    input: for non-device events (e.g. DevicePresence) use MAX_DEVICES as id.

    Using id = 0 only worked pre-MPX since XInput didn't allow XOpenDevice for the
    core devices (0 and 1). Now we can now legally register for events so we may
    overwrite our device-independent classes with the ones selected for the VCP.

    So, increase the EMASKSIZE to MAX_DEVICES + 1 and use MAX_DEVICES as the ID
    when we don't have a device.

Set --enable-builtin-fonts as default.

Some reasons to embed fonts by default:
1. X server doesn't pick a good default font path so it's easiest just
to built in the core fonts and let new X hackers more happy. Developers
and distro guys are wise enough to just set --disable-builtin-fonts
when they want.

2. Seems that this is by far the most popular FAQ
(http://www.x.org/wiki/FAQErrorMessages).

3. No one gave a good argument to not do this:

Mixing usage where some parts of the code treated this field as a bitmask and other parts as an array of card8 was wrong, and as the wire protocol wanted bitmasks, it was less invasive to switch the newer counting code use booleans.

Master devices track slave buttons by waiting for all slave buttons to be released before delivering the release event to the client.

This also removes the state merging code in DeepCopyDeviceClasses -- that code was changing master device state without delivering any events, violating protocol invariants. The result will be that existing slave button state which does not match the master will not be visible through the master device. Fixing this would require that we synthesize events in this function, which seems like a bad idea. Note that keyboards have the same issue.

input: fix up usage of button->down, used to be a bitmask, is now an array.

device->button->down used to be a 32-byte bitmask with one bit for each button. This has changed into a 256-byte array, with one byte assigned for each button. Some of the callers were still using this array as a bitmask however, this is fixed with this patch.

Xi: avoid double button mapping.

Button events were mapped once in GetPointerEvents and then again in UpdateDeviceState. While it might make sense to just fix up UpdateDeviceState, it turns out to be better to leave the raw button number in the event because DGA reports raw device events without button translation, and so when it calls UpdateDeviceState, the button down counts get scrambled and buttons get stuck
down.

CVE-2008-2362 - RENDER Extension memory corruption

Integer overflows can occur in the code validating the parameters for
the SProcRenderCreateLinearGradient, SProcRenderCreateRadialGradient
and SProcRenderCreateConicalGradient functions, leading to memory
corruption by swapping bytes outside of the intended request
parameters.

CVE-2008-2361 - RENDER Extension crash

An integer overflow may occur in the computation of the size of the
glyph to be allocated by the ProcRenderCreateCursor() function which will cause less memory to be allocated than expected, leading later to dereferencing un-mapped memory, causing a crash of the X server.

CVE-2008-1379 - MIT-SHM arbitrary memory read

An integer overflow in the validation of the parameters of the ShmPutImage() request makes it possible to trigger the copy of arbitrary server memory to a pixmap that can subsequently be read by the client, to read arbitrary parts of the X server memory space.

CVE-2008-1377 - RECORD and Security extensions memory corruption

Lack of validation of the parameters of the SProcSecurityGenerateAuthorization SProcRecordCreateContext functions makes it possible for a specially crafted request to trigger the swapping of bytes outside the parameter of these requests, causing memory corruption.

dix: Call RealizeCursor during InitializeSprite.

RealizeCursor should be called when the cursor is allocated. However, when the root cursor is allocated, no devices exist yet, and thus RealizeCursor is never called. This may lead to segfaults later on in DDXes like Xnest that actually need to do something for each cursor, and later on rely on that DDX-specific data for each cursor has been initialized.

xkb: delete default rules when devices are closed.
We only have one set of default rules options in xkb. When the second keyboard is brought up with Xkb options specified, these new options overwrite the old. In future server generations, the rules used for the VCK are a mixture of the default ones and ones previously specified for other keyboards. Simply resetting the xkb default rules to NULL avoids this issue.

Reproducible by setting XkbLayout "de" and XkbVariant "nodeadkeys". In the second server generation, the VCK has "us(nodeadkeys)". This again produces a SIGABRT when the first key is hit.

I could not figure out why the SIGABRT happens. This patch is avoiding the issue rather than fixing it.

Xext: use GPE/GKE from XTestFakeInput #16145

This commit fixes two problems:
1) XTFI used to assemble the event itself, then passed it to the device. It's
much easier to just pass the variables into GPE/GKE and let the DIX do the
rest.

2) XTFI would pass the VCP/VCK as default device to event processing. As a
result, updating LEDs would be updated on the VCK, not on the actual keyboard.
Instead, we now pass the events through the last-used SD, thus toggling the
LEDs on the last keyboard that sent through this MD.

Also some cleanup in XTFI to merge validity checks a bit closer together
rather than having several different sections.

This breaks XTestFakeMotion with Xinerama though.

dix: store the absolute values in the motion history.

The core protocol requires absolute values and it's a bit hard to get them if we only have relative ones in the history. Switch the motion history to absolute, and if we really need the relative values, we can probably generated them from the abs. ones in the future.

commit 1883485edd7eb90c0b76bca41c71e26ae2c0b91a
Author: Peter Hutterer <peter@cs.unisa.edu.au>
Date: Mon May 26 16:35:23 2008 +0930

If core motion history is required, scale back to screen coords and INT16.
Ensure the motion history is merged for master devices.

Add each event to the master's MH as well as to the SDs. In the MD, store min/max and the actual value. When retrieving the MH, rescale all coordinates to the current coordinate range and only post those valuators that are currently active on the device.

dix: Allocate MD's motion history to be large enough for potential valuators

Since we can't predict how many valuators may be in a future SD attached to an MD, we need to preallocate a history buffer that is large enough to keep MAX_VALUATORS coordinates per event.

In addition, the history buffer needs to memorize the coordinate ranges at the time, thus requiring MDs to store (min_val, max_val, current_val, time) instead of (current_val, time) for each motion history entry.

This commit only fixes the allocation.

Remove GetMotionProc from ValuatorClassRec.

With the MD/SD device hierarchy we need control over the generation of the motion history as well as the conversion later before posting it to the client. So let's not let the drivers change it.

No x.org driver currently uses it anyway, linuxwacom doesn't either so dumping it seems safe enough.
Xi: reset motion history when swapping device classes.

This isn't really the correct solution, but it'll have to do until I figured out how to transfer the history over correctly.

dix: more device scaling insanity.

Assuming master->last.valuators is in screen coords, SD's are always in device
cordinates.

1. If an event comes in, scale masters->last to the device, drop into device's
   last->valuators.
2. Apply motion from the actual event
3. Scale back to screen coords, check if we may need to cross screens
4. Drop screen coords into master->last
5. Rescale to device coords, drop into deviceValuator event and SD->last
6. Drop screen coords into ev->root_x/y

Whoopee...
input: instead of lastx/y, use a last.valuators[] array on the device.

During GetPointerEvents (and others), we need to access the last coordinates posted for this device from the driver (not as posted to the client!). Lastx/y is ok if we only have two axes, but with more complex devices we also need to transition between all other axes.

ABI break, recompile your input drivers.

Get out of the mesa symlinking business.

This copies over the files generated from mesa/src/mesa/glapi. There's a corresponding mesa commit that makes it easy to generate the glapi files straight into the xserver tree when the XML definitions change.

The only few files that are copied from mesa but aren't generated are glapi.[ch] and gthread.[ch]. Everything in there is technically DRI driver API and the whole setup is still a bit fragile, but it's not a new problem.

The --with-mesa-source configure option is still around since other parts of the server (XGL and DMX - grep for MESA_SOURCE) need that, but for common case of building with GLX and AIGLX support, that option is no longer needed.

Use LD_EXPORT_SYMBOLS_FLAG when linking Xnest.

Fix reduced-blanking mode filtering in RANDR 1.2.

If the monitor isn't reduced-blanking (either through EDID logic, or config file setting), then remove RB modes from the default pool. Any RB modes from the driver and config file pools will stick around though; you asked for them, you got them.

OpenBSD doesn't define __x86_64__, simplify tests.

Seeing as this code seems to be specific to OpenBSD I don't think
__x86_64__ should have been added there at all. It appears to have
been added wherever __amd64__ existed before which is wrong. I
think that part of the commit should be reverted but also all four of
the checks should be __OpenBSD__ && __amd64__ instead of two one
direction and two flipped.

    Restructure and organize the code.

    It was removed and simplified some conditionals. We don't need test for
    pDev->isMaster inside xf86CursorSetCursor() because only MD enters there.

    In the last chunk, ScreenPriv fields were being assigned without need, so
    that code was wrapped inside the conditional to avoid it.
I also tried to make the indentation more sane in some parts that I touched.

Xi: assemble button/modifier state before updating the device. #15934
The state field of the event must specify the state of the devices before the event occurred. With the code as it was, the state would also include the event (e.g. state from a button press event would show the button as pressed) Gathering the state before updating the device should fix this.

dix: don't undisplay cursor if we don't own a sprite.
Sometimes we didn't have a cursor when coming back from suspend. Reason was that the suspend caused the server to lose the device that was attached to the VCP, and a RemoveDevice() would then set the cursor to NULL.
Solution: only set the cursor to NULL if we actually own the sprite.

Bug #14692: Allow drivers to have a say in Xinerama visual consolidation.

Create a new exported global variable, XineramaVisualsEqualPtr. Use this pointer to decide whether two visuals are equal during visual consolidation. This pointer can be wrapped, which allows drivers and extensions to control which visuals are consolidated. A wrapper can reject the visuals without calling down, but must call down and return that result if it deems the visuals equal. This ensures that all layers agree that the visuals are equal.

Pass the screen of the other visual into the VisualsEqual callchain.

Don't free PanoramiXVisuals since we need it for PanoramiXTranslateVisualID.

Don't skip the first visual on the other screen in PanoramiXMaybeAddVisual.

Skip the loop in PanoramiXTranslateVisualID if screen is 0.

Prevent the -wm command line option from causing a SEGV

The -wm (when mapped) option for the BackingStore support has been causing the server to dereference a NULL pointer.

This has probably been the case since backing store has been implemented on top of Composite.

It looks like (some of?) Composite didn’t expect its WIndowPtr argument to be the root window.

In Composite’s compCheckRedirect() function we now avoid calling compAllocPixmap() and compFreePixmap() when the pWin pointer’s parent member is NULL, as is it the case with a server’s root window.

cfg: override xkb_{r,m,l,v} with Xkb{r,m,l,v} if the latter is set.

The HAL spec says that input.xkb.{rmlv}* can be sent, but if the user
specifies a X-specific {rmlv}, then this is overridden through the use of
input.x11_options.Xkb[RMLV].
However, the way how the server parses options--by ignoring capitalisation,
underscores and spaces--the HAL and the x11_options would override each other.

So we simply filter the options, letting Xkb[RMLV] override xkb_{rmlv} and
only actually add them to the device after parsing _all_ options.

Bug #13104: Don't let XAA glyph pixmaps anywhere near video memory.

Since glyphs are stored in pixmaps now, they can make their way into VRAM,
which invalidates a bunch of fast-path assumptions in the XAA code. Thus
you end up doing color-expands or WriteBitmap from la-la land and your
aliased glyphs go all funny.

Since XAA isn't ever growing the ability to do sane glyph accel, just force
glyph pixmaps into host memory by catching them at CreatePixmap time.

xfree86: call SetCursor for the VCP when switching between SW/HW rendering.

We need a manual call to SetCursor when we switch from SW to HW rendering and
the other way round. This way we display the new cursor after removing the old
one.
In addition, we only update the internal state for the VCP's sprite. This way,
when we switch back to HW rendering the state is up-to-date and wasn't
overwritten with the other sprite's state.

The second part is a hack. It would be better to keep a state for each sprite,
but then again we don't have hardware that can render multiple cursors so we might as well do with the hack.

When a new device is added, calculate the event size needed if a DCCE event is sent and set the EQ's event size to this minimum. This avoids reallocs when an event is sent (which may happen during a SIGIO).

Keep rotation wrappers in place while transforms are in use
LeaveVT/EnterVT cycles will free/realloc shadow frame buffers. Because of
this, the presence/absence of that data is insufficient to know whether
the screen function wrappers are necessary. Instead, the 'transform_in_use'
flag should be used.

This patch also adds 'xf86RotateFreeShadow' for drivers to use at LeaveVT
time to free the rotation data; it will be reallocated on EnterVT.

Revert "Xi: disable XI for clients < XI 2.0"

Turns out some programs don't like this change. gnome-settings-daemon crashes hard if you tell it that XI doesn't exist. So, tell them we have XI, but leave the other change (the one that pretends no devices are available).
This reverts commit 8973a3f7983240407dd6da59b3643f40e6a3d83a.

Xi: if a pre-XI2 client tries to list the devices, pretend we don't have any.

XI 1.x isn't supported anymore, so let's pretend we don't have any devices.
This stops clients from opening them and thus stops interference.

Xi: disable XI for clients < XI 2.0

Sorry. With the huge changes in the device handling I honestly don't know how
to support XI and XI2 alongside. So let's just pretend XI doesn't exist if a
client doesn't request it supporting XI2.

Xi: add versioning support.

Remember the version the client sent to us, so we can adjust our replies
accordingly. This requires the client to use the {major|minor}Version fields
in the GetExtensionVersion request. However, they were padding before, so we
must assume they are garbage if nbytes is non-zero. If nbytes is zero, the
client is probably a new client and we can handle it correctly.

Xi: don't attempt to send to a NULL window.

Only applicable when the server comes down/restarts. In this case,
WindowTable[i] may be NULL. Let's not try to send an event then.

dix: NULL out WindowTable after freeing all the windows.

CloseDownDevices() tries to send PresenceNotify events. If the windows are
already freed, then we are accessing dangling pointers.

xfree86: don't free the config-file related information in DIDR. #15645

In DeleteInputDeviceRequest, leave the conf_idev (which is shared with
xf86ConfigLayout.input) alone for devices that were specified in the
ServerLayout section of the config file. This way, in the next server
generation we are left with what was the original config and can thus re-init
the devices.

This is an addon to 6d22a9615a0e6ab3d00b0beb22f001b6ece02ae, an attempt to
fix Bug 14418.

xfree86: Don't free master devices.

The previous check works in the master-branch, but doesn't work with MPX. We actually copy the SD's information into the MDs public.devicePrivate, so we need to explicitly check whether a device is a MD before freeing the module.

Xext: re-do the XGE versioning handling.

Basically the same approach RandR takes. Remember which one the client requested, send back the one the server supports. Also divide XGE server version (now defined in geext.c) and the client's version (still in the protocol definition).

Prefer glxvisuals with stencil buffer for default visuals

The first fbconfig which has a depthbuffer > 0 and doublebuf is chosen
when associating fbconfigs with the visuals, indepenent of stencil bits.
This happens to work ok on intel as there all fbconfigs with a
depthbuffer > 0 also have stencil bits.

This patch fixes this by first trying to get a fbconfig for default X visuals
with both stencilbuf, depthbuf and doublebuffering, and if that fails fallback

EXA: Offscreen memory eviction improvements.

* Make sure available areas are considered to have no eviction cost. This seems to help for https://bugs.freedesktop.org/show_bug.cgi?id=15513 but I'm afraid that may just be coincidence.
* Only calculate eviction cost of each area once for each eviction pass. Safeguard against potential (though unlikely) division by zero.
* Cosmetic enhancements: Name eviction cost related variables 'cost' instead of 'score' to emphasize that smaller values are better, update Doxygen file comment to the way eviction works now.
Minor xorg.conf manpage fixups

Use __libmansuffix__ instead of __oslibmansuffix__ which isn't getting replaced, and rewrap some text to get __xservername__ replaced in the description of Option "Accel" (cpp doesn't like the preceding quote).

Remove fbpseudocolor

"An experimental pseudocolor emulation layer. Not fully completed, currently only works for 16bpp." That was almost four years ago. It still doesn't work, only one driver even attempts to use it, it contains an ad-hoc implementation of damage, and should really be done up in Composite now anyway.

  Create dix/libXpdir.la for Xprint-specific build of libdix.la
  (cherry picked from commit 4e2c6dbabdbaaaca213fd08edd422de15d0900cc)

  required because of commit 7c0709a736c0f3aa011de67dd2c2962585ab146e,
  which made requestingClient in dix specific to Xprint only.
  Add to XPRINT_LIBS in hw/xprint/Makefile.am in front of
$(XSERVER_LIBS) to override definitions in libdix.la for standard xservers.

Follows 571206832d454771e3c638c7515767958365c19c (providing -DXPRINT to xprint subdirs).

Note it may be possible to restructure the code so that requestingClient is stored elsewhere than in dix. See discussions following http://lists.freedesktop.org/archives/xorg/2008-March/033844.html If this is done it may be possible to revert this commit (if not 571206...).

    Xi: store feedback classes in devProviates system as well.

    This is a follow-up to cb48d880856fd196ab8e8de5eb1f14944a1b4fff.

commit cb48d880856fd196ab8e8de5eb1f14944a1b4fff
Xi: store unused classes in devPrivates.

Rather than freeing/allocating classes each time the device capabilities need to swap, store them in the devPrivates system. When a class is unused, it is pushed into the devPrivates, and later recovered when needed again. This saves us a lot of memory allocations/frees, admittedly on the cost of some memory.

Xi: Fix pointer handling in KeyClassRec copy.

We don't free the class anymore, so just store the previous pointers, do the memcpy from the SD and then restore the pointers.
Plugs a memleak too, before xkbInfo was never freed.

xkb: two fixes to avoid server crashes.
- map can be NULL in some cases, so don't try to dereference it.
- don't default to inputInfo.keyboard

This is firefighting, I presume something in the class copy may have gone wrong to get a NULL map in the first instance?

commit 415c6df0da1197d487456b4c48e2e28e7ded8b8e
Author: Peter Hutterer <peter@cs.unisa.edu.au>
Date:   Sun Apr 13 11:46:44 2008 +0930

Xi: copy feedback classes first, in some cases xkb relies on kbdfeed.

XkbInitIndicatorMap (in XkbInitDevice) calls XkbFindSrvLedInfo. This accesses the devices kbdfeed struct, which is all nice and dandy if it is NULL. When copying the device classes however, kbdfeed may not be NULL and thus XkbFindSrvLedInfo goes on its merry way to do whatever it does.

By copying kbdfeed first, we avoid XkbFSLI to reference the "old" kbdfeed struct of the previous SD.

dix: Call DeleteInputDeviceRequest from CloseDownDevices (#14418)

The DDX (xfree86 anyway) maintains its own device list in addition to the one in the DIX. CloseDevice will only remove it from the DIX, not the DDX. If the server then restarts (last client disconnects), the DDX devices are still there, will be re-initialised, then the hal devices come in and are added too. This repeats until we run out of device ids.

This also requires us to strdup() the default pointer/keyboard in checkCoreInputDevices.

Remove NDEBUG (assert() disable) define from the X Server.

A few pieces of code were abusing this define for other purposes, which are
converted to ifndef DEBUG instead. There should be no ABI consequences
to this change.

The rationale is that having the define in xorg-server.h also disables
assert() drivers, which is unexpected, and also difficult to avoid since
xorg-server.h is included in their config.h, and you can't put a #undef in
config.h. As for removing it from the server instead of moving it to an
internal header, we probably shouldn't have unnecessary assert()s in
critical server paths anyway, and if we do we could #define NDEBUG in the
specific cases needed.

dix: don't free MDs classes on init.

The device classes aren't deleted anymore on a class change, so there's no
need to store the MD's original classes. We should however restore the MD to
 sane defaults when disconnecting the last device, consider this as TODO item.

dix: Rework Enter/Leave semaphore system.

Instead of a simple counter, use bits to keep track of which device is where etc. When device enters a window (or sets focus), the bit matching the device is set, when it leaves again, it is unset. If there are 0 bits set, then Leave/Enter/Focus events may be sent to the client.

