoint can be assigned
        to its own CMS.  If the specific endpoint does not have
        the corresponding CMS information in this table, the
        endpoint is considered as not
 provisioned with voice
        services.  Objects in this table do not persist across
        MTA reboots."

  STATUS     current
  DESCRIPTION
     " This object contains a string indicating the call agent
       name (e.g., ca@example.com).  The call agent name, after
       the character '@', MUST be a fully qualified domain name
       (FQDN) and MUST have a corresponding pktcMtaDevCmsFqdn
       entry in the pktcMtaDevCmsTable.  The object
       pktcMtaDevCmsFqdn is defined in the PacketCable MIBMTA
       Specification.  For each particular endpoint, the MTA MUST
       use the current value of this object to communicate with
       the corresponding CMS.  The MTA MUST update this object
       with the value of the 'Notified Entity' parameter of the
       NCS message.  Because of the high importance of this object
       to the ability of the MTA to maintain reliable NCS
       communication with the CMS, it is highly recommended not
       to change this object's value using SNMP during normal

    operation."

  SYNTAX     InetPortNumber (1025..65535)
  MAX-ACCESS  read-create
  STATUS     current
  DESCRIPTION
     " This object contains the current value of the User
       Datagram Protocol (UDP) receive port on which the
       call agent will receive NCS from the endpoint.
       For each particular endpoint, the MTA MUST use the current
       value of this object to communicate with the corresponding
       CMS.  The MTA MUST update this object with the value of the
```

'Notified Entity' parameter of the NCS message. If the
Notified Entity parameter does not contain a CallAgent
port, the MTA MUST update this object with the default
value of 2727. Because of the high importance of this
object to the ability of the MTA to maintain reliable NCS
communication with the CMS, it is highly recommended
not
to change this object's value using SNMP during normal
operation."

    MAX-ACCESS  read-only
    STATUS      current
```

```
  DESCRIPTION
    " This object contains the type of Internet address contained
      in the MIB object 'pktcSigEndPntStatusCallIpAddress'.

      Since pktcSigEndPntStatusCallIpAddress is expected to
      contain an IP address, a value of dns(16)
 is disallowed."

  ::= { pktcSigEndPntConfigEntry 29 }

pktcSigEndPntStatusCallIpAddress  OBJECT-TYPE
  SYNTAX      InetAddress
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
    " This MIB object contains the chosen IP address of the CMS
      currently being used for the corresponding endpoint.

      The device determines the IP address by using DNS to
      resolve the IP address of the CMS from the FQDN stored in
      the MIB object 'pktcSigEndPntConfigCallAgentId'.  The
      processes are outlined in the PacketCable NCS and Security
      specifications, and MUST be followed by the MTA.

      The IP address type contained in this MIB object is
      indicated by pktcSigEndPntStatusCallIpAddressType."
  REFERENCE
     "PacketCable NCS Specification;
      PacketCable Security specification, [PKT-SP-SEC]."
::= { pktcSigEndPntConfigEntry 30 }

pktcSigEndPntStatusError  OBJECT-TYPE
  SYNTAX INTEGER {
           operational
 (1),
           noSecurityAssociation (2),

           disconnected (3)
         }
  MAX-ACCESS   read-only
  STATUS  current
  DESCRIPTION
    " This object contains the error status for this interface.
      The operational status indicates that all operations
      necessary to put the line in service have occurred, and the
      CMS has acknowledged the Restart In Progress (RSIP)
```

message successfully. If pktcMtaDevCmsIpsecCtrl is enabled
for the associated call agent, the noSecurityAssociation
status indicates that no Security Association (SA) yet
exists for this endpoint. If pktcMtaDevCmsIpsecCtrl is
disabled for the associated call agent, the
noSecurityAssociation status is not applicable and should
not be used by the MTA. The disconnected status indicates
one of the following two:
If pktcMtaDevCmsIpsecCtrl is disabled, then no security
association
is involved with this endpoint. The NCS
signaling software is in process of establishing the NCS
signaling link via an RSIP exchange.
Otherwise, when pktcMtaDevCmsIpsecCtrl is enabled,
security Association has been established, and the NCS
signaling software is in process of establishing the NCS
signaling link via an RSIP exchange."

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial

revisions, annotations, elaborations, or other modifications
represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this
License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the
Work or Derivative Works thereof in any medium, with or without
modifications, and in Source or Object form, provided that You
meet the following conditions:

(a) You must give any other recipients of the Work or
Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices
stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works
that You distribute, all copyright, patent, trademark, and
attribution notices from the Source form of the Work,
excluding those notices that do not pertain to any part of
the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its
distribution, then any Derivative Works that You distribute must
include a readable copy of the attribution notices contained
within such NOTICE file, excluding
those notices that do not
pertain to any part of the Derivative Works, in at least one
of the following places: within a NOTICE text file distributed
as part of the Derivative Works; within the Source form or
documentation, if provided along with the Derivative Works; or,
within a display generated by the Derivative Works, if and
wherever such third-party notices normally appear. The contents
of the NOTICE file are for informational purposes only and
do not modify the License. You may add Your own attribution
notices within Derivative Works that You distribute, alongside
or as an addendum to the NOTICE text from the Work, provided
that such additional attribution notices cannot be construed
as modifying the License.

You may add Your own copyright statement to Your modifications and
may provide additional or different license terms and conditions

for use, reproduction, or distribution of Your modifications, or
for any such Derivative Works as a whole, provided Your use,
reproduction, and distribution of the Work otherwise complies with
the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise,
any Contribution intentionally submitted for inclusion in the Work
by You to the Licensor shall be under the terms and conditions of
this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following
boilerplate notice, with the fields enclosed by brackets "[]"
replaced with your own identifying information. (Don't include
the brackets!) The text should be enclosed in the appropriate
comment syntax for the file format. We also recommend that a
file or class name and description of purpose be included on the
same "printed page" as the copyright notice for easier
identification within third-party archives.

Apache License

Version 2.0, January 2004

http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean
 the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name)
to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual
or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by
combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

You must give any other recipients of the Work or Derivative Works a copy of this License; and
You must cause any modified files to carry prominent notices stating that You changed the files; and
You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and
attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that
such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.
5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or
product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any
Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims
asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

/**
* Provides an implementation of the NTLM authentication protocol.
* <p>
* This class provides methods for generating authentication
* challenge responses for the NTLM authentication protocol.  The NTLM
* protocol is a proprietary Microsoft protocol and as such no RFC
* exists for it.  This class is based upon the reverse engineering
* efforts of a wide range of people.</p>
*
* <p>Please note that an implementation of JCE must be correctly installed and configured when
* using NTLM support.</p>
*
* <p>This class should not be used externally to HttpClient as it's API is specifically
* designed to work with HttpClient's use
 case, in particular it's connection management.</p>

1.533.1 Available under license :

No license file was found, but licenses were detected in source scan.

/**
*
* A `ClassTag[T]` stores the erased class of a given type `T`, accessible via the `runtimeClass`
* field. This is particularly useful for instantiating `Array`s whose element types are unknown
* at compile time.
*
* `ClassTag`s are a weaker special case of [[scala.reflect.api.TypeTags#TypeTag]]s, in that they
* wrap only the runtime class of a given type, whereas a `TypeTag` contains all static type
* information. That is, `ClassTag`s are constructed from knowing only the top-level class of a
* type, without necessarily knowing all of its argument types. This runtime information is enough
* for runtime `Array` creation.
*
* For example:
* {{{

```
*   scala> def mkArray[T : ClassTag](elems: T*) = Array[T](elems: _*)
*   mkArray: [T](elems: T*)(implicit evidence$1: scala.reflect.ClassTag[T])Array[T]
*
*   scala> mkArray(42, 13)
*   res0: Array[Int] = Array(42, 13)
*
*   scala> mkArray("Japan","Brazil","Germany")
 *   res1: Array[String] = Array(Japan, Brazil, Germany)
* }}}
*
* See [[scala.reflect.api.TypeTags]] for more examples, or the
* [[http://docs.scala-lang.org/overviews/reflection/typetags-manifests.html Reflection Guide: TypeTags]]
* for more details.
*

```
/**
* A token issued by {@link TokenService}.
*
* <p>
* It is important that the keys assigned to tokens are sufficiently randomised and secured that
* they can serve as identifying a unique user session. Implementations of {@link TokenService}
* are free to use encryption or encoding strategies of their choice. It is strongly recommended that
* keys are of sufficient length to balance safety against persistence cost. In relation to persistence
* cost, it is strongly recommended that returned keys are small enough for encoding in a cookie.
* </p>
*

RFC1213-MIB DEFINITIONS ::= BEGIN

IMPORTS

```
      mgmt, NetworkAddress, IpAddress, Counter, Gauge,
           TimeTicks
         FROM RFC1155-SMI
      OBJECT-TYPE
           FROM RFC-1212;

--  This MIB module uses the extended OBJECT-TYPE macro as
--  defined in [14];

--  MIB-II (same prefix as MIB-I)

mib-2      OBJECT IDENTIFIER ::= { mgmt 1 }

-- textual conventions

DisplayString ::=
  OCTET STRING
-- This data type is used to model textual information taken
-- from the NVT ASCII character set.  By convention, objects
-- with this syntax are declared as having

--
--      SIZE (0..255)

PhysAddress ::=
  OCTET STRING
-- This data type is used to model media addresses.  For many
-- types of media, this will be in a binary representation.
-- For example, an ethernet address would be represented as
-- a string of 6 octets.

-- groups in MIB-II

system       OBJECT IDENTIFIER ::= { mib-2 1 }

interfaces
  OBJECT IDENTIFIER ::= { mib-2 2 }

at          OBJECT IDENTIFIER ::= { mib-2 3 }

ip          OBJECT IDENTIFIER ::= { mib-2 4 }

icmp         OBJECT IDENTIFIER ::= { mib-2 5 }

tcp         OBJECT IDENTIFIER ::= { mib-2 6 }
```

```
udp         OBJECT IDENTIFIER ::= { mib-2 7 }

egp         OBJECT IDENTIFIER ::= { mib-2 8 }

-- historical (some say hysterical)
-- cmot      OBJECT IDENTIFIER ::= { mib-2 9 }

transmission OBJECT IDENTIFIER ::= { mib-2 10 }

snmp        OBJECT IDENTIFIER ::= { mib-2 11 }

-- the System group

-- Implementation of the System group is mandatory for all
-- systems.  If an agent is not configured to have a value
-- for any of these variables, a string of length 0 is
-- returned.

sysDescr OBJECT-TYPE
  SYNTAX  DisplayString (SIZE (0..255))
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
        "A textual description of the entity.  This value
        should include the full name and version
        identification of the
 system's hardware type,
        software operating-system, and networking
        software.  It is mandatory that this only contain
        printable ASCII characters."
  ::= { system 1 }

sysObjectID OBJECT-TYPE
  SYNTAX  OBJECT IDENTIFIER
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
        "The vendor's authoritative identification of the
        network management subsystem contained in the
        entity.  This value is allocated within the SMI
        enterprises subtree (1.3.6.1.4.1) and provides an
        easy and unambiguous means for determining `what
        kind of box' is being managed.  For example, if
        vendor `Flintstones, Inc.' was assigned the
        subtree 1.3.6.1.4.1.4242, it could assign the
        identifier 1.3.6.1.4.1.4242.1.1 to its `Fred
        Router'."
```

```
  ::= { system 2 }

sysUpTime OBJECT-TYPE
  SYNTAX  TimeTicks
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
          "The time (in hundredths of a second) since the
          network management portion of the system was last
          re-initialized."
  ::= { system 3 }

sysContact OBJECT-TYPE
  SYNTAX  DisplayString (SIZE (0..255))
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
          "The textual identification of the contact person
          for this managed node, together with information
          on how to contact this person."
  ::= { system 4 }

sysName OBJECT-TYPE
  SYNTAX  DisplayString (SIZE (0..255))
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
          "An administratively-assigned name for this
          managed node.  By convention, this is the node's
          fully-qualified domain name."
  ::= { system 5 }

sysLocation OBJECT-TYPE
  SYNTAX  DisplayString (SIZE (0..255))
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
          "The physical location of this node (e.g.,
          `telephone closet,
 3rd floor')."
  ::= { system 6 }

sysServices OBJECT-TYPE
  SYNTAX  INTEGER (0..127)
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
          "A value which indicates the set of services that
```

this entity primarily offers.

The value is a sum. This sum initially takes the value zero, Then, for each layer, L, in the range 1 through 7, that this node performs transactions for, 2 raised to (L - 1) is added to the sum. For example, a node which performs primarily routing functions would have a value of 4 (2^(3-1)). In contrast, a node which is a host offering application services would have a value of 72 (2^(4-1) + 2^(7-1)). Note that in the context of the Internet suite of protocols, values should be calculated accordingly:

layer functionality
1 physical (e.g., repeaters)

2 datalink/subnetwork (e.g., bridges)
3 internet (e.g., IP gateways)
4 end-to-end (e.g., IP hosts)
7 applications (e.g., mail relays)

For systems including OSI protocols, layers 5 and 6 may also be counted."
::= { system 7 }

-- the Interfaces group

-- Implementation of the Interfaces group is mandatory for
-- all systems.

ifNumber OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-only

ifSpecific OBJECT-TYPE
  SYNTAX  OBJECT IDENTIFIER
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
        "A reference to MIB definitions specific to the
        particular media being used to realize the
        interface.  For example, if the interface is
        realized by an ethernet, then the value of this
        object refers to a document defining objects
        specific to ethernet.  If this information is not
        present, its value should be set to the OBJECT
        IDENTIFIER { 0 0 }, which is a syntatically valid
        object identifier, and any conformant
        implementation of ASN.1 and BER must be able to
        generate and recognize this value."
  ::= { ifEntry 22 }

-- the Address Translation group

-- Implementation of the Address Translation group is
-- mandatory for all
 systems.  Note however that this group
-- is deprecated by MIB-II. That is, it is being included

-- solely for compatibility with MIB-I nodes, and will most
-- likely be excluded from MIB-III nodes.  From MIB-II and
-- onwards, each network protocol group contains its own
-- address translation tables.

-- The Address Translation group contains one table which is
-- the union across all interfaces of the translation tables
-- for converting a NetworkAddress (e.g., an IP address) into
-- a subnetwork-specific address.  For lack of a better term,
-- this document refers to such a subnetwork-specific address
-- as a `physical' address.
```

```
-- Examples of such translation tables are: for broadcast
-- media where ARP is in use, the translation table is
-- equivalent to the ARP cache; or, on an X.25 network where
-- non-algorithmic translation to X.121 addresses is
-- required, the translation table contains the
-- NetworkAddress to X.121 address equivalences.

atTable OBJECT-TYPE
  SYNTAX
 SEQUENCE OF AtEntry
  ACCESS  not-accessible
  STATUS  deprecated
  DESCRIPTION
        "The Address Translation tables contain the
        NetworkAddress to `physical' address equivalences.
        Some interfaces do not use translation tables for
        determining address equivalences (e.g., DDN-X.25
        has an algorithmic method); if all interfaces are
        of this type, then the Address Translation table
        is empty, i.e., has zero entries."
  ::= { at 1 }

atEntry OBJECT-TYPE
  SYNTAX  AtEntry
  ACCESS  not-accessible
  STATUS  deprecated
  DESCRIPTION
        "Each entry contains one NetworkAddress to
        `physical' address equivalence."
  INDEX   { atIfIndex,

```
  DESCRIPTION
          "The interface on which this entry's equivalence
          is effective.  The interface identified by a
          particular value of this index is the same
          interface as identified by the same value of
          ifIndex."
  ::= { atEntry 1 }

atPhysAddress OBJECT-TYPE
  SYNTAX  PhysAddress
  ACCESS  read-write
  STATUS  deprecated
  DESCRIPTION
          "The media-dependent `physical' address.

          Setting this object to a null string (one of zero
          length) has the effect of invaliding the
          corresponding entry in the atTable object.  That
          is, it effectively dissasociates the interface
          identified with said entry from the mapping
          identified with said entry.  It is an
          implementation-specific matter as to whether the
          agent removes an invalidated entry from the table.
          Accordingly,
 management stations must be prepared
          to receive tabular information from agents that
          corresponds to entries not currently in use.
          Proper interpretation of such entries requires
          examination of the relevant atPhysAddress object."
  ::= { atEntry 2 }

  STATUS  mandatory
  DESCRIPTION
        "The IP address of the next hop of this route.
        (In the case of a route bound to an interface
        which is realized via a broadcast media, the value
        of this field is the agent's IP address on that
        interface.)"
  ::= { ipRouteEntry 7 }

ipRouteType OBJECT-TYPE
  SYNTAX  INTEGER {
            other(1),       -- none of the following

            invalid(2),     -- an invalidated route
```

```
                    -- route to directly
            direct(3),      -- connected (sub-)network

                    -- route to a non-local
            indirect(4)     -- host/network/sub-network
          }
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
          "The type of route.  Note that the values
          direct(3) and indirect(4) refer
to the notion of
          direct and indirect routing in the IP
          architecture.

          Setting this object to the value invalid(2) has
          the effect of invalidating the corresponding entry
          in the ipRouteTable object.  That is, it
          effectively dissasociates the destination
          identified with said entry from the route
          identified with said entry.  It is an
          implementation-specific matter as to whether the
          agent removes an invalidated entry from the table.
          Accordingly, management stations must be prepared
          to receive tabular information from agents that
          corresponds to entries not currently in use.
          Proper interpretation of such entries requires
          examination of the relevant ipRouteType object."

ipRouteMask OBJECT-TYPE
  SYNTAX  IpAddress
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
          "Indicate the mask to be logical-ANDed with the
          destination address before being compared to the
          value in the ipRouteDest field.  For those systems
          that do not support arbitrary subnet masks, an
          agent constructs the value of the ipRouteMask by
          determining whether the value of the correspondent
           ipRouteDest field belong to a class-A, B, or C
          network, and then using one of:

              mask           network
```

```
            255.0.0.0      class-A
            255.255.0.0    class-B
            255.255.255.0  class-C
        If the value of the ipRouteDest is 0.0.0.0 (a
        default route), then the mask value is also
        0.0.0.0.  It should be noted that all IP routing
        subsystems implicitly use this mechanism."

  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
        "The state of this TCP connection.
```

```
        The only value which may
 be set by a management
        station is deleteTCB(12).  Accordingly, it is
        appropriate for an agent to return a `badValue'
        response if a management station attempts to set
        this object to any other value.

        If a management station sets this object to the
        value deleteTCB(12), then this has the effect of
        deleting the TCB (as defined in RFC 793) of the
        corresponding connection on the managed node,
        resulting in immediate termination of the
        connection.

        As an implementation-specific option, a RST
        segment may be sent from the managed node to the
        other TCP endpoint (note however that RST segments
        are not sent reliably)."

        "A control variable used to trigger operator-
        initiated Start and Stop events.  When read, this
        variable always returns the most recent value that
        egpNeighEventTrigger was set to.  If it has not
        been set since the last initialization of the
```

```
        network management subsystem on the node, it
        returns a value of `stop'.

        When set, this variable causes a Start or Stop
        event on the specified neighbor, as specified on
        pages 8-10 of RFC 904.  Briefly, a Start event
        causes an Idle peer to begin neighbor acquisition
        and a non-Idle peer to reinitiate neighbor
        acquisition.  A stop event causes a non-Idle peer
        to return to the Idle state until a Start event
        occurs, either via egpNeighEventTrigger or
        otherwise."

-- the Transmission group

-- Based on the transmission media underlying each interface
-- on a system, the corresponding portion of the Transmission
-- group is mandatory for that system.

-- When Internet-standard definitions for managing
-- transmission media are defined, the transmission group is
-- used to provide a prefix for the names of those objects.

-- Typically, such definitions reside in the experimental
-- portion of the MIB until they are "proven", then as a
-- part of the Internet standardization process, the
-- definitions are accordingly elevated and a new object
-- identifier, under the transmission group is defined. By
-- convention, the name assigned is:
--
--     type OBJECT IDENTIFIER    ::= { transmission number }
--
-- where "type" is the symbolic
 value used for the media in
-- the ifType column of the ifTable object, and "number" is
```

```
-- the actual integer value corresponding to the symbol.

-- the SNMP group

-- Implementation of the SNMP group is mandatory for all
-- systems which support an SNMP protocol entity.  Some of
-- the objects defined below will be zero-valued in those
-- SNMP implementations that are optimized to support only
-- those functions specific to either a management agent or
-- a management station.  In particular, it should be
-- observed that the objects below refer to an SNMP entity,
-- and there may be several SNMP entities residing on a
-- managed node (e.g., if the node is hosting acting as
-- a management station).

    REVISION     "199401310000Z"  -- Jan 31, 1994
    DESCRIPTION  "Initial version of this MIB as published in
                 RFC 1573."

    ::= { mib-2 30 }

 IANAifType ::= TEXTUAL-CONVENTION
    STATUS       current
    DESCRIPTION
          "This data type is used as the syntax of the ifType
          object in the (updated) definition of MIB-II's
          ifTable.

          The definition of this textual convention with the
          addition of newly assigned values is published
          periodically by the IANA, in either the Assigned
          Numbers RFC, or some derivative of it specific to
```

```
        Internet
Network Management number assignments.  (The
        latest arrangements can be obtained by contacting the
        IANA.)

        Requests for new values should be made to IANA via
        email (iana&iana.org).

        The relationship between the assignment of ifType
        values and of OIDs to particular media-specific MIBs
        is solely the purview of IANA and is subject to change
        without notice.  Quite often, a media-specific MIB's
        OID-subtree assignment within MIB-II's 'transmission'
        subtree will be the same as its ifType value.
        However, in some circumstances this will not be the
        case, and implementors must not pre-assume any
        specific relationship between ifType values and
        transmission subtree OIDs."

IANAtunnelType ::= TEXTUAL-CONVENTION
  STATUS     current
  DESCRIPTION
        "The encapsulation method used by a tunnel. The value
        direct indicates that a packet is encapsulated
        directly within a normal IP header, with no
        intermediate header, and unicast to the remote tunnel
        endpoint (e.g., an RFC 2003 IP-in-IP tunnel, or an RFC
        1933 IPv6-in-IPv4 tunnel). The value minimal indicates
        that a Minimal Forwarding Header (RFC 2004) is
        inserted between the outer header and the payload
        packet. The value UDP indicates that the payload
        packet is encapsulated within a normal UDP packet
        (e.g., RFC 1234).

        The values sixToFour, sixOverFour, and isatap
        indicates that an IPv6 packet is encapsulated directly
        within an IPv4 header, with no intermediate header,

        and unicast to the destination determined by the 6to4,
        6over4, or ISATAP protocol.

        The remaining protocol-specific values indicate that a
        header of the protocol of that name is inserted
        between the outer header and the payload header.

        The assignment policy for IANAtunnelType values is
        identical to the policy for assigning IANAifType
        values."

    DESCRIPTION
      "The MIB module for measuring application performance
      as experienced by end-users.

      Copyright (C) The Internet Society (2004). This version of
      this MIB module is part of RFC 3729; see the RFC itself for
      full legal notices."

    REVISION "200402190000Z"    -- February 19, 2004
    DESCRIPTION
      "The original version of this MIB Module, published as
      RFC3729."

    ::= { rmon 23 }

apmMibObjects OBJECT IDENTIFIER ::= { apm 1 }
apmConformance OBJECT IDENTIFIER ::= { apm 2 }
apmCompliances
     OBJECT IDENTIFIER ::= { apmConformance 1 }
apmGroups         OBJECT IDENTIFIER ::= { apmConformance 2 }

AppLocalIndex ::= TEXTUAL-CONVENTION
    STATUS       current
    DESCRIPTION
      "A locally arbitrary unique identifier associated with an
      application or application verb.

      All objects of type AppLocalIndex are assigned by the agent
      out of a common number space. In other words, AppLocalIndex
      values assigned to entries in one table must not overlap with
      AppLocalIndex values assigned to entries in another
      table. Further, every protocolDirLocalIndex value registered
      by the agent automatically assigns the same value out of the

      AppLocalIndex number space.

      For example, if the protocolDirLocalIndex values { 1, 3, 5, 7 }
      have been assigned, and the apmHttpFilterAppLocalIndex values
      { 6, 8, 9 } have been assigned:
```