Same theory as before, but this should get around the insanity with Grab/Ungrab special cases. Those cases are basically untested though.

Xi: dont copy FocusClassRec if the master already has one.

Blindly copying will override the focus setting of the master. If there's XI applications running, they may set the SD focus, while leaving the MD's focus as it was. In this case, after a class swap we still want to get the MD's events to the same window as before.

If an pointer event is being processed during a device grab, don't deliver it to the focus window, even if the device has a focus class. Reason being that

xfree86: Sanity check before retrieving the paired device.

Some pointer devices send key events [1], blindly getting the paired device crashes the server. So let's check if the device is a pointer before we try to get the paired device.

[1] The MS Wireless Optical Desktop 2000's multimedia keys are sent through the pointer device, not through the keyboard device.

dix: When floating, set sprite to NULL before calling InitializeSprite.

InitializeSprite won't create a new one if it already exists, with the result of overwriting the master's sprite. This master sprite is then assigned to the floating slave, and freed when the slave is reattached later.
Setting the sprite to NULL forces InitializeSprite to alloc a new one, and this one can be freed without further repercussions.

Xi: When attaching, check for ptr -> ptr and keybd -> keybd.

Some pointer devices have key classes (e.g. MS Optical Desktop 2000). The previous test was performed as Error if ptr -> keybd or keybd -> ptr. This doesn't work with such devices. New test is Succeed if ptr->ptr or keybd->keybd.

Fix clock_gettime presence detect on FreeBSD.

For non-Linux, _POSIX_C_SOURCE and friends restrict symbols defined rather
than enabling defines of symbols. Additionally, CLOCK_MONOTONIC was
apparently added to the standard around 2000 anyway, not 1993.

XSELinux: Add a request to get a client's context from a resource ID.
Implement DRI2 direct rendering and update AIGLX to DRI interface changes.

Get rid of glcontextmodes.[ch] from build, rename __GlcontextModes to __GLXcontext. Drop all #includes of glcontextmodes.h and glcore.h. Drop the DRI context modes extension.

Add protocol code to DRI2 module and load DRI2 extension by default.

EXA: Optimize the eviction scanning loop in exaOffscreenAlloc.

Reduce the cost of the inner loop, by keeping a set of pointers to the first and the last areas in the series, subtracting the cost of the first area from the score, and adding the cost of the last area while walking the list. This commit also moves the scanning loop from exaOffscreenAlloc into a separate function.

Idea by Michel Dänzer.

EXA: Improve the algorithm used for tracking offscreen pixmap use.

Replace the current score keeping algorithm with a rolling counter that's incremented in ExaOffscreenMarkUsed, with the previous value being stored in the area. exaOffscreenAlloc uses the difference between the counter value and the value in the area when deciding which area to evict. It now also takes the size of the areas into account, and favors evicting smaller areas.

The credit for these ideas goes to Michel Dänzer.

Cleanup logic in xf86PrepareOutputs

Should have done this in the first place. Since we're checking for the absence of the get_crtc callback in the first place, we'll short circuit the later call.

Make xf86SetDesiredModes aware of current output configuration

By adding a new output callback, ->get_crtc, xf86SetDesiredModes is able
to avoid turning off outputs & CRTC's if the current output<->CRTC mappings are the
same as the desired configuration.  This helps avoid flickering displays at
startup time, which speeds things up a little and looks better.

Allow RandR get output property to call into drivers

In order to report accurate values to users of the RandR property interface, it's sometimes necessary to ask the driver to update the value (for example when backlight brightness changes without the server's knowledge, due to hotkey events or direct sysfs banging).

This patch wires up the core server code with a new xf86CrtcFuncs callback, get_property, to allow for this.

The new code is available under the RANDR_13_INTERFACE define, which in turn depends on the RANDR_12_INTERFACE code.

Fix distcheck.

Make xf86InitialConfiguration slightly smarter.

Old heuristic was to find the first monitor that expressed a preference, then attempt to get all other monitors to agree. This doesn't work particularly well when the two sets of modes don't precisely intersect, you get overlapping-but-not-identical output geometry and things go wrong.

New heuristic is:
- Exact user preference, if given
- Exact output preference, if the same for all outputs
- Best (largest) mode of modes common to all outputs:
  - with the same aspect ratio as all outputs (may be NULL)
  - with 4:3 aspect ratio
- Then the old heuristic to try to get something lit

Note that it is simply not doable to have a reliable initial output guess if you insist on trying to clone all outputs together. It's far too easy to end up with displays that simply don't have modes in common. We need to switch to right-of-placement someday, once we're not limited to CRTC size limits and we have working multi-GPU in RANDR.

Fix CVT abuse in DDCModesFromStandardTiming.

CVT is enough different from GTF that it should not be used on monitors that aren't expecting it. This brings us closer to what the spec says the correct behaviour is.

   Remove some #if 0 guarding code duplicated in xf86Modes.c
Allow xf86DuplicateMode() to work correctly on read-only modes.

Before this it was meaningless to try to mark DisplayModeRec tables const, since the mode name would be emitted as a pointer to an anonymous string constant, and therefore would have to be fixed up by ld.so and so couldn't live in .rodata. With this change the standard mode lists can live in .rodata, and modes duplicated from them will have their names filled in on the fly.

dix: before copying the classes the first time, set the VCK's classes to NULL.

XkbFinishDeviceInit does the following:
  xkbi->kbdProc= pXDev->kbdfeed->CtrlProc;
pXDev->kbdfeed->CtrlProc= XkbDDXKeybdCtrlProc;

If we directly copy the device classes for the VCK, pXDev->kbdfeed->CtrlProc at the time of copying is still XkbDDXKeybdCtrlProc. So at some point XkbDDXKeybdCtrlProc is called, and calls itself, and calls itself, and...

Setting the device's classes to NULL seems to fix things. The memory isn't lost, it gets stored into the devPrivates and freed at device closing time.

    Fix Xinerama's consolidated visual handling.

    Formerly the code claimed it could only handle up to 256 visuals, which
was true. Also true, but not explicitly stated, was that it could only
handle visuals with VID < 256. If you have enough screens, and subsystems
that add lots of visuals, you can easily run off the end. (Made worse
because we allocate visual IDs from the same pool as XIDs.) If your app
then chooses a visual > 256, then the Xinerama code would throw BadMatch
on CreateColormap and your app wouldn't start.

    With this change, PanoramiXVisualTable is gone. Other subsystems that
were using it as a translation table between each screen's visuals now
use a PanoramiXTranslateVisual() helper.

Revert "xfree86: plug a memory leak in xf86LoadModules."

This reverts commit 3abce3ea2b1f43bd111664d4a57e5ccd282acab0 and 6cbaf15e6109ba77819c4070f5b46c78237ec460.

The memory returned to xf86LoadModule was allocated in doPostLoadModule, which calls the respective module's PreInit. As it turns out, input and output drivers store a pointer to the module elsewhere, so freeing it in xf86LoadModule is a bad idea.

For further reference: hw/xfree86/common/xf86Helper.c
    Input drivers: xf86InputDriverList[blah]->module = module;
    Output drivers: xf86DriverList[blah]->module = module;

Unloading the module would not look pretty then.

dix: Ensure enough memory for ClassesChangedEvent for a new device.

dix: change GetEventList to return length of list and set parameter in place.

Changing DDXs to use new prototype too.

dix: add InputEventListLen and SetMinimumEventSize

The latter is used to increase the amount of allocated memory for the event list. This will be needed for ClassesChangedEvents that can be of more or less arbitrary size (larger than 32 anyway).

xfree86: guard against NULL-pointer dereferences in xf86LoadModules.

Should have been part of 3abce3ea2b1f43bd111664d4a57e5ccd282acab0, but I forgot to git-update-index before I committed.

Thanks to Bill Crawford for pointing it out.

Move input event list initialisation and storage from DDX to DIX.

Rather than letting the DDX allocate the events, allocate them once in the DIX and just pass it around when needed.

DDX should call GetEventList() to obtain this list and then pass it into Get{Pointer|Keyboard}Events.

Xi: make SizeDeviceInfo public and re-use from CreateClassesChangedEvent.
xfree86: plug a memory leak in xf86LoadModules.

LoadModule() returns the only reference to a fresh piece of memory (a ModuleDescPtr). Sadly, xf86LoadModules dropped the return value on the floor leaking memory for each module it loaded.

glx: Use glapi sources from the mesa tree

With recent mesa HEAD, the glapi sources used only in the xserver glx
module are carried in the mesa tree. Previously, these were generated
separately and committed to the xserver tree.

The build is changed to symlink these files like the other mesa sources.
This reduces the chance for mismatches between mesa's glX API and the
xserver's glX API.

XKB: Ditch XkbFileInfo

Sorry about the megacommit, but this touches on a lot of stuff.
Get rid of XkbFileInfo, which was pretty seriously redundant, and move the only useful thing it had (defined) into XkbDescRec. defined will be removed pretty soon anyway. Is the compat map pointer non-NULL? Then you have a compat map, congratulations! Anyhow, I digress.

All functions that took an XkbFileInfoPtr now take an XkbDescPtr, _except_ XkmReadFile, which returns an XkbDescPtr *, because people want to deal in XkbDescPtrs, not XkbDescRecs.

Resize composite overlay window when the root window changes.

- This allows some compositing managers to work, even after randr12 has changed the root window size.
- Thanks to ajax for figuring out the best place to put this.
- Example:
  - xf86RandR12SetMode() calls EnableDisableFBAccess().
  - That calls xf86SetRootClip() which in turn calls ResizeChildrenWinSize().
  - The final step is the call to PositionWindow().

X86EMU: handle CPUID instruction

After trying to switch from X to VT (or just quit) the video-amd driver
attempts to issue INT 10/0 to go to mode 3 (VGA). The emulator, running
the BIOS code, would then spit out:

c000:0282: A2 ILLEGAL EXTENDED X86 OPCODE!

The opcode was 0F A2, or CPUID; it was not implemented in the emulator.
This simple patch, against 1.3.0.0, handles the CPUID instruction in one of
two ways:
1) if ran on __i386__ or __x86_64__ then it calls the CPUID instruction
directly.
2) if ran elsewhere it returns a canned 486dx4 set of values for
function 1.

This fix allows the video-amd driver to switch back to console mode,
with the GSW BIOS.

Thanks to Symbio Technologies for funding my work, and ThinCan for
providing hardware :)

Bug # 10324: dix: Allow arbitrary value ranges in GetPointerEvents

Don't use a possitive value as a marker for if a max-value is defined on the valuators. Use the existence of a valid value range instead. This will also make it possible to define arbitrary start and end-values for min and max as long as min < max.

Don't break grab and focus state for a window when redirecting it.

Composite uses an unmap/map cycle to trigger backing pixmap allocation
and cliprect recomputation when a window is redirected or unredirected.
To avoid protocol visible side effects, map and unmap events are
disabled temporarily. However, when a window is unmapped it is also
removed from grabs and loses focus, but these state changes are not
disabled.

This change supresses the unmap side effects during the composite
unmap/map cycle and fixes this bug:

http://bugzilla.gnome.org/show_bug.cgi?id=488264

where compiz would cause gnome-screensaver to lose its grab when
compiz unredirects the fullscreen lock window.

Xi: remove some leftovers from ProcessOtherEvents.

Core handling not needed anymore here.

commit 32aa252e988be8cbfd4f7e373fb7b7736ef1f5f2
Author: Peter Hutterer <peter@cs.unisa.edu.au>
Date:   Tue Jan 15 15:22:39 2008 +1030

dix: Process an input event as a single event, instead of two separate ones.

This is a significant shift in how input events are perceived. The common approach was to treat a core event as a different entity than the XI event. This could result in the XI event being delivered to a different client than the core event. This doesn't work nicely if they come from the same device.

Instead, we treat an input event as a single event, that is delivered through two separate APIs. So when delivering an event, we first try the XI event, then the core event. If the window wants neither, we go to the parent and repeat. Once either core or XI has been delivered, the processing stops.

Important: Different to the previous method, if a client registers for core button events, the parent window will not get XI events. This should only cause problems when you're mixing core and XI events, so don't do that!

Generic events don't fit into this yet, they cause me headaches.

Author: Tiago Vignatti <vignatti@c3sl.ufpr.br>
Date:   Tue Jan 15 02:59:56 2008 -0200

dix: Emulate core events within CheckDeviceGrabs and ComputeFreezes.

This should restore the correct passive grab processing. When checking for
passive grabs, the core event is emulated and we check first for XI grabs on
the window, then for core grabs. Regardless of which event activates the grab,
the XI event is stored in the device's EQ.

When replaying the event, we take the XI event and replay it on the next
window, again including the emulation of the core event.

Xi: keep a counter of buttons down to avoid duplicate press/release events.

If two devices are attached to the same master device, pressing button 1 on

release.

   Xi: ProcXSetClientPointer should directly check for the client from the id.

   The window ID includes the client ID anyway, so we might as well just look up

This also fixes a possible issue with XACE. If the client had permission to write on the client but not on the window, the previous approach would have failed.

GL: Add GLX compile flags lost in modular X server changes

RISC chips that trap on unaligned loads and stores need to define __GLX_ALIGN64. This used to get added to the cflags in the old *.cf files but it no longer does in the modular X server.

Also, Alpha needs to pass -mieee to the compiler as well.

This is a simple backport of a patch that debian, and probably other distributions, have been applying forever. To the best of my knowledge the patch was written by Jurij Smakov. See Debian bug number #388125.

I just checked and this has been rotting for more than a year in freedesktop bugzilla as #8392.

include: never overwrite realInputProc with enqueueInputProc. Bug #13511

In some cases (triggered by a key repeat during a sync grab) XKB unwrapping
 can overwrite the device's realInputProc with the enqueueInputProc. When the
 grab is released and the events are replayed, we end up in an infinite loop.
 Each event is replayed and in replaying pushed to the end of the queue again.

This fix is a hack only. It ensures that the realInputProc is never
 overwritten with the enqueueInputProc.

commit efcde0d7010f4e6ec833842cb010a07068edf7ab
Author: Adam Jackson <ajax@redhat.com>
Date:   Thu Dec 13 15:38:41 2007 -0500

Correct the documentation comments in xf86Modes.c

Most of those functions do not, in fact, work with circular mode lists,
and by this point the API isn't really "proposed" anymore.

dix: change the filters to be per-device.

If we have one global filter, one pointer may change the filter value and affect another pointer.

Reproduceable effect:
blackbox and xterm, start dragging xterm then click anywhere with the other pointer (attached to different mastered device!). The button release resets the filter[Motion_Filter(button)] value, thus stopping dragging and no event is sent to the client anymore.
Having the filters set per device gets around this.

Darwin: Combine launcher and server X11.app
This should hopefully eliminate confusion some people have over which X11.app is which.
Now BOTH are in /A/U/X11.app and we intelligently determine whether to execute our app_to_run

connect to an X DISPLAY, we execute app_to_run. Otherwise, we launch the server.

mi: only call UpdateSpriteForScreen if the screen actually changed.

If we call it unconditionally, we flip the dev->spriteInfo->sprite permanently when using XTestFakeInput (once in CheckMotion as called from the processInputProc, another time in UpdateSpriteForScreen when we actually warp the cursor). USFS also updates to the screen's root window unconditionally, which is not really what we want if we haven't changed screen at all.

dix: Add special treatment of NotifyUngrab for enter/leave events.

In some cases (e.g. using x2x) the previous model broke, with a window ending not counting down to 0 anymore. Special treatment for NotifyUngrab seems to help here.

Current solution: If a NotifyGrab is to be sent ignore it. If a NotifyUngrab enter is sent, only adjust the semaphore if it is on 0. Likewise, do the same for a NotifyUngrab leave if the semaphore is on 1. This seems to work alright so far.

   Xi: When switching MD classes, make a deep copy instead of pointer flip.

   Turns out it's really really hard synchronising device state across multiple duplicated events if they all share the same struct. So instead of doing so, when the SD changes deep-copy all it's classes into the MD. The MD then has the same capabilities, but the state can be set separately. This should fix xkb, key state, repeat etc. problems.

   Updating the device state allows us to remove the SwitchCoreKeyboard from the event gathering, it's all done during event processing now.

Xi: toggle the public.devPrivate as well when switching device classes.

The master needs to have the same devPrivate as the slave, in case a client issues a request that goes down to the driver.
Example: if a driver wants to ring the keyboard bell, it'll pick a keyboard. The KeyClassPtr will direct it to the matching method in the driver, but because the MD doesn't have the devPrivate set the driver segfaults. Even if all drivers were updated to not dereference the nullpointer, nothing would actually ever happen.

To avoid this, we flip the master's public.devPrivate to the last SDs...
devPrivate.

dix: Send MappingNotify when keyboard maps change.

If a slave device is attached to a master device, then we need to send a
mapping notify to the client.
Mapping notify needs to be sent if
- different slave device but on same master
- different master

This gives you funny behaviour with the ClientPointer. When a
MappingNotify is sent to the client, the client usually responds with a
GetKeyboardMapping. This will retrieve the ClientPointer's keyboard mapping,
regardless of which keyboard sent the last mapping notify request. So
depending on the CP setting, your keyboard may change layout in each app...

Each time a different slave device sends through a master, an DeviceClassesChangedEvent is enqueued. When this event is processed, all classes of the matching master device are changed, and the event is sent to the clients.

Patch to rootless code that should fix many crashes. Credit to Ken Thomases at CodeWeavers for the patch. From his description:

Fix a display bug with the X server. The Generic Rootless extension installs overrides for certain GC (graphics context) operations. Within these overrides, they temporarily uninstall themselves, perform their work, and then reinstall themselves. Except sometimes they would return early and wouldn't reinstall themselves when they should. Now they do in all cases.

Fix a bug in RootlessCopyWindow where early returns could leave the screen's dispatch table entry for CopyWindow unwrapped. We think that this is another case (hopefully the last) of the rootless drawing bug.

dix, mi: stop segfaults when a floating device emits events.

For pointers: don't try to set master->valuator fields if there is no master. For keyboards: check if device is valid before trying to access the fields in miPointerGetScreen (btw. this disables DGA events for floating keyboards).

Also stop the hideous number of ErrorFs if we request the paired device for a floating dev.

Xnest: fix lib dependancy to make libtool happy

This fixes an undefined symbol error happening when compiling
the server with the --disable-xv configure switch.
Basically, xnest was linking against @XSERVER_LIBS@ and @XNEST_LIBS@ and the order of the libraries given to the linker at the end of the process was bogus.

* configure.ac: make XNEST_LIBS contain the $XSERVER_LIBS re-ordered in such a way that the linker finds the symbols of all the libs contained in $XNEST_LIBS.
* hw/xnest/Makefile.am: don't link against @XSERVER_LIBS@ anymore because XNEST_LIBS contains the right thing.

Modified performance patches from Arjan van de Ven <arjan@infradead.org>
Subject: [PATCH] fix some performance gaps in Xace

The XaceHook function is used in several hotpaths.
The problem with it (performance wise) is twofold:
* The XaceHook function has a big switch() statement for the hook number in it
* The XaceHook function uses varargs to reassemble the final dispatch arguments again

Both are expensive operations... for something that is known at compile time

This patch turns the hotpath XaceHook call into a direct call to avoid the switch and varargs; this gives me over 10% performance gain on the x11perf benchmark.

Due to RANDR 1.2, xf86findOptionValue and xf86nameCompare are now ABI. Make sure they're exported from the server.

Move SIGUSR1 notification as late as possible.

If we inherited a signal mask from the parent process that ignores SIGUSR1, then we will send SIGUSR1 to the parent to indicate when we're ready to accept connections. Unfortunately, we send this notification way too early, right after creating the sockets rather than just before entering the main loop.

Move it to just before Dispatch() so we're not lying quite so much.

Enable MIT-SHM in Xdmx.

The extension is entirely DIX-level, no new DDX changes needed.

reduce wakeups from smart scheduler

The smart scheduler itimer currently always fires after each request (which in turn causes the CPU to wake out of idle, burning precious power). Rather than doing this, just stop the timer before going into the select() portion of the WaitFor loop. It's a cheap system call, and it will only get called if there's no more commands batched up from the active fd.

This change also allows some of the functions to be simplified; setitimer() will only fail if it's passed invalid data, and we don't do that... so make it void and remove all the conditional code that deals with failure.

The change also allows us to remove a few variables that were used for
housekeeping between the signal handler and the main loop.

Set up visuals for the existing X visuals.

This makes the root visual a GLX capable visual again and adds a GLX visual for the COMPOSITE ARGB visual cleanly (as opposed to the hack we had before).

commit a5546a99ac4da61ae0d49c55bcb38bce9a96aa
Author: Kristian Høgsberg <krh@redhat.com>
Date: Mon Oct 29 18:06:41 2007 -0400

Change the GLX module to initialize after COMPOSITE.

This changes the module initialization order so that the GLX module initializes after COMPOS1TE. The reason for this change is to be able to initialize a GLX visual config for the COMPOSITE ARGB visual.

xfree86: wrap keyboard devices for XKB.

Call ProcessOtherEvents first, then for all keyboard devices let them be wrapped by XKB. This way all XI events will go through XKB.

Note that the VCK is still not wrapped, so core events will bypass XKB.

Instead of hardcoding CoreProcessPointerEvent, actually try to unwrap properly and then call the unwrapped processInputProc. Seems to be a better idea, especially since it makes stuff actually work...

Introduce a new "GlxVisuals" option that controls which visuals are added.

Right now we default to "all" which gives us a situation much like before, but when the "typical" option is implemented, we can change the default and reduce the number of visuals the GLX module bloats the X server with.

Add code to set up GLX visuals and add one for the first double buffered FBConfig.

Separate handling of GLX visuals and GLX FBConfigs.

XIDs for GLX visuals and FBConfigs used to be interchangeable and the list of GLX visuals was identical to the list for FBConfigs. This patch splits handling of these two data types and allows the X server to pick and choose the FBConfigs that are exposed as visuals.

Drop VisualConfigPriv support from the DRI module.

No DDX driver uses this, and this patch stops the DRI module from...
poking around GLX module data structures.

commit 7d74690536b64f7b8e8036507ab7790807349c50
Author: Kristian Høgsberg <krh@redhat.com>
Date:   Sun Oct 14 15:39:21 2007 -0400

Simplify and clean up GLX visual initialization.

Instead of the fragile setup where we filter the modes common between the
DDX generated GLX visuals and the DRI driver generated fbconfigs, we now
just take the fbconfigs returned by the DRI driver to be our supported set.

commit ab4bce02a9457dd9c86b774fc74caf3dd6b287ca
Author: Eric Anholt <eric@anholt.net>
Date:   Thu Oct 18 15:22:42 2007 -0700

Add a quirk for Philips 107P5 which lacks the preferred bit on detailed timing.

Also fix the prefer-large-75 quirk if the prefer-first-detailed bit was set,
though it's not the case for the existing prefer-large-75 consumer.

Author: Peter Hutterer <peter@cs.unisa.edu.au>
Date:   Wed Oct 17 09:52:30 2007 +0930

mi: fix some macros to allow multiple cursors for master devices.

Macros defaulted to inputInfo.pointer for devices that weren't spriteOwners.
Changed to take the device's master device now.

This includes sticking in a number of checks and warnings that cursor
rendering won't be called for floating devices.

Bug #10304,12784,11603: Add quirks for several physical size issues.

A lot of EDID writers apparently end up stuffing centimeters (like the maximum image size field) into the detailed timings, instead of millimeters. Some of them only get it wrong in one direction. Also, add a quirk to let us mark the largest 75hz mode as preferred, which will often be used for EDID 1.0 CRTs.

specify something like using EXA without having a screen section) or a
default screen section if none is present in the file.

Don't require that the screen explicitly attach the device section

This will allow the screen to not explicitly have a device section. If
this is the case and there is a device section in the xorg.conf, the first
one will be used. If there is no device section at all, a default one will
be created that loads the automatically determined module.

  We can now launch GL or XV apps in any of the Xephyr screens we want.

  * hw/kdrive/ephyr/hostx.c,h:
    (hostx_get_window):
    (hostx_create_window): make these functions be screen number aware.
  * hw/kdrive/ephyr/XF86dri.c : fix some compiler warnings.
  * hw/kdrive/ephyr/ephyrdri.c:
    (ephyrDRIQueryDirectRenderingCapable),
    (ephyrDRIOpenConnection),
    (ephyrDRIAuthConnection),
    (ephyrDRICloseConnection),
    (ephyrDRIGetClientDriverName),
    (ephyrDRICreateContext),
    (ephyrDRI_DestroyContext),
    (ephyrDRICreateDrawable),
    (ephyrDRIGetDrawableInfo),
    (ephyrDRIGetDeviceInfo): in all those functions, don't forward
the screen number we receive - from the client - to the host X.
We (Xephyr) are always targeting the same X display screen, which is
the one Xephyr got launched against. So we enforce that in the code.

* hw/kdrive/ephyr/ephyrdriext.c:
  (EephyrMirrorHostVisuals): make this duplicate the visuals of the host X
default screen into a given Xephyr screen. This way we have a chance
to update the visuals of all Xephyr screen to make them mirror those
of the host X.
(many other places): specify screen number where required by the api
change in hostx.h.
* hw/kdrive/ephyr/ephyrglxext.c: specify screen number where required
by the api change in hostx.h
* hw/kdrive/ephyr/ephyrhostglx.c: don't forward the screen number we
receive - from the client - to the host X.
We (Xephyr) are always targeting the same
X display screen, which is
the one Xephyr got launched against. So we enforce that in the code.
* hw/kdrive/ephyr/ephyrhostvideo.c,h: take in account the screen number received
from the client app. This is useful to know on which Xephyr screen we
need to display video stuff.
* hw/kdrive/ephyr/epyhyrvideo.c: update this to reflect the API change
in hw/kdrive/ephyr/ephyrhostvideo.h.
(ephyrSetPortAttribute): when parameters are not valid
- they exceed their validity range - send them to the host anyway
and do not return an error to clients.
Some host expose buggy validity range, so rejecting client for that
is too harsh.

dix: ignore passive grab if the client already has a grab on the device.
In some cases a button press may activate a passive core grab. If the client owning the passive grab already has a core grab on another device, don't actually activate it. Otherwise the client gets two simultaneous passive core grabs, and may never ungrab the device again (only if the other grab uses GrabModeSync).

Reproducable: fire up gnome-session, open up gnome-terminal. Click with the ClientPointer onto the window decoration, then click with another pointer onto an application icon in the panel. Drag the icon out, release the button and voila - you just lost your second mouse.

dix: change Enter/Leave semaphore handling to accommodate for NotifyGrab.

This is a half-assed attempt at getting rid of some enter-leave problems. When a grab is activated, the events didn't get sent before, leading to interesting results. This commit papers over it but doesn't actually fix it properly. The whole enter/leave (focusin/out) structure needs to be ripped out and changed for multiple devices.

Kdrive: use fbcmap_mi.c instead of fbcmap.c

* hw/kdrive/src/Makefile.am: use fb/fbcmap_mi.c
and not fb/fbcmap.c. This allows kdrive to take advantage of
extensions redefining the entry points of micmap.c stuff.
For instance it allows Xephyr to have a working GL, which is not
possible otherwise, because GL redefines mInitVisualsProc
to initialise its visuals.

This is useful so that servers using this entry point can use fbcmap_mi.c,
and be obliged to stick to fbcmap.c. Note that fbcmap.c does implement this
entry point. Up to now, kdrive based server could not use fbcmap_mi.c because this
entry point was missing. The will allow Xephyr to properly use GL.

GLX: allow skipping of visual init wrapping

* GL/glx/glxvisuals.c: added boolean to disable
calling init_visuals(). This gives a chance to Xephyr
to take over visuals manipulation and avoid a crash at
server shutdown in __glX MesaScreenDestroy(), due to the fact
that mesa might sees more visual than what it has actually created in
init_visuals(). It might see more visuals because Xephyr can augment
the number of visuals, dynamically.

Xephyr: fix a host X hang.

* hw/kdrive/ephyr/ephyrdri.c:
(ephyrDRIGetDrawableInfo): quickly hook this into getting the drawable info from the host X server. For the time being, this only gets the drawable info of the Xephyr main window in the host. It should really get the info of a the peer drawable in the host X. So there should be a peer drawable to begin with.

* hw/kdrive/ephyr/ephyrdriext.c: (ProcXF86DRIGetDrawableInfo): some cleanups. Properly get the the drawable info otherwise there is a host X hang.

* hw/kdrive/ephyr/ephyrhostglx.c: do not (ephyrHostGLXQueryVersion): do not use C bindings of the glx protocol calls. Some of those actually access DRI context directly, resulting in the context having three clients. Instead all XF86DRI proto forwarding request should be coded by hand and only forward the protocol requests

Xephyr: Make glxinfo work on the ATI R200 free driver.

* hw/kdrive/ephyr/ephyr.c: (EphyrDuplicateVisual): when duplicating the visual, copy the color component masks and the class
from the hostX
(EphyrMirrorHostVisuals): don't mix blue and green mask.
* hw/kdrive/ephyr/ephyrdri.c: add more logs.
  (ephyrDRICreateDrawable): actually implement this.
for the moment it creates a DRI drawable for the hostX window,
no matter what drawable this call was issued for.
(ephyrDRIGetDrawableInfo): actually implemented this.
for the moment the drawable info queried for its attrs is the
Xephyr main main window.
* hw/kdrive/ephyr/ephyrdriext.c:
  (ProcXF86DRIGetDrawableInfo): properly hook this dispatch
  function to the ephyrDRIGetDrawableInfo() function.
* hw/kdrive/ephyr/ephyreglxext.c: add a bunch of GLX implementation hooks
  here. Hijack some of the xserver GLX hooks with them. Still need to
  properly support byteswapped clients though.
* hw/kdrive/ephyr/ephyrhostglx.c,h: actually implemented the protocol
  level forwarding functions used by the GLX entr points in
  ephyreglxext.c. Here as well, there are a bunch of them, but we are
  far from having implemented all the GLX calls.
* hw/kdrive/ephyr/hostx.c,h:
  (hostx_get_window_attributes): added this new entry point
  (hostx_allocate_resource_id_peer): added this to keep track of
  resource IDs peers: one member of the peer is in Xephyr, the other
  is in host X.
  (hostx_get_resource_id_peer): ditto.

proxy the glXGetFBConfigSGIX call

* hw/kdrive/ephyr/ephyrglxext.c:
  (ephyrGLXGetFBConfigsSGIX): proxy the GLXGetFBConfigsSGIX call.
  It is a vendor extension to get the visual configs as a list of name/value pairs.
  (ephyrHijackGLXExtension): hijack the VendorPriv_dispatch_info dispatch table to register our implementation of GLXGetFBConfigsSGIX
  (ephyrGLXGetFBConfigsSGIXReal): added this where the real implementation of GLXGetFBConfigsSGIX is. It support bytes swapping.
  (ephyrGLXGetFBConfigsSGIX,ephyrGLXGetFBConfigsSGIXSwap): these are the dispatch entry points. They just call ephyrGLXGetFBConfigsSGIXReal.

  Initial dri forwarding big bricks.

* hw/kdrive/ephyr/ephyrdriext.c: added this to implement a DRI extension into Xephyr. Normally the DRI extension is only present in the xfree86 server, but I have ported it to Xephyr. The extension calls functions that declared/defined in ephyrdri.h ephyrdri.c that forwards the DRI calls to the host X. It does not work yet, as this entry is just to put the big bricks in place.
* hw/kdrive/ephyr/ephyrdri.c,h: declaration & definition of the DRI client API that would hit the hostX server.
* hw/kdrive/ephyr/GL/internal/dri_interface.h: added this, otherwise inclusion of /usr/include/X11/dri/xf86dri.h won't compile

Xephyr: add "multiscreen" support

* This patch adds multiscreen support to Xephyr. For instance, the command line: "Xephyr -screen 320x240 -screen 640x480" will launch with two "screens" - namely two main windows.
The first main window represents a screen that has the number :4.0, with a geometry of 320x240 pixels, and the second one represents a screen that has the number :4.1 with a geometry of 640x480.
The command line: "DISPLAY=:4.1 xclock" will launch the xclock program on the second screen, for instance.

* This patch was edited by Dodji Seketeli <dodji@openedhand.com> for:
- better style compliance with the rest of the Xephyr code
- make sure Xephyr could be launched with no -screen option. By default that creates a default screen of 640x480 pixel like before
- display full titles on the windows - with instructions to grab keyboard and mouse - like before.

Remove generation of core events, long live XI!

Let the drivers only generate XI events and put those into the event queue. When processing events, generate core events as needed. This fixes a number of problems with XKB and the DIX in general.

The previous approach was to put core events and XI events as separate events into the event queue. When being processed, the server had no knowledge of them coming from the same device state change. Anything that would then change the state of the device accordingly was in danger of changing it twice, leading to some funny (i.e. not funny at all) results.

Emulating core events while processing XI events fixes this, there is only one path that actually changes the device state now. Although we have to be careful when replaying events from synced devices, otherwise we may lose events.

Note: XI has precedence over core for passive grabs, but core events are delivered to the client first.

This removes the wrapping added in 340911d7243a7f1095d79b5b2dcfa81b145c2474

commit 8f9bf927e1beecf9b9ec8877131ec12c765e4d84

Instead of hardcoding CoreProcessPointerEvent, actually try to unwrap properly
and then call the unwrapped processInputProc. Seems to be a better idea,
especially since it makes stuff actually work...

commit 3342b5ad47be25c6838321c0aafc28c329c308b5
Author: Peter Hutterer <peter@cs.unisa.edu.au>
Date:   Wed Sep 26 18:03:21 2007 +0930

Xi: fix the wrapper code for processInputProc wrapping.

Followup to [1].
If a core grab causes the device to freeze, it overwrites the processInputProc
of the device. [1] would then overwrite this while unwrapping, the device
does not thaw anymore.
Changing this to only re-wrap if the processInputProc hasn't been changed
during the event handling.

[1] 340911d7243a7f1095d79b5b2defa81b145c2474
xfree86: pass in the XKB event processing proc instead of the XI one.

We need to pass ProcessPointerEvent or ProcessKeyboardEvent to XkbSetExtension, otherwise we lose the xkb layer.

dix: unify ErrorFs. prepend all with [dix].

dix: GetPointerEvents: remove unused variable compiler warning.

Xi: unify ErrorFs. Prefix all with [Xi].

Wrap core event handling through ProcessOtherEvents.
When processing events from the EQ, _always_ call the processInputProc of the matching device. For XI devices, this proc is wrapped in three layers. Core event handling is wrapped by XI event handling, which is wrapped by XKB. A core event now passes through XKB -> XI -> DIX.

This gets rid of a sync'd grab problem: with the previous code, core events did disappear during a sync'd device grab on account of mieqProcessInputEvents calling the processInputProc of the VCP/VCK instead of the actual device. This lead to the event being processed as normal instead of being enqueued for later replaying.

Merge remote branch 'origin/master' into paint-window

Conflicts:

mi/miexpose.c

Remove the PaintWindow optimization.

This was an attempt to avoid scratch gc creation and validation for paintwin because that was expensive. This is not the case in current servers, and the danger of failure to implement it correctly (as seen in all previous implementations) is high enough to justify removing it. No performance difference detected with x11perf -create -move -resize -circulate on Xvfb. Leave the screen hooks for PaintWindow* in for now to avoid ABI change.

Try again to fix drawable and tile offsets in miPaintWindow

Many coordinate spaces are hard. Let's go drinking.

miPaintWindow draw to window for background.

Instead of drawing to window pixmap for everything, draw to window for background as that works for Xnest and Xdmx; draw to pixmap for borders which neither of those X servers use.

Fix build on FreeBSD after Popen changes.
Rewrite miPaintWindow to draw to window pixmap.

miPaintWindow was drawing to the root window, or (sometimes) drawing to the window after smashing the window clip list. This is losing, and easily fixed by just drawing to the window pixmap.

Replace a non-ascii char with the corresponding groff escape in exa.man.pre

Because our "popen" implementation uses stdio, and because nobody's stdio library is capable of surviving signals, we need to make absolutely sure that we hide the SIGALRM from the smart scheduler. Otherwise, when you open a menu in openoffice, and it recompiles XKB to deal with the accelerators, and you popen xkbcomp because we suck, then the scheduler will tell you you're taking forever doing something stupid, and the wait() code will get confused, and input will hang and your CPU usage slams to 100%. Down, not across.

xserver: test presence of strlcpy in configure

* configure.ac: define HAVE_STRLCPY when function strlcat is present this serves at least to unbreak libxtrans code compilation.
(exaDDXDriverInit): pExaScr->hideOffscreenPixmapData does not exist anymore, so don't set it.

EXA: exa(Shm)PutImage improvements.

Improve exaShmPutImage performance and reuse its core in exaPutImage as it seems faster than the previous code when the driver doesn't provide an UploadToScreen hook.

Make sure all damage records are notified of the damage incurred by actual ShmPutImage calls.

Remove superfluous manual damage tracking for actual PutImage calls.

EXA: RENDER improvements.

Exclude bits that will be overwritten from migration.

Use exaGlyphs even when Composite can't be accelerated, to avoid PolyFillRect roundtrip via offscreen memory.

Initialize mask pixmap in exaGlyphs in FB in addition to system if the driver provides Composite hooks to avoid migration overhead.

Remove manual damage tracking where superfluous.

EXA: Improvements for 1x1 pixmaps.

Initialize system and FB copy in exaFillRegionSolid and adapt exaGetPixmapFirstPixel to the new migration infrastructure.

This should mostly eliminate migration overhead for these, whether they are used for acceleration or fallbacks.

commit 489bc7551ffcc7360ba9648ca5c98b59c7e7a1fd1
Author: Michel Dänzer <michel@tungstengraphics.com>
Date: Thu Aug 30 13:37:53 2007 +0200

EXA: exaImageGlyphBlt improvements.

As we can't actually accelerate anything interesting here, just migrate out once and call fbSolidBoxClipped instead of taking a round trip via offscreen memory with exaSolidBoxClipped.

Reuse pending damage region for extents and to prevent any actual migration of pixmap contents when we're overwriting the whole pending damage region.

Remove superfluous manual damage tracking.

EXA: Hide pixmap pointer outside of exaPrepare/FinishAccess whenever possible.

We finally want to catch all cases where the pixmap pointer is dereferenced outside of exaPrepare/FinishAccess.

EXA: Support partial migration of pixmap contents between Sys and FB.

The initiator of migration can pass in a region that defines the relevant area of each source pixmap or the irrelevant area of the destination pixmap. By default, the pending damage region is assumed relevant for the destination pixmap, and everything for source pixmaps.

Thanks to Jarno Manninen for reassuring me that my own ideas for this were feasible and for providing additional ideas.

dix: Enabling devices must not overwrite existing sprites/pairing.

EnableDevices is (amongst others) called after a VT switch. We must not create
a new sprite or re-pair the device, otherwise we lose the input device setup
that we had before the VT switch.

This requires the devices to be in exactly the same order as before
the VT switch. Removing a device while on a different VT is probably a bad
idea.

xfree86: wrap keyboard devices for XKB.

Call ProcessOtherEvents first, then for all keyboard devices let them be
wrapped by XKB. This way all XI events will go through XKB.