- Assignment of new AppLocalIndex values must not use
the
values { 1, 3, 5, 6, 7, 8, 9 }.
- AppLocalIndex values { 1, 3, 5, 7 } are automatically
assigned and are associated with the identical value of
protocolDirLocalIndex. In particular, an entry in the
apmAppDirTable indexed by a value provides further
information about a protocol indexed by the same value
in the protocolDirTable of RMON2.

The value for each supported application must remain constant
at least from one re-initialization of the entity's network
management system to the next re-initialization, except that
if an application is deleted and re-created, it must be
re-created with a new value that has not been used since the
last re-initialization.

The specific value is meaningful only within a given SNMP
entity. An AppLocalIndex value must not be re-used until the
next agent restart."
SYNTAX Unsigned32
(1..2147483647)

ProtocolDirNetworkAddress ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"A network level address whose semantics and encoding are
specified by an associated protocolDirLocalIndex
value. Objects of this type must specify which
protocolDirLocalIndex value is used. This value is encoded
according to the encoding rules for the identified
protocolDirectory entry.

For example, if the associated protocolDirLocalIndex indicates
an encapsulation of ip, this object is encoded as a length
octet of 4, followed by the 4 octets of the ip address,
in network byte order.

Objects of this type may allow this value to be the zero
length string. If so, they must identify they meaning of this
value."
SYNTAX OCTET STRING (SIZE(0..255))

DataSourceOrZero ::= TEXTUAL-CONVENTION

STATUS current

```
  DESCRIPTION
      "Identifies the source of
 the data that the associated
      function is configured to analyze. This source can be any
      interface on this device.

      In order to identify a particular interface, this
      object shall identify the instance of the ifIndex
      object, defined in [4], for the desired interface.

      For example, if an entry were to receive data from
      interface #1, this object would be set to ifIndex.1.

      If the source of the data isn't an interface or cannot be
      localized to an interface, this object would be set to 0.0"

  REFERENCE    "The DataSource textual convention is defined in
              RFC 2021 [5]."
  SYNTAX       OBJECT IDENTIFIER

RmonClientID ::= TEXTUAL-CONVENTION
  STATUS       current
  DESCRIPTION
      "A long-lived unique ID assigned to an end-system. This ID is
      assigned by the agent using an implementation-specific
      algorithm.

      Because a client machine may be assigned multiple addresses

     over any time period it can be difficult to attribute
      behavior to a particular client based solely on its
      address. A ClientID may be assigned to provide a more
      stable handle for referencing that client. The entity that
      assigns the ClientID may use various implementation
      techniques to keep track of a client but if the assigning
      entity is unable to track client address mappings, it may map
      client identifiers to client addresses rather than to
      distinct client machines.

      This is named ClientID because it helps to solve a problem
      seen in network clients (servers usually have well-known,
      long-lived addresses). However, ClientID's may be assigned to
      any end-system regardless of its role on the network."
  SYNTAX       Unsigned32 (0..4294967295)

TransactionAggregationType ::= TEXTUAL-CONVENTION
  STATUS       current
```

DESCRIPTION

"Specifies one of 4 different techniques
for aggregating
transactions.

The metrics for a single transaction are the responsiveness of
the transaction and whether the transaction succeeded (a
boolean). When such metrics are aggregated in this MIB Module,
these metrics are replaced by averages and distributions of
responsiveness and availability. The metrics describing
aggregates are constant no matter which type of aggregation is
being performed. These metrics may be found in the
apmReportTable.

The flows(1) aggregation is the simplest. All transactions
that share common application/server/client 3-tuples are
aggregated together, resulting in a set of metrics for all
such unique 3-tuples.

The clients(2) aggregation results in somewhat more
aggregation (i.e., fewer resulting records). All transactions
that share common application/client tuples are aggregated
together, resulting in a
set of metrics for all such unique
tuples.

The servers(3) aggregation usually results in still more
aggregation (i.e., fewer resulting records). All transactions
that share common application/server tuples are aggregated
together, resulting in a set of metrics for all such unique
tuples.

The applications(4) aggregation results in the most
aggregation (i.e., the fewest resulting records). All
transactions that share a common application are aggregated
together, resulting in a set of metrics for all such unique
applications.

Note that it is not meaningful to aggregate applications, as
different applications have widely varying characteristics. As a
result, this set of aggregations is complete."
SYNTAX INTEGER {
flows(1), -- Least Aggregation
clients(2),
servers(3),

applications(4) -- Most Aggregation
}

-- The APM Application Directory Group

-- The Application Directory Table contains a record for every

-- application monitored by this agent. This table is also used to
-- configure whether or not an application will be measured and which
-- bucket boundaries will be used for the application.
--
-- The bucket boundaries define the break-points between bins of a
-- histogram analysis for that application. As an example of how this
-- works, consider an entry representing response-time for http.
-- If the boundaries are set as follows:
-- Boundary1: 500 milliseconds
-- Boundary2: 1 second
-- Boundary3: 2 seconds
-- Boundary4: 5
-- Boundary5: 15
-- Boundary6: 60
--
-- If the following measurements are made (all in milliseconds):

--
Bucket7: 0

apmAppDirTable OBJECT-TYPE
SYNTAX SEQUENCE OF ApmAppDirEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"The APM MIB directory of applications and application
verbs. The agent will populate this table with all
applications/verbs of any responsivenessType it has the
capability to monitor. Since the agent populates this table
with every entry it has the capability to monitor, the

entries in this table are read-write, allowing the management
station to modify parameters in this table but not to add new
entries or delete entries (however, entries may be
disabled). If new entries are added to the apmHttpFilterTable
or the apmUserDefinedAppTable, the agent will add the
corresponding entries to this table.

It is an implementation-dependent matter as to how the agent
sets these default parameters. For example, it may leave
certain entries
in this table 'off(0)' if the agent developer

believes that combination will be infrequently used, allowing
a manager that needs that capability to set it to 'on(1)'.

Some applications are registered in the RMON2 protocol
directory and some are registered in other tables in this
MIB Module. Regardless of where an application is originally
registered, it is assigned an AppLocalIndex value that is the
primary index for this table.

The contents of this table affect all reports and exceptions
generated by this agent. Accordingly, modification of this
table should be performed by a manager acting in the role of
administrator. In particular, management software should not
require or enforce particular configuration of this table - it
should reflect the preferences of the site administrator, not
the software author. As a practical matter, this requires
management
software to allow the administrator to configure
the values it will use so that it can be adapted to the site
policy."

              }
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "This object describes and configures the agent's support for
     application performance measurement for this application.
     There are 3 types of measurements for different types of
     applications:

     Transaction-Oriented applications have a fairly constant
     workload to perform for all transactions. The responsiveness
     metric for transaction-oriented
 applications is application
     response time (from first request to final delivery of
     service) and is measured in milliseconds. This is
     commonly referred to as end-user response time.

     Throughput-Oriented applications have widely varying workloads
```

based on the nature of the client request. In particular, throughput-oriented applications vary widely in the amount of data that must be transported to satisfy the request. The responsiveness metric for throughput-oriented applications is kilobits per second.

Streaming-Oriented applications deliver data at a constant metered rate of speed regardless of the responsiveness of the networking and computing infrastructure. This constant rate of speed is generally specified to be below (sometimes well below) the nominal capability of the infrastructure. However, when the infrastructures cannot deliver data at this speed, interruption of service or degradation of service can result. The responsiveness metric for streaming-oriented applications is the ratio of time that the service is degraded or interrupted to the total service time. This metric is measured in parts per million.

Note that for some applications, measuring more than one responsiveness type may be interesting. For agents that wish

to support more than one measurement for a application, they will populate this table with multiple entries for that application, one for each type."

```

configurations of this table."
::= { apmMibObjects 2 }

apmAppDirID OBJECT-TYPE
SYNTAX OBJECT IDENTIFIER
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"This object allows managers to avoid downloading application directory information when the directory is set to a known (usually fixed) configuration.

If the value of this object isn't 0.0, it signifies that the entire contents of the apmAppDirTable, apmHttpFilterTable, apmUserDefinedAppTable and protocolDirTable are equal to a known state identified by the value of this object. If a manager recognizes this value as identifying a directory configuration it has a local copy of, it may use this local copy rather than downloading these tables. Note that it may have downloaded this local copy (and the ID) from another agent and used this copy for all other agents that advertised the same ID.

If an agent recognizes that the entire contents of the apmAppDirTable, apmHttpFilterTable, apmUserDefinedAppTable and protocolDirTable are equal to a known state to which an ID has been assigned, it should set this object to that ID.

In many cases when this feature is used, the application directory information will be in read-only memory and thus the tables may not be modified via SNMP requests. In the event

that the tables are writable and a modification is made, the
agent is responsible for setting this object to 0.0 if it cannot determine that the state is equal to a known state.

An agent is not obligated to recognize and advertise all such registered states as it may not have knowledge of all states. Thus, a manager may encounter agents whose DirectoryID value is 0.0 even though the contents of the directory were equal to a registered state.

Note that the contents of those tables includes the protocolDirLocalIndex and appLocalIndex values. In other

words, these values can't be assigned randomly on each agent,
but must be equal to values that are part of the known
state. While it is possible for a manager to download
application directory details using SNMP and to set the
appropriate directoryID, the manager would need to have some
scheme to ensure consistent values of LocalIndex variables
from agent to agent.
Such schemes are outside the scope of
this specification.

Application directory registrations are unique within an
administrative domain.

Typically these registrations will be made by an agent
software developer who will set the application directory
tables to a read-only state and assign a DirectoryID to that
state. Thus, all agents running this software would share the
same DirectoryID. As the application directory might change
from one software release to the next, the developer may
register different DirectoryID's for each software release.

A customer could also create a site-wide application directory
configuration and assign a DirectoryID to that configuration
as long as consistent values of LocalIndex variables can be
ensured.

The value of this object must persist across reboots."

-- APM HTTP Filter Table

-- The HTTP Filter Table
creates virtual applications which measure the
-- performance of certain web pages or sets of web pages. Some
-- circumstances where this is particularly useful are:
--
-- - An Intranet or ASP scenario where a business application is
-- running on one or more web pages or scripts.

-- (i.e., /expense/submit.cgi?employeeID=3426&...)
-- - A web-hosting scenario where one wants to measure the
-- service level for a particular customer
-- - An e-commerce scenario where the performance of certain
-- pages needs to be monitored more closely.
-- (i.e., shopping cart, shipping, credit card authorization)

```
apmHttpFilterTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF ApmHttpFilterEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "A table that creates virtual applications which measure the
     performance of certain web pages or sets of web pages.

     When an entry is added to this table, the agent
 will
     automatically create one or more entries in the
     apmAppDirTable (one for each responsivenessType it is
     capable of measuring).

     Note that when entries exist in this table some HTTP
     transactions will be summarized twice: in applications
     represented here as well as the HTTP application. If entries
     in this table overlap, these transactions may be summarized
     additional times.

     The contents of this table affect all reports and exceptions
     generated by this agent. Accordingly, modification of this
     table should be performed by a manager acting in the role of
     administrator. In particular, management software should not
     require or enforce particular configuration of this table - it
     should reflect the preferences of the site administrator, not

-- The APM Name Table

apmNameTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF ApmNameEntry
  MAX-ACCESS  not-accessible
  STATUS      current
```

DESCRIPTION
"A client machine may have multiple addresses during a period of monitoring. The apmNameTable assigns a long-lived identifier to a client and records what addresses were assigned to that client for periods of time. Various implementation techniques exist for tracking this mapping but if an agent is unable to track client address mappings, it may map client identifiers to client addresses rather than to distinct client machines.

A particular apmNameClientID should be a constant attribute of a particular client. When available, the agent may also record the machine name and/or user name which may be valuable for displaying to humans. The apmNameMachineName and apmNameUserName are relatively constant, changing only if these attributes actually change on the client.

The agent will store a historical log of these entries, aging out old entries as the log becomes too large. Since this table contains information vital to the interpretation of other tables (e.g., the apmReportTable), the agent should ensure that the log doesn't age out entries that would be referenced by data in those tables.

Note that an entry for a clientID is active from its StartTime until the StartTime of another entry (for the same clientID) that supersedes it, or 'now' if none supersede it. Therefore, if a clientID only has a single entry, it is by definition very new and should never be aged out. No entry for a clientID should be aged out unless it has been updated by a new entry for the client (i.e., with an updated address) and only if the new entry is 'old' enough.

To determine how old is old enough, compute the maximum value of Interval * (NumReports + 1) of all entries in the apmReportControlTable (the '+ 1' is to allow a reasonable period of time for the report to be downloaded). Then take the larger of this value and the age in seconds of the oldest entry in the current transaction table. If an entry for a clientID is superseded by another entry whose StartTime is more than this many seconds ago, then the older entry may be deleted."

     apmReportControlStatus object is equal to active(1)."
  ::= { apmReportControlEntry 2 }
```

```
apmReportControlAggregationType OBJECT-TYPE
  SYNTAX      TransactionAggregationType
        --    INTEGER {
        --      flows(1),
        --       clients(2),
        --      servers(3),
        --      applications(4)
        --    }
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
     "The type of aggregation being performed for this set of
     reports.

     The metrics for a single transaction are the responsiveness of
     the transaction and whether the transaction succeeded (a
     boolean). When such metrics are aggregated in this MIB Module,
     these metrics are replaced by averages and distributions of
     responsiveness and availability. The metrics describing
     aggregates are constant no matter which type of aggregation is
     being performed. These metrics may be found in the
     apmReportTable.

     The flows(1) aggregation is the simplest. All transactions
     that share common application/server/client 3-tuples are
     aggregated together, resulting in a set of metrics for all
     such unique 3-tuples.

      The clients(2) aggregation results in somewhat more
     aggregation (i.e., fewer resulting records). All transactions
     that share common application/client tuples are aggregated
     together, resulting in a set of metrics for all such unique
     tuples.

     The servers(3) aggregation usually results in still more
     aggregation (i.e., fewer resulting records). All transactions
     that share common application/server tuples are aggregated
     together, resulting in a set of metrics for all such unique
     tuples.

     The applications(4) aggregation results in the most
     aggregation (i.e., the fewest resulting records). All

     transactions that share a common application are aggregated
     together, resulting in a set of metrics for all such unique
```

```
        applications.

        Note that it is not meaningful to aggregate applications, as
        different applications have widely varying characteristics.
        As
    a result, this set of aggregations is complete.

        This object may not be modified if the associated
        apmReportControlStatus object is equal to active(1)."
    ::= { apmReportControlEntry 3 }

apmReportControlInterval OBJECT-TYPE
    SYNTAX      Unsigned32
    UNITS       "Seconds"
    MAX-ACCESS  read-create
    STATUS      current
    DESCRIPTION
        "The interval in seconds over which data is accumulated before
        being aggregated into a report in the apmReportTable.  All
        reports with the same apmReportControlIndex will be based on
        the same interval. This object must be greater than zero.

        Many users desire that these reports be synchronized to within
        seconds of the beginning of the hour because the results may
        be correlated more meaningfully to business behavior and so
        that data from multiple agents is aggregated over the same
        time periods. Thus management software may take extra effort
        to synchronize
    reports to the beginning of the hour and to one
        another. However, the agent must not allow reports to 'drift'
        over time as they will quickly become unsynchronized. In
        particular, if there is any fixed processing delay between
        reports, the reports should deduct this time from the interval
        so that reports don't drift.

        This object may not be modified if the associated
        apmReportControlStatus object is equal to active(1)."

  STATUS      current
  DESCRIPTION
     "The number of entries per
 report the agent has allocated
     based on the requested amount in apmReportControlRequestedSize.
     Since multiple reports are saved, the total number of entries
     allocated will be this number multiplied by the value of
     apmReportControlGrantedReports, or 1 if that object doesn't
     exist.

     When the associated apmReportControlRequestedSize object is
     created or modified, the agent should set this object as
     closely to the requested value as is possible for the
     particular implementation and available resources. When
     considering resources available, the agent must consider its
     ability to allocate this many entries for all reports.