Note that the VCK is still not wrapped, so core events will bypass XKB.

commit 03680a384aa423ece75b658f00b96db2628c39fa
Author: Peter Hutterer <peter@cs.unisa.edu.au>
Date: Thu Sep 6 15:43:47 2007 +0930

dix: don't change the device struct while processing core events.

The device state needs to be changed while processing the XI event. Core events are always processed after XI, so by then the device is already set up properly. However, we now rely on DeviceButtonMotionMask to be equal to ButtonMotionMask. It already is, but stick a big fat warning in so nobody attempts to change it.

This commit disables XKB for the VCK, thus essentially for all devices. Temporarily anyway.

Deliver correct event when releasing keys on VT switch.

In commit 41bb9fce47f6366cc3f7d45790f7883f74289b5a, the event delivery loop for Xinput enabled keyboards was changed and accidentally used the wrong index variable, causing random events to be delivered when returning from VT switch.

In addition, in commit aeba855b07832354f59678e20cc29a085e42bd99, SIGIO was blocked during delivery of these events, but not for the entire period the xf86Events array was being used. Block SIGIO for the whole loop to avoid other event delivery from trashing the key release events.

Fix server version reporting to be the server package version.

Previously, the server version reported by xdpyinfo and Xorg -version would
bear some vague resemblance to a X.Org katamari version, but in the presence of modularization (and client-server relationships with different katamari versions on each side) those numbers don't really make sense. Instead, just report the package version.

When branching a stable branch, master's version should be immediately updated to the endpoint of the stable branch plus a snapshot of 1 (for example, 1.4.0.1 after server-1.4-branch). The stable branch should then be changed to RC0 at that time (1.3.99.0, for example).

This scheme was partially attempted for server 1.3, but lacked the appropriate master updates, thus why it had to be revisited now. While here, we can also remove a lot of versioning complexity since everything is based on the package version.

[COMPOSITE] Composite used for pixmap population on redirect. (Bug #7447)

compNewPixmap copies bits from the parent window to the redirected child pixmap to populate the pixmap with reasonable data. It cannot always use CopyArea as that only works across matching depths. Use Composite when the depths do not match.

[RANDR] Compare only milliseconds of config time. (Bug #6502)

The timestamp transferred in the X protocol is a 32-bit number of milliseconds.

The timestamp stored in the server is a structure that contains two fields: months (!) and milliseconds.

When the server passes the config timestamp to the client, it discards the months part and sends only the milliseconds part.

When the server receives the config timestamp from the client, it tries to guess the "months" part by looking at the current time and then maybe adding or subtracting one. The guess is wrong after the server has been running long enough (several hours).

I have added two ErrorF calls around the 'if' statement that returns RRSetConfigInvalidConfigTimestamp in randr/randr.c and my Xorg.0.log has this:

randr request got good config time: 0:-2103495671

for the first few successful xrandr calls, and

randr request failed with RRSetConfigInvalidConfigTime: client passed 1:-2103495671, server has 0:-2103495671
when it fails. The server has been running for 8 and a half hours.

The obvious fix would be to ignore the months field and only compare the milliseconds.

To give credit to the DOSEMU Team for this inspiration a comment
was added to the code which could suggest that code from the
GPLed DOSEMU was directly incorporated into this code.

xace: drop map-window checking hook, add new hooks for controlling the delivery of events to windows and clients.

This is tentative. It's likely that an additional last-resort hook will be necessary for code that calls TryClientEvents or WriteEventsToClient directly. It's also possible that new xace machinery will be necessary to classify events and pull useful resource ID's out of them.

The failure case also needs some thinking through. Should event delivery "succeed" or should it report undeliverable?

Finally, XKB appears to call WriteToClient to pass events. Sigh.

Implement core protocol backing store exclusively in terms of Composite.

Composite's automatic redirection is a more general mechanism than the
ad-hoc BS machinery, so it's much prettier to implement the one in terms
of the other. Composite now wraps ChangeWindowAttributes and activates
automatic redirection for windows with backing store requested. The old
backing store infrastructure is completely gutted: ABI-visible structures
retain the function pointers, but they never get called, and all the
open-coded conditionals throughout the DIX layer to implement BS are gone.

Note that this is still not a strictly complete implementation of backing
store, since Composite will throw the bits away on unmap and therefore
WhenMapped and Always hints are equivalent.

EXA: Wrap Trapezoids to prevent excessive migration of the alpha pixmap.

miTrapezoids creates an alpha pixmap and initializes the contents using PolyFillRect, which causes the pixmap to be moved in for acceleration. The subsequent call to RasterizeTrapezoid won't be accelerated by EXA, which causing the pixmap to be moved back out again.

By wrapping Trapezoids and using ExaCheckPolyFillRect instead of PolyFillRect to initialize the pixmap, we avoid this roundtrip.

dix: Allow flexible devices for passive core grabs.

A passive core grab doesn't specify the device, and is thus created with the ClientPointer as device. When this grab is activated later, don't actually activate the grab on the grab device, but rather change the device to the one that caused the grab to activate. Same procedure for keyboards.

Makes core apps _A LOT_ more useable and reduces the need to set the ClientPointer.

Only applies to core grabs!

Updates some piece of the dead mouse evdev code under the new hotplug scheme. I exported the evdev driver to Xephyr server. I'm running it using something like:

```
$ /hw/kdrive/ephyr/Xephyr :1 -mouse evdev,,device=/dev/input/event4 -keybd \
  evdev,,device=/dev/input/event1,xkmodel=abnt2,xklayout=br
```

It also closes #5668.
Export device path key options to be called by the command line of server.

Update KdUseMsg() for completeness.

Hotplug: HAL: Fix error handling

Don't use our DBusError for property getting, because we simply don't care: this fixes D-Bus error spew to stderr. Thanks Michel Dänzer for debugging and testing.

Config: HAL: Use input.xkb namespace

Use an explicit input.xkb.foo namespace, not input.xkb_foo.

Make sure all DDXes get $CONFIG_LIB. Build-tested with Xvfb and Xdmx.

RRScanOldConfig wasn't getting crtc set correctly

The output crtc is set by RRCrtcNotify, which is called at the end of RRSanOldConfig. Several uses of output->crtc in this function were wrong.
Decrement mode count when removing RandR output mode.

Removing an output mode without decrementing the mode count scrambles the output mode array badly.

When we call Xephyr with `-pointer` a new pointer is added inside the server and the Xephyr virtual mouse keeps alive. With this patch the semantic changes turning `-pointer` & `Xephyr virtual mouse` always false.

Now we can open a device pointer and pass its options in Xephyr's command line without having other pointer unused.

Create a Picture as well as a Pixmap at the time of AllocateGlyph

This avoids some inefficiency in creating a temporary Picture for every glyph at rendering time. My measurements with an i965 showed the previous patch causing a 10-15% slowdown for NoAccel and XAA cases, (while providing an 18% speedup for EXA).

With this change, the NoAccel and XAA performance regression is eliminated, and the overall EXA speedup, (before any of the glyphs-as-pixmaps work), is now 32%.

Use per-screen Pixmaps for glyphs

Instead of system-memory data which prevents accelerated compositing of glyphs, (at least without forcing an upload of the glyph data before compositing).

Use strong hash (SHA1) for glyphs

Using a cryptographically strong hash means that comparing the hash alone is sufficient for determining glyph equality (no need to compare the glyph bits directly). This will allow us to replace system-memory copies of the glyph bits, (which we've only been holding onto for comparisons), with Pixmaps.
ProcRenderAddGlyphs: Avoid allocating a glyph just to find it cached

This is a cleanup without any real savings (yet). Previously, the
implementation would allocate a new glyph, then (often) find it in
the cache, and immediately discard the allocated object. This
re-organization first uses a new FindGlyphByHash function and only
allocates the glyph if nothing is found.

This isn't a real savings yet, since FindGlyphByHash currently still
does a temporary glyph allocation, but this is expected to be replaced
immediately as we switch to an alternate hashing mechanism (SHA1).

Remove duplicated licenses

Some files had two copies of the same license.

Add proper COPYING file

I went through the entire xorg-server distribution and aggregated all the licenses I could find (except the questionable GPL files, see my last mail).

There are many many permutations on essentially the same license terms, but I have been pedantic and treated slight differences as separate licenses.

Here is a description of the process I used:

tar xvjf /usr/portage/distfiles/xorg-server-1.1.1.tar.bz2

cd xorg-server-1.1.1
find -name "*.c" -o -name "*.h" | xargs gvim

egrep -Rli "permission|copyright" | grep -v "\.[ch]" \
  | grep -v "\..in$" | xargs gvim

cd..
tar xvjf /usr/portage/distfiles/xorg-server-1.3.0.0.tar.bz2
diff -urNp xorg-server-1.1.1 xorg-server-1.3.0.0

git clone git://anongit.freedesktop.org/git/xorg/xserver
cd xserver
git diff xorg-server-1.3.0.0..

For each file, licenses have been aggregated as follows:

If 2 files have identical license text but different copyright notices, the copyright notices are aggregated and the license text is included only once.

Note that by identical I mean really identical, i.e.:
'AUTHOR(S)' is not the same as 'AUTHORS'
'KEITH PACKARD DISCLAIMS' is not the same as 'KEITH PACKARD AND COMPAQ DISCLAIM'

Otherwise, licenses and accompanying copyright notices have been stacked.

When going through the changes from 1.1.1 to 1.3.0.0 then HEAD, licenses have been added and removed (so I have reflected this since the original version of my COPYING file). It's slightly concerning to see that even between 1.3.0.0 and HEAD, new license permutations are being added. I'd suggest that a primary license be chosen and this would be indicated at the top of this COPYING file.

Darwin: Remove missing file

Xserver.m is missing and still hasn't been added, so just remove it for now.

Config: Add missing include

Config: Add current FDI file

Add the FDI file we're using at the moment, until it gets into upstream HAL.

Config: Fix merge detritus

Input: Fix stuck modifiers (bug #11683)

Disclaimer: It's 6:51am. I'm trying to be as understandable as possible.

What was happening previously was this:
* Press Alt
* Extended event generated and processed: state is now Alt down once
* Core event generated
  - keyboard switched: inherited state is Alt down once
  - event processed: Alt down twice
* Release Alt
* Extended event generated and processed: state is now null
* Core event generated and processed: Alt down once

If we switch the order:
* Press Alt
  * Core event generated:
    - keyboard switched: inherited state is null
    - event processed: Alt down once
  * Extended event generated and processed: state is now Alt down once
  * Release Alt
  * Core event generated and processed: state is now null
  * Extended event generated and processed: state is now null

When we carry over the previous state, it needs to be the _previous_ state
(state and modifiersPerKey), assuming that we're going to catch now-core
events for any of these. For example, if Ctrl is held down as we pivot, we
need to carry Ctrl over with a count of one, for which an extended + core
release will then clear. Carrying over the union of the previous state _and
the state resulting from the immediate action_ was what broke things.

If the pixel in framebuffer memory isn't modified since we uploaded it, we can just read from the system memory copy, which avoids both a readback and an accelerator stall.

In principle this function is still wrong, and all the framebuffer pixel
access should be going through (w)fb so we can get pixel layout corrections.

MakeAtom needs length without trailing NUL. sizeof("string") includes NUL.

I made a mistake in some new code using MakeAtom, passing the size of the string instead of the length of the string. Figuring there might be other such mistakes, I reviewed the server code and found four bugs of the same form.

Add RandR reflection support.

Replace the ad-hoc transformation mechanisms with matrices. Prepares for more general transformation as well.

Screen size bounds check in ProcRRSetCrtcConfig not masking out reflections.

When checking how to validate the selected mode and position against the current screen size, the test against 90/270 rotation did not mask out reflection, so that when reflection was specified, the 90/270 test would never succeed. This caused incorrect bounds checking and would return an error to the user instead of rotating the screen.

When syncing logfile, also flush it.

When the logfile is set to sync, the actual sync occurs whenever the log file is flushed. If the log file is not also set to flush, no syncing occurs.

Use %S instead of %s for strftime seconds when printing build time.

Change CheckMotion to ignore non-pointer events but acknowledge XI events.

Call CheckMotion from ProcessOtherEvents() to make sure absolute XI events update the sprite before an event is sent.
DeliverGrabbedEvent: stop segfault when gemask == NULL.

Call CheckMotion for all core events.

We need to do this to update the sprites x/y coordinate before we assemble a button event. Absolute devices may send a buttonEvent with valuators attached. If we don't update the sprite before assembling the event, the valuators are lost and the button press is delivered to the previous position of the device. Doesn't have any effect on relative devices.

ProcX{Change|Query}WindowAccess: change device list from char* to XID*.

Fix regression from recent composite changes.

One pWin->redirectDraw test was converted incorrectly, causing incorrect rendering in some cases.

Use the same struct for generic event masks throughout the code. Renaming those structs too.

Previously grabs were using a different struct than windows, which was reasonably stupid.

Fix MEMORY SMASH in XkbCopyKeymap.

XkbCopyKeymap reallocates the destination keymap when it is not large enough to hold the source data. When reallocating the map->types data, it needs to zero out the new entries. The computation for where to start bzero'ing was accounting for the size of the data type twice, once implicitly in the pointer arithmetic, and once explicitly with '* sizeof (XkbKeyTypeRec)'. This would often lead to random memory corruption when the destination keymap had existing map->types data.

This patch changes the semantics of manual redirect windows so that they no

that region is damaged by other actions.

Split checks for dtrace & getpeerucred()

Make sure DRIScreenPrivIndex is -1 when no DRI screen private is allocated.

Fixes https://bugs.freedesktop.org/show_bug.cgi?id=11340

Quickfix to stop core key events from doubling up.

cfgFiles(): don't return anything when declared as void.

NULL-terminate device list when synthesizing core devices.

This fix is required for 93ca526892c0d22afa05ccee6496198e652043a19 to work.

Set the detail field for DeviceKeyEvents to the keycode.

Only decrement buttonsDown when the button count is greater than 0.
Device drivers flush their buttons on device init and cause a button down event to be generated. If we unconditionally decrease the buttons, we won't be able to ever get a passive device grab.

Format documentation for CheckDeviceGrabs to make it readable.

exaGetImage: Don't migrate or try to accelerate for 1x1.

This is mainly to avoid wasting effort for XSync(), but just reading a single
pixel directly is probably faster than DownloadFromScreen anyway. Though in
light of the latter, even larger thresholds might be useful.

Also move the swappedOut check before the migration checks because migration
can't actually occur when swapped out.

Add implicitGrab field to GrabInfoRec.
Is set when passive grab is implicit as result of a ButtonPress event. If this
is the case, we need to store the XI mask as well as the core mask to ensure
delivery of XI events during the grab's lifetime.

Remove all core grabs on other devices when client issues a GrabPointer or
GrabKeyboard request. Let's assume that the client really only wants one
device to interact, so this seems like a reasonable solution.

Need to use minPitch in miscanLineWidth() to get the shrinked linePitch.
Add a deviceMask to the GrabRec and don't interfere with passiveGrabs.

xf86XVFillKeyHelper assumed root clip never changed.

When the root window changed size, xf86XVFillKeyHelper would not revalidate the GC, leaving the clip at the old size causing lossage (and possibly memory corruption if the screen and frame buffer shrunk).

Fixed by just using a scratch GC; saving memory, eliminating bugs and shrinking the code.

When available, use the 2D driver texOffsetStart hook and the 3D driver
setTexOffset hook to save the overhead of passing the pixmap data to
glTex(Sub)Image.

The basic idea is to update the driver specific 'offset' for bound pixmaps
before dispatching a GLX render request and to flush immediately afterwards
if there are any pixmaps bound. This should ensure that the 3D driver can
use pixmaps for texturing directly regardless of the X server moving them
around.

DRI: Add TexOffset driver hooks.

To be used by AIGLX for GLX_EXT_texture_from_pixmap without several data copies.

The texOffsetStart hook must make sure that the given pixmap is accessible by
the GPU for texturing and return an 'offset' that can be used by the 3D
driver for that purpose.

The texOffsetFinish hook is called when the pixmap is no longer being used for texturing.

Disable Simba PCI bridge routing code (Bug #8020).

The code in hw/xfree86/os-support/bus/sparcPci.c:simbaCheckBus() is trying to mimmick VGA routing by disabling I/O space responses behind the Simba PCI-PCI controller.

Unfortunately, doing this also happens to disable access to the IDE controller I/O space registers, thus crashing the system. The granularity of the I/O disabling in the Simba controller is not fine enough to disable VGA without also disabling the IDE controller registers.

Provide UseDefaultFontPath option

This provides a new option, UseDefaultFontPath. This option is enabled by
default, and causes the X server to always append the default font path
(defined at compile time) to the font path for the server. This will allow
people to specify additional font paths if they want without breaking
their font path, thus hopefully avoiding ye olde "fixed front" problem.

Because this option is a ServerFlag option, the ServerFlags need to be
processed before the files section of the config file, so swap the order
that they are processed.

Improve modules loading defaults

Provide default modules that may be overrided easily. Previously the
server would load a set of default modules, but only if none were
specified in the xorg.conf, or if you didn't have a xorg.conf at all. This
patch provides a default set and you can add only the "Load" instructions
to xorg.conf that you want without losing the defaults. Similarly, if you
don't want to load a module that's loaded by default, you can add "Disable
modulename" to your xorg.conf (see man xorg.conf in this release for
details). This allows for a minimal "Modules" section, where the user only
need specify what they want to be different. See bug #10541 for more.

The list of default modules is taken from the set loaded by default when
there was a xorg.conf containing no "Modules" section.

A potential problem for some users is that some users disable a module,
most notably DRI, by commenting out the "Load" line in their xorg.conf.
This needs to be changed to an uncommented "Disable" line, as DRI is
loaded by default.

In __glXCreateARGBConfig(), insert the new GL mode at the _end_ of the linked list.
Previously, the new mode was added at the head of the list. This caused the positional correspondence between modes and the XMesaVisuals array to be off by one. The net result was GLX clients failing when they tried to use the last GLX mode/visual.

We still have the problem of DRI drivers not being able to use the extra mode/visual introduced by __glXCreateARGBConfig(). glXCreateContext fails with BadAlloc if it's attempted. This is also the source of the often-seen warning "libGL warning: 3D driver claims to not support visual xxx" Look into fixing that someday...

Adjust EQ to support long events.  
Add RawDeviceEvent (pointers only for now).

This commit changes the event queue to use EventLists instead of xEvent arrays. Only EQ is affected, event delivery still uses xEvent* (look for comment in mieqProcessInputEvent).

RawDeviceEvents deliver driver information to the client, without clipping or acceleration.

Check VCP's and VCK's ids when searching for a new device id.

Both VCP and VCK are not in the inputInfo.devices list anymore, so we need to check them separately. If we don't do this, we end up re-using ids 0 and 1, causing all sorts of grief for clients.

Add GenericEvent extension to Xext.

This adds (unconditional) support for the GE extension. Anything from now on that sends events in MPX will have to use the GE extension. No GE, no MPX events. GE is not actually used yet from anywhere with this commit.

You will need to update x11proto, xextproto, libX11, libXext and xcb to the matching xge branches. Things will _NOT_ work without the updated protocol headers and libraries.

Fix cursor rendering for multi-head.

Before putting anything on the screen, check if the GC was made for the ScreenRec we want to render to. If not, toss the GC and create a new one. This is not the best solution but it does the job for now. Same thing for ARGB cursors except that it's even uglier.

Also remember the screen the cursor was rendered to and check for the right screen in the BlockHandler, SourceValidate and a few others. Only remove or restore the cursor if we are rendering to the same screen, otherwise we get artefacts that are both funky and really annoying.

Fix a buffer overrun on machines with excessively large PCI busses.

Formerly we sized an array with a compile time constant, then initialized
its size to the same constant, but the Linux PCI init code would increase
that "constant". So if you happened to have more than 128 PCI devices,
you'd happily scribble into whatever variables happened to be in .bss
after that array.