     Note that while the actual number of entries stored in the
     reports may fluctuate due to changing conditions, the agent
     must continue to have storage available to satisfy the full
     report size for all reports when necessary. Further, the agent
     must
 not lower this value except as a result of a set to the
     associated apmReportControlRequestedSize object."

apmReportControlEntry is activated, the first report will be
numbered one."
::= { apmReportControlEntry 10 }

apmReportControlDeniedInserts OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The number of failed attempts to add an entry to reports for

this apmReportControlEntry
because the number of entries
would have exceeded apmReportControlGrantedSize.

This number is valuable in determining if enough entries have
been allocated for reports in light of fluctuating network
usage. Note that since an entry that is denied will often be
attempted again, this number will not predict the exact number
of additional entries needed, but can be used to understand
the relative magnitude of the problem.

Also note that there is no ordering specified for the entries
in the report, thus there are no rules for which entries will
be omitted when not enough entries are available. As a
consequence, the agent is not required to delete 'least
valuable' entries first."
::= { apmReportControlEntry 11 }

apmReportControlDroppedFrames OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The total number of frames which were
received by the agent
and therefore not accounted for in the *StatsDropEvents, but
for which the agent chose not to count for this entry for
whatever reason. Most often, this event occurs when the agent
is out of some resources and decides to shed load from this
collection.

This count does not include packets that were not counted
because they had MAC-layer errors.

This counter is only relevant if this apm report is based on

```
        a data source whose collection methodology is based on
        analyzing network traffic.

        Note that if the apmReportTables are inactive because no
        applications are enabled in the application directory, this
        value should be 0.

        Note that, unlike the dropEvents counter, this number is the
        exact number of frames dropped."

  MAX-ACCESS  not-accessible

  STATUS      current
  DESCRIPTION
      "A conceptual row in the apmReportTable.
      The apmReportControlIndex value in the index identifies the
      apmReportControlEntry on whose behalf this entry was created.
      The apmReportIndex value in the index identifies which report
      (in the series of reports) this
 entry is a part of.
      The apmAppDirAppLocalIndex value in the index identifies
      the common application of the transactions aggregated in this
      entry.
      The apmAppDirResponsivenessType value in the index
      identifies the type of responsiveness metric reported by
      this entry and uniquely identifies this entry when more
      than one responsiveness metric is measured for a flow.
      Entries will only exist in this table for those
      combinations of AppLocalIndex and ResponsivenessType
      that are configured 'on(1)'.
      The protocolDirLocalIndex value in the index identifies
      the network layer protocol of the apmReportServerAddress.
      When the associated apmReportControlAggregationType value is
      equal to applications(4) or clients(2), this
      protocolDirLocalIndex value will equal 0.
      The apmReportServerAddress value in the index identifies the
      network layer address of the server in transactions
```

```
 aggregated
      in this entry.
      The apmNameClientID value in the index identifies the
      client in transactions aggregated in this entry. If the
      associated apmReportControlAggregationType is equal to
      applications(4) or servers(3), then this protocolDirLocalIndex
      value will equal 0.

      An example of the indexing of this entry is
      apmReportTransactionCount.3.15.3.1.8.4.192.168.1.2.3232235788

      Note that some combinations of index values may result in an
      index that exceeds 128 sub-identifiers in length which exceeds
      the maximum for the SNMP protocol. Implementations should take
      care to avoid such combinations."

STATUS current
DESCRIPTION

"The network server address for this apmTransactionEntry.

This is represented as an octet string with specific semantics
and length as identified by the protocolDirLocalIndex
component of the index. This object may not be the zero length
string.

For example, if the protocolDirLocalIndex indicates an
encapsulation of ip, this object is encoded as a length octet
of 4, followed by the 4 octets of the ip address, in network
byte order. Care should be taken to avoid values of this
object that, in conjunction with the other index variables,
would result in an index longer than
SNMP's maximum of 128
subidentifiers."

-- The APM Exception table
-- The APM Exception Table creates filters so that a management
-- station can get immediate notification of a transaction that has
-- had poor availability or responsiveness.
--
-- This function is particularly helpful in unaggregated situations
-- where the numbers of agents is relatively high and the transaction
-- rate per agent is relatively low (such as agents for desktops or
-- dedicated to small workgroups). Polling agents in such an
```

```
-- environment would either cause scalability problems (high rate) or
-- lead to long notification delays (low rate).

apmExceptionTable
 OBJECT-TYPE
   SYNTAX      SEQUENCE OF ApmExceptionEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "This table creates filters so that a management station can
      get immediate notification of a transaction that has had poor

      availability or responsiveness.

      Each apmExceptionEntry is associated with a particular type of
      transaction and is applied to all transactions of that
      type. Multiple apmExceptionEntries may be associated with a
      particular type of transaction. A transaction type is
      identified by the value of the apmAppDirAppLocalIndex
      component of the index.

      Because the quality of a transaction is not known until it is
      completed, these thresholds are only applied after the
      transaction has completed."

::= { apmExceptionEntry 9 }

apmThroughputExceptionMinTime OBJECT-TYPE
SYNTAX Unsigned32
UNITS "seconds"
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"Because the responsiveness for throughput-oriented
transactions is divided by the elapsed time, it can be very
sensitive to short-term performance variations for
transactions that take a short period of time. For example,
when downloading
a very short file, a single dropped packet
could double or triple the total response time.

Further, throughput is usually examined for applications that
transfer a lot of data, and when doing so it is helpful to
conceptualize transaction costs that are proportional to the
amount of data separately from those costs that are relatively
fixed (i.e., independent of the amount of data). For very
short transactions, these fixed transaction costs (handshake,
setup time, authentication, round-trip time) may dominate the

total response time for the transaction, resulting in
throughput measurements that aren't really proportional to the
network's, server's and client's combined data throughput
capability.

This object controls the minimum number of seconds that an
throughput-based transaction must exceed before an exception
can be generated for it. If this object is set
to zero, then
all throughput-based transactions are candidates for
exceptions.

The value of this object must persist across reboots."

    DESCRIPTION
       "This is the MIB Module for DOCSIS 2.0-compliant Radio
```

Frequency (RF) interfaces in Cable Modems and
Cable Modem Termination Systems.

Copyright (C) The Internet Society (2006). This
version of this MIB module is part of RFC 4546; see
the RFC itself for full legal notices."

REVISION "200605240000Z"
DESCRIPTION
"Revision of the IETF RF MIB module for DOCSIS 2.0.
This version published as RFC 4546.
This MIB module revision includes the following
among others:
Usage of ifType (205) for upstream logical channels.
Addition of downstream and upstream utilization
counters.
Additional statistics per upstream interface.
Upstream channel offline configuration mechanism.
Added MIB support for new DOCSIS 2.0 modulation
attributes.
Euro-DOCSIS downstream interleave values.
Adjustments to RFC 2670 definitions based on
the MIB review guidelines from the IETF

Operations and Management Area (OPS)."

REVISION "199908190000Z"
DESCRIPTION
"Initial version, published as RFC 2670.
Modified by Mike St. Johns to fix problems identified by
the first pass of the MIB doctor. Of special note,
docsIfRangingResp and docsIfCmtsInsertionInterval were
obsoleted and replaced by other objects with the same
functionality, but with more appropriate syntax."

DocsEqualizerData ::= TEXTUAL-CONVENTION
     STATUS       current
     DESCRIPTION
        "This data type represents the equalizer data
         as measured at the receiver interface.
         The format of the equalizer follows the structure of the
         Transmit Equalization Adjust RNG-RSP TLV of DOCSIS RFI
         v2.0 :
         1 byte Main tap location 1..(n + m)
          1 byte Number of forward taps per symbol
         1 byte Number of forward taps: n
         1 byte Number of reverse taps: m

         Following are the equalizer coefficients:
         First, forward taps coefficients:
         2 bytes F1 (real),  2 bytes  F1 (imag)

         ...
         2 bytes Fn (real),  2 bytes  Fn (imag)

         Then, reverse taps coefficients:
         2 bytes D1 (real),  2 bytes  D1 (imag)
         ...

         2 bytes Dm (real),  2 bytes  Dm (imag)

         The equalizer coefficients are considered signed 16-bit
         integers in the range from -32768 (0x8000) to 32767
         (0x7FFF).

         DOCSIS specifications require up to a maximum of
         64 equalizer taps (n + m); therefore, this object size
```

```
          can get up 260 bytes (4 + 4x64).
          The minimum object size (other than zero) for a t-spaced
          tap with a minimum of 8 symbols will be 36 (4 + 4x8)."

    STATUS      current
    DESCRIPTION
        "This table describes the attributes of attached upstream
         channels."
    ::= { docsIfBaseObjects 2 }

docsIfUpstreamChannelEntry OBJECT-TYPE
    SYNTAX      DocsIfUpstreamChannelEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
        "List of attributes for a single upstream channel.  For
         DOCSIS 2.0 CMTSs, an entry in this table exists for
         each ifEntry with an ifType of docsCableUpstreamChannel
         (205).
         For DOCSIS 1.x CM/CMTSs and DOCSIS 2.0 CMs, an entry in
         this table exists for each ifEntry with an ifType of
         docsCableUpstream (129).

         For DOCSIS 2.0 CMTSs, two classes of interfaces can be
         defined for this table:
```

o Upstream Physical Interfaces: The traditional DOCSIS
1.x CMTS upstream interface ifType 129 and the DOCSIS
2.0 ifType 205 that are functional. In other words,
interfaces that represent upstream receivers within
an RF MAC interface.
Entries of physical interfaces are exposed to the
management interface with their corresponding
ifStack hierarchy and are not administratively
created by this table.

o Upstream Temporary Interfaces: A fictitious
interface created for the purpose of manipulating
physical interface parameters offline, then
validating prior to updating the target physical
interface.

In case of a reinitialization of the managed system,
physical interfaces values persist while the temporary
interfaces are not recreated.

This mechanism helps to minimize
service disruptions
originating in situations where a group of interface
parameter values need to be consistent with each other
in SET operations. A temporary buffer
(temporary interface) is provided to allow the CMTS
to validate the parameters offline."

    MAX-ACCESS  read-create
    STATUS      current
    DESCRIPTION
        "Used to perform the copy of adjusted parameters from the
        temporary interface entry to the physical interface
        indicated by the docsIfUpChannelCloneFrom
 object.  The
        transfer is initiated through an SNMP SET to 'true' of

        this object.
        A SET to 'true' fails and returns error 'commitFailed'
        if docsIfUpChannelStatus value is 'notInService', which
```

means that the interface parameters values are not
compatible with each other or have not been validated yet.
Reading this object always returns 'false'."
::= { docsIfUpstreamChannelEntry 17 }

docsIfUpChannelStatus OBJECT-TYPE
SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object is only used for the creation of a temporary
upstream row with the purpose of updating the parameters
of a physical upstream channel entry.

The following restrictions apply to this object:
1. This object is not writable for physical interfaces.
2. Temporary interface entries are only created by a SET

of this object to createandWait(5).
3. ifAdminStatus from the Interface MIB RFC 2863 is used
to take a physical upstream channel offline, to be
consistent with DOCSIS 1.x operation, as indicated in
RFC 2670.
In addition,
o ifAdminStatus 'down' is reflected in this object
as 'notInService'.
o ifOperStatus 'down' while ifAdminStatus 'up' is
reflected in this object as 'notInservice'.
4. Temporary created rows MUST be set to 'active' with
the purpose of validating upstream parameter
consistency prior to transferring the parameters to the
physical interface.

Below is a mandatory procedure for adjusting the values
of a physical interface:
1. Create a temporary interface entry through an SNMP SET
using 'createAndWait'. At this point, the RowStatus
reports 'notReady'.
The Manager entity uses an ifIndex value outside the
operational range of the physical interfaces for the
creation of a temporary interface.
2. Set the docsIfUpChannelCloneFrom object to the ifIndex
value of the physical row to update. Now
docsIfUpChannelStatus reports 'notInService'.
3. Change the upstream parameters to the desired values
in the temporary row.

```
        4. Validate that all parameters are consistent by setting
           docsIfUpChannelStatus to 'active'.  A failure to set the
           RowStatus to 'active' returns the error 'commitFailed',
           which means the parameters are not compatible with the
           target physical interface.
        5. With docsIfUpChannelStatus 'active', transfer the
           parameters to the target physical interface by setting
           the object docsIfUpChannelUpdate to 'true'.
        6. Delete the temporary
 row by setting
           docsIfUpChannelStatus to 'destroy'."

```
docsIfQosProfileEntry OBJECT-TYPE
   SYNTAX      DocsIfQosProfileEntry

   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "Describes the attributes for a single class of service.
       If implemented as read-create in the Cable Modem
       Termination System, creation of entries in this table is
       controlled by the value of
       docsIfCmtsQosProfilePermissions.

       If implemented as read-only, entries are created based
       on information in REG-REQ
 MAC messages received from
       cable modems (for Cable Modem Termination System), or
       based on information extracted from the TFTP option file
       (for Cable Modem).
       In the Cable Modem Termination System, read-only entries
       are removed if no longer referenced by
       docsIfCmtsServiceTable.

       An entry in this table MUST not be removed while it is
       referenced by an entry in docsIfCmServiceTable (Cable
       Modem) or docsIfCmtsServiceTable (Cable Modem Termination
       System).

       An entry in this table SHOULD NOT be changeable while
       it is referenced by an entry in docsIfCmtsServiceTable.

       If this table is created automatically, there SHOULD only
       be a single entry for each Class of Service.  Multiple
       entries with the same Class of Service parameters are NOT
       RECOMMENDED."

         in the RF Interface Specification.  Returned status
         information is the CM status, as assumed by the CMTS,
```

```
        and indicates
 the following events:
        other(1)
          Any state other than below.
        ranging(2)
          The CMTS has received an Initial Ranging Request
          message from the CM, and the ranging process is not
          yet complete.
        rangingAborted(3)
          The CMTS has sent a Ranging Abort message to the CM.

        rangingComplete(4)
          The CMTS has sent a Ranging Complete message to the CM.
        ipComplete(5)
          The CMTS has received a DHCP reply message and
          forwarded it to the CM.
        registrationComplete(6)
          The CMTS has sent a Registration Response message to
          the CM.
        accessDenied(7)
          The CMTS has sent a Registration Aborted message
          to the CM.
        operational(8)
          Value 8 is considered reserved and should not be defined
          in future revisions of this MIB module to avoid conflict
          with documented
 implementations that support value 8 to
          indicate operational state after completing the BPI
          initialization process.
        registeredBPIInitializing(9)
          Baseline Privacy (BPI) is enabled and the CMTS is in the
          process of completing BPI initialization.  This state
          MAY last for a significant length of time if failures
          occur during the initialization process.  After
          completion of BPI initialization, the CMTS will report
          registrationComplete(6).
        The CMTS only needs to report states it is able to
        detect."

::= { docsIfCmtsChannelUtilizationEntry 2 }

docsIfCmtsChannelUtUtilization OBJECT-TYPE
SYNTAX Integer32 (0..100)
UNITS "percent"
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The calculated and truncated utilization index for this
physical upstream or downstream channel, accurate as of
the most recent docsIfCmtsChannelUtilizationInterval.

Upstream Channel Utilization Index:

The upstream channel utilization index is expressed as a
percentage of mini-slots utilized on the physical channel,
regardless of burst type. For an Initial Maintenance
region, the mini-slots for the complete region are
considered utilized if the CMTS received an upstream
burst within the region from any CM on the physical
channel. For contention REQ and REQ/DATA regions, the
mini-slots for a transmission opportunity within the
region are considered utilized if the CMTS received an
upstream burst within the opportunity from any CM on the
physical channel. For all other regions, utilized
mini-slots are those in which the CMTS granted
bandwidth to any unicast SID on the physical channel.

For an upstream interface that has multiple logical
upstream channels enabled, the utilization index is a
weighted sum of utilization indices for the logical
channels. The weight for each utilization index is the
percentage of upstream mini-slots allocated for the
corresponding logical channel.

Example:
If 75% of bandwidth is allocated to the first logical
channel and 25% to the second, and the utilization

indices for each are 60 and 40, respectively, the

utilization index for the upstream physical channel is
(60 * 0.75) + (40 * 0.25) = 55. This figure
applies to the most recent utilization interval.

Downstream Channel Utilization Index:

The downstream channel utilization index is a percentage
expressing the ratio between bytes used to transmit data
versus the total number of bytes transmitted in the raw
bandwidth of the MPEG channel. As with the upstream
utilization index, the calculated value represents
the most recent utilization interval.
Formula:
Downstream utilization index =
(100 * (data bytes / raw bytes))

Definitions:
Data bytes: Number of bytes transmitted as data in the

docsIfCmtsChannelUtilizationInterval.
Identical to docsIfCmtsDownChannelCtrUsed
Bytes measured over the utilization
interval.
Raw bandwidth: Total number of bytes available for
transmitting data, not including bytes
used for headers and other overhead.
Raw bytes: (raw bandwidth *
docsIfCmtsChannelUtilizationInterval).
Identical to docsIfCmtsDownChannelCtrTotal
Bytes measured over the utilization
interval."

    DESCRIPTION  "The SNMP Management Architecture MIB

                  Copyright (C) The Internet Society (2002). This
                  version of this MIB module is part of RFC 3411;
                  see the RFC itself for full legal notices.
                 "

    REVISION     "200210140000Z"        -- 14 October 2002
    DESCRIPTION  "Changes in this revision:
                  - Updated various administrative information.
                  - Corrected some typos.
                  - Corrected typo in description of SnmpEngineID
                    that led to range overlap for 127.
                  - Changed '255a' to '255t' in definition of
                    SnmpAdminString to align with current SMI.
                  - Reworded 'reserved' for value zero in
                    DESCRIPTION of SnmpSecurityModel.
                  - The algorithm for allocating security models
                    should give
 256 per enterprise block, rather
                    than 255.
                  - The example engine ID of 'abcd' is not
                    legal. Replaced with '800002b804616263'H based
                    on example enterprise 696, string 'abc'.
                  - Added clarification that engineID should
                    persist across re-initializations.
                  This revision published as RFC 3411.