Only really fixed for Linux atm. Other OSes will simply (still) fail to
work on video devices above the 128th PCI device.

From pixman (Jeff Muizelaar)

Fix up the fast-path compositing operators; those are useful for
sources without alpha, but can't be used for sources with
alpha. Also, replaced fbCompositeSrcSrc_nxn with call to fbBlt as
this function must handle 1, 4, 8, 16, 24, 32 bpp objects. Would
be nice to optimize fbBlt for common cases involving 8, 16, 24 and
32bpp.

Add functions fbCompositeSrcSrc_nxn() and fbCompositeTrans_0565xnx0565
from xserver via pixman. Add READ/WRITE and fbFinishAccess as
appropriate.
Disable devices before removing, remove unrecoverable devices.

Use DevicePresence events to tell the client about enabled/disabled devices.

Include the device id in the event sent to the client.

Gradient fixes

* Port fix for bug 7685 from pixman. Patch by Carl Worth

* Add projective version of radial gradient code.

* Make sure that all Pict*Gradient types have PictGradient as prefix, since code in various places relies on that.

    Disable SourceValidate in rotation to capture cursor.

    SourceValidate is used exclusively by the software cursor code to pull the
cursor off of the screen before using the screen as a source operand. This
eliminates the software cursor from the frame buffer while painting the
rotated image though. Disabling this function by temporarily setting the
screen function pointer to NULL causes the cursor image to be captured.

    Was accidentally disabling rotation updates in mode set.

    Setting a mode on an unrotated CRTC was causing all of the rotation updates
to be disabled; the loop looking for active rotation wasn't actually looking
at each crtc, it was looking at the modified crtc many times.

Change FocusIn/Out semantics to match Enter/Leave semantics.

Change enter/leave semantics for events with detail Notify[Nonlinear]Virtual.

Core enter/leave events with detail Notify[Ancestor|Inferior|Nonlinear] are only sent for the first/last pointer to enter/leave. Events with detail Notify[Nonlinear]Virtual are sent at all times, but not to those windows that currently have one or more pointers inside their boundaries.
Allow outputs to be explicitly enabled in config, overriding detect.

remove sources deleted in Mesa

commit 02d42f344ce020c9b84723671cb9c68d5c064933
Author: Thomas Hellstrom <thomas-at-tungstengraphics-dot-com>
Date:   Mon Apr 16 17:24:53 2007 +0200

Changes for single-entity multi-screen DRI.

The entity (device) has a locking SAREA and a master file descriptor that optionally isn't closed between server generation.

The locking SAREA contains the device hardware lock.
Each DRI screen creates an new SAREA containing the drawable lock, drawable-and private info, the drawable SAREA.
The first screen optionally shares its drawable SAREA with the
device SAREA.

Default is to close the master descriptor between server generations,
and to share the drawable SAREA of the first screen with the device locking
SAREA. Thus we should (hopefully) have full backwards compatibility.

Mesa changes to support single-device multiple screens are pending.

In AIGLX EnterVT processing, invoke driver EnterVT before resuming glx.

As the driver EnterVT function generally re-enables the hardware and prepares it for rendering, it must be called before any gl functions are called which could touch the hardware.

Add setrlimit call in -core option to make dumps occur.

Default core size limit for most environments is 0, which disables core dumps. Add code in the -core option processing path to set the core limit to the maximum value.
Alloc sprite memory in devices' devPrivates, allow undisplaying cursors.

Improve memory usage by allocating the sprite's memory only to devices that actually have a sprite and provide means to remove a device's cursor from the screen (more hotplugging, yay!).
This commit breaks ScreenRec's ABI.

Close down virtual core devices when closing all devices.

Don't explicitly init sprite for VCP, EnableDevice() will take care of that.

Adding some comments to devices.c.

Fix: pick new ClientPointer when device is closed.

XFree86: Treat evdev and vmmouse as mouse drivers (bug #10512, #10559)

When we see an evdev or vmmouse section, assume that it's a mouse, and don't add a default mouse device. This will break users who have an evdev keyboard section but no mouse, and want the mouse to get added by default.

Swap RRScreenChangeNotifyEvent dimensions when the screen has one crtc and it's rotated.

RandR 1.1 clients expect the size fields in this event to be the unrotated dimensions of the screen. This behavior is "weird", but that's the way the old code worked so we need to be bug-compatible with it.

Split the xserver/fb/fbcmap.c file into two files.

Now, fbcmap_mi.c contains the fb functions which just wrap mi functions.
Previously, these were in fbcmap.c and compiled when XFree86Server was defined.
Now, clients of fbcmap should either use fbcmap.c or fbcmap_mi.c and not worry
about setting the XFree86Server symbol.

In dmxBackendMouGetInfo() initialize the info->minval[], maxval[] arrays to the size of the backend display.

It seems that the changes to X input exposed a problem that wasn't detected before. The axis clipping code in GetPointerEvents() uses those limits to constrain the pointer's coordinate range. The max was zero so the pointer couldn't move.

Checkpoint DMX updates: things are working much better now, but still not 100% right.

Use new dmxCoreMotion2() function which enqueues motion events with GetPointerEvents()/mieqEnqueue().
The clipAxis() code in GetPointerEvents() is causing some grief. The limits seem to have always been (0,0) according to the original calls to InitValuatorAxisStruct() in dmxininputinit.c.
Terrible hack for now: Call InitValuatorAxisStruct() with hard-coded max values of 1280 (my screen width).

Make xf86glx.c unaware of Mesa internals

Use newly added XMesaCopyContext() and drop the GlxSetRenderTables() call for Xgl, as this is now done inside XMesaGetCurrent(). This leaves xmesaP.h but only for the declarations of the three XMesa/XFree86 functions. Also, GlxSetRenderTables() stays but is only used in hw/xgl/glxext/.

Also drop xf86glxint.h, no longer used.

dix: Fix wrong cursor refcount.

Calloc cursor struct to ensure devPrivates are zeroed out and don't increase the refcnt for devices automatically when allocating a new cursor. Use new DeviceIsPointerType() to detect if device is a pointer before device has been activated and can thus be identified and set up grab functions accordingly. This way we can increase the refcnt when we get a pointer grab.

GL: Update for Mesa changes
Added s_fragprog.c to fix the build.
Enable Composite by default now that it disables itself in the known bad cases.

Disable composite when Xinerama is active.

It will likely take a decent bit of work to make that work right.

Disable Composite when the screen's visual is pseudocolor.

Rendering fails badly in this case, and I don't care enough to fix it.

Refuse to initialize Composite if Render is not present.

Composite relies on the presence of Render, in particular for the automatic compositing.

Move libcw setup to the only renderer requiring it (XAA).

Additionally, protect libcw setup behind checks for Render, to avoid segfaulting if Render isn't available (xnest).

The previous setup was an ABI-preserving dance, which is better nuked now.
Now, anything that needs libcw must explicitly initialize it, and miDisableCompositeWrapper (previously only called by EXA and presumably binary drivers) is gone.

Make pending properties force mode set. And, remove AttachScreen calls.

Yes, two changes in one commit. Sorry 'bout that.

The first change ensures that when pending property values have been changed, a mode set to the current mode will actually do something, rather than being identified as a no-op. In addition, the driver no longer needs to manage the migration of pending to current values, that is handled both within the xf86 mode setting code (to deal with non-RandR changes) as well as within the RandR extension itself.

The second change eliminates the two-call Create/AttachScreen stuff that was done in a failed attempt to create RandR resources before the screen structures were allocated. Merging these back into the Create function is cleaner.

dix: Move sprite initialization/pairing from ActivateDevice to EnableDevice.

    Evdev adds previously hotplugged devices on its own when rescanning, and ActivateDevice does not get called for those devices. Sprites need to be initialized or paired before the device gets started, so the safest place to do so is EnableDevice (which actually does get called by the evdev driver).

Remove extra (and wrong) I2C ByteTimeout setting in DDC code.

The DDC code sets the I2C timeouts to VESA standards, except that it had an extra setting of the ByteTimeout value which was wrong (off by a factor of 50). Removing this should help DDC work on many more monitors. Note that the Intel driver duplicated these settings, along with the error. Yay for cult and paste coding.

Correct ref counting of RRMode structures

RRModes are referenced by the resource db, RROutput and RRCrtc structures. Ensure that the mode reference count is decremented each time a reference is lost from one of these sources. The missing destroys were in RRCrtcDestroyResource and RROutputDestroyResource, which only happen at server reset time, so modes would be unavailable in subsequent server generations.

Eliminate RRModeRec devPrivate field.

The xf86 mode setting code was mis-using this field to try and store a pointer to a DisplayModeRec, however, each output has its own copy of every DisplayModeRec leaving the one in in the RRModeRec devPrivate field pointing at a random DisplayModeRec.

Instead of attempting to rectify this, eliminating the devPrivate entirely turned out to be very easy; the DDX code now accepts an arbitrary RRModeRec structure and set that to the hardware, converting it on the fly to a DisplayModeRec as needed.

Add support for user-defined modelines in RandR.

The RandR protocol spec has several requests in support of user-defined modes, but the implementation was stubbed out inside the X server. Fill out the DIX portion and start on the xf86 DDX portion. It might be necessary to
add more code to the DDX to insert the user-defined modes into the output mode list.

commit 9562b6abe1da566cf73a08c4f4c4339fb67fbc71
Author: Keith Packard <keithp@neko.keithp.com>
Date:   Thu Mar 15 10:50:45 2007 -0700

  Allow xf86_reload_cursors during server init.

  xf86_reload_cursors is supposed to be called from the crtc mode setting
  commit hook; as that happens during server initialization, check for this
  case.
Set the RandR version returned, rather than just passing the proto's version.

Fix calculations in x86 emulator for the long long case (Andreas Schwab).

Create driver-independent CRTC-based cursor layer.

This moves most of the cursor management code out of the intel driver and into the general server code. Of course, the hope is that this code will be useful for other driver writers as well.

Check out xf86Crtc.h for the usage information, making sure you add the needed hooks to the crtc funcs structure for your driver.

Handle non-zero origin rotated crtc. Damage crtc area on re-rotate.

Box transformation from source to dest area was broken, leaving the wrong
areas painted when the crtc origin was non-zero.

When rotating from left to right, the pixmap doesn't get reallocated, and so
no damage was left in the pixmap from xf86RotatePrepare. Separately damage
the whole crtc area when this occurs to repaint the area.

Add a canGrow argument to xf86InitialConfiguration.

canGrow indicates to the DDX that the driver can enlarge the desktop via the
xf86_config->funcs->resize hook. If so, xf86InitialConfiguration will set
virtual[XY] to match the configuration it chooses and will leave the crtc config
size ranges alone. If FALSE, it will bloat the screen to fit the largest probed
mode and also set the crtc config max size to limit the desktop to the initial
virtual[XY] size.

Add a screen resize hook to xf86CrtcConfigRec.

This hook is called when the DDX needs to resize the screen. The driver is
responsible for changing virtualX and virtualY, along with any other related
screen properties (devPrivate.ptr, devKind, displayWidth, etc.).

Use the size range from the crtc config instead of randrp->virtual[XY] when
reporting the min and max screen sizes to the DDX.

Don't set subpixel order during startup; the screen won't be ready.

in xf86CrtcSetMode, scrn->pScreen will be NULL during server startup time,
so don't try to set the subpixel order. subpixel order will be set in the
randr initialization anyways.

Enable startup-time rotation; change rotation pixmap creation API.

Add monitor "Rotate" option taking one of "normal", "left", "inverted" or
"right". However, because initial mode selection is made before the screen
is completely initialized, we cannot create the shadow pixmap object at this
point. Pending the shadow pixmap creation until the block handler.

Note that this code is not completely functional yet.

More build fixes / updates for XDarwin:
  quartz/cr: "Cocoa Rootless" support (deprecated in favor of xpr?)
  quartz/fullscreen: Fullscreen support using Xplugin (not yet functional)
kdrive/ephyr: fix keysym type confusion once and for all

Take keysyms in as an XID in hostx_load_keymap() and explicitly convert them to CARD32 for loading into the server. Fixes Xephyr on AMD64, wa-hey.

kdrive: delete input debugging, yet again...

I have no idea how this keeps on coming back.

Remove nasty function pointer type from DevUnion, return to documented type.

Kludge around duplicate code added in hw/xfree86/modes.

Code added in hw/xfree86/modes came from the server-1.3-branch. Portions of this code had previously been integrated into xf86Mode.c and edid_modes.c.

To preserve hw/xfree86/modes as much as possible, the duplicate code from the other files has been disabled; a more careful review would figure out
where that code actually belonged.

Report correct RandR 1.0 sizeID. Report correct subpixel order.

RandR 1.0 sizeID must be computed the same way every time, so when reporting
it in the ScreenChangeNotify event, just construct the usual 1.0 data block
and use that.

subpixel geometry information can be computed by looking at the connected
outputs and finding any with subpixel geometry and using one of those for
the global screen subpixel geometry. This might be improved by reporting
None if more than one screen has information and they conflict.

Add an RDTSC implementation to the x86 emulator.

This instruction is being used in some debug VBIOSes. This implementation
doesn't even try to be accurate. Instead, it just increments the counter by a
fixed amount every time an rdtsc instruction in encountered, to avoid divides by
zero.

Bug #9680: Remove bogus blank length limiting in xf86SetModeCrtc().

Our modes typically come from EDID or default modes, and when the monitor asks for a specific mode, deciding to tweak it usually results in incorrect display. And if the user is specifying a mode by hand, tweaking it then is still pretty rude.

Require glproto >= 1.4.8 for GLX.

It builds against 1.4.7 as well, but it hardcodes the GLX_EXT_tfp tokens that were finalized in 1.4.8, so GLX_EXT_tfp breaks if the client side was built against an older glproto. This will hopefully alert people to rebuild other
components (in particular Mesa) against the new glproto as well.

Events and internal data structures need to be updated whenever the physical or pixel size of the screen changes. The code was ignoring the physical

Use RRScreenSetSizeRange in 1.0 compat. Check RRGetInfo for error.

The RRScreenSizeSetRange function is used externally for 1.2 API drivers,
but can also be used in the 1.0 compatibility code. This also ensures that
the right changed bits are set so that clients are correctly notified when
the range changes.

RRGetInfo can return an error, use that to return BadAlloc to clients
instead of blindly going on with various requests.

fbdevhw: Override RGB offsets and masks after setting initial mode.

fbdevhw: Use displayWidth for fbdev virtual width when appropriate.

The fbdev API doesn't allow setting the pitch explicitly, so we have to set
the virtual width to the pitch we're using for drawing. This fixes corruption
after changing the virtual width with RandR.

commit c385bcbf0bde38dd869f7065f859dd4b4126f5690

fbdevhw: Fix some issues with the previous commit.

Fix a TRACE_ENTER typo and only update the internal fbdev mode state cache
after actually setting a mode.
fbdevhw: Consolidate modeset ioctl calling, report failure if it modifies mode.

The fbdev API allows the driver to 'accept' modes it doesn't really support by modifying it to the nearest supported mode. Without this check, e.g. vesafb would appear to accept all modes, even though it actually can't set any modes other than the bootup mode at all.

Switch the default migration heuristic for EXA to "always".

This has been what has been used the most successfully post-damagetrack. The current thinking is that:
1) We should be able to accelerate basically everything. So we don't need to try to migrate trees of pixmaps permanently out of framebuffer to speed CPU drawing up.
2) Migration is cheaper in the thrashing case, so we don't want to go to a lot of effort to try (and fail badly) to find a working set.

Export exaMove{In,Out}Pixmap().

dix/events: take screen number, not pointer, in PostSyntheticMotion Since we were using PostSyntheticMotion incorrectly anyway, update the declared API to match.
os: test for userland, not kernel

It doesn't matter which kernel we're running on, the relevant part when dealing with includes is what our userland is.

commit 670bbb87310503fccc17203ceccfa6f4f2f5db51d2
Author: Keith Packard <keithp@neko.keithp.com>
Date:   Wed Dec 13 01:21:32 2006 -0800

    RandR 1.2 rotation code must adjust width/height.

    Mode lines reflect the monitor mode, not the projected size into the frame
    buffer. Flip width/height around so that the dimensions are oriented
    correctly.

    RandR 1.0 refresh rates unscrambled. SetScreenConfig uses RRCrtcSet right.

    RandR 1.0 refresh rates were scrambled when working with a 1.2 driver that
    returned sizes in a mixed order. SetScreenConfig was treating RRCrtcSet as
    returning an RandR status instead of a Bool.

commit 628c7daeb12713d28e85e6b49fa037a7748dff83
RandR: config time updates when hardware config changes.

The config time in the RandR protocol reflects when the hardware state has changed. It was getting changed anytime the driver changed the usage of the hardware as well.

RandR mode list needs both output and crtc modes.

When an output no longer reports the current mode, it must still be included in the list advertised by the X server. Walk the crtc to ensure it is included.

Add RRInit function to create resource types for RR objects.
To allow RandR objects to be created before the screen object exists, the resource types must be registered with the resource database. A driver wishing to create RandR objects must call RRInit before doing so.

Also, fix a segfault when setting Output data before it is associated with a screen.

commit ec77a95a02329a2ee3a94d7de9d2a234aeccb9ca0
Author: Keith Packard <keithp@mandolin.keithp.com>
Date:   Wed Nov 8 21:36:35 2006 -0800

Allow RandR objects to be created before the associated ScreenRec.

xf86 drivers need to create RandR object in the PreInit stage, before the ScreenRec is allocated. Changing the RandR DIX code to permit this required the addition of functions that later associate the objects with the related screen.

An additional change is that modes are now global, and no longer associated with a specific screen. This change actually makes mode management cleaner as there is no more per-screen list of modes to deal with.

This changes the RandR 1.2 ABI/API for drivers.

Avoid dereferencing sprite.screen when Xinerama is not running. (#8925)

With Xinerama support built into the X server but not in use,
sprite.screen is NULL and yet the SyntheticMotion macro would dereference it. Avoid that by just passing sprite.screen to PostSyntheticMotion which can then dereference it when Xinerama is enabled.

Also, define PostSyntheticMotion in dixevents.h and include dixevents.h in getevents.c

Do not map full 0-1MB legacy range

If we're mapping something in the "legacy range" (0-1Mb), we shouldn't expand the requested range to the entire 0-1Mb range. Typically this is for mapping the VGA frame buffer, and some platforms support mmap of the frame buffer but not the entire 0-1Mb range.

For example, HP sx1000 and sx2000 ia64 platforms can have memory from 0-0x9ffff, VGA frame buffer from 0xa0000-0xbffff, and memory from 0xc0000-0xfffff. On these platforms, we can't map the entire 0-1Mb range with the same attribute because the memory only supports WB, while the frame buffer supports only UC. But an mmap of just the frame buffer should work fine.

Fixing mach64 driver bailing out on ia64

Mach64 driver bails out on ia64 because it cannot map device memory. It turns out that some bogus and unneeded code attempts to find the root bridge of the device and fails to do so properly as there this host-to-pci bridge is not existant. This code has been around for years although it completely unclear what it had been intended for. Fixing this by eliminating the bogus code.

GetTimeInMillis: simplify monotonic test
We don't actually need to get the CPU clock ID, which means we don't need
the monotonic_usable test. Since there's now only one branch, the
compiler will treat that as likely, so we don't need xproto 7.0.9 anymore.
The fallback through to gettimeofday() is preserved.

GetTimeInMillis: spuport monotonic clock
Add support for CLOCK_MONOTONIC from clock_gettime, and use that in
GetTimeInMillis() if available, falling back to the old gettimeofday() implementation.
This is _slightly_ faster on some 64-bit architectures, and _slightly_ slower on others (though barely measurable).

    xkb: fix virtual modmap size computation
    Compute virtual modmap size bounded by nVModMapKeys-1, rather than
    nVModMapKeys.

    This is sort of a best guess. The other way seems a little more
    logical, but also leads to segfaults pretty quickly if you hammer
    GetMap hard enough. So let's try this one.

    xkb: make sure we set the map on the right device, not necessarily core
    Forgot that all XKB requests took a device spec: the comparison of
    'if working on the core keyboard, does this device send core events; or,
    is this device the core keyboard?' was broken. Instead, what we want is
    'if working on the core keyboard, does this device send core events; or,
    is this device the one we're working on?'.

Just unref the connection instead of explicitly closing it (thanks, Rob McQueen).
Add a commented-out unregister_object_path call: unfortunately, when we call it, libdbus segfaults. But if we don't unregister the path, we can't register it again. So regenerations are broken either way, but a little less violently like this.

dix/devices: add devices in proper forward order
Add devices in forward order with the normal linked list convention. Previously, AddInputDevice would add all the devices in reverse order to off_devices, before they were added again in reverse order to devices with EnableDevice.
This just makes both work in forward order, which provides the ordering as you'd expect when hotplugging devices (i.e. adds them to the head, not the tail).

mipointer: take device arguments, split miPointerAbsoluteCursor
Update mipointer API to take a device argument to (almost) all functions,
and split miPointerAbsoluteCursor into a couple of separate functions.
Remove miPointerAbsoluteCursor call from mieq, as we now deal with it in

Make miPointerSetPosition (successor of miPointerAbsoluteCursor) take
pointers to x and y, so it can return the clipped values.
Modify callers of miPointer*() functions to generally use the new
functions.

Steal Xinerama code from SiS driver. Add missing files.

Provide a Xinerama implementation when DIX version isn't enabled. This version exposes each crtc as a separate 'screen' and reports the size of that patch. The extension also sends ConfigureNotify events to the root window whenever crtcs change so that applications will re-fetch xinerama information. This actually works for metacity.

Always believe the monitor when it reports a reduced-blanking mode.

CVT reduced blanking modes are typically only seen on digital connections to
LCDs, but there are some monitors that report them as supported over the
VGA connector too, which is perfectly legitimate, electrically speaking.

In xf86MatchPciInstances, fail gracefully when there's no PCI device at all.

This allows the autoconfig logic to fall through sanely on non-PCI machines,
which importantly includes Xen virtual machines.
Prefer driver-provided modes when matching name strings to modelines.

Well, kinda. Strictly we prefer M_T_BUILTIN strongest since those are modes where the driver has said it absolutely can't do anything else (VBE). Then we look for user-defined modes, ie, modelines from the config file. Then we consider modes reported by the monitor via EDID. Finally if nothing has matched yet we consider the default mode pool.

Within each of the above-mentioned classes, modes with the M_T_PREFERRED bit take priority over other modes in the same class.

This logic ensures that the timings sent to the monitor exactly match the timings it reported as supported, which occasionally don't match the numbers you might get for that mode from CVT or GTF.

Mark EDID modes as driver modes. Infer virtual size from driver modes.

This allows the server to guess an appropriate initial virtual size and resolution. The heuristic is to select the largest driver-reported mode that matches the monitor's physical aspect ratio. We revalidate this estimate after mode validation, since we may have filtered away all modes that would fill that size.

Also, the EDID preferred timing is now marked as M_T_PREFERRED as well.

Attempt to add the 'mouse' driver in more situations.

Always add a mouse driver instance configured to send core events, unless a core pointer already exists using either the mouse or void drivers. This handles the laptop case where the config file only specifies, say, synaptics, which causes the touchpad to work but not the pointing stick. We don't double-instantiate the mouse driver to avoid the mouse moving twice as fast, and we skip this logic when the user asked for a void core pointer since that probably means they want to run with no pointer at all.

Fix up EDID blocks where the max pixclock exceeds the preferred mode clock.

Base EDID only lets you specify the maximum dotclock in tens of MHz, which is too fuzzy for some monitors. 1600x1200@60 is just over 160MHz, but if the monitor really can't handle any mode at 170MHz, then 160 is more correct. Fix up the EDID block before the driver can see it in this case, so we don't spuriously reject modes.

commit b3a3020fd018df8bc5a8193d36e1a1c7ae8af8ba
Author: Jesse Barnes <jbarnes@nietzche.virtuousgeek.org>
the new PCI mapping routines are broken on sparc64 (in fact they look broken for any 32 bit X server running on a 64 bit kernel) so #ifdef them out for now. the PCI rework tree will make all this crap go away, so I think we can tolerate the extra #ifdef for the next release.

Fix problems with vertex program protocol

There were two sets of bugs in the vertex program (ARB and NV)
protocol. First, several of the ARB functions were missing the
'doubles_in_order="true"' annotation. Second, after the ARB decided
that glVertexAttrib*ARB functions must not alias fixed-function state
for GLSL, Nvidia re-assigned GLX protocol opcodes for
glVertexAttrib*NV (circa September 2004). For some reason gl_API.xml
was never updated to reflect this, and the updated version of the
GL_NV_vertex_program spec never made into the registry.

This is just a server-side regeneration from gl_API.xml version 1.68.

Finish support for GL_ARB_texture_compression.

Fill in __glXDisp_GetCompressedTexImageARB and __glXDispSwap_GetCompressedTexImageARB to finish support for GL_ARB_texture_compression. With this extension (and the related compression extensions), the server-side GLX supports all of the protocol for GL 1.4. w00t!

The bad news is that this has received only minimal testing, and Mesa does not contain any good tests for GL_ARB_texture_compression.

Add LOCALCONN to dix-config.h template for xtrans
Convert protocol decode tables for Render and RenderLarge to use nice, compact N-way search trees generated by scripts in Mesa.

Fix __glXDispatchInfo::dispatch_functions and __glXDispatchInfo::size_table. dispatch_functions had the const in the wrong place, and size_table was declared as an array of two pointers to int_fast16_t instead of a pointer to an array of 2 int_fast16_t. cdecl to the rescue!

Rename __glXDrawArraysSize to __glXDrawArraysReqSize. This makes its name match the pattern of all the other functions in __glXRenderSizeTable.

Re-generated files after a fix to glX_API.xml (in Mesa).

Convert protocol decode tables for Single, VendorPrivate, and VendorPrivateWithReply message to use nice, compact N-way search trees generated by scripts in Mesa.

The Render protocol decode tables are next...

Make sure Composite is never enabled for Xnest.

Sanitized glxdri’s Block/Wakeuphandler calling.

__glXDRIleaveServer() and __enterServer() used to call DRIDoBlockHandler (resp DRIDoWakeupHandler) directly. They are now calling DRIBlockHandler (resp DRIWakeupHandler) to account for driver specific block/wakeup hooks.

Refactor xf86CheckPciSlot to use xf86GetPciEntity.

Add framebuffer access wrapper infrastructure.

Create fbPrepareAccess macros to call into the driver to set up the wfbReadMemory and wfbWriteMemory pointers. Call these from fbGetDrawable and fbGetStipDrawable.

Add the READ and WRITE macros, which expand to simple memory accesses for fb, and calls through the function pointers for wfb.

Add fbFinishAccess macro to give the driver an opportunity to clean up. Add calls to this in the appropriate places.

Date: Mon Jul 24 13:33:34 2006 -0700
Global s/xf86MapDomainIO/xf86MapLegacyIO/. Let's call a duck a duck, okay? Since xf86MapLegacyIO is called from only one place, cut the parameter list down to the one parameter that actually conveys some information: the one that gives a PCI device. Change from using a PCITAG to a pci_device.

ScanPciDisplayPCICardInfo now uses pci_device interface for PCI
scanning. Log messages simplified to make the code shorter and less
convoluted. ScanPciDisplayPCICardInfo is now void since it was only
called from one place with a constant parameter.

Bug #7381: Coordinates get wrapped in accelerated line drawing on pixmap

XAAPolylinesWideSolid was adding the drawable origin onto each element in the pPts array. Since the values got stored back into the pPts array, they got truncated to 16 bits, causing the overflow I saw. This patch avoids storing the coords back into the pPts array (and actually reduces the size of the code too :). Now the 32-bit sum of coords + origin doesn't get truncated to 16 bits, and the problem is solved.

it changes.

Unbreak unbreaking the loader. Re-add the symbol reference lists so that the linker will include everything it's supposed to. This is a terrible solution, but ld semantics don't let you do anything better.

Move probe_devices_from_device_sections,
add_matching_devices_to_configure_list, and check_for_matching_devices

a single place in xf86Init.c, so it makes sense for them to live
there. They were originally in xf86Helper.c because they evolved out
another function that was already in that file.

Improve EXA fallback debugging output to include the locations of pixmaps. This is being used in tracking down recent compositing performance regressions.

commit 83b061776a57025076fc26d6d01fe2e049c2243b
Author: Eric Anholt <anholt@freebsd.org>
Date:   Thu Apr 27 19:17:34 2006 +0000

Add trivial PolySegment acceleration for 0-width horizontal/vertical lines, which still happen somewhat frequently and were cluttering up my fallback debugging output. x11perf says it's a major performance win in those cases (though probably irrelevant), and it passes Xlib9.
In drawing glyphs, shortcut our way to exaComposite instead of going through the whole CompositePicture stack and doing things like computing damage over again. This is a sizeable win for text drawing with a compmgr. Also avoid calling down into the server for dealing with the scratch pixmap when we are able to do UploadToScreen successfully and never need it.

Add a helper for the Component Alpha Over case, which breaks the operation down into an OutReverse and an Add. Turn off the fallback to software glyphs when component alpha, now that we expect all (new) drivers to be able to support it. Also, make Xephyr fall back in the CA Over case to exercise this code. This speeds up my rgb24text and ls -lR in gnome-terminal by a factor of 5.

Bug #6751: Use the Linux PCI ROM interface on Linux properly. The old domain code, still modified BARs not a good idea, Just talk to sysfs, if 0 read, fallback to old methods.

Bug #6750: This patch detects Intel bridges that are transparent but aren't reported as such. From the Linux kernel fixups. This patch also removes the reserved BIOS area from the area to allocate resources in.

Improve the migration debugging output.
Fix a bug in the intersection computation that could conceivably cause incorrect results to be returned (but would probably usually be over-conservative).

commit 5d00859c6e7d4b7ebce56f438ec4993334de2328
Author: Eric Anholt <anholt@freebsd.org>
Date:   Tue Apr 25 23:56:17 2006 +0000

Bug #4668: Check if the lists of glyphs don't have any intersecting glyphs, and if they all have a maskFormat matching the format of the actual glyphs. If so, we can avoid the temporary pixmap for accumulating glyphs, which reduces the number of operations done, and makes it easier on the migration system. This fixes some significant performance issues, particularly with subpixel antialiasing. Note that it does increase the amount of damage computation which is done, so is not always a win with a compositing manager running.

Missed in previous commit: Add a new migration scheme, called "Smart" for
lack of a better name. This one behaves somewhat between Greedy and
Always. It moves in if we can accelerate, unless the destination is
clean and shouldn't be kept in framebuffer according to the score, in
which case we migrate out (and force-migrate anything where migration
is free). This should help fix lack of acceleration for drivers without
UTS since removing exaAsyncPixmapGCOps, and has removed one performance
trap with Radeon I'd noticed. It is the new default.

commit 2387bfa5ff5ed82f3f732fb9152c1ea95850a914
Author: Aaron Plattner <aplattner@nvidia.com>
Date:  Fri Apr 7 18:56:04 2006 +0000

  Bump the ABI versions. Due to Glyph privates and the XV update below, the
  video driver ABI needs to be bumped to 1.0. The rest of the ABI minor
  versions were bumped to include the LoaderGetABIVersion function.
  Add a DrawablePtr argument to the XV hooks. This allows drivers to determine
  that the target window is redirected and draw to the appropriate place.

Author: Eric Anholt <anholt@freebsd.org>
Date: Fri Mar 31 19:41:28 2006 +0000

Add an option to EXA for the DDX to request that EXA hide the pixmap's
devPrivate.ptr when pointing at offscreen memory, outside of
exaPrepare/FinishAccess(). This was used with fakexa to find (by NULL
dereference) many instances of un-Prepared CPU access to the
framebuffer:
- GC tiles used in several ops when fillStyle == FillTiled were never
  Prepared.
- Migration could lead to un-Prepared access to mask data in render's
  Trapezoids and Triangles
- PutImage's UploadToScreen failure fallback failed to Prepare.

commit 759033703ce17b20d57756206f48a7ae410a50d1
Author: Eric Anholt <anholt@freebsd.org>
Date:   Thu Mar 30 21:44:36 2006 +0000

    Remove the exaAsyncPixmapGCOps mostly-unaccelerated ops vector, and always
    plug in the accelerated one, even if the destination pixmap is
    currently offscreen. This was a leftover from when kaa originally got
    accelerated offscreen pixmap support, and its only conceivable use was
    to avoid a little overhead on ops to in-system pixmaps that weren't
    going to get migrated. At this point, we probably care more about just
    getting everything accelerated that we easily can, which should happen
    with the new migration support.

Author: Eric Anholt <anholt@freebsd.org>
Date:   Thu Mar 30 21:25:43 2006 +0000

    Don't do an extra fallback path for CopyWindow while swappedOut, since
    exaCopyNtoN takes care of the fallback anyway, and we don't care about
    the performance of this path.
Add a dependency on EXA, so it rebuilds when the library does. The manual indicated I shouldn't do this, but experience indicates I should.

Mark the ARGB FBConfig as nonconforming to prevent drivers and apps from falling over.

Bug #2986: Add PutImage acceleration for the ZPixmap, planeMask =~
FB_ALLONES, bitsPerPixel >= 8, GXcopy cases. With the radeon driver on
my machine, this gives about 10% speedup in PutImage
10x10 and 500x500, and 40% speedup for 10x10 ShmPutImage, up to 65%
improvement in 500x500 ShmPutImage. Also fixes a crasher in GetImage
that slipped in at the last minute.

commit 3cf46cc1e32efc0e4be1d88be111ba0438e0f021
Author: Eric Anholt <anholt@freebsd.org>
Date:   Thu Mar 30 05:15:58 2006 +0000

Add an UploadToScreen implementation, for testing PutImage support, and
make the DownloadFromScreen more robust.

commit e799dd68e2bd0fa8ac3c344111fb12e1f32d4c10
Author: Eric Anholt <anholt@freebsd.org>
Date:   Wed Mar 29 22:25:17 2006 +0000

Bug #2986: Add acceleration of GetImage using DownloadFromScreen for the
ZPixmap, planeMask =~ FB_ALLONES, bitsPerPixel >= 8 case. I'm pretty
convinced that this is the only case that we care about at all. Tested
with xwd -root and xwd on a gnome-terminal, in a composited environment
or not.

Author: Eric Anholt <anholt@freebsd.org>
Date:   Wed Mar 29 22:03:18 2006 +0000

Add a DownloadFromScreen implementation, used for testing GetImage
acceleration, and set the migration scheme to Always on init (since
this is all for testing, and Always should make migration happen more
frequently than Greedy).

Change EXA so that exaMoveOutPixmap() retains the framebuffer copy of the pixmap, and damage is tracked so that a later exaMoveInPixmap won't result in an upload if no upload is necessary. This will likely improve the performance of the "Always" migration scheme significantly, and is a step in the path to more exact damage tracking between framebuffer and system memory.

 Fix DRIExtensionInit() to not register callbacks when it hasn't been initialized for the current server generation. Fixes a problem where it would use stale private index and blow up in colorful ways if no driver called DRIScreenInit() on the second generation (which happens due to a bug in radeon that I'll fix separately). Note: clearing the index in DRIReset() wouldn't work as DRIReset() is called before the CloseScreen() chain.

 Add a new migration scheme, "always", which will move pixmaps to their desired location always (unless they don't fit in FB, in which case they all get moved out for software rendering). The default remains as before, but can be controlled by the MigrationHeuristic xorg.conf option (which is intentionally not documented, as it may be short-lived). This is part of the exa-damagetrack work, which appears stable in testing with fakexa, unlike the work as a whole.

Add more doxygen documentation, including notes on WaitMarker() and MarkSync() that I noticed were needed while reading the VIA driver.

commit 693e42114f1127528448126d78a5209dd1198d8d
Move migration logic to a new function, exaDoMigration(). This is largely a
manual conversion to allow for different migration schemes to be
implemented reasonably, but does include some minor improvements such
as accounting for pinned pixmaps not being acceleratable, and for our
current GetImage and GetSpans not being accelerated.

Pull code for getting the (0,0) pixel from a pixmap out to a separate
function, since it gets repeated (with bad error handling, in one
case).

Bail out early if screen doesn’t support DRI.

Updated ChangeLog for my latest composite and xfixes changes.

First batch of AIGLX fixes from David Reveman.
Add getter for Mesa provider.

Fix build when AIGLX is false.

Improve doxygen formatting, and attempt to clarify the 1:1 ratio of successful PrepareCopy()s to DoneCopy()s.

Make exaCopyNtoNTwoDir() call DoneCopy() at the end of each string of consecutive Copy() calls (rather than exactly once at the end of the function).

If fakeX is enabled, create a larger buffer in the Ximage, but keep the same width/height for front-buffer drawing. The fakeX code then uses this extra space for offscreen pixmaps. Note that this tones down the absurdity of fakeX's offscreen pixmap alignment requirements (odd alignment is too weird, so stick with "24", which is still strange but exists out there). It also fixes a couple of bugs in the fakeX implementation revealed by using offscreen pixmaps.

Move the exaDrawableDirty in exaPrepareAccess to exaFinishAccess, which is after the drawing is done. Previously, a failed PrepareAccess could have migrated and cleared the dirty flag before the damage was ever done.

Commit changes missed in last commit (mis-typed path and didn’t notice): Do
a first pass of doxygen documentation of EXA. This removes the
 corresponding pieces of exa-driver.txt, which were becoming stale.
Hopefully the documentation will stay much more up-to-date this way.
Many thanks to jbarnes for writing exa-driver.txt which was used a lot
in writing this documentation.

commit 2822ebc1fb2271844e7ae10c3629aaa940ae402
Author: Eric Anholt <anholt@freebsd.org>
Date: Thu Mar 9 06:04:07 2006 +0000

Rearrange EXA driver structures so that there's a hope of maintaining ABI when extending the driver interface. The card and accel structures are merged into the ExaDriverRec, which is to be allocated using exaDriverAlloc(). The driver structure also grows exa_major and exa_minor, which drivers fill in and have checked by EXA (double-checking that the driver really did check that the EXA version was correct). Removes exaInitCard(), which is replaced by the driver filling in the rec by hand, and the exaGetVersion() and related EXA_*VERSION which are replaced by always using the XFree86 loadable module versioning.

render/picture.c Initialize the format of a source picture to PICT_a8r8g8b8. Fixes a failure in the gradients test of rendercheck. In the long term we could do better by setting the format to something without alpha whenever the gradient doesn't contain colors with alpha. This triggers a reduction of the over operation to a pure source operation.

Author: Eric Anholt <anholt@freebsd.org>
Add appropriate MIT license. Oops.

Add a new flag to ephyr, "-fakexa", which turns on an EXA acceleration implementation that calls fb to get its work done. The purpose is to have a trusted EXA driver for use with testing changes to the core of EXA. However, fakexa has not received much testing yet, lacks offscreen pixmaps support, and doesn't reliably provide garbage when EXA doesn't get its syncing right. All of these should be fixed soon.

Remove stale EXA files, which failed to get removed during the move to top-level, somehow.

Fix cvt -r check again. CH7011 TV encoder had 800x600 PAL hit the check.

Eliminate unused PCI BIOS reading functionality. The old code used several function pointers to implement a level of flexibility that was never used. The code also had unused support for extracting a single image type from a larger expansion ROM.
Fix the spelling of PCI_BIOS_OPEN_FIRMWARE.
Fix a couple errors in #ifdef debug code.
These changes have been tested on x86 and x86-64 Linux.