 SnmpEngineID ::= TEXTUAL-CONVENTION
```

STATUS current
DESCRIPTION "An SNMP engine's
administratively-unique identifier.

Objects of this type are for identification, not for addressing, even though it is possible that an address may have been used in the generation of a specific value.

The value for this object may not be all zeros or all 'ff'H or the empty (zero length) string.

The initial value for this object may be configured via an operator console entry or via an algorithmic function. In the latter case, the following example algorithm is recommended.

In cases where there are multiple engines on the same system, the use of this algorithm is NOT appropriate, as it would result in all of those engines ending up with the same ID value.

1) The very first bit is used to indicate how the

rest of the data is composed.

0 - as defined by enterprise using former methods that existed before SNMPv3. See item 2 below.

1 - as defined by this architecture, see item 3 below.

Note that this allows existing uses of the engineID (also known as AgentID [RFC1910]) to co-exist with any new uses.

2) The snmpEngineID has a length of 12 octets.

The first four octets are set to the binary equivalent of the agent's SNMP management private enterprise number as assigned by the Internet Assigned Numbers Authority (IANA). For example, if Acme Networks has been assigned { enterprises 696 }, the first four octets would be assigned '000002b8'H.

The remaining eight octets

are determined via

one or more enterprise-specific methods. Such methods must be designed so as to maximize the possibility that the value of this object will be unique in the agent's administrative domain. For example, it may be the IP address of the SNMP entity, or the MAC address of one of the interfaces, with each address suitably padded with random octets. If multiple methods are defined, then it is recommended that the first octet indicate the method being used and the remaining octets be a function of the method.

3) The length of the octet string varies.

The first four octets are set to the binary equivalent of the agent's SNMP management private enterprise number as assigned by the Internet Assigned Numbers Authority (IANA). For example, if Acme Networks has been assigned { enterprises 696 }, the first four octets would be assigned '000002b8'H.

The very first bit is set to 1. For example, the above value for Acme Networks now changes to be '800002b8'H.

The fifth octet indicates how the rest (6th and following octets) are formatted. The values for the fifth octet are:

0 - reserved, unused.

1 - IPv4 address (4 octets)
lowest non-special IP address

2 - IPv6 address (16 octets)
lowest non-special IP address

3 - MAC address (6 octets)
lowest IEEE MAC address, canonical order

4 - Text, administratively assigned
Maximum remaining length 27

5 - Octets, administratively assigned
Maximum remaining length 27

6-127 - reserved, unused

128-255 - as defined by the enterprise
Maximum remaining length 27
"
SYNTAX OCTET STRING (SIZE(5..32))

SnmpSecurityModel ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION "An identifier that uniquely identifies a
Security Model of the Security Subsystem within
this SNMP Management Architecture.

The values for securityModel are allocated as
follows:

- The zero value does not identify any particular
security model.

- Values between 1 and 255, inclusive,
are reserved
for standards-track Security Models and are
managed by the Internet Assigned Numbers Authority
(IANA).
- Values greater than 255 are allocated to
enterprise-specific Security Models. An
enterprise-specific securityModel value is defined
to be:

enterpriseID * 256 + security model within
enterprise

For example, the fourth Security Model defined by
the enterprise whose enterpriseID is 1 would be
259.

This scheme for allocation of securityModel values allows for a maximum of 255 standards-based Security Models, and for a maximum of 256 Security Models per enterprise.

It is believed that the assignment of new securityModel values will be rare in practice because the larger the number of simultaneously utilized Security Models, the larger the chance that interoperability will suffer. Consequently, it is believed that such a range will be sufficient. In the unlikely event that the standards committee finds this number to be insufficient over time, an enterprise number can be allocated to obtain an additional 256 possible values.

Note that the most significant bit must be zero; hence, there are 23 bits allocated for various organizations to design and define non-standard securityModels. This limits the ability to define new proprietary implementations of Security Models to the first 8,388,608 enterprises.

It is worthwhile to note that, in its encoded form, the securityModel value will normally require only a single byte since, in practice, the leftmost bits will be zero for most messages and sign extension is suppressed by the encoding rules.

As of this writing, there are several values of securityModel defined for use with SNMP or reserved for use with supporting MIB objects. They are as follows:

0 reserved for 'any'
1 reserved for SNMPv1
2 reserved for SNMPv2c
3 User-Based Security Model (USM)
"

SYNTAX INTEGER(0 .. 2147483647)

```
SnmpMessageProcessingModel ::= TEXTUAL-CONVENTION
  STATUS       current
  DESCRIPTION "An identifier that uniquely identifies a Message
              Processing Model of the Message Processing
              Subsystem within this SNMP Management
 Architecture.

              The values for messageProcessingModel are
              allocated as follows:

              - Values between 0 and 255, inclusive, are
                reserved for standards-track Message Processing
                Models and are managed by the Internet Assigned
                Numbers Authority (IANA).

              - Values greater than 255 are allocated to
                enterprise-specific Message Processing Models.
                An enterprise messageProcessingModel value is
                defined to be:

                enterpriseID * 256 +
                    messageProcessingModel within enterprise

                For example, the fourth Message Processing Model
                defined by the enterprise whose enterpriseID

                is 1 would be 259.

              This scheme for allocating messageProcessingModel
              values allows for a maximum of 255 standards-
               based Message Processing Models, and for a
              maximum of 256 Message Processing Models per
              enterprise.

              It is believed that the assignment of new
              messageProcessingModel values will be rare
              in practice because the larger the number of
              simultaneously utilized Message Processing Models,
              the larger the chance that interoperability
              will suffer. It is believed that such a range
              will be sufficient.  In the unlikely event that
              the standards committee finds this number to be
              insufficient over time, an enterprise number
              can be allocated to obtain an additional 256
              possible values.
```

Note that the most significant bit must be zero;
hence, there are 23 bits allocated for various
organizations to design and define non-standard
messageProcessingModels. This limits the ability
to define new proprietary implementations of
Message Processing Models to the first 8,388,608
enterprises.

It is worthwhile to note that, in its encoded
form, the messageProcessingModel value will
normally require only a single byte since, in
practice, the leftmost bits will be zero for
most messages and sign extension is suppressed
by the encoding rules.

As of this writing, there are several values of
messageProcessingModel defined for use with SNMP.
They are as follows:

0 reserved for SNMPv1
1 reserved for SNMPv2c
2 reserved for SNMPv2u and SNMPv2*
3 reserved for SNMPv3
"
SYNTAX INTEGER(0 .. 2147483647)

SnmpSecurityLevel
::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION "A Level of Security at which SNMP messages can be
sent or with which operations are being processed;
in particular, one of:

noAuthNoPriv - without authentication and
without privacy,
authNoPriv - with authentication but
without privacy,
authPriv - with authentication and
with privacy.

These three values are ordered such that
noAuthNoPriv is less than authNoPriv and

authNoPriv is less than authPriv.
"
SYNTAX INTEGER { noAuthNoPriv(1),
authNoPriv(2),
authPriv(3)
}

SnmpAdminString ::= TEXTUAL-CONVENTION
DISPLAY-HINT "255t"
STATUS
current
DESCRIPTION "An octet string containing administrative
information, preferably in human-readable form.

To facilitate internationalization, this
information is represented using the ISO/IEC
IS 10646-1 character set, encoded as an octet
string using the UTF-8 transformation format
described in [RFC2279].

Since additional code points are added by
amendments to the 10646 standard from time
to time, implementations must be prepared to
encounter any code point from 0x00000000 to
0x7fffffff. Byte sequences that do not
correspond to the valid UTF-8 encoding of a
code point or are outside this range are
prohibited.

The use of control codes should be avoided.

When it is necessary to represent a newline,

the control code sequence CR LF should be used.

The use of leading or trailing white space should
be avoided.

For code points not directly supported by user
interface hardware or software, an alternative
means of entry and display, such as hexadecimal,
may be provided.

For information encoded in 7-bit US-ASCII,
the UTF-8 encoding is identical to the

```
            US-ASCII encoding.

            UTF-8 may require multiple bytes to represent a
            single character / code point; thus the length
            of this object in octets may be different from
            the number of characters encoded.  Similarly,
            size constraints refer to the number of encoded
            octets, not the number of characters represented
            by an encoding.

            Note that when this
 TC is used for an object that
            is used or envisioned to be used as an index, then
            a SIZE restriction MUST be specified so that the
            number of sub-identifiers for any object instance
            does not exceed the limit of 128, as defined by
            [RFC3416].

            Note that the size of an SnmpAdminString object is
            measured in octets, not characters.

DESCRIPTION
"This is the MIB Module for DOCSIS-compliant cable modems

and cable-modem
termination systems.

Copyright (C) The IETF Trust (2006). This version
of this MIB module was published in RFC 4639; for full
legal notices see the RFC itself."

REVISION "200612200000Z" -- December 20, 2006
DESCRIPTION
"Second version, published as RFC 4639.

Modifications to this MIB module since RFC 2669 include:
- Deprecation of the docsDevFilter group in favor of the
DiffServ MIB groups, to enable support for IPv6
filtering and DiffServ Code Point (DSCP) marking.
- Deprecation of the docsDevCpeGroup in favor of the
docsDevCpeInetGroup, to enable support of IPv6.
- Addition of various InetAddress objects to enable
support of IPv6.
- Deprecation of docsDevNmAccessTable in favor of SNMP
Coexistence and SNMPv3 -- yet adding
docsDevNmAccessTrapVersion and clarifying
docsDevNmAccessIp for current use of this table,
- Addition of docsDevIgmpModeControl for management and
control of the IGMP mode of operation,
- Addition of docsDevMaxCpe for management of the
maxmium number of CPEs permitted access through a
cable modem,
- Addition of docsDevSwServerTransportProtocol, and
modifications to docsDevSoftware object DESCRIPTIONS,
to enable software downloads via either TFTP or HTTP,
- Replacement of docsDevEvThrottleInhibited with
docsDevEvThrottleThresholdExceeded to simplify
event threshold management,
- Modification of docsDevEvReporting to enable local
logging to the internal volatile log, and not to the
internal non-volatile log,
- Modification of the compliance statement to make the

docsDevCpe objects optional
- Created placeholders for two OIDs in the
docsDevFilterPolicyTable that were never used
- Modified the DESCRIPTION of
docsDevSwServerTransportProtocol and
docsDevSwServerAddressType to address the
dependence between each object
- Added a reference to docsDevServerConfigTftpAddress
- Clarified the scope of notifications that are covered
by docsDevEvThrottleThreshold
- Clarified an error condition that could occur when

doing a SET to docsDevEvReporting
- Defined each of the enumerated types for both
docsDevEvLevel and docsDevEvPriority
- Added UNITS clause to docsDevFilterLLCMatches,
docsDevFilterIpMatches, docsDevMaxCpe,
docsDevEvThrottleThreshold and docsDevEvCounts.
- Added REFERENCE clause to docsDevFilterIpProtocol
- Modified DESCRIPTION
of docsDevCpeInetAddr to be
more protocol-neutral
- Removed the enumerated value (1) from both
docsDevCpeInetSource and docsDevCpeSource
- Covered additional read-write and read-create objects
in the Security Considerations section
- Modified the default value of docsDevNmAccessIpMask
to be consistent with OSSI specification
- Modified the SYNTAX of docsDevNmAccessCommunity and
docsDevNmAccessInterfaces in the Conformance
Statement section
- Added SYNTAX clause to docsDevEvReporting in the
Conformance Statement section
- Modified SYNTAX clause of docsDevEvReporting to
move new enumerated type to byte boundary
- Added references to DOCSIS 2.0 specifications to
multiple objects
- Clarified non-persistency across reboots for
all
tables
- Clarified functionality of docsDevSw objects as
they relate to docsDevSwOperStatus
- Clarified enumerated types (9) and (10) for
docsDevServerBootState
- Defined the state of unknown(0) for the following
objects: docsDevServerDhcpAddressType,

```
            docsDevServerTimeAddressType,
            docsDevServerConfigTftpAddressType and
            docsDevServerConfigTftpAddressType
          - Modified the value in docsDevFilterIpDaddr to be
            consistent with the SYNTAX
          - Specified which rows could be modified in an
            active row for docsDevFilterPolicyStatus
          - Defined the term 'manually' in docsDevCpeEnroll
          - Clarified the description for
            docsDevFilterTosOrMask
          - Covered the case of a non-existent row for
            docsDevFilterPolicyPtr
          - Added DEFVAL clauses for multiple
objects
          - Replaced docsDevNotification OBJECT IDENTIFIER
            with docsDevNotifications to address possible
            compatibility issues

          - Added support for the usage of RFC 3413 and RFC 3014
            as event notification mechanisms
          - Removed docsDevFilterPolicyObsoleteGroup
          - Added stdInterface(9) type to docsDevEvReporting to
            support the usage of RFC3413 and RFC3014
          - Modified DESCRIPTION for docsDevMaxCpe"

      REVISION "199908190000Z"
      DESCRIPTION
         "Initial version, published as RFC 2669."

docsDevBase OBJECT IDENTIFIER ::= { docsDevMIBObjects 1 }

--
-- For the following object, there is no concept in the
-- RFI specification corresponding to a backup CMTS.  The
-- enumeration is provided here in case someone is able
-- to define such a role or device.
--

docsDevRole OBJECT-TYPE
       SYNTAX INTEGER {
          cm(1),
          cmtsActive(2),
```

```
        cmtsBackup(3)
    }
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "Defines the current role of this device.  cm(1) is a
        Cable Modem, cmtsActive(2) is a Cable Modem Termination
        System that is controlling the system of cable modems,
        and cmtsBackup(3) is a CMTS that is currently connected
        but is not controlling the system (not currently used).

        In general, if this device is a 'cm', its role will not
        change during operation or between reboots.  If the
        device is a 'cmts' it may change between cmtsActive and
        cmtsBackup and back again during normal operation.  NB:
        At this time, the DOCSIS standards do not support the
        concept of a backup CMTS, but cmtsBackup is included for
        completeness."
    ::= { docsDevBase 1 }

docsDevDateTime
 OBJECT-TYPE
    SYNTAX      DateAndTime
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
        "The current date and time, with time zone information
        (if known).

        If the real data and time cannot be determined, this
        shall represent elapsed time from boot relative to
        the standard epoch '1970-1-1,0:0:0.0'.  In other
        words, if this agent has been up for 3 minutes and
        not been able to determine what the actual date and
        time are, this object will return the value
        '1970-1-1,0:03:0.0'."
    ::= { docsDevBase 2 }

docsDevResetNow OBJECT-TYPE

docsDevNmAccessTable OBJECT-TYPE
        SYNTAX      SEQUENCE OF DocsDevNmAccessEntry
```

```
        MAX-ACCESS  not-accessible
        STATUS      deprecated
        DESCRIPTION
           "This table controls access to SNMP objects by network
            management stations.  If the table is empty, access to
            SNMP objects is unrestricted.  The objects in this table
            MUST NOT persist across reboots.  The objects in this
            table are only accessible from cable devices that are
            not capable of operating in SNMP Coexistence mode
            (RFC 3584) or in SNMPv3 mode (RFC 3410).
            See the conformance section for
            details.  Note that some devices are required by other
            specifications (e.g., the DOCSIS OSSIv1.1 specification)
            to support the legacy SNMPv1/v2c docsDevNmAccess mode
            for
    backward compatibility.

            This table is deprecated.  Instead, use the SNMP
            coexistence MIBs from RFC 3584, the TARGET and
            NOTIFICATION MIBs from RFC 3413, and
            the View-Based Access Control Model (VACM) MIBs for
            all SNMP protocol versions from RFC 3415."

docsDevNmAccessInterfaces OBJECT-TYPE
      SYNTAX      OCTET STRING (SIZE (1..32))
      MAX-ACCESS  read-create
      STATUS      deprecated
      DESCRIPTION
         "Specifies the set of interfaces from which requests from
          this NMS will be accepted.  Each octet within
          the value of this object specifies a set of eight
```

interfaces, the first octet specifying ports 1
through 8, the second octet specifying interfaces 9
through 16, etc. Within each octet, the most
significant bit represents the lowest numbered
interface, and the least significant bit represents the
highest numbered
interface. Thus, each interface is
represented by a single bit within the value of this
object. If that bit has a value of '1' then that
interface is included in the set.

Note that entries in this table apply only to link-layer
interfaces (e.g., Ethernet and CATV MAC). Bits
representing upstream and downstream channel interfaces
MUST NOT be set to '1'.

Note that if bits corresponding to non-existing
interfaces are set, the result is implementation
specific.

Note that according to the DOCSIS OSSIv1.1
specification, when ifIndex '1' is included in the
set, then this row applies to all CPE
(customer-facing) interfaces.

The size of this object is the minimum required to
represent all configured interfaces for this device."

docsDevSwAdminStatus OBJECT-TYPE
SYNTAX INTEGER {
upgradeFromMgt(1),
allowProvisioningUpgrade(2),
ignoreProvisioningUpgrade(3)
}
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"If set to upgradeFromMgt(1), the device will initiate a
TFTP or HTTP software image download. After
successfully receiving an image, the device will set
its state to ignoreProvisioningUpgrade(3) and reboot.
If the download process is interrupted (e.g., by a reset
or power failure), the device will load the previous
image and, after re-initialization, continue to attempt
loading the image specified in docsDevSwFilename.

If set to allowProvisioningUpgrade(2), the device will
use the software version information supplied by the
provisioning server when next rebooting (this does not
cause a reboot).

When set to ignoreProvisioningUpgrade(3), the device
will disregard software image upgrade information
from the provisioning server.

Note that reading this object can return
upgradeFromMgt(1). This indicates that a software
download is currently in progress, and that the device
will reboot after successfully receiving an image."

    DESCRIPTION
       "InProgress(1) indicates that a TFTP or HTTP download is
        underway, either as a result of a version mismatch at
        provisioning or as a result of a upgradeFromMgt request.

        No other docsDevSw* objects can be modified in
        this state.

        CompleteFromProvisioning(2) indicates that the last
        software upgrade was a result of version mismatch at
        provisioning.

        CompleteFromMgt(3) indicates that the last software
        upgrade was a result of setting docsDevSwAdminStatus to
        upgradeFromMgt.

        Failed(4) indicates that the last attempted download
        failed, ordinarily due to TFTP or HTTP timeout."

    STATUS      current
    DESCRIPTION
        "If operational(1), the device has completed loading and
         processing of configuration parameters, and the CMTS has
         completed the Registration exchange.

         If disabled(2), then the device was administratively
         disabled, possibly by being refused network access
in
         the configuration file.

         If waitingForDhcpOffer(3), then a Dynamic Host
         Configuration Protocol (DHCP) Discover has been
         transmitted, and no offer has yet been received.

         If waitingForDhcpResponse(4), then a DHCP Request has
         been transmitted, and no response has yet been received.

         If waitingForTimeServer(5), then a Time Request has been
         transmitted, and no response has yet been received.

         If waitingForTftp(6), then a request to the TFTP
         parameter server has been made, and no response
         received.

         If refusedByCmts(7), then the Registration
         Request/Response exchange with the CMTS failed.

         If forwardingDenied(8), then the registration process
         was completed, but the network access option in the
         received configuration file prohibits forwarding.

         If other(9), then the registration
process reached a
         point that does not fall into one of the above
         categories.

         If unknown(10), then the device has not yet begun the
         registration process or is in some other indeterminate
         state."

            stopAtThreshold(3),
            inhibited(4)
        }
        MAX-ACCESS  read-write
        STATUS      current
        DESCRIPTION
            "Controls the transmission of traps and syslog messages
             with respect
    to the trap pacing threshold.

             unconstrained(1) causes traps and syslog messages to be
             transmitted without regard to the threshold settings.

             maintainBelowThreshold(2) causes trap transmission and
             syslog messages to be suppressed if the number of traps
             would otherwise exceed the threshold.

             stopAtThreshold(3) causes trap transmission to cease at
             the threshold and not to resume until directed to do so.

             inhibited(4) causes all trap transmission and syslog
             messages to be suppressed.

             A single event is always treated as a single event for
             threshold counting.  That is, an event causing both a
             trap and a syslog message is still treated as a single
             event.

             Writing to this object resets the thresholding state."

            "The priority level that is controlled by this
             entry.  These are ordered from most (emergency) to least
```

(debug) critical. Each event with a CM or CMTS has a particular priority level associated with it (as defined by the vendor).

emergency(1) events indicate vendor-specific fatal hardware or software errors that prevent normal system operation.

alert(2) events indicate a serious failure that causes the reporting system to reboot but is not caused by hardware or software malfunctioning.

critical(3) events indicate a serious failure that requires attention and prevents the device from transmitting data but that could be recovered without rebooting the system.

error(4) and warning(5) events indicate that a failure occurred that could interrupt the normal data flow but that does not cause the device to re-register.

notice(6) and information(7) events indicate a milestone or checkpoint in normal operation that could be of particular importance for troubleshooting.

debug(8) events are reserved for vendor-specific events.

During normal operation, no event more critical than notice(6) should be generated. Events between warning and emergency should be generated at appropriate levels of problems (e.g., emergency when the box is about to crash)."

docsDevEvReporting OBJECT-TYPE
SYNTAX BITS {
local(0),
traps(1),
syslog(2),
-- The following are extensions to the original set of
-- labels. The extensions start at an octet boundary.
-- So for bits 3 - 7, one MUST set them to zero on send
-- and one MUST ignore them on receipt.

```
        localVolatile(8),
        stdInterface(9)
    }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
        "Defines the action to be taken on occurrence of this
        event class.  Implementations may not necessarily
        support all options for all event classes but at
        minimum must allow traps and
syslogging to be
        disabled.