Fix an occasional crash on VT switches: the server would save a pointer to
the current cursor when disabling FB access and would try to restore
that cursor when re-enabling. However, that cursor might have been
destroyed in between. This fixes it by updating the saved cursor
pointer when a cursor is set and vtSema is FALSE.

Move EXA implementation up to the top level and remove its XFree86 dependencies. It was nearly abstract enough already to be used by multiple DDXes. This will be useful for EXA development through providing a fake acceleration implementation within Xephyr, so that testing can be done on new EXA code without worrying about buggy drivers.

Rearrange and rename EXA code to be a bit more logically organized. Also
removes a little bit of debugging leftovers. Summary:
exa.c -> exa.c (miscellaneous code) exa_accel.c (all acceleration code)
exa_migration.c (migration logic) exaasync.c -> exa_unaccel.c (software
fallbacks) exapict.c -> exa_render.c (render extension stuff)
exaoffscreen.c -> exa_offscreen.c exaPriv.h -> exa_priv.h

Fix the AC_TRY_RUN for sys/linker.h which had no hope due to lacking a
main() to instead use a nice AC_CHECK_HEADERS that works. Also, fix the
nearby SYSV IPC check which was lacking an argument and giving bogus
results (it's "AC_TRY_LINK(includes, main, yes, no)").

  Add an additional meaning to the "dirty" flag. Now, if !dirty && !area, the
  pixmaps's contents are undefined, so we won't need to upload the
  undefined contents in MoveIn. Use the ExaCheck* for async ops as well,
  so that dirty is always tracked. While the performance impact for my ls
  -IR test was not significant (though the avoiding-upload path was being
  hit), it's likely to be important for the upcoming Get/PutImage
  acceleration from ajax.

  Set default font path to match the default in the monolith so fonts are
  actually found.
Install Xorg & xorg.conf man pages even when not building docs

Add sysv and sco os-support subdirs and add simple EXTRA_DIST Makefile.am in those dirs. Remove unsupported os-support subdirs (bsd, dgux, hurd, nto, os2, pmax, qnx4) that have no maintainer and we don't dist.
Add Options.

remove reference to non-existent agpgart.h

Add XTRAP_LIB to XPRINT_EXTENSIONS to fix xprint build when xtrap is enabled.

Require glproto >= 1.4.1 if building DRI with GLX. This fixes a build failure on a number of hyperpipe functions.

Remove reference to XF86config-4. Add xorgcfg(1) to See Also list.

Set substitutions needed in xorgconfig man page.

Remove an RM line that appears unnecessary and was breaking the build at
xf86DefModeSet.c with FreeBSD make, where RM was undefined. While here,
make the build of xf86DefModeSet.c depend on its sources, so it'll
rebuild properly, and make it a normal CLEANFILE rather than a
DISTCLEANFILE, since the intention seems to be to build it at the
user's build time.

commit 12994b9afbc18bfb7209f677abf673415c9ddf15
Author: Benjamin Herrenschmidt <benh@kernel.crashing.org>
Date:   Tue Oct 11 23:11:37 2005 +0000

Fix a couple of bugs in the offscreen allocator. One mostly harmless was causing our search loop for evictable blocks to possibly skip a good candidate, and another was the allocator would occasionally use area->offset as if it was the base of the pixmap, while for a pixmap that is not in available state, it is not. This caused some funny miscalculation leading to overlapping pixmaps and accesses beyond the end of the framebuffer. To make things clearer, I renamed save_offset to base_offset, made sure it's the one used everywhere in the allocator, and only align "offset" for the client at the end of exaOffscreenAlloc().

Don't try the accelerated glyphs path for component-alpha text (which I
don't expect drivers to be able to accelerate without exa assistance).
Instead, drop back to plain old miGlyphs for a 62.5% +/- 1.5% reduction
in runtime of my ls -IR test (n=5) with component alpha. While a
reasonable approach would seem to be making a better test to see
whether the entire path would be accelerated and force migration
appropriately, my attempt at this made the situation much worse.

    Clients tend to set picture->repeat when not necessary. Most HW cannot

commit 8814896da83b19be01beedd0b2b3380298778328
Author: Eric Anholt <anholt@freebsd.org>
Date:   Sun Oct 2 08:53:18 2005 +0000

Fix include path for commit of bug #4616.
Bugzilla #4616:
- Merge various fb/ bits of COMPOSITE support from xserver, which weren't necessary before due to cw hiding the issues. Fixes offset calculations for a number of operations, and may pull some fixes thatcairo has wanted for XAA as well.
- Add a new call, miDisableCompositeWrapper(), which a DDX can call to keep cw from getting initialized from the damage code. While it would be cleaner to have each DDX initialize it if it needs it, we don't have control over all of them (e.g. nvidia).
- Use the miDisableCompositeWrapper() to keep cw from getting set up for screens using EXA, because EXA is already aware of composite. Avoiding cw improved performance 0-35% on operations tested by ajax in x11perf.

commit 2e82429f8957ed0268c0e4e4fe5aed9093f33960

Refactors __glXImageSize and __glXImage3DSize into a single function. It replaces all calls to the old functions with calls to __glXImageSize with the new parameter list.
I have also added 'target' as a parameter. This is a stepping stone to the code in patch #2410. Basically, if the texture target is one of GL_PROXY_*, the image size is always zero. This gathers all the checks for that into a single place. I have *not* modified the existing callers to take this into account. They still do their own checks for GL_PROXY_. However, when the generated versions of those functions are added to the tree, they *will* rely on that.
The code growth is mainly due to the new 40 line comment before __glXImageSize.
I have tested this with a few of the texture using demos and tests from Mesa, including tunnel, texdown, and drawpix.

- Change migration-in rule slightly: previously, if your score was less
  than the max, it was bumped, and then if you were above the threshold
  you got moved in. Instead, do the above-threshold check separate from
  score starting out less than max. While this will likely make thrashing
  cases worse, I hope it will fix some issues with long term performance
  (think of an xcompmgr with a backbuffer it's doing only accelerated
  operations to. If some new pixmap comes in and bumps it out, even once,
  it will never get a chance to re-migrate because its score will be
  maxed). Change migration-out to be the same way for symmetry, though it
  shouldn't ever affect anything.
- Fix a lot of debugging output, both in terms of printing quality, and
  completeness. The fallback debugging covers a lot more now, pointing
  out new areas for improvement. Debugging toggles are now centralized in
  exaPriv.h.

Add support for hardware accelerating tiled background painting. One
example of this is the root weave, which paints slightly slower on SiS
now in my testing. However, according to keithp some apps use this
feature for a sort of cheap backing store, which this could help with
significantly. While I haven't done much performance testing with it,
it will at least rule out one possible source of terrible performance.

Break EXA ABI while we still can. Add coordinates to the UploadToScreen hook so we can upload a subset of a pixmap, and convert the current drivers to respect that. Use this support to directly UploadToScreen in exaGlyphs, providing a 47.4% +/-2.4% decrease in wall time for ls -IR programs/Xserver in an antialiased gnome-terminal on an M6 (n=3, caches hot). I would have bumped major version, only I can't tell what the EXA_VERSION_* is supposed to be doing as opposed to the module version.

- Bug #4485: Add a new routine, exaGlyphs, to handle font drawing. Glyphs were being accumulated in from non-migratable scratch pixmaps, causing the destination pixmap to move towards screen but the migration necessary for source never to happen, leading to abysmal performance. Instead, copy the scratch glyph data into a real pixmap first, then composite from that into the destination, allowing for migration. time ls -IR from programs/Xserver showed 26.9% (+/- 6.3%) decrease in wall time (n=3).
- Create exaDrawableUse* wrapping exaPixmapUse*, but which are aware of windows needing backing store. Makes migration code prettier, and ensures that composited windows will be migrated as normal when we turn off cw for EXA. (issue brought up by keithp)

Add a pair of hooks, PrepareAccess() and FinishAccess(), which get called around CPU access to the framebuffer. This allows the hardware to set up swappers to deal with endianness, or to tell EXA to move the pixmap out to framebuffer if insufficient swappers are available (note: must not fail on front buffer!).

   Teach xkb how to optionally run xkbcomp from $bindir instead of
   $datadir/xkb.
Make RGB_PATH configurable.
Move I2C modules back to $(moduledir)/multimedia.

Include xkb-config.h if we have it so we pick up the paths defined there.

Save keyboard LED state on startup and restore on exit so text console mode
LEDs match text console mode state. Move push of streams module earlier
so it's loaded before we start using kbd ioctls provided by the streams
module.

Use the $(moduledir) makefile variable instead of @moduledir@ so it can be
overridden at make install time.
Remove driverdir and inputdir from pkg-config file. The directory layout of
moduledir is fixed and well known by drivers.

Remove existing broken maxX/maxY code for composite (results in infinite loops, doesn't deal with failure, doesn't present the interface to drivers that I expected) and instead replace it with a simple fallback to software when coordinate limits could be violated. Act similarly in other acceleration cases as well.

The solution I want to see (and intend to do soon) is to (when necessary) create temporary pictures/pixmaps pointing towards the real ones' bits, with the offsets adjusted, then render from/to those using adjusted coordinates.

Bugzilla #4226: Change the pixmap migration strategy for the CopyNtoN case.
   Now, if either source or dest were in framebuffer, try to get both
   there, but prefer system memory for both otherwise. Required making
   exaasync.c go through the try-acceleration path. This significantly
   improves window resizing under composite, because previously the
   pattern of creating a new pixmap and copying default contents from the
   screen caused a fallback every time due to the new destination pixmap
   being in system memory.

Include Xv and XvMC headers in the SDK.
Fix linkage for Xnest, Xvfb, Xdmx and Xorg DDXes; include all libs.

Fix inclusion order of dix-config.h, so _XSERVER64 gets defined before X.h or Xdefs.h get included. (Jürg Billeter)

Add _XSERVER64 definition to config headers.

Huge cleanup. Group into sections: hardware feature detection, extension detection/configuration, DDX options. Make building of Xorg DDX fully optional. Clarify and correct some help texts. Change all comments to use dnl instead of #. Quote all tests correctly, and guard pure-variable tests with 'x' (e.g. test $DMX = yes -> test "x$DMX" = xyes). Since the DDXes seem to have pretty divergent extension support these days, get rid of EXTENSION_LIBS, DMX_EXTENSIONS and XPRINT_EXTENSIONS, and go back to building extension lists by hand in the DDX-specific sections. Use portable POSIX constructs everywhere (e.g. test foo && test bar, instead of test foo -a bar).

Clean up old cruft.
Set _XSERVER64 on 64-bit architectures, and use x86_64 for host_cpu instead of amd64 (Jürg Billeter).

Change xorg_bus_sbus to xorg_bus_sparc; build sparcPci.c on all SPARCs.

Bug #3740 <https://bugs.freedesktop.org/show_bug.cgi?id=3740> Patch #3058
<https://bugs.freedesktop.org/attachment.cgi?id=3058>
08-Jul-2005 nv driver updates from Mark Vojkovich:
Change some console restore code for NV11. Hopefully, we can more reliably
restore the console for desktop systems using DVI. This may correct a
recent regression on NV11.
Also, new PCI IDs.
Add new nVidia PCI ids to match nv_driver.c changes.

- Replace the syncAccel hook in the kdrive structure with a pair of hooks in the kaa structure: markSync and waitMarker. The first, if set, returns a hardware-dependent marker number which can then be waited for with waitMarker. If markSync is absent (which is the case on all drivers currently), waitMarker must wait for idle on any given marker number. The intention is to allow for more parallelism when we get downloading from framebuffer, or more fine-grained idling.
- Replace the KdMarkSync/KdCheckSync functions with kaaMarkSync and kaaWaitSync. These will need to be refined when KAA starts being smart about using them. Merge kpict.c into kasync.c since kasyn.c has all the rest of these fallback funcs.
- Restructure all drivers to initialize a KaaInfo structure by hand rather than statically in dubious order.
- Whack the i810 driver into shape in hopes that it'll work after this change (it certainly wouldn't have before this). Doesn't support my i845 though.
- Make a new KXXV helper to avoid duplicated code to fill the region with the necessary color key. Use it in i810 and mach64 (tested).

VBESetVBEMode() calls int10 0x4f02 to set a VBE video mode. This can be a standard mode solely determined by the mode ID or it may be a detailed mode with almost arbitrary mode parameters. The mode parameters are passed to the BIOS in a memory area pointed to by es:di. If bit 11 in the video mode is set this memory area is evaluated. When we don't have such an area (passed to VBESetVBEMode() this function should unset this bit for sanity reasons. (Bugzilla #3329)

Avoid segfaults if the number of user supplied monitor ranges exceed the number of preallocated slots. We should really make this dynamic - but I don't think this ever caused a problem so it's more or less academic.
A. Avoid that *SyncStart starts before *BlankStart. If *BlankStart > *SyncStart it is made = *SyncStart and its width is made maximal but such that the blank does not exceed *Total. Since the Sync width has the same restrictions as the Blank width monitors should still be able to clamp after the sync pulse. B. Over time mode validation has become inconsistent when people started to add additional features to the mode validation. One such feature is that the mode->Crtc* values have been (ab)used to allow the driver ValidMode() function to pass driver normalized timing values back to the validation function. The introduction of these features made the code less readable and created numerous possibly unintended side effects in the validation semantics. I've attempted to consolidate these changes making the code more
consistent and eliminating a number of side effects. This should not cause problems for the majority of drivers, still it should receive testing - especially with ATi Mach64 and Radeon code. (Bugzilla #3325).

Don't fail calling function when DriverFunc() for RandR fails as
DriverFunc() also returns FALSE when the specific sub function isn't
supported. In the case of xf86RandRGetInfo() we simply rely on what has
been set before and return TRUE. In the case of xf86RandRSetConfig() we
only bail with FALSE if we have to do a rotation and the call fails. We
presently cannot do rotation on the fly without the help of a driver
function (Bugzilla #2745).

Add an OUT_RING_REG macro for use with DMA_PACKET0, which is like OUT_RING
but includes debugging to ensure that the reg being submitted is the one that follows in the packet. Convert most uses of OUT_RING to it, and convert a couple of OUT_REG sets to DMA_PACKET0/OUT_RING_REG. Also, add checking to see if more registers are submitted to a DMA_PACKET0 than should be, to avoid hangs during stupid mistakes (checking for less isn't done).

Fix R100 text by forcing the 3d engine to idle before executing more 3d commands. Add docs for the ISYNC_CNTL register, which doesn't quite do what we want.

Finish converting RB2D_DSTCACHE to RB3D_DSTCACHE. Remove an extra pixel cache flush in the idle function. Init an extra reg for r200, and annotate the TCL_BYPASS better. Also, clean up some style nits from the last commit.

Add tracing. Hack Radeon cache registers to use 3D addresses. Works on M6

Let the OS instead of X save/restore text console fonts on Linux. So far we relied on the generic VGA layer to restore text console fonts for us when shutting down the server or VT switching back to the text console. This has worked rather well but it has some downsides on Linux: 

a. Many people use fbdev as console text mode. In this case it is not necessary to save/restore console fonts as the console is running in graphics mode anyway. 
b. Some architectures don't have a fbdev console but require a full POST of even the primary card (ie. IA64). This posting has to take place before we even have a chance to save anything. Therefore the fonts we save are the once written to the chip by POST, not what has been programmed by the user. 
c. Certain chipsets utilize the BIOS to perform mode setting. This may interfere with the vga save/restore font function in a strange way. It would therefore be preferrable to let the OS - which has been used to set up the font in the first place - take care of saving/restoring the data. I will attach a patch which will do so for Linux. To make this fully functional a small patch needs to be applied to the Linux kernel. To disable this feature add: #define DoOSFontRestore NO to your host.def. (Bugzilla #2277)

Back out the previous day's broken R200 "fix" -- the same number of coords
are always emitted. Fix the real problem, which was not enough regs
being initialized in ati_draw.c. Fix a typo that was resulting in alpha
coming out as 0 * src or 0 * broken instead of src * 1 or src * mask.
Assign the blending results to R0, as appears to be necessary. Unbreak
the dst-alpha-blend-with-no-dst-alpha code. Yow. And set the right DMA
count for the r200 traps code.

Make Xorg the default server to install.
Avoid PIO access on IA64. Some IA64 machine check if legacy ports outside
the VGA range are accessed. The ATi driver however does this to probe
for ISA Mach8/32/64. Since no IA64 has ISA slots this restriction
should not be relevant to the user.
Avoid recursive calls of xf86scanpci(). This function normally detects that
it has been called before by checking if the PCI structure is filled
out. So far if this was not the case (because PCI probing has failed
for some reason) the function is traversed again. With the chipset
specific PCI bus probing this can lead to an endless recursive loop as
the post-probing code calls xf86scanpci() from within this function.
The OS specific PCI code for Linux worked only if bus 0 was populated as it
checked for the presence of /proc/bus/pci/00. Fixed to check for
/proc/bus/pci/<bus_to_look_for> instead.

  PostScript DDX to remove all content from a vector pixmap when a
  [PolyFillRect()] call covers the whole pixmap surface with a solid fill
(this avoids that a backbuffer vector pixmap gets constantly filled even when the content is not visible anymore after \texttt{XdbeSwapBuffers()} has cleared the hidden buffer with the background color).

Made handling of DevelDrivers for x86-64 more conformant to other platforms.
Compress all font encodings (Stefan Dirsch).
Fixed warnings.
Turn on forwarding XNSpotLocation event to XIM server in OffTheSpot and Root mode (bugzilla #1580, James Su).
Added another compose key combination for the Euro symbol (Stefan Dirsch).
Added support for UTF-8 in ja_JP, ko_KR and zh_TW locales (Mike Fabian).
Changed default encoding for ru from KOI8-R to ISO8859-5 (Mike Fabian).
This is the encoding that is also used by glibc. We may break other libc - lets see who complains.
Added explanation for DESTDIR to install to a different directory than /.
Added some early bailouts to atiprobe if PCI structure pointer is NULL to prevent sig11.
XV support doesn't depend on 2D acceleration any more. This patch removes this limitation from the NSC driver. This is a patch that I have committed to XFree86 a while ago but never ported over to X.Org.
Matthieu Herrb contributed some build fixes.
Fixing \texttt{SetDPMSTimers()} so that \texttt{DPMS*Time == 0} disables the appropriate
timer. This takes advantage of the fact that TimerSet() with a timeout argument 0 behaves like TimerCancel().

Use /dev/xconsole (named pipe) or devpts for system logger (Werner Fink).

Create missing links for backward compatibility to XFree86 (Stefan Dirsch).

Changed comment to mention xorg.

Changed cursor for the 'kill' action from XC_draped_box to XC_Pirate. If you don't like it we can change it back (original author unknown).

Added 'pic' to the man page rendering command pipeline (Werner Fink).

Added missing return value (Stefan Dirsch, Roland Mainz)

Set fbdev mode as the default mode on PPC (Olaf Hering).
Added support for IBM space saver keyboard (Stefan Dirsch). Added support for Cherry CyMotion Master XPress (Marcus Schaefer).
Change order of SetDisplayDevice(), HWRestore(), UnbindGART() and RestoreBIOSMemSize() to be exactly opposite to the Save procedure in EnterVT() (Matthias Hopf, Alan Hourihane).
Fix text mode restoration by removing the assumption that the register which determines which head is programmed is set to the active head by the BIOS (Mark Vojkovich).

When I wrote the resource code 5 years ago I made some assumptions which turned out to be false: I've assumed that the bus number of the PCI hostbridge would be the PCI bus the bridge links to. This is not correct. Fixing this assumption is not easy. However I hope that the attached patch will make the system work regardless as it 'ignores' host bridges from which the target bus is not known. This should not matter at all as we really don't care about host bridges (unless we have bridge specific code which retrieves information about the bridge).
Fixed server crash on reset when a structure allocated in PreInit() was freed on CloseScreen().