        If the local(0) bit is set, then log to the internal
        log and update non-volatile store, for backward
        compatibility with the original RFC 2669 definition.
        If the traps(1) bit is set, then generate
        an SNMP trap; if the syslog(2) bit is set, then
        send a syslog message (assuming that the syslog address
        is set).  If the localVolatile(8) bit is set, then
        log to the internal log without updating non-volatile
        store.  If the stdInterface(9) bit is set, then the
        agent ignores all other bits except the local(0),
        syslog(2), and localVolatile(8) bits.  Setting the
        stdInterface(9) bit indicates that RFC3413 and
        RFC3014 are being used to control event reporting
        mechanisms."

```

vendor. These are ordered from most serious (emergency)
to least serious (debug).

emergency(1) events
indicate vendor-specific fatal
hardware or software errors that prevent normal system
operation.

alert(2) events indicate a serious failure that causes
the reporting system to reboot but that is not caused by
hardware or software malfunctioning.

critical(3) events indicate a serious failure that
requires attention and prevents the device from
transmitting data but that could be recovered without
rebooting the system.

error(4) and warning(5) events indicate that a failure
occurred that could interrupt the normal data flow but
that does not cause the device to re-register.

notice(6) and information(7) events indicate a
milestone or checkpoint in normal operation that could
be of particular importance for troubleshooting.

debug(8) events are reserved for vendor-specific

events.

During normal operation, no event more
critical than notice(6) should be generated. Events
between warning and emergency should be generated at
appropriate levels of problems (e.g., emergency when the
box is about to crash)."

        match IP filters (or Internet filters, if implemented)
        is defined by docsDevFilterIpDefault.

        If set to discard(1), all packets not matching an IP
        filter in docsDevFilterIpTable will be discarded.  If
        set to accept(2), all packets not matching an IP filter
        or an Internet filter will be accepted for further
        processing (e.g., bridging)."
    DEFVAL { accept }
    ::= { docsDevFilter 3 }

docsDevFilterIpTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF DocsDevFilterIpEntry
    MAX-ACCESS
 not-accessible
    STATUS      deprecated
    DESCRIPTION
       "An ordered list of filters or classifiers to apply to
        IP traffic.  Filter application is ordered by the filter
        index, rather than by a best match algorithm (note that
        this implies that the filter table may have gaps in the
        index values).  Packets that match no filters will have
        policy 0 in the docsDevFilterPolicyTable applied to
        them, if it exists.  Otherwise, Packets that match no
        filters are discarded or forwarded according to the
        setting of docsDevFilterIpDefault.

        Any IP packet can theoretically match multiple rows of
        this table.  When considering a packet, the table is
        scanned in row index order (e.g., filter 10 is checked
        before filter 20).  If the packet matches that filter
        (which means that it matches ALL criteria for that
 row),
        actions appropriate to docsDevFilterIpControl and
        docsDevFilterPolicyId are taken.  If the packet was
        discarded processing is complete.  If
        docsDevFilterIpContinue is set to true, the filter
        comparison continues with the next row in the table,
        looking for additional matches.
```

If the packet matches no filter in the table, the packet
is accepted or dropped for further processing
according to the setting of docsDevFilterIpDefault.
If the packet is accepted, the actions specified by
policy group 0 (e.g., the rows in
docsDevFilterPolicyTable that have a value of 0 for
docsDevFilterPolicyId) are taken, if that policy

group exists.

Logically, this table is consulted twice during the
processing of any IP packet: once upon its acceptance
from the L2 entity, and once upon
its transmission to
the L2 entity. In actuality, for cable modems, IP
filtering is generally the only IP processing done for
transit traffic. This means that inbound and outbound
filtering can generally be done at the same time with
one pass through the filter table.

The objects in this table are only accessible from cable
devices that are not operating in DiffServ MIB mode
(RFC 3289). See the conformance section for details.

Note that some devices are required by other
specifications (e.g., the DOCSIS OSSIv1.1 specification)
to support the legacy SNMPv1/v2c docsDevFilter mode
for backward compatibility.

Table entries MUST NOT persist across reboots for any
device.

This table is deprecated. Instead, use the DiffServ MIB
from RFC 3289."

--
-- Policy Mapping Table
--

docsDevFilterPolicyTable OBJECT-TYPE
     SYNTAX      SEQUENCE OF DocsDevFilterPolicyEntry
     MAX-ACCESS  not-accessible
     STATUS      deprecated
     DESCRIPTION
        "A Table that maps between a policy group ID and a set
         of pointers to policies to be applied.  All rows with
         the same docsDevFilterPolicyId are part of the same
         group of policy pointers and are applied in the order
         in this table.  docsDevFilterPolicyTable exists to
         allow multiple policy actions (referenced by policy
         pointers) to be applied to any given classified packet.
         The policy actions are applied in index order.
         For example:

         Index   ID    Type    Action
          1      1     TOS     1
          9      5     TOS     1
          12     1     IPSEC   3

     This says that a packet that matches a filter with
         policy id 1 first has TOS policy 1 applied (which might
         set the TOS bits to enable a higher priority) and next
         has the IPSEC policy 3 applied (which may result in the
         packets being dumped into a secure VPN to a remote
         encryptor).

         Policy ID 0 is reserved for default actions and is
         applied only to packets that match no filters in
         docsDevFilterIpTable.

         Table entries MUST NOT persist across reboots for any
         device.

         This table is deprecated.  Instead, use the DiffServ MIB

         from RFC 3289."

      STATUS      deprecated
      DESCRIPTION
         "This object points to a row in an applicable filter
          policy table.  Currently, the only standard policy
          table is docsDevFilterTosTable.

          Per the textual convention, this object points to the
          first accessible object in the row; e.g., to point to a
          row in docsDevFilterTosTable with an index of 21, the
          value of this object would be the object identifier
          docsDevTosStatus.21.

          Vendors are recommended to adhere to the same convention
          when adding vendor-specific policy table extensions.

          If this pointer references an empty or non-existent

         row, then no policy action is taken.

          The default upon row creation is a null pointer that
          results in no policy action being taken."
      DEFVAL { zeroDotZero }

--
-- TOS Policy action table
--
```

```
docsDevFilterTosTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF DocsDevFilterTosEntry
    MAX-ACCESS  not-accessible
    STATUS      deprecated
    DESCRIPTION
       "Table used to describe Type of Service (TOS) bits

        processing.

        This table is an adjunct to the docsDevFilterIpTable
        and the docsDevFilterPolicy table.  Entries in the
        latter table can point to specific rows in this (and
        other) tables and cause specific actions to be taken.
        This table permits the manipulation of the value of the
        Type of Service bits in the IP header of the matched
        packet as follows:

        Set the tosBits
 of the packet to
          (tosBits & docsDevFilterTosAndMask) |
          docsDevFilterTosOrMask

        This construct allows you to do a clear and set of all
        the TOS bits in a flexible manner.

        Table entries MUST NOT persist across reboots for any
        device.

        This table is deprecated.  Instead, use the DiffServ MIB

SpdBooleanOperator ::= TEXTUAL-CONVENTION
  STATUS   current
  DESCRIPTION
      "The SpdBooleanOperator operator is used to specify
       whether sub-components in a decision-making process are

       ANDed or ORed together to decide if the resulting
       expression is true or false."
  SYNTAX      INTEGER { or(1), and(2) }
```

```
SpdAdminStatus ::= TEXTUAL-CONVENTION
  STATUS   current
  DESCRIPTION
     "The SpdAdminStatus is used to specify the administrative
      status of an object.  Objects that are disabled MUST NOT
      be used by the packet processing engine."
  SYNTAX      INTEGER { enabled(1), disabled(2) }

SpdIPPacketLogging ::= TEXTUAL-CONVENTION
  DISPLAY-HINT "d"
  STATUS   current
  DESCRIPTION
     "SpdIPPacketLogging specifies
 whether an audit message
      SHOULD be logged if a packet is passed through a Security
      Association (SA) and if some of that packet is included in
      the log event.  A value of '-1' indicates no logging.  A
      value of '0' or greater indicates that logging SHOULD be
      done and indicates the number of bytes starting at the
      beginning of the packet to place in the log.  Values greater
      than the size of the packet being processed indicate that
      the entire packet SHOULD be sent.

      Examples:
      '-1' no logging
      '0'  log but do not include any of the packet in the log
      '20' log and include the first 20 bytes of the packet
          in the log."

  SYNTAX      Integer32 (-1..65535)

SpdTimePeriod ::= TEXTUAL-CONVENTION
  DISPLAY-HINT "31t"
  STATUS       current
  DESCRIPTION
     "This property identifies an overall range of calendar dates
      and time.  In a boolean context, a value
 within this time
      range, inclusive, is considered true.

      This information is encoded as an octet string using
      the UTF-8 transformation format described in STD 63,
      RFC 3629.

      It uses the format suggested in RFC 3060.  An octet string
```

```
        represents a start date and time and an end date and time.
        For example:

        yyyymmddThhmmss/yyyymmddThhmmss

        Where: yyyy = year     mm = month     dd = day
               hh = hour     mm = minute    ss = second

        The first 'yyyymmddThhmmss' sub-string indicates the start
        date and time.  The second 'yyyymmddThhmmss' sub-string
        indicates the end date and time.  The character 'T' within
        these sub-strings indicates the beginning of the time
        portion of each sub-string.  The solidus character '/'
        separates the start from the end date and time.  The end
        date and time MUST be subsequent to the start date and

 time.

        There are also two allowed substitutes for a
        'yyyymmddThhmmss' sub-string: one for the start date and
        time, and one for the end date and time.

        If the start date and time are replaced with the string
        'THISANDPRIOR', this sub-string would indicate the current
        date and time and the previous dates and time.

        If the end date and time are replaced with the string
        'THISANDFUTURE', this sub-string would indicate the current
        date and time and the subsequent dates and time.

        Any of the following SHOULD be considered a
        'wrongValue' error:
        - Setting a value with the end date and time earlier than
          or equal to the start date and time.
        - Setting the start date and time to 'THISANDFUTURE'.
        - Setting the end date and time to 'THISANDPRIOR'."
    REFERENCE "RFC 3060, 3269"

```
spdGroupContPriority OBJECT-TYPE
  SYNTAX      Integer32 (0..65535)

 MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "The priority (sequence number) of the sub-component in
      a group that this row represents.  This value indicates
      the order that each row of this table MUST be processed
      from low to high.  For example, a row with a priority of 0
      is processed before a row with a priority of 1, a 1 before
      a 2, etc."
  ::= { spdGroupContentsEntry 2 }

spdGroupContFilter OBJECT-TYPE
  SYNTAX      VariablePointer
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
     "spdGroupContFilter points to a filter that is evaluated
      to determine whether the spdGroupContComponentName within
      this row is exercised.  Managers can use this object to
      classify groups of rules, or subgroups, together in order to
      achieve a greater degree of control and optimization over
      the execution order of the items within the group.  If the

 filter evaluates to false, the rule or subgroup will be
      skipped and the next rule or subgroup will be evaluated
      instead.  This value can be used to indicate a scalar or
      row in a table.  When indicating a row in a table, this
      value MUST point to the first column instance in that row.

      An example usage of this object would be to limit a
      group of rules to executing only when the IP packet
      being processed is designated to be processed by IKE.
      This effectively creates a group of IKE-specific rules.

      The following tables and scalars can be pointed to by this
      column.  All but diffServMultiFieldClfrTable are defined in
      this MIB:

          diffServMultiFieldClfrTable
          spdIpOffsetFilterTable
          spdTimeFilterTable
          spdCompoundFilterTable
```

```
            spdTrueFilter
            spdIpsoHeaderFilterTable

        Implementations MAY choose to provide
 support for other
        filter tables or scalars.

        If this column is set to a VariablePointer value, which
        references a non-existent row in an otherwise supported
        table, the inconsistentName exception MUST be returned.  If
        the table or scalar pointed to by the VariablePointer is
        not supported at all, then an inconsistentValue exception
        MUST be returned.

        If, during packet processing, a row in this table is applied
        to a packet and the value of this column in that row
        references a non-existent or non-supported object, the
        packet MUST be dropped."

  STATUS      current
  DESCRIPTION
     "The priority of a given filter within a compound filter.
      The order of execution is from lowest to highest priority
       value (i.e., priority 0 before priority 1, 1 before 2,
      etc.).  Implementations MAY choose to follow this ordering,
      as set by the manager that created the rows.  This can allow
      a manager to intelligently construct filter lists such that
      faster filters are evaluated first."
  ::= { spdSubfiltersEntry 1 }

spdSubFiltSubfilter OBJECT-TYPE
  SYNTAX      VariablePointer
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION

     "The OID of the contained filter.  The value of this
      object is a VariablePointer that references the filter to
      be included in this compound filter.

      The following tables and scalars can be pointed to by this
      column.  All but diffServMultiFieldClfrTable are defined in
      this MIB.  Implementations MAY choose to provide support
      for other filter tables or scalars as well:

           diffServMultiFieldClfrTable
           spdIpsoHeaderFilterTable
            spdIpOffsetFilterTable
           spdTimeFilterTable
           spdCompoundFilterTable
           spdTrueFilter

      If this column is set to a VariablePointer value that
      references a non-existent row in an otherwise supported
      table, the inconsistentName exception MUST be returned.  If
      the table or scalar pointed to by the VariablePointer is
      not supported at all, then an inconsistentValue exception
      MUST be returned.
```

```
        If, during packet processing, this column has a value that
        references a non-existent or non-supported object, the
        packet MUST be dropped."

  MAX-ACCESS  read-create
  STATUS      current
```

```
  DESCRIPTION
     "Defines which days of the month the current time is
      valid for.  It is a sequence of 64 BITS, where each BIT
      represents a corresponding day of the month in forward or
      reverse order.  Starting from the left-most bit, the first
      31 bits identify the day of the month, counting from the
      beginning of the month.  The following 31 bits (bits 32-62)
      indicate the day of the month, counting from the end of the

      month.  For months with fewer than 31 days, the bits that
      correspond to the non-existent days of that month are
      ignored (e.g., for non-leap year Februarys, bits 29-31 and
      60-62 are ignored).

      This column evaluates
 to 'true' if the current day of the
      month's bit is set.

      For example, a value of 0X'80 00 00 01 00 00 00 00'
      indicates that this column evaluates to true on the first
      and last days of the month.

              spdIPDestinationAddress,
```

```
            spdPacketDirection }
    STATUS  current
    DESCRIPTION
        "Notification that an action was executed by a rule.
        Only actions with logging enabled will result in this
        notification getting sent.  The object includes the
        spdActionExecuted object, which will indicate which action
        was executed within the scope of the rule.  Additionally,
        the spdIPSourceType, spdIPSourceAddress,
        spdIPDestinationType, and spdIPDestinationAddress objects
        are included to indicate the packet source and destination
        of the packet that triggered the action.  Finally, the
        spdIPEndpointAddType, spdIPEndpointAddress, and
        spdPacketDirection objects indicate which interface the
        executed action was associated with, and if the packet was
        ingress or egress through the endpoint.

        A spdActionNotification SHOULD be limited to a maximum of
        one notification sent per minute
    for any action
        notifications that do not have any other configuration
        controlling their send rate.

        Note that compound actions with multiple executed
        sub-actions may result in multiple notifications being sent
        from a single rule execution."

  SYNTAX   Unsigned32 (1..4294967295)

IndexIntegerNextFree ::= TEXTUAL-CONVENTION
  DISPLAY-HINT "d"
  STATUS   current
  DESCRIPTION
    "An integer which may be used as a new Index in a table.
```

```
      The special value of 0 indicates that no more new entries can be
      created in the relevant table.

      When a MIB is used for configuration, an object with this SYNTAX
      always contains a legal value (if non-zero) for an index that is
      not currently used in the relevant table. The Command Generator
      (Network Management Application) reads this variable and uses the
      (non-zero) value read when creating a new row with an SNMP SET.
      When the SET is performed, the Command Responder (agent) must
      determine whether the value is indeed
 still unused; Two Network
      Management Applications may attempt to create a row
      (configuration entry) simultaneously and use the same value. If
      it is currently unused, the SET succeeds and the Command
      Responder (agent) changes the value of this object, according to
      an implementation-specific algorithm.  If the value is in use,

      however, the SET fails.  The Network Management Application must
      then re-read this variable to obtain a new usable value.

      An OBJECT-TYPE definition using this SYNTAX MUST specify the
      relevant table for which the object is providing this
      functionality."
    SYNTAX   Unsigned32 (0..4294967295)

IfDirection ::= TEXTUAL-CONVENTION
    STATUS current
    DESCRIPTION
      "IfDirection specifies a direction of data travel on an
      interface. 'inbound' traffic is operated on during reception from
      the interface, while 'outbound' traffic is operated on prior to
      transmission on
 the interface."
    SYNTAX  INTEGER {
              inbound(1),     -- ingress interface
              outbound(2)     -- egress interface
}

--
-- Data Path
--

diffServDataPath       OBJECT IDENTIFIER ::= { diffServMIBObjects 1 }

--
-- Data Path Table
```

```
--
-- The Data Path Table enumerates the Differentiated Services
-- Functional Data Paths within this device.  Each entry in this table
-- is indexed by ifIndex and ifDirection.  Each entry provides the
-- first Differentiated Services Functional Data Path Element to
-- process data flowing along specific data path.  This table should
-- have at most two entries for each interface capable of
-- Differentiated Services processing on this device: ingress and
-- egress.

-- Note that Differentiated Services Functional Data Path Elements
-- linked together using their individual next pointers and anchored by
-- an entry of the diffServDataPathTable constitute a functional data
-- path.
--

diffServDataPathTable OBJECT-TYPE
  SYNTAX
    SEQUENCE OF DiffServDataPathEntry
  MAX-ACCESS   not-accessible
  STATUS       current

  DESCRIPTION
    "The data path table contains RowPointers indicating the start of
    the functional data path for each interface and traffic direction
    in this device. These may merge, or be separated into parallel
    data paths."
  ::= { diffServDataPath 1 }

diffServDataPathEntry OBJECT-TYPE
  SYNTAX       DiffServDataPathEntry
  MAX-ACCESS   not-accessible
  STATUS       current
  DESCRIPTION
    "An entry in the data path table indicates the start of a single
    Differentiated Services Functional Data Path in this device.

    These are associated with individual interfaces, logical or
    physical, and therefore are instantiated by ifIndex. Therefore,
    the interface index must have been assigned, according to the
    procedures applicable to that, before it can be meaningfully
    used. Generally, this means that the interface must
 exist.

    When diffServDataPathStorage is of type nonVolatile, however,
    this may reflect the configuration for an interface whose ifIndex
```

```
    has been assigned but for which the supporting implementation is
    not currently present."
  INDEX { ifIndex, diffServDataPathIfDirection }
  ::= { diffServDataPathTable 1 }

DiffServDataPathEntry ::= SEQUENCE  {
  diffServDataPathIfDirection    IfDirection,
  diffServDataPathStart          RowPointer,
  diffServDataPathStorage        StorageType,
  diffServDataPathStatus         RowStatus
}

diffServDataPathIfDirection OBJECT-TYPE
  SYNTAX       IfDirection
  MAX-ACCESS   not-accessible
  STATUS       current
  DESCRIPTION
    "IfDirection specifies whether the reception or transmission path
    for this interface is in view."
  ::= { diffServDataPathEntry 1 }

diffServDataPathStart OBJECT-TYPE
  SYNTAX       RowPointer
  MAX-ACCESS   read-create
  STATUS       current

  DESCRIPTION
     "This selects the first Differentiated Services Functional Data
    Path Element to handle traffic for this data path. This
    RowPointer should point to an instance of one of:
      diffServClfrEntry
      diffServMeterEntry
      diffServActionEntry
      diffServAlgDropEntry
      diffServQEntry

    A value of zeroDotZero in this attribute indicates that no
    Differentiated Services treatment is performed on traffic of this
    data path. A pointer with the value zeroDotZero normally
    terminates a functional data path.

    Setting this to point to a target that does not exist results in
    an inconsistentValue error.  If the row pointed to is removed or
    becomes inactive by other means, the treatment is as if this
    attribute contains a value of zeroDotZero."
  ::= { diffServDataPathEntry 2 }
```

```
diffServDataPathStorage OBJECT-TYPE
  SYNTAX       StorageType
  MAX-ACCESS   read-create
  STATUS       current
  DESCRIPTION

    row may be modified at any time."
  ::= { diffServDataPathEntry 4 }

--
-- Classifiers
--

diffServClassifier     OBJECT IDENTIFIER ::= { diffServMIBObjects 2 }

--

-- Classifier Table
--
-- The Classifier Table allows multiple classifier elements, of same or
-- different types, to be used together. A classifier must completely
-- classify all packets presented to it. This means that all traffic
-- presented to a classifier must match at least one classifier element
-- within the classifier, with the classifier element parameters
--
 specified by a filter.

-- If there is ambiguity between classifier elements of different
-- classifier, classifier linkage order indicates their precedence; the
-- first classifier in the link is applied to the traffic first.

-- Entries in the classifier element table serves as the anchor for
-- each classification pattern, defined in filter table entries.  Each
-- classifier element table entry also specifies the subsequent
```

```
-- downstream Differentiated Services Functional Data Path Element when
-- the classification pattern is satisfied. Each entry in the
-- classifier element table describes one branch of the fan-out
-- characteristic of a classifier indicated in the Informal
-- Differentiated Services Model section 4.1.  A classifier is composed
-- of one or more classifier elements.

diffServClfrNextFree OBJECT-TYPE
  SYNTAX      IndexIntegerNextFree
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
    "This object contains an unused value for diffServClfrId,
 or a
    zero to indicate that none exist."
  ::= { diffServClassifier 1 }

diffServClfrTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF DiffServClfrEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
    "This table enumerates all the diffserv classifier functional
    data path elements of this device.  The actual classification
    definitions are defined in diffServClfrElementTable entries
    belonging to each classifier.

    An entry in this table, pointed to by a RowPointer specifying an
    instance of diffServClfrStatus, is frequently used as the name
    for a set of classifier elements, which all use the index
    diffServClfrId. Per the semantics of the classifier element
    table, these entries constitute one or more unordered sets of
    tests which may be simultaneously applied to a message to

    classify it.

    The primary function of this table is to ensure that the value of
    diffServClfrId
 is unique before attempting to use it in creating
    a diffServClfrElementEntry. Therefore, the diffServClfrEntry must
    be created on the same SET as the diffServClfrElementEntry, or
    before the diffServClfrElementEntry is created."
  ::= { diffServClassifier 2 }

diffServClfrElementTable OBJECT-TYPE
  SYNTAX       SEQUENCE OF DiffServClfrElementEntry
  MAX-ACCESS   not-accessible
  STATUS       current
  DESCRIPTION
    "The classifier element table enumerates the relationship between
    classification patterns and subsequent downstream Differentiated
    Services Functional Data Path elements.
    diffServClfrElementSpecific points to a filter that specifies the
    classification parameters. A classifier may use filter tables of
    different types together.

    One example of a filter table defined in this MIB is
    diffServMultiFieldClfrTable, for
 IP Multi-Field Classifiers
    (MFCs). Such an entry might identify anything from a single
    micro-flow (an identifiable sub-session packet stream directed
    from one sending transport to the receiving transport or
    transports), or aggregates of those such as the traffic from a
    host, traffic for an application, or traffic between two hosts
    using an application and a given DSCP. The standard Behavior
    Aggregate used in the Differentiated Services Architecture is
    encoded as a degenerate case of such an aggregate - the traffic
    using a particular DSCP value.

    Filter tables for other filter types may be defined elsewhere."

  DESCRIPTION
    "An index that enumerates the Classifier Element entries.
    Managers obtain new values for row creation in this table by
    reading diffServClfrElementNextFree."
  ::= { diffServClfrElementEntry 1 }

diffServClfrElementPrecedence OBJECT-TYPE
  SYNTAX      Unsigned32  (1..4294967295)
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
    "The relative order in which classifier elements are applied:
    higher numbers
 represent classifier element with higher
    precedence.  Classifier elements with the same order must be
    unambiguous i.e. they must define non-overlapping patterns, and
    are considered to be applied simultaneously to the traffic
    stream. Classifier elements with different order may overlap in
    their filters:  the classifier element with the highest order
    that matches is taken.

    On a given interface, there must be a complete classifier in
    place at all times in the ingress direction.  This means one or
    more filters must match any possible pattern. There is no such
```

```
    requirement in the egress direction."
  ::= { diffServClfrElementEntry 2 }

diffServClfrElementNext OBJECT-TYPE
  SYNTAX      RowPointer
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
    "This attribute provides one branch of the fan-out functionality
    of a classifier described in the Informal Differentiated Services

 Model section 4.1.

    This selects the next Differentiated Services Functional Data
    Path Element to handle traffic for this data path. This
    RowPointer should point to an instance of one of:
      diffServClfrEntry
      diffServMeterEntry
      diffServActionEntry
      diffServAlgDropEntry
      diffServQEntry

    A value of zeroDotZero in this attribute indicates no further
    Differentiated Services treatment is performed on traffic of this
    data path. The use of zeroDotZero is the normal usage for the
    last functional data path element of the current data path.

    Setting this to point to a target that does not exist results in
    an inconsistentValue error.  If the row pointed to is removed or
    becomes inactive by other means, the treatment is as if this
    attribute contains a value of zeroDotZero."

  ::= { diffServClfrElementEntry 3 }

--
-- Meters
--

diffServMeter         OBJECT IDENTIFIER ::= { diffServMIBObjects 3 }

--
```

```
-- This MIB supports a variety of Meters.  It includes a specific
-- definition for Token Bucket Meter, which are but one type of
-- specification. Other metering parameter sets can be defined in other
-- MIBs.

-- Multiple meter elements may be logically cascaded using their
-- diffServMeterSucceedNext and diffServMeterFailNext pointers if
-- required. One example of this might be for an AF PHB implementation
-- that uses multiple level conformance meters.

-- Cascading of individual meter elements in the MIB is intended to be
-- functionally equivalent to multiple level conformance determination
-- of a packet.
 The sequential nature of the representation is merely
-- a notational convenience for this MIB.

-- srTCM meters (RFC 2697) can be specified using two sets of
-- diffServMeterEntry and diffServTBParamEntry. The first set specifies
-- the Committed Information Rate and Committed Burst Size
-- token-bucket.  The second set specifies the Excess Burst Size
-- token-bucket.

-- trTCM meters (RFC 2698) can be specified using two sets of
-- diffServMeterEntry and diffServTBParamEntry. The first set specifies
-- the Committed Information Rate and Committed Burst Size
-- token-bucket.  The second set specifies the Peak Information Rate
-- and Peak Burst Size token-bucket.

-- tswTCM meters (RFC 2859) can be specified using two sets of
-- diffServMeterEntry and diffServTBParamEntry. The first set specifies
-- the Committed Target Rate token-bucket.  The second set specifies

-- the Peak Target Rate token-bucket. diffServTBParamInterval in each
-- token bucket reflects the Average Interval.

  ::= { diffServAlgDropEntry 1 }

diffServAlgDropType OBJECT-TYPE
  SYNTAX      INTEGER {
                other(1),
                tailDrop(2),
                headDrop(3),
                randomDrop(4),
                alwaysDrop(5)
}
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
    "The type of algorithm used by this dropper. The value other(1)
    requires further specification in some other MIB module.

    In the tailDrop(2) algorithm, diffServAlgDropQThreshold
    represents the maximum depth of the queue, pointed to by
    diffServAlgDropQMeasure, beyond which all newly arriving packets

 will be dropped.

    In the headDrop(3) algorithm, if a packet arrives when the
    current depth of the queue, pointed to by
    diffServAlgDropQMeasure, is at diffServAlgDropQThreshold, packets
    currently at the head of the queue are dropped to make room for
    the new packet to be enqueued at the tail of the queue.

    In the randomDrop(4) algorithm, on packet arrival, an Active
```

Queue Management algorithm is executed which may randomly drop a
packet. This algorithm may be proprietary, and it may drop either
the arriving packet or another packet in the queue.
diffServAlgDropSpecific points to a diffServRandomDropEntry that
describes the algorithm. For this algorithm,

diffServAlgDropQThreshold is understood to be the absolute
maximum size of the queue and additional parameters are described
in diffServRandomDropTable.

The alwaysDrop(5) algorithm is as its name specifies; always
drop. In
this case, the other configuration values in this Entry
are not meaningful; There is no useful 'next' processing step,
there is no queue, and parameters describing the queue are not
useful. Therefore, diffServAlgDropNext, diffServAlgDropMeasure,
and diffServAlgDropSpecific are all zeroDotZero."
::= { diffServAlgDropEntry 2 }

diffServAlgDropNext OBJECT-TYPE
SYNTAX RowPointer

which is stored in diffServAlgDropQThreshold. Changes in this
variable may or may not be reflected in the reported value of
diffServRandomDropMaxThreshBytes."
::= { diffServRandomDropEntry 5 }

diffServRandomDropProbMax
OBJECT-TYPE

SYNTAX Unsigned32 (0..1000)
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The worst case random drop probability, expressed in drops per
thousand packets.

For example, if in the worst case every arriving packet may be
dropped (100%) for a period, this has the value 1000.
Alternatively, if in the worst case only one percent (1%) of
traffic may be dropped, it has the value 10."
::= { diffServRandomDropEntry 6 }

```
diffServRandomDropWeight OBJECT-TYPE
  SYNTAX       Unsigned32 (0..65536)
  MAX-ACCESS   read-create
  STATUS       current
  DESCRIPTION
    "The weighting of past history in affecting the Exponentially
    Weighted Moving Average function that calculates the current
    average queue depth.  The equation uses
    diffServRandomDropWeight/65536 as the coefficient for the new
    sample in the equation, and (65536 -
    diffServRandomDropWeight)/65536
 as the coefficient of the old
    value.

    Implementations may limit the values of diffServRandomDropWeight
    to a subset of the possible range of values, such as powers of
    two. Doing this would facilitate implementation of the
    Exponentially Weighted Moving Average using shift instructions or
    registers."
  ::= { diffServRandomDropEntry 7 }

diffServRandomDropSamplingRate OBJECT-TYPE
  SYNTAX       Unsigned32 (0..1000000)
  MAX-ACCESS   read-create
  STATUS       current
  DESCRIPTION
    "The number of times per second the queue is sampled for queue
    average calculation.  A value of zero is used to mean that the
    queue is sampled approximately each time a packet is enqueued (or
    dequeued)."
  ::= { diffServRandomDropEntry 8 }

--
-- Minimum Rate Parameters Table
--
-- The parameters used by a scheduler for its inputs or outputs are
-- maintained separately from the Queue or Scheduler table entries for
```

```
-- reusability reasons and so that they may be used by both queues and
-- schedulers.  This follows the approach for separation of data path
-- elements from parameterization that is used throughout this MIB.
-- Use of these Minimum Rate Parameter Table entries by Queues and
-- Schedulers allows the modeling of hierarchical scheduling systems.
--
-- Specifically, a Scheduler has one or more inputs and one output.
-- Any queue feeding a scheduler, or any scheduler which feeds a second
-- scheduler,
 might specify a minimum transfer rate by pointing to an
-- Minimum Rate Parameter Table entry.
--
-- The diffServMinRatePriority/Abs/Rel attributes are used as
-- parameters to the work-conserving portion of a scheduler:
-- "work-conserving" implies that the scheduler can continue to emit
-- data as long as there is data available at its input(s).  This has
-- the effect of guaranteeing a certain priority relative to other
-- scheduler inputs and/or a certain minimum proportion of the
-- available output bandwidth. Properly configured, this means a
-- certain minimum rate, which may be exceeded should traffic be
-- available should there be spare bandwidth after all other classes
-- have had opportunities to consume their own minimum rates.

diffServMaxRateAbsolute OBJECT-TYPE
  SYNTAX       Unsigned32
 (1..4294967295)
  UNITS        "kilobits per second"
  MAX-ACCESS   read-create
  STATUS       current
  DESCRIPTION
    "The maximum rate in kilobits/sec that a downstream scheduler
    element should allocate to this queue. If the value is zero, then
    there is effectively no maximum rate limit and that the scheduler
```

should attempt to be work conserving for this queue. If the value
is non-zero, the scheduler will limit the servicing of this queue
to, at most, this rate in a non-work-conserving manner.

Note that this attribute value and that of
diffServMaxRateRelative are coupled: changes to one will affect
the value of the other. They are linked by the following

equation, in that setting one will change the other:

diffServMaxRateRelative =
(diffServMaxRateAbsolute*1000000)/ifSpeed

or, if appropriate:

diffServMaxRateRelative = diffServMaxRateAbsolute/ifHighSpeed"

        side of the Remote
 Authentication Dial-In User Service
        (RADIUS) accounting protocol.  Copyright (C) The
        Internet Society (2006).  This version of this MIB
        module is part of RFC 4670; see the RFC itself for
        full legal notices."
    REVISION "200608210000Z"  -- 21 August 2006
    DESCRIPTION
        "Revised version as published in RFC 4670.
        This version obsoletes that of RFC 2620 by
        deprecating the MIB table containing IPv4-only
        address formats and defining a new table to add support
        for version-neutral IP address formats.  The remaining
        MIB objects from RFC 2620 are carried forward into this
        version."

mioxPleEnAddrToX121LkupFlrs OBJECT-TYPE
```

```
        SYNTAX  Counter
        ACCESS  read-only
        STATUS  mandatory
        DESCRIPTION
                "The number of times a translation from an
                Encapsulated Address to an X.121 address
                failed to find a corresponding X.121
                address.  Encapsulated addresses can be
                looked up in the mioxPeerTable or translated
                via an algorithm as for the DDN.  Addresses

                that are successfully recognized do not
                increment this counter.  Addresses that are
                not recognized (reflecting an abnormal
                packet delivery condition) increment this
                counter.

                If an address translation fails, it may be
                difficult to determine which PLE entry
                should count the failure.  In such cases the
                first likely entry in this table should be
                selected.  Agents should record the failure
                even if they are unsure which PLE should be
                associated with the failure."
        ::= { mioxPleEntry 3 }

    mioxPleLastFailedEnAddr OBJECT-TYPE
        SYNTAX  OCTET STRING (SIZE(2..128))
        ACCESS  read-only
        STATUS  mandatory
        DESCRIPTION
                "The last Encapsulated address that failed
                to find a corresponding X.121 address and
                caused mioxPleEnAddrToX121LkupFlrs
     to be
                incremented.  The first octet of this object
                contains the encapsulation type, the
                remaining octets contain the address of that
                type that failed.  Thus for an IP address,
                the length will be five octets, the first
                octet will contain 204 (hex CC), and the
                last four octets will contain the IP
                address.  For a snap encapsulation, the
                first byte would be 128 (hex 80) and the
                rest of the octet string would have the snap
                header."

mioxPeerStatus OBJECT-TYPE
      SYNTAX  INTEGER {
                  valid (1),
                  createRequest (2),
                  underCreation (3),
```

invalid (4),
clearCall (5),
makeCall (6)
}
ACCESS read-write
STATUS mandatory
DESCRIPTION
"This reports the status of a peer entry.
A value of valid indicates a normal entry
that is in use by the agent. A value of

underCreation indicates a newly created
entry which isn't yet in use because the
creating management station is still setting
values.

The value of invalid indicates the entry is
no longer in use and the agent is free to
delete the entry at any time. A management
station is also free to use an entry in the
invalid state.

Entries are created by setting a value of
createRequest. Only non-existent or invalid
entries can be set to createRequest. Upon
receiving a valid createRequest, the agent
will create an entry in the underCreation
state. This object can not be set to a
value of underCreation directly, entries can
only be created by setting a value of
createRequest. Entries that exist in other

than the invalid state can not be set to
createRequest.

Entries with a value of underCreation are
not used by the system and the management
station can change the values of other
objects in the table entry. Management
stations should also remember to configure
values in the mioxPeerEncTable with the same
peer index value as this peer entry.

An entry in the underCreation state can be
set to valid or invalid. Entries in the
underCreation state will stay in that state
until 1) the agent times them out, 2) they
are set to valid, 3) they are set to

invalid. If an agent notices an entry has been in the underCreation state for an abnormally long time, it may decide the management station has failed and invalidate

the entry. A prudent agent will understand that the management station may need to wait for human input and will allow for that possibility in its determination of this abnormally long period.

Once a management station has completed all fields of an entry, it will set a value of valid. This causes the entry to be activated.

Entries in the valid state may also be set to makeCall or clearCall to make or clear X.25 calls to the peer. After such a set request the entry will still be in the valid state. Setting a value of makeCall causes the agent to initiate an X.25 call request to the peer specified by the entry. Setting a value of clearCall causes the agent to initiate clearing one X.25 call present

to

the peer. Each set request will initiate another call or clear request (up to the maximum allowed); this means that management stations that fail to get a response to a set request should query to see if a call was in fact placed or cleared before retrying the request. Entries not in the valid state can not be set to makeCall or clearCall.

The values of makeCall and clearCall provide for circuit control on devices which perform Ethernet Bridging using static circuit assignment without address recognition; other devices which dynamically place calls based on destination addresses may reject such requests.

An agent that (re)creates a new entry because of a set with createRequest, should

```
      also (re)create a mioxPeerEncTable entry
            with a mioxPeerEncIndex of 1, and a
            mioxPeerEncType of 204 (hex CC)."
      ::= { mioxPeerEntry 2 }

      STATUS  mandatory
      DESCRIPTION
            "The number of seconds a call to this peer
            was active.  This counter
 will be
            incremented by one for every second a
            connection to a peer was open.  If two calls
            are open at the same time, one second of
            elapsed real time will results in two
            seconds of connect time."
      ::= { mioxPeerEntry 5 }

mioxPeerX25CallParamId OBJECT-TYPE
      SYNTAX  InstancePointer
      ACCESS  read-write
      STATUS  mandatory
      DESCRIPTION
            "The instance of the index object in the
            x25CallParmTable from RFC 1382 for the X.25
            call parameters used to communicate with the
```

```
            remote host.  The well known value {0 0}
            indicates no call parameters specified."
        DEFVAL { {0 0} }
        ::= { mioxPeerEntry 6 }

mioxPeerEnAddr  OBJECT-TYPE
        SYNTAX    OCTET STRING (SIZE (0..128))
        ACCESS  read-write
        STATUS  mandatory
        DESCRIPTION
            "The Encapsulation address of the remote
             host mapped by this table entry.  A length
            of zero indicates the remote IP address is
            unknown or unspecified for use as a PLE
            default.

            The first octet of this object contains the
            encapsulation type, the remaining octets
            contain an address of that type.  Thus for
            an IP address, the length will be five
            octets, the first octet will contain 204
            (hex CC), and the last four octets will
            contain the IP address.  For a snap
            encapsulation, the first byte would be 128
            (hex 80) and the rest of the octet string
            would have the snap header."
        DEFVAL { "h }

-- ###############################################################
--              Peer Encapsulation Table
-- ###############################################################

mioxPeerEncTable OBJECT-TYPE
        SYNTAX  SEQUENCE OF MioxPeerEncEntry
        ACCESS  not-accessible
        STATUS
  mandatory
        DESCRIPTION
                "This table contains the list of
                encapsulations used to communicate with a
                peer.  This table has two indexes, the first
                identifies the peer, the second
                distinguishes encapsulation types.
```

```
            The first index identifies the corresponding
            entry in the mioxPeerTable.  The second
            index gives the priority of the different
            encapsulations.

            The encapsulation types are ordered in
            priority order.  For calling a peer, the
            first entry (mioxPeerEncIndex of 1) is tried
            first.  If the call doesn't succeed because
            the remote host clears the call due to
            incompatible call user data, the next entry
            in the list is tried.  Each entry is tried
            until the list is exhausted.

            For answering a call, the
 encapsulation type
            requested by the peer must be found the list
            or the call will be refused.  If there are
            no entries in this table for a peer, all
            call requests from the peer will be refused.

            Objects in this table can only be set when
            the mioxPeerStatus object with the same
            index has a value of underCreation.  When
            that status object is set to invalid and
            deleted, the entry in this table with that
            peer index must also be deleted."
        ::= { mioxPeer 2 }

mioxPeerEncEntry OBJECT-TYPE

        ::= { mioxPeerEncTable 1 }

MioxPeerEncEntry ::= SEQUENCE {
        mioxPeerEncIndex
            PositiveInteger,
        mioxPeerEncType
             INTEGER
        }

mioxPeerEncIndex        OBJECT-TYPE
        SYNTAX  PositiveInteger
```

```
        ACCESS  read-only
        STATUS    mandatory
        DESCRIPTION
                "The second index in the table which
                distinguishes different encapsulation
                types."
        ::= { mioxPeerEncEntry 1 }

mioxPeerEncType OBJECT-TYPE
        SYNTAX  INTEGER (0..256)
        ACCESS  read-write
        STATUS  mandatory
        DESCRIPTION
                "The value of the encapsulation type.  For
                IP encapsulation this will have a value of
                204 (hex CC).  For SNAP encapsulated
                packets, this will have a value of 128 (hex
                80).  For CLNP, ISO 8473, this will have a
                value of 129 (hex 81).  For ES-ES, ISO 9542,
                this will have a value of 130 (hex 82).  A
                value of 197 (hex C5) identifies the Blacker
                X.25 encapsulation.  A value
 of 0,
                identifies the Null encapsulation.

                This value can only be written when the
                mioxPeerStatus object with the same
                mioxPeerIndex has a value of underCreation.
                Setting this object to a value of 256
                deletes the entry.  When deleting an entry,
                all other entries in the mioxPeerEncTable
                with the same mioxPeerIndex and with an
                mioxPeerEncIndex higher then the deleted
                entry, will all have their mioxPeerEncIndex
                values decremented by one."

dlswNodeStdPacingSupport  OBJECT-TYPE
  SYNTAX     INTEGER  {
     none            (1),  -- does not support DLSw
                           -- Standard pacing scheme
     adaptiveRcvWindow (2),  -- the receive window size
                           -- varies
     fixedRcvWindow
   (3)   -- the receive window size
                           -- remains constant
  }
  MAX-ACCESS read-only
  STATUS     current
  DESCRIPTION
    "Circuit pacing, as defined in the DLSw Standard, allows each
     of the two DLSw nodes on a circuit to control the amount
     of data the other is permitted to send to them.  This object
     reflects the level of support the DLSw node has for this
     protocol.  (1) means the node has no support for the standard
     circuit pacing flows;  it may use RFC 1434+ methods only, or
     a proprietary flow control scheme.  (2) means the node supports
     the standard scheme and can vary the window sizes it grants as
     a data receiver.  (3) means the node supports the standard
     scheme but never varies its receive window size."

dlswNodeStatus
  OBJECT-TYPE
  SYNTAX     INTEGER  {
     active       (1),
     inactive      (2)
  }
  MAX-ACCESS read-write
  STATUS     current
```

```
  DESCRIPTION
    "The status of the DLSw part of the system.  Changing the
     value from active to inactive causes DLSw to take
     the following actions - (1) it disconnects all circuits
     through all DLSw partners, (2) it disconnects all
     transport connections to all DLSw partners, (3) it
     disconnects all local DLC connections, and (4) it stops
     processing all DLC connection set-up traffic.
     Since these are destructive actions, the user should
     query the circuit and transport connection tables in
     advance to understand the effect this action will have.
     Changing the value from inactive to active causes DLSw
     to come up in its initial state, i.e., transport
     connections established and ready to bring up circuits."

  STATUS     current
  DESCRIPTION
    "The largest frame size (including DLC header and info field
     but not any MAC-level or framing octets) this DLSw can forward
     on any path through itself.  This object can represent any box-
     level frame size forwarding restriction (e.g., from the use
     of fixed-size buffers).  Some DLSw implementations will have
      no such restriction.

     This value will affect the LF size of circuits during circuit
     creation.  The LF size of an existing circuit can be found in
     the RIF (Routing Information Field)."

dlswTConnConfigSapList  OBJECT-TYPE
  SYNTAX     OCTET STRING  (SIZE(16))
  MAX-ACCESS read-create
  STATUS     current
  DESCRIPTION
     "The SAP list indicates which SAPs are advertised to
      the transport connection defined by this conceptual
      row.  Only SAPs with even numbers are represented,
      in the form of the most significant bit of the first
      octet representing the SAP 0, the next most significant
      bit representing the SAP 2, to the least significant
      bit of the last octet representing the SAP 254.  Data
      link switching is allowed for those SAPs which have
      one in its corresponding bit, not allowed otherwise.
      The whole SAP list has to be changed together.  Changing
      the SAP list affects only new circuit establishments
      and has no effect on established circuits.

      This list can be used to restrict specific partners
      from knowing about all the SAPs used by DLSw on all its

    interfaces (these are represented in dlswIfSapList for
      each interface).  For instance, one may want to run NetBIOS
```

```
        with some partners but not others.

        If a node supports sending run-time capabilities exchange
        messages, changes to this object should cause that action.
        When to start the run-time capabilities exchange is
        implementation-specific.
        The DEFVAL below indicates support for SAPs 0, 4, 8, and C."

      disconnecting      (5),
      disconnected       (6)
  }
  MAX-ACCESS read-write
  STATUS     current
  DESCRIPTION
     "The state of this transport connection.  The transport
      connection enters `connecting' state when DLSw makes
      a connection request to the transport layer.  Once initial
      Capabilities Exchange is sent, the transport connection
      enters enters `initCapExchange' state.  When partner
      capabilities have been determined and the transport
      connection is ready for sending CanUReach (CUR) messages,
      it moves
 to the `connected' state.  When DLSw is in the
      process of bringing down the connection, it is in the
      `disconnecting' state.  When the transport layer
      indicates one of its connections is disconnected, the
      transport connection moves to the `disconnected' state.

      Whereas all of the values will be returned in response
      to a management protocol retrieval operation, only two
```

```
      values may be specified in a management protocol set
      operation: `quiescing' and `disconnecting'.  Changing
      the value to `quiescing' prevents new circuits from being
      established, and will cause a transport disconnect when
      the last circuit on the connection goes away.  Changing
      the value to `disconnecting' will force off all circuits
      immediately and bring the connection to `disconnected'
      state."

-- ----------------------------------------------------------------
dlswCircuitTable  OBJECT-TYPE
  SYNTAX     SEQUENCE OF DlswCircuitEntry
  MAX-ACCESS not-accessible
```

```
  STATUS
    current
  DESCRIPTION
     "This table is the circuit representation in the DLSw
      entity. Virtual data links are used to represent any internal
      end stations.  There is a conceptual row associated with
      each data link.  Thus, for circuits without an intervening
      transport connection, there are two conceptual rows
      for each circuit.

      The table consists of the circuits being established,
      established, and as an implementation option, circuits that
      have been disconnected.  For circuits carried over
      transport connections, an entry is created after
      the CUR_cs was sent or received.  For circuits between
      two locally attached devices, or internal virtual MAC
      addresses, an entry is created when the equivalent of
      CUR_cs sent/received status is reached.

      End station 1 (S1) and End station 2 (S2) are used to
      represent the two end stations of the circuit.
      S1 is always
 an end station which is locally attached.
      S2 may be locally attached or remote.  If it is locally
      attached, the circuit will be represented by two rows indexed
      by (A, B) and (B, A) where A & B are the relevant MACs/SAPs.

      The table may be used to store the causes of disconnection of
      circuits.  It is recommended that the oldest disconnected
      circuit entry be removed from this table when the memory
      space of disconnected circuits is needed."

DESCRIPTION
"Session Initiation Protocol (SIP) Common MIB module. This
module defines objects that may be common to all SIP entities.

SIP is an application-layer signaling protocol for creating,
modifying and terminating multimedia sessions with one or more
participants. These sessions include Internet multimedia
conferences and Internet telephone calls. SIP is defined in
RFC 3261 (June 2002).

This MIB is defined for managing objects that are common to
SIP User Agents (UAs), Proxy, Redirect, and Registrar servers.
Objects specific to each of these entities MAY be managed using
entity specific MIBs defined in other modules.

Copyright (C) The IETF Trust (2007). This version of
this MIB module is part of RFC 4780; see the RFC itself for
full legal notices."

              }
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
    "This object contains the current operational state of
     the SIP application.

     unknown    : The operational status cannot be determined
                  for some reason.
     up         : The application is operating normally and is
                  processing (receiving and possibly issuing) SIP
                  requests and responses.
     down       : The application is currently unable to process
                  SIP messages.
     congested  : The application is operational but no additional

                  inbound transactions can be accommodated at the
                   moment.
     restarting : The application is currently unavailable, but it
                  is in the process of restarting and will
                  presumably, soon be able to process SIP messages.
     quiescing  : The application is currently operational
                  but has been administratively put into
                  quiescence mode.  Additional inbound
                  transactions MAY be rejected.
     testing    : The application is currently in test mode
                  and MAY not be able to process SIP messages.

     The operational status values defined for this object are not
     based on any specific information contained in the SIP
     standard."

   MAX-ACCESS  read-only
   STATUS      current
   DESCRIPTION
     "This object will specify the transport protocol the SIP entity
      will use to receive SIP messages.

      This object is a bit map.  Each bit represents a transport
      protocol.  If a bit has value 1, then that transport protocol
      is currently being used.  If a bit has value 0, then that
      transport protocol is currently not being used."
   ::= { sipCommonPortEntry 2 }

--
-- Support for SIP option tags (SIP extensions).
-- SIP extensions MAY be supported or required by SIP entities.
--

sipCommonOptionTagTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF SipCommonOptionTagEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
     "This table contains a list of the SIP option tags (SIP
      extensions) that are either required, supported, or
      unsupported by the SIP entity.  These option tags are
       used in the Require, Proxy-Require, Supported, and
      Unsupported header fields.

      Example: If a user agent client supports, and requires the
      server to support, reliability of provisional responses
      (RFC 3262), this table contains a row with the option tag string
      '100rel' in sipCommonOptionTag and the OCTET STRING value of
      '1010 0000' or '0xA0' in sipCommonOptionTagHeaderField.

      If a server does not support the required feature (indicated in
      a Require header to a UAS, or in a Proxy-Require to a Proxy
      Server), the server returns a 420 Bad Extension listing the
      feature in an Unsupported header.

      Normally, the list of such features supported by an entity is
      static (i.e., will not change over time)."

::= { sipCommonSummaryStatsEntry 4 }

sipCommonSummaryTotalTransactions OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This object contains a count of the number of transactions that
are in progress and transactions that have reached the
'Terminated' state. It is not applicable to stateless SIP Proxy
Servers.

A SIP transaction occurs between a client and a server, and
comprises all messages from the first request sent from the
client to the server, up to a final (non-1xx) response sent
from the server to the client.

If the request is INVITE and the final response is a non-2xx,
the transaction also include an ACK to the response. The ACK
for a 2xx response to an INVITE request is a separate
transaction.

The branch ID parameter in the Via header field values serves
as a transaction identifier.

A transaction is identified by the CSeq sequence number within
a single call leg. The ACK request has the same CSeq number as
the corresponding INVITE request, but comprises a transaction
of its own.

In the case of a forked request, each branch counts as a single
transaction.

For a transaction stateless Proxy Server, this counter is
always 0.

Discontinuities in the value of this counter can occur at
re-initialization of the SIP entity or service. A Management

```
    Station can detect discontinuities in this counter by
        monitoring the sipCommonSummaryDisconTime object in the same
        row."

               }
   MAX-ACCESS  read-write
   STATUS      current
   DESCRIPTION

      "The object sipCommonStatusCodeNotifSend MUST be set to 'true'
       for the values of this object to have any effect.  It is
      RECOMMENDED that the desired emit mode be established by this
      object prior to setting sipCommonStatusCodeNotifSend to 'true'.
      This object and the sipCommonStatusCodeNotifSend object can
      obviously be set independently, but their respective values
      will have a dependency on each other and the resulting
      notifications.

      This object specifies the mode for emissions of
      sipCommonStatusCodeNotif notifications.

      normal    : sipCommonStatusCodeNotif notifications will be
                  emitted by the system for each SIP response
                  message sent or received that contains the
                  desired status code.

      oneShot   : Only one sipCommonStatusCodeNotif notification
                  will be emitted.  It will be the next SIP response
                  message sent or received that contains the
                  desired
 status code.
```

No more notifications are emitted until this
object is set to 'oneShot' again or set to
'normal'. This option is provided as a means of
quelling the potential promiscuous behavior that
can be associated with the
sipCommonStatusCodeNotif.

triggered : This value is only readable and cannot be set. It
reflects that the 'oneShot' case has occurred,
and indicates that the mode needs to be reset to
get further notifications. The mode is reset by
setting this object to 'oneShot' or 'normal'."

::= { sipCommonStatusCodeNotifEntry 2 }

sipCommonStatusCodeNotifThresh OBJECT-TYPE
SYNTAX Unsigned32
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"This object specifies the number of response messages sent or

received by this system that are considered excessive. Based
on crossing that threshold, a
sipCommonStatusCodeThreshExceededInNotif notification or a
sipCommonStatusCodeThreshExceededOutNotif will be sent. The
sipCommonStatusCodeThreshExceededInNotif and

sipCommonStatusCodeThreshExceededOutNotif notifications can be
used as an early warning mechanism in lieu of using
sipCommonStatusCodeNotif.

Note that the configuration applied by this object will be
applied equally to inbound and outbound response messages."
DEFVAL { 500 }
::= { sipCommonStatusCodeNotifEntry 3 }

sipCommonStatusCodeNotifInterval OBJECT-TYPE

DESCRIPTION
"The MIB module for managing remote monitoring
device implementations. This MIB module
extends the architecture introduced in the original
RMON MIB as specified in RFC 2819.

Copyright (C) The Internet Society (2006). This version of
this MIB module is part of RFC 4502; see the RFC itself for
full legal notices."

REVISION "200605020000Z" -- May 2, 2006
DESCRIPTION
"This version updates the proposed-standard version of the
RMON2 MIB (published
as RFC 2021) by adding 2 new
enumerations to the nlMatrixTopNControlRateBase object and
4 new enumerations to the alMatrixTopNControlRateBase object.
These new enumerations support the creation of high-capacity
topN reports in the High Capacity RMON MIB [RFC3273].

Additionally, the following objects have been deprecated, as
they have not had enough independent implementations to
demonstrate interoperability to meet the requirements of a
Draft Standard:

probeDownloadFile
probeDownloadTFTPServer
probeDownloadAction
probeDownloadStatus

serialMode
serialProtocol
serialTimeout
serialModemInitString
serialModemHangUpString
serialModemConnectResp
serialModemNoConnectResp
serialDialoutTimeout
serialStatus
serialConnectDestIpAddress
serialConnectType
serialConnectDialString
serialConnectSwitchConnectSeq
serialConnectSwitchDisconnectSeq
serialConnectSwitchResetSeq
serialConnectOwner

serialConnectStatus
netConfigIPAddress
netConfigSubnetMask
netConfigStatus
netDefaultGateway
tokenRingMLStats2DroppedFrames
tokenRingMLStats2CreateTime
tokenRingPStats2DroppedFrames
tokenRingPStats2CreateTime
ringStationControl2DroppedFrames
ringStationControl2CreateTime
sourceRoutingStats2DroppedFrames
sourceRoutingStats2CreateTime
trapDestIndex
trapDestCommunity
trapDestProtocol
trapDestAddress
trapDestOwner
trapDestStatus

In addition, two corrections were made. The LastCreateTime Textual Convention had been defined with a base type of another textual convention, which isn't allowed in SMIv2. The definition has been modified to use TimeTicks as the base type.

Further,
the SerialConfigEntry SEQUENCE definition included sub-typing information that is not allowed in SMIv2. This information has been deleted. Ranges were added to a number of objects and textual-conventions to constrain their maximum (and sometimes minimum) sizes. The addition of these ranges documents existing practice for these objects. These objects

are:
ControlString
protocolDirID
protocolDirParameters
addressMapNetworkAddress
nlHostAddress
nlMatrixSDSourceAddress
nlMatrixSDDestAddress
nlMatrixDSSourceAddress
nlMatrixDSDestAddress
nlMatrixTopNSourceAddress
nlMatrixTopNDestAddress

```
            alHostEntry
            alMatrixSDEntry
            alMatrixDSEntry
            alMatrixTopNSourceAddress
            alMatrixTopNDestAddress

        Finally, the TimeFilter TC has been updated to encourage agent
         implementations that allow a MIB walk to behave well even when
        performed by an application that is not aware of the special
        TimeFilter semantics."

    REVISION "200207080000Z"        -- 08 July, 2002
    DESCRIPTION
        "Added new enumerations to support the High-Capacity RMON
        MIB as defined in RFC 3273.  Also fixed some typos and
        added clarifications."

    REVISION "199605270000Z"    -- 27 May, 1996

-- Textual Conventions

ZeroBasedCounter32 ::= TEXTUAL-CONVENTION
    STATUS current
    DESCRIPTION
        "This TC describes an object that counts events with the
        following semantics: objects of this type will be set to
        zero(0) on creation and will thereafter count appropriate
```

events, wrapping back to zero(0) when the value 2^32 is
reached.

Provided that an application discovers the new object within
the minimum time to wrap, it can use the initial value as a
delta since it last polled the table of which this object is
part. It is important for a management station to be aware of
this minimum time and the actual time between polls, and to
discard data if the actual time is too long or there is no
defined minimum time.

Typically, this TC is used in tables where the INDEX space is
constantly changing and/or the TimeFilter mechanism is in use."
SYNTAX Gauge32

LastCreateTime ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"This TC describes an object that stores the value of the
sysUpTime object at the last time its entry was created.

This can be used for polling applications to determine that an
entry has been deleted and re-created between polls, causing
an otherwise undetectable discontinuity in the data.

If sysUpTime is reset to zero as a result of a re-
initialization of the network management (sub)system, then
the values of all LastCreateTime objects are also reset.
However, after approximately 497 days without a re-
initialization, the sysUpTime object will reach 2^^32-1 and
then increment to zero; in this case, existing values
of TimeStamp objects do not change.
This can lead to
ambiguities in the value of TimeStamp objects."
SYNTAX TimeTicks

TimeFilter ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"To be used for the index to a table. Allows an application
to download only those rows changed since a particular time.

Note that this is not a history mechanism. Only current values
of underlying objects are returned; saved instance values
associated with particular values of sysUpTime are not.

An entry is considered changed if the value of any object in the
entry changes, if the row is created, or if any object in the
entry is created or deleted. Note that deleted entries cannot
be detected or downloaded.

A time-filtered conceptual table is created by inserting a
single object of SYNTAX TimeFilter as the first INDEX component
in a copy of an existing basic conceptual table (i.e., any
SEQUENCE without a TimeFilter INDEX component). Thus,
for
each conceptual entry 'I' in the basic table, there exists N
conceptual entries in the time-filtered version, indexed N.I,
where 'N' is equal to the value of sysUpTime.

When an application retrieves conceptual instances from a
time-filtered table, and an INDEX value is provided for the
TimeFilter INDEX component 'N', the agent will only consider
returning basic conceptual entries (e.g., 'fooColumn.N.I') if
any column within the basic conceptual entry has changed since
sysUpTime 'N'. If not, the basic conceptual entry will
be ignored for the particular retrieval operation.

When sysUpTime is equal to zero, this table shall be empty.

One conceptual entry exists for each past value of sysUpTime,
except that the whole table is purged should sysUpTime wrap.

As an entry in a time-filtered table is updated (i.e., one of
the columns in the basic conceptual table is changed), new
conceptual
entries are also created in the time-filtered version
(which still shares the now updated object values with all other
instances). The number of unique time-filtered instances that
are created is determined by the value of sysUpTime at which the
basic entry was last updated. One unique instance will exist
for each value of sysUpTime at the last update time for the row.
However, a new TimeFilter index instance is created for each new
sysUpTime value. The TimeFilter index values not associated
with entry updates are called duplicate time-filtered instances.

After some deployment experience, it has been determined that
a time-filtered table is more efficient if the agent
stops a MIB walk operation by skipping over rows with a
TimeFilter index value higher than the value in the received
GetNext/GetBulk request. That is, instead of incrementing a
TimeFilter index value, the agent will continue to the
next

object or table. As a consequence, GetNext or GetBulk operations will provide only one pass through a time-filtered table.

It is suggested that an agent implement a time-filtered table in this manner to improve performance and avoid a MIB walk getting stuck in time-filtered tables. It is, however, still acceptable for an agent to implement a time-filtered table in the traditional manner (i.e., every conceptual time-filtered instance is returned in GetNext and GetBulk PDU responses), and management applications must be able to deal with such traditional implementations.

See the appendix for further discussion of this textual convention.

The following example is provided to demonstrate TimeFilter behavior:

Consider the following basic conceptual table, basicFooTable. (Note that the basic version of a time-filtered table may not actually be defined.)

```
   basicFooTable:

    basicFooTable ...
   INDEX { fooIndex }

   BasicFooEntry {
     fooIndex     Integer32,
     fooCounts    Counter32
   }
```

For this example, the basicFooTable contains two static conceptual entries (fooIndex equals '1' and '2'), created at time zero. It also contains one dynamic conceptual entry (fooIndex equals '3'), which is created at time '3' and deleted at time '7'.

The time-filtered version of the basicFooTable could be defined as follows:

```
   FooTable:

   fooTable ...
   INDEX { fooTimeMark, fooIndex }
```

```
    FooEntry {

      fooTimeMark  TimeFilter,
      fooIndex     Integer32,
      fooCounts    Counter32
    }
```

Note that entries exist in the time-filtered conceptual table only if they actually exist in the underlying (basic) table.

For this example, the fooTable will have three underlying basic entries (fooIndex == 1, 2, and 3), with the following activity (for sysUpTime equal 0 to 9):

- fooEntry.N.1 is created at time '0' and most recently updated at time '6' to the value '5'.
- fooEntry.N.2 is created at time '0' and most recently updated at time '8' to the value '9'.
- fooEntry.N.3 is created at time '3', updated at time '5' to the value '17', and deleted at time '7'.

The following tables show the values that would be returned for MIB walk operations with various TimeFilter values, done at different times. An application issues a retrieval request at time 'T', with a TimeFilter value, 'N' (typically set to a lower value, such as the value of sysUpTime at the last polling cycle).

The following values would be returned in a MIB walk of fooCounts.N if T equals '0' and N equals '0':

fooCounts.N.I	Value
fooCounts.0.1	0
fooCounts.0.2	0

Note that nothing is returned for fooCounts.0.3, since that entry does not exist at sysUpTime equals '0'.

The following values would be returned in a full (traditional) MIB walk of fooCounts.N if T equals '3' and N equals '0':

fooCounts.N.I	Value

```
======================
fooCounts.0.1    0
fooCounts.0.2    0
fooCounts.0.3    0
fooCounts.1.3    0
fooCounts.2.3    0
fooCounts.3.3    0
```

Note that there are no instances for T equals 1 or 2 for the first two values of N, as these entries did not change since they were created at time '0'.

Note that the current value for 'fooCounts.N.3' is returned here, even for values of N less than '3' (when the entry was created). The agent only considers the current existence of an entry in the TimeFilter algorithm, not the time when the entry

was created.

Note that the instances 'fooCounts.0.3', 'fooCounts.1.3', and 'fooCounts.2.3' are duplicates and can be suppressed by the agent in a MIB walk.

The following values would be returned in a full (traditional) MIB walk of fooCounts.N if T equals '6' and N equals '3':

```
fooCounts.N.I    Value
======================
fooCounts.3.1    5
fooCounts.3.3    17
fooCounts.4.1    5
fooCounts.4.3    17
fooCounts.5.1    5
fooCounts.5.3    17
fooCounts.6.1    5
```

Note that no instances for entry 'fooCounts.N.2' are returned, since it has not changed since time '3'.

Note that all instances except 'fooCounts.5.3' and 'fooCounts.6.1' are duplicates and can be suppressed by the agent in a MIB walk.

The following values would be returned in a full (traditional) MIB walk of fooCounts.N if T equals '9' and N equals

'6':

fooCounts.N.I Value
==========
fooCounts.6.1 5
fooCounts.6.2 9
fooCounts.7.2 9
fooCounts.8.2 9

Note that no instances for entry 'fooCounts.N.3' are returned,
since it was deleted at time '7'.

Note that instances 'fooCounts.6.2' and 'fooCounts.7.2'

are duplicates and can be suppressed by the agent in a MIB
walk."

SYNTAX TimeTicks

DataSource ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"Identifies the source of the data that the associated
function is configured to analyze. This source can be any
interface on this device.

In order to identify a particular interface, this
object shall identify the instance of the ifIndex
object, defined in [RFC2863], for the desired interface.

For example, if an entry were to receive data from
interface #1, this object
would be set to ifIndex.1."

}

protocolDirID OBJECT-TYPE
  SYNTAX     OCTET STRING  (SIZE (4..128))
  MAX-ACCESS  not-accessible
  STATUS     current
  DESCRIPTION
      "A unique identifier for a particular protocol.  Standard
      identifiers will be defined in such a manner that they

      can often be used as specifications for new protocols - i.e.,
      a tree-structured assignment mechanism that matches the
      protocol encapsulation 'tree' and that has algorithmic
      assignment mechanisms for certain subtrees.  See RFC 2074 for
      more details.

      Despite the algorithmic mechanism, the probe will only place
      entries in here for those protocols it chooses to collect.  In
      other words, it need not populate this table with all
      possible ethernet protocol types, nor need it create them on
      the fly when it sees them.  Whether it does these
      things is a matter of product definition (cost/benefit,
      usability) and is up to the designer of the product.

      If an entry is written to this table with a protocolDirID that
      the agent doesn't understand, either
 directly or
      algorithmically, the SET request will be rejected with an
      inconsistentName or badValue (for SNMPv1) error."
  ::= { protocolDirEntry 1 }

protocolDirParameters OBJECT-TYPE
  SYNTAX     OCTET STRING (SIZE (1..32))

```
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
      "A set of parameters for the associated protocolDirID.
      See the associated RMON2 Protocol Identifiers document
      for a description of the possible parameters.  There
      will be one octet in this string for each sub-identifier in
      the protocolDirID, and the parameters will appear here in the
      same order as the associated sub-identifiers appear in the
      protocolDirID.

      Every node in the protocolDirID tree has a different, optional
      set of parameters defined (that is, the definition of
      parameters for a node is optional).  The proper parameter
      value for each node is included in this string.  Note that
 the
      inclusion of a parameter value in this string for each node is
      not optional.  What is optional is that a node may have no
      parameters defined, in which case the parameter field for that
      node will be zero."
  ::= { protocolDirEntry 2 }

protocolDirLocalIndex OBJECT-TYPE
  SYNTAX      Integer32 (1..2147483647)
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION

      "The locally arbitrary but unique identifier associated
      with this protocolDir entry.

      The value for each supported protocol must remain constant at
      least from one re-initialization of the entity's network
      management system to the next re-initialization, except that
      if a protocol is deleted and re-created, it must be re-created
      with a new value that has not been used since the last
      re-initialization.

      The specific value is meaningful only within a given SNMP
      entity.  A protocolDirLocalIndex must not
 be re-used until the
      next agent restart in the event that the protocol directory
      entry is deleted."
  ::= { protocolDirEntry 3 }

protocolDirDescr OBJECT-TYPE
```

  SYNTAX      DisplayString (SIZE (1..64))
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
     "A textual description of the protocol encapsulation.
     A probe may choose to describe only a subset of the
     entire encapsulation (e.g., only the highest layer).

     This object is intended for human consumption only.

     This object may not be modified if the associated
     protocolDirStatus object is equal to active(1)."
  ::= { protocolDirEntry 4 }

protocolDirType OBJECT-TYPE
  SYNTAX      BITS {
                 extensible(0),
                 addressRecognitionCapable(1)
              }
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
     "This object describes 2 attributes of this protocol
      directory entry.

 The presence or absence of the 'extensible' bit describes
       whether this protocol directory entry can be extended
       by the user by creating protocol directory entries that are
       children of this protocol.

       An example of an entry that will often allow extensibility is

       'ip.udp'.  The probe may automatically populate some children
       of this node, such as 'ip.udp.snmp' and 'ip.udp.dns'.
       A probe administrator or user may also populate additional
       children via remote SNMP requests that create entries in this
       table.  When a child node is added for a protocol for which the
       probe has no built-in support extending a parent node (for
       which the probe does have built-in support),
       that child node is not extendable.  This is termed 'limited
       extensibility'.

       When a child node is added through this extensibility
       mechanism, the values of protocolDirLocalIndex and
       protocolDirType
```

shall be assigned by the agent.

The other objects in the entry will be assigned by the manager who is creating the new entry.

This object also describes whether this agent can recognize addresses for this protocol, should it be a network-level protocol. That is, while a probe may be able to recognize packets of a particular network-layer protocol and count them, it takes additional logic to be able to recognize the addresses in this protocol and to populate network-layer or application-layer tables with the addresses in this protocol. If this bit is set, the agent will recognize network-layer addresses for this protocol and populate the network- and application-layer host and matrix tables with these protocols.

Note that when an entry is created, the agent will supply values for the bits that match the capabilities of the agent

with respect to this protocol. Note that since row creations usually exercise the limited extensibility feature, these bits will usually be set to zero."
::= { protocolDirEntry 5 }

protocolDirAddressMapConfig OBJECT-TYPE
SYNTAX INTEGER {
notSupported(1),
supportedOff(2),
supportedOn(3)
}
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object describes and configures the probe's support for address mapping for this protocol. When the probe creates entries in this table for all protocols that it understands,

it will set the entry to notSupported(1) if it doesn't have the capability to perform address mapping for the protocol or if this protocol is not a network-layer protocol. When an entry is created in this table by a management operation as part of the limited extensibility feature,
the probe must set
this value to notSupported(1), because limited extensibility of the protocolDirTable does not extend to interpreting

addresses of the extended protocols.

If the value of this object is notSupported(1), the probe
will not perform address mapping for this protocol and
shall not allow this object to be changed to any other value.
If the value of this object is supportedOn(3), the probe
supports address mapping for this protocol and is configured
to perform address mapping for this protocol for all
addressMappingControlEntries and all interfaces.
If the value of this object is supportedOff(2), the probe
supports address mapping for this protocol but is configured
to not perform address mapping for this protocol for any
addressMappingControlEntries and all interfaces.
Whenever this value changes from supportedOn(3) to
supportedOff(2), the probe
shall delete all related entries in
the addressMappingTable."
::= { protocolDirEntry 6 }

protocolDirHostConfig OBJECT-TYPE
SYNTAX INTEGER {
notSupported(1),
supportedOff(2),
supportedOn(3)
}
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object describes and configures the probe's support for
the network-layer and application-layer host tables for this
protocol. When the probe creates entries in this table for
all protocols that it understands, it will set the entry to
notSupported(1) if it doesn't have the capability to track the
nlHostTable for this protocol or if the alHostTable is
implemented but doesn't have the capability to track this
protocol. Note that if the alHostTable is implemented, the
probe may only support a protocol if it is supported in both
the nlHostTable and the
alHostTable.

If the associated protocolDirType object has the
addressRecognitionCapable bit set, then this is a network-
layer protocol for which the probe recognizes addresses, and

thus the probe will populate the nlHostTable and alHostTable
with addresses it discovers for this protocol.

```
      If the value of this object is notSupported(1), the probe
      will not track the nlHostTable or alHostTable for this
      protocol and shall not allow this object to be changed to any
      other value.  If the value of this object is supportedOn(3),
      the probe supports tracking of the nlHostTable and alHostTable
      for this protocol and is configured to track both tables
      for this protocol for all control entries and all interfaces.
      If the value of this object is supportedOff(2), the probe
      supports tracking of the nlHostTable and alHostTable for this
      protocol but is configured to not track these
 tables
      for any control entries or interfaces.
      Whenever this value changes from supportedOn(3) to
      supportedOff(2), the probe shall delete all related entries in
      the nlHostTable and alHostTable.

      Note that since each alHostEntry references 2 protocol
      directory entries, one for the network address and one for the
      type of the highest protocol recognized, an entry will
      only be created in that table if this value is supportedOn(3)
      for both protocols."

   STATUS      current
   DESCRIPTION
      "This object describes and configures the probe's support for
      the network-layer and application-layer matrix tables for this
      protocol.  When the probe creates entries
 in this table for
      all protocols that it understands, it will set the entry to
      notSupported(1) if it doesn't have the capability to track the
      nlMatrixTables for this protocol or if the alMatrixTables are
      implemented but don't have the capability to track this
      protocol.  Note that if the alMatrix tables are implemented,
      the probe may only support a protocol if it is supported in
      both of the nlMatrixTables and both of the
      alMatrixTables.

      If the associated protocolDirType object has the
      addressRecognitionCapable bit set, then this is a network-
```

layer protocol for which the probe recognizes addresses, and
thus the probe will populate both of the nlMatrixTables and
both of the alMatrixTables with addresses it discovers for
this protocol.

If the value of this object is notSupported(1), the probe
will not track either of the nlMatrixTables or the
alMatrixTables
for this protocol and shall not allow this
object to be changed to any other value. If the value of this
object is supportedOn(3), the probe supports tracking of both
of the nlMatrixTables and (if implemented) both of the
alMatrixTables for this protocol and is configured to track
these tables for this protocol for all control entries and all
interfaces. If the value of this object is supportedOff(2),
the probe supports tracking of both of the nlMatrixTables and
(if implemented) both of the alMatrixTables for this protocol
but is configured to not track these tables for this
protocol for any control entries or interfaces.
Whenever this value changes from supportedOn(3) to
supportedOff(2), the probe shall delete all related entries in
the nlMatrixTables and the alMatrixTables.

Note that since each alMatrixEntry references 2 protocol
directory entries, one for
the network address and one for the
type of the highest protocol recognized, an entry will
only be created in that table if this value is supportedOn(3)
for both protocols."

DESCRIPTION
"Controls the setup of protocol type distribution statistics
tables.

Implementations are encouraged to add an entry per monitored
interface upon initialization so that a default collection
of protocol statistics is available.

Rationale:
This table controls collection of very basic statistics
for any or all of the protocols detected on a given interface.
An NMS can use this table to quickly determine bandwidth
allocation utilized by different protocols.

A media-specific
statistics collection could also
be configured (e.g., etherStats, trPStats) to easily obtain
total frame, octet, and droppedEvents for the same
interface."

STATUS current
DESCRIPTION
"The number of times an alHost entry has been
inserted into the alHost table. If an entry is inserted, then
deleted, and then inserted, this counter will be incremented
by 2.

To allow for efficient implementation strategies, agents may
delay updating this object for short periods of time. For
example, an implementation strategy may allow internal
data structures to differ from those visible via SNMP for
short periods of time. This counter may reflect the internal
data structures for those short periods of time.

Note that the table size can
be determined by subtracting
hlHostControlAlDeletes from hlHostControlAlInserts."
::= { hlHostControlEntry 8 }

STATUS current
DESCRIPTION
"The number of times an alHost entry has been
deleted from the alHost table (for any reason). If an entry
is deleted, then inserted, and then deleted, this counter will
be incremented by 2.

To allow for efficient implementation strategies, agents may
delay updating this object for short periods of time. For

example, an implementation strategy may allow internal
data structures to differ from those visible via SNMP for
short periods of time. This counter may reflect the internal
data structures for those short periods of time.

Note that the table size can be determined by subtracting
hlHostControlAlDeletes from hlHostControlAlInserts."

::= { hlHostControlEntry 9 }

hlHostControlAlMaxDesiredEntries OBJECT-TYPE
SYNTAX Integer32 (-1..2147483647)
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The maximum number of entries that are desired in the alHost
table on behalf of this control entry. The probe will not
create more than this number of associated entries in the
table but may choose to create fewer entries in this table
for any reason, including the lack of resources.

```
      If this object is set to a value less than the current number
      of entries, enough entries are chosen in an
      implementation-dependent manner and deleted so that the number
      of entries in the table equals the value of this object.

      If this value is set to -1, the probe may create any number
      of entries in this table.  If the associated
      hlHostControlStatus object is equal to 'active', this
      object may not be modified.

   This object may be used to control how resources are allocated
      on the probe for the various RMON functions."
   ::= { hlHostControlEntry 10 }

hlHostControlOwner OBJECT-TYPE
   SYNTAX      OwnerString
   MAX-ACCESS  read-create
   STATUS      current
   DESCRIPTION
      "The entity that configured this entry and is
      therefore using the resources assigned to it."
   ::= { hlHostControlEntry 11 }

hlHostControlStatus OBJECT-TYPE
   SYNTAX      RowStatus
   MAX-ACCESS  read-create
   STATUS      current
   DESCRIPTION

      "The status of this hlHostControlEntry.

      An entry may not exist in the active state unless all
      objects in the entry have an appropriate value.

      If this object is not equal to active(1), all associated
      entries in the nlHostTable and alHostTable shall be deleted."
   ::= { hlHostControlEntry 12 }

nlHostTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF NlHostEntry
   MAX-ACCESS  not-accessible
   STATUS
   current
   DESCRIPTION
      "A collection of statistics for a particular network layer
```

```
      address that has been discovered on an interface of this
      device.

      The probe will populate this table for all network layer
      protocols in the protocol directory table whose value of
      protocolDirHostConfig is equal to supportedOn(3), and
      will delete any entries whose protocolDirEntry is deleted or
      has a protocolDirHostConfig value of supportedOff(2).

      The probe will add to this table all addresses seen
      as the source or destination address in all packets with no
      MAC errors, and will increment octet and packet counts in the
      table for all packets with no MAC errors."
::= { nlHost 2 }

--
-- Network Layer Matrix
 Group
--
-- Counts the amount of traffic sent between each pair of network
-- addresses discovered by the probe.
-- Note that while the hlMatrixControlTable also has objects that
-- control optional alMatrixTables, implementation of the
-- alMatrixTables is not required to fully implement this group.

hlMatrixControlTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF HlMatrixControlEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
      "A list of higher-layer (i.e., non-MAC) matrix control entries.

      These entries will enable the collection of the network- and
      application-level matrix tables containing conversation
      statistics indexed by pairs of network addresses.
      Both the network- and application-level matrix tables are
      controlled by this table so that they will both be created
      and deleted at the same time, further increasing the ease with
      which they can be implemented as a single datastore.  (Note that
       if an implementation stores application-layer matrix records
```

```
      in memory, it can derive network-layer matrix records from
      them.)

      Entries in the nlMatrixSDTable and nlMatrixDSTable will be
      created on behalf of each entry in this table.  Additionally,
      if this probe implements the alMatrix tables, entries in the
      alMatrix tables will be created on behalf of each entry in
      this table."

hlMatrixControlIndex OBJECT-TYPE
  SYNTAX      Integer32 (1..65535)
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
      "An index that uniquely identifies an entry in the
      hlMatrixControlTable.  Each such entry defines
      a function that discovers conversations on a particular
      interface and places statistics about them in the
```

nlMatrixSDTable and the nlMatrixDSTable, and optionally the
alMatrixSDTable and alMatrixDSTable, on
behalf of this

hlMatrixControlEntry."
::= { hlMatrixControlEntry 1 }

hlMatrixControlDataSource OBJECT-TYPE
SYNTAX DataSource
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The source of the data for the associated matrix tables.

The statistics in this group reflect all packets
on the local network segment attached to the
identified interface.

This object may not be modified if the associated
hlMatrixControlStatus object is equal to active(1)."
::= { hlMatrixControlEntry 2 }

hlMatrixControlNlDroppedFrames OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The total number of frames that were received by the probe
and therefore not accounted for in the *StatsDropEvents, but
that the probe chose not to count for this entry for
whatever reason. Most often, this event occurs when the probe
is out of
some resources and decides to shed load from this
collection.

This count does not include packets that were not counted
because they had MAC-layer errors.

Note that if the nlMatrixTables are inactive because no
protocols are enabled in the protocol directory, this value
should be 0.

Note that, unlike the dropEvents counter, this number is the
exact number of frames dropped."
::= { hlMatrixControlEntry 3 }

```
hlMatrixControlNlInserts OBJECT-TYPE
  SYNTAX     Counter32
  MAX-ACCESS read-only
  STATUS     current
  DESCRIPTION
     "The number of times an nlMatrix entry has been
     inserted into the nlMatrix tables.  If an entry is inserted,

     then deleted, and then inserted, this counter will be
     incremented by 2.  The addition of a conversation into both
     the nlMatrixSDTable and nlMatrixDSTable shall be counted as
     two insertions (even though every addition into one table must
      be accompanied by an insertion into the other).

     To allow for efficient implementation strategies, agents may
     delay updating this object for short periods of time.  For
     example, an implementation strategy may allow internal
     data structures to differ from those visible via SNMP for
     short periods of time.  This counter may reflect the internal
     data structures for those short periods of time.

     Note that the sum of then nlMatrixSDTable and nlMatrixDSTable
     sizes can be determined by subtracting
     hlMatrixControlNlDeletes from hlMatrixControlNlInserts."
  ::= { hlMatrixControlEntry 4 }