Fixed ring buffer lock ups that happened because the structure that contained ringbuffer data was not zeroed after allocation.

Fixed numerous warnings due to signed unsigned comparisons.

Adding support for OS dependent probing of IA64 chipsets. Not all IA64 chipsets can be probed without OS support as probing them is only possible using ACPI. One example of this are the HP ZXJ/2 chipsets: previously the code assumed that these chips were present when no other of the known chipsets could be probed. This assumption brought SGI Altix machines with 64 CPUs to a grinding halt.

- Add disabled WIP trapezoid code for R128 and R100. The R128 rendering is not doing an add of 1 per triangle like I hoped, and instead seems to be saturating all the pixels or something. The R100 acceleration renders pretty well, with some gaps. Note that both are slower than software due to lack of DMA to submit vertices.
- Mostly fix R128 and Radeon transform support, including supporting bilinear filtering on R128. Subpixel offsets are still probably an issue (reported by rendercheck), but I want to make 100% sure about my understanding of the protocol before changing everybody, including fb.
- Add support for dst formats without alpha to R128 Composite.
- Remove the R128 Blend code, which has long outlived its usefulness. (I kept it around for one reason: It could be useful for the w/h > 1024 case with no mask and a non-src op. That seems pretty infrequent and not worth the trouble).

Add a set of three hooks for accelerating trapezoids, and use it for the RasterizeTrapezoid screen function. These hooks will be called for imprecise, non-sharp trapezoids with A8 destinations.

Note that the current main consumer of trapezoids, cairo, is requesting precise, sharp trapezoids by not changing the default Picture attributes, but gets non-sharp effects in software because fb bases its choice of sharp/non-sharp on the mask format being A8 vs A1, and cairo asks for A8. Follow fb's (poor?) example by ignoring the sharp setting and basing the choice off of the mask being A8.
Rather than initially place pixmaps in framebuffer based on a size heuristic, delay the decision until the first kaaPixmapUse{Screen|Memory}, and put it in framebuffer if UseScreen was called. Provides a significant improvement in cairo speeds (100% speedup in cairogears here) and is likely to improve text performance as well.

Fix make install when BuildServersOnly is YES (Bug #1213).
Fix build failures when UseDeprecatedKeyboardDriver is YES and DoLoadableServer is NO (Bug #1229, Kristian Hgsberg).
Fix failure when using DLL loader and LD_BIND_NOW is set (Bug #1212, Adam Jackson).

Don't define _XOPEN_SOURCE before including math.h on Solaris - it's not needed on older releases, and breaks builds on Solaris 10. (Same as bugzilla #189).

Fix for XV memory allocation: Also use tiled area for allocation even if it hasn't been used before.

Bug #1101: Fix PaintWindow in the pixmap case when the window's origin is not at the backing pixmap's origin. Resulted in incorrect rendering in at least aisleriot, fluxbox, and KDE apps, and probably many more. While here, move the ParentRelative loop above the drawable grab -- may improve correctness with ParentRelative background origins as well. Note that the border code doesn't handle ParentRelative yet.

document broken composite in XWin

Fix banner to print out proper version information.

Clip destination instead of source. Should be the same, but it looks nicer to me.
Clean up transition between cheap and expensive GC wrappers by using the prologue and epilogue macros. Before, the GC would be left unvalidated sometimes which would cause all kinds of entertaining bugs against a DDX which cares (XAA).

Remove debugging code which did a full tree walk on every window operation Eliminate needless (and, it turns out, dangerous) call to ChangeGC on DestroyGCPrivate.
in cwSetWindowPixmap, check if the pixmap is the screen pixmap and disable the wrapper by setting the private to NULL.

Apply a kludge to initialize the composite wrapper before DamageSetup. If not, DamageSetup will wrap some operations first, and the cw initializes during ExtensionInit, so cw comes higher in the wrapping chain. cw going first will result in damage getting confused when the drawables get changed around.

Fix various cw issues, including a couple reported by deronj:
- Fix wrapping of GC ops/funcs according to policy described in bug #1045.
- Remove ValidateGC/ValidatePictures on the redirected drawables/pictures
  -- it's not needed, and DDXs shouldn't be seeing redirected drawables in render or GC ops/funcs when cw is running.
- Mark all GC/Picture state as dirty when moving from redirected to non-redirected, since it hadn't been passed down in Change* or Validate* while redirected.
- Remove CreatePicture wrapper that didn't do anything.
- Comment on why AddTraps wrapper isn't needed.

commit ae1580c494fde2b56f9faa40f7ebcf637728efc8
Author: Eric Anholt <anholt@freebsd.org>
Date:   Thu Aug 5 18:24:58 2004 +0000

    - Add a new Render function, CopyPicture, which will update a picture with
      the flagged bits from a source picture. Approved in principle by
      keithp.
    - Use CopyPicture and SetTransform to update most of the backing picture's
      state in the composite wrapper. Filters are still missing.
    - Don't allocate a picture private, now that we calculate clipping properly
      and don't need the serialNumber or stateChanges.
    - Use the format of the source pixmap rather than generating the format
      from the window's visual.
    - Wrap the rest of the Render primitives that were stubbed out before.

commit 73e14bd611fa7ec649a2b4c7964959d9eae887b
Author: Eric Anholt <anholt@freebsd.org>
Date:   Wed Aug 4 23:18:38 2004 +0000

    - Always validate the backing GC in cwValidateGC, not just when the clip
      list changes.
    - Use FillTiled instead of FillSolid for painting tiled border/background
      pixmaps, and don't needlessly change the scratch GC's defaults.
    - Use the preferred dixChangeGC instead of DoChangeGC.
    - Simplify a silly loop and clean up a couple of comments.

commit 751fd11a9ad1a473d7311362246b0869a008001b
Author: Eric Anholt <anholt@freebsd.org>
Date:   Wed Aug 4 10:05:37 2004 +0000

    - Add two new XAA hooks, SetupForCPUToScreenTexture2 and
SetupForCPUToScreenAlphaTexture2. These add a dstFormat argument after the previous format argument, which the driver needs to use to properly set up the destination format. Two new arrays are added for the list of destination formats supported that correspond to the previous format arrays for sources.

- Make Render acceleration only occur when the new hook for that acceleration type is supplied and the dst format list is set, along with the src format list being set. Without knowing the destination format, the Render acceleration couldn't properly support all the destinations it might encounter.

- Bump XAA module minor version.

- Update the Radeon Render acceleration to use the new hooks when the XAA module is sufficiently new. Fix a bug in the src/dst alpha booleans for ops, and use them to set blend_cntl to support destinations without alpha. Add missing PICT_a1r5g5b5 texture format, and add list terminator. (!)

Fix declaration of XAACachePlanarMonoStippleProc. Rename XAACachePlanarMonoStippleWeak to XAACachePlanarMonoStipple() for consistency with other parts of xaa and fix forward declaration in xaalocal.h. Fixes last comments on Bug #962.
Major improvements to Composite wrapper. Several issues remain, but it now appears stable in limited testing.
- Allocate the picture private, avoiding segfault.
- Wrap PaintWindow to draw the background/border to the backing pixmap (based on Deron Johnson's comptran.c).
- Set the x_off/y_off returns to translate coordinates properly.
- Don't bother allocating temporary areas for the modified coordinates.
  Layers above are responsible for handling lower layers changing the arguments, so cw doesn't have to worry about it. mibstore.c has to do the allocation because it calls down twice (front buffer and backing store). (Suggested by keithp)
- Handle the mode argument to PolyPoint, Polylines, and FillPolygon.
- Remove some dead elements in the cw privates.
- Kill a prototype warning in compinit.c by adding the cw.h header.

The Damage extension has to wrap after (be called before) the Composite extension so that the redirecting of drawables by the wrapper doesn't confuse Damage.

Bug #962: Remove LoaderSymbol calls introduced by the dlloader work so DoLoadableServer NO builds work again.

Removed double cast.

Removed distro specific stuff.
Fixed FreeType module to build with FreeType versions older than 2.1.7.
Fixed typo.
Added vtSema to protect call of driver DPMS function.
removed unneeded variable
Modified RandR driver hook to reduce the number of function calls to one.
   Function is sufficiently generic to be extended in the future.

   Integrate COMPOSITEWRAP branch including composite wrapper. This code still
   has several issues, including:
   - CopyWindow and PaintWindow wrappers missing (will be done soon)
   - Some segfaults seen in the Render wrappers.
   - Xprt server build breaks with Composite.
   - DDXs must be recompiled for Composite due to VisualRec size change.
   - Composite bugs pointed out by Deron Johnson in email.
   Also, reorder XFixes initialization according to comments by Keith which
   are also in xservr CVS.

Bug #400 (partial): Driver fixes for the dlloader. When using dlloader, all framebuffer formats except cfb and the overlay modes should work, and r128 and radeon need to be loaded from the ati driver (both issues to be fixed soon). Tested on i740, s3virge, mach64, tdfx, vesa, and vga drivers. elfloader users shouldn't be affected.
Add generic rootless layer documentation missed from last commit.

Merge many XDarwin improvements:
- Fix launch of X clients by double clicking in the Finder when there is a space in the path (Torrey T. Lyons).
- Interpret scroll wheel mouse events correctly when shift is held down (Benjamin Burke).
- Add option to always use Mac command key equivalents (John Harper and Torrey T. Lyons).
- Add support for dynamic screen configuration changes in rootless mode (John Harper and Torrey T. Lyons).
- Add documentation on generic rootless layer (Torrey T. Lyons).

Removed bugs on TweakMemorySize() which prevented it from working at all. Initialized last element of BIOS version number string to 0 to avoid random problems.

Fixed typo in a comment.
Deleted bogus comment.
Added debugging support.

Add initial Xinput support for XDarwin (Greg Parker).

Make XDarwin not default to StaticColor on ix86 (Shantonu Sen).

Eliminate bogus rate check in fbdevModeSupported. Hmm. Potentially bogus rate selection necessary for Mac fbdev.

Don't know about fb changes to pixmaps, so can't track dirt.

Add Mac specific 1280x854 mode. Warn when requested mode isn't found.

Add ability to soft-boot video cards.

Add region expand request. FIXME: need test cases

commit 0e45f2a7536bf4b66d6f64d96b44431310884af3
Author: Egbert Eich <eich@suse.de>
Date: Tue Jul 6 14:49:13 2004 +0000

ifdef'ed some IA32-only assembler statements. Presently these chipsets are IA32 only, anyway (Egbert Eich).
Disabling generic VGA testing for IA64 architectures. Temporarily disabling support for ZX1 bus. This code is extremely invasive and is executed as fallback without testing for a ZX1 chipset. It brings a SGI Altrix to a grinding halt. (Egbert Eich).

commit df2b55a25b7056ac92c1f6cbee9f16bd0a37ba8c
Author: Egbert Eich <eich@suse.de>
Date: Tue Jul 6 14:37:48 2004 +0000

Separated Intel drivers from default DriDrivers to avoid building them on IA64 (Egbert Eich).
Fixed wrong function prototype (Egbert Eich).
Don't test for generic VGA on IA64 (Egbert Eich).
Fixed a segfault when accessing a structure before verifying the pointer exists (Egbert Eich).
Added a showcache option for debugging (Egbert Eich).
Increase default video RAM size to 16MB when DRI is enabled and more than 128MB are available (Egbert Eich). Fixed lockups during mode switch. Problem was introduced when attempting to copy the behavior during LeaveVT()/EnterVT() but but forgetting to call I810DRILEave() before I810DRIEnter(). The entire DRILEave()/Enter() scenario has been commented out as it didn't seem to be necessary (Egbert Eich).
Fix TweakMemorySize() (tested with i855/i865) (Egbert Eich).
increased MAX_DEVICES to 128 (Egbert Eich).
Use OS provided PCI config space access as default method (Egbert Eich).
Added support for Linux 2.6 proc file format.
Fixed unaligned accesses to pieces of the VBE info block. VESA did not
align elements to size (Egbert Eich).

commit d5db59bd79f5d8788b99056bf9d969b53ad99e1
Author: Eric Anholt <anholt@freebsd.org>
Date:   Tue Jun 29 20:37:51 2004 +0000

Add an offscreen area scoring to improve choosing offscreen areas to kick
out when allocation can't find a free area of the requested size. When
offscreen pixmaps get used, the offscreen area's score is increased by
a constant value. Every certain number of increases, all offscreen area
scores get decreased by a fraction. When choosing a set of areas to
remove for a new allocation, the set of areas with the smallest total
score is chosen for removal. While this is not the smartest system, it
prevents things like always removing the first offscreen area in memory
(likely the most recent) to be kicked out when doing replacing.
Add GLX_ALIAS_VOID for GLX_ALIAS of functions with return type void to fix builds with non-gcc compilers that refuse to let you do return function_that_returns_void(...) programs/Xserver/hw/xfree86/os-support/shared/sigiostubs.c Remove includes of xf86drm.h that break non-DRI builds

Separate out off-screen allocation from Init. Fix Enable to update off-screen addresses. Wrap RandR to update off-screen addresses. Set off_screen_base and memory_size fields correctly.

Add ARGB cursor support for Radeon cards.

Fix SYNC_ALWAYS (debugging) code to use mach64WaitIdle instead of KdCheckSync -- the boolean used in the latter won't be set yet.
Oops. == instead of =.
Must sync hardware before rasterizing trapezoids in case the mask is in off-screen memory and has just been erased. Yes, it is silly to place masks in off-screen memory. That's a separate issue.

commit 94648799c82e59166155ca5abf22a9391693e6a1
Author: Keith Packard <keithp@keithp.com>
Date: Thu May 20 02:42:20 2004 +0000

Pin header-only pixmaps in memory.
Off-screen reallocation could have used a stale pointer.
Separate framebuffer mapping computation from actual frame buffer mapping.
Now map the frame buffer from vesaEnable so that VT switch shares the same mapping code. This makes sure any shadow framebuffer is allocated again.

commit cade317d31dddab61199d5e90bceff36fb12f3cd1
Author: Eric Anholt <anholt@freebsd.org>
Date:   Mon May 17 20:18:02 2004 +0000

Overhaul of the ATI driver:
- Add monochrome hardware cursor support.
- Try to auto-detect AGP support for DRI on Radeons. And fail. Detect it properly on R128.
- Set up card for pseudo-DMA if possible. Convert 2D rendering code to
  prepare DMA packets only. Use generic code to decode DMA packets to
  MMIO if PDMA is unavailable. Add WIP code to support "real" DMA without
  DRM support.
- Dispatch pending DMA commands when the server sleeps. Otherwise some things, such as typing in an xterm, wouldn't show up for a time.
- Fix Radeon Composite acceleration in many ways, and add Rage 128
  Composite acceleration. Disable them both due to still-not-understood issues they have. They fail with In, Out, AtopReverse, and Xor, and text rendering is strange.
- Add textured XV support for R100 and Rage 128. No brightness/sat controls, but it does support multiple ports, and cooperates with Composite.
- Add WIP code for hostdata uploads.
- Many cleanups and fixes.

Don't let the visible screen get "migrated" offscreen, which manifests
itself as a hang.
Reported by: Ginokas <ginokas@free.fr>
Add generic functions for copying packed/planar XV data, copied from mach64.

Move fourcc.h to a generic location in src/.

Follow GLX in setting ARGB visual nplanes to 24. Retry current mouse protocol when sync is lost.

There's no need to explicitly set softCursor -- kdrive handles this if the cursor hooks aren't set.

Fix problems in render fb implementation found by rendercheck:
- fbCombineSaturate was pointed at fbCombineDisjointOver, instead of fbCombineDisjointOverReverse as it should. Instead, point fbCombineDisjointOverReverse at fbCombineSaturate (which is likely to be faster).
- fix previously-unused fbCombineSaturate implementation.
- fbCombineMaskAlphaC was just a copy of fbCombineMaskValueC. Make it do what it's supposed to (return a cs.alpha).
- fbCombineAtopC didn't invert the source alpha value.
- fix copy'n'paste errors in fbCombine(Dis/Con)jointGeneralC, also source alpha wasn't treated in a component fashion.
- fbCompositeSrc_8888* didn't handle when the source lacks an alpha channel. Rather than adding that and possibly slowing down the (normal) alpha case, don't let x8r8g8b8/x8b8g8r8 Pictures be used in fbCompositeSrc_8888* because Over with one of these is just Src.

BugZilla #601: Fixing makedepend choking on floating point exception because CHAR_BIT is defined to __CHAR_BIT__ which is a compiler intrinsic define. BugZilla #605: Fixing build on IA64 which is broken due to the inclusion of the kernel header asm/page.h. Kernel headers however don't work with -ansi. The inclusion of asm/page.h can however savely be removed as it there are plenty of other ways to determine the page size.

small fixes, but still can't get this driver woking again

commit b526276faa765df893197e04370a915ed73947dc
Author: Brent Cook <busterbcook@yahoo.com>
Date:   Mon Apr 5 02:52:35 2004 +0000

removed hardcoded vesa references so we can operate with any backend. fbdev
works for initializing the screen, but input fails shortly after.

commit 920e6ff81baeeec16465f81bacbcff711ce82e149
Author: Brent Cook <busterbcook@yahoo.com>
Date:   Sun Apr 4 07:30:07 2004 +0000
Begin separating VESA calls into a more generic backend wrapper like the ati driver, cascading between VESA and FBDEV. We only have init functions done so far; need to add all of the others. Fixed some compiler warnings. Whitespace and formatting cleanups (using 4 spaces, no tabs)

commit 530371ceaf7f593badf38bbce2d2e50f6a920d24f
Author: Brent Cook <busterbcook@yahoo.com>
Date:   Sat Apr 3 22:26:37 2004 +0000

added touchscreen support, detect all known PCI chips in the Neomagic line. We'll not bother with ISA for now.

commit 962b898868dcab959c390986dec0b4d750dc107
Author: Brent Cook <busterbcook@yahoo.com>
Date:   Sat Apr 3 22:22:48 2004 +0000

initial import of original driver by Franco Catrin L. Wraps VESA for most parts, with some hardware acceleration enabled for the cursor on the NM2300.

Author: Egbert Eich <eich@suse.de>
Date:   Tue Mar 30 14:23:15 2004 +0000

36. Conversion: __AMD64__ > __amd64__ (Egbert Eich).
35. Fixed stretching option and centering in C&T driver (Egbert Eich).
34. Added support for memory size tweaking in BIOS for i845 (Egbert Eich,
   thanks to Christian Ziez)
33. Removed video playback dependency on Accel in NSC drivers (Egbert
3Eich).
32. Fix HW cursor state on Savage driver when entering VT as some BIOSes seem to enable it unconditionally (Egbert Eich).
31. Fixed Emulate3Button message to distinguish between 'hard' (ie. configured) and 'soft' (ie. automatic emulation that is disabled as soon as the middle button is pressed) (Egbert Eich).
30. Free XrmDB in XCloseDisplay() only when implicitly allocated by XGetDefaults(). If Client allocates it itself it should free it also. Trying to free it for the client may result in segfault if the client has already freed it (Egbert Eich).

Twenty link errors for Xizzle now - count `em. 20.
Get rid of all references to SCO.
Change SDK include dir to $(includedir)/xizzle. Add SDK libs where necessary.
Reformat to be nicer and easier to shuffle around; also, fix lib ordering
so we get so much closer to the elusive final link. Shuffle
common/xf86Init.c into libxizzle.a.
Fix a couple of early snafus - s/BUILDXI/XINPUT/; et al; make the SDK stuff conditional as needed; fix the SBus includes.
Name library os-support/libxizzleos.a, not os-support/foo/libxizzlefoo.a.
Clean up ARCH_SOURCES so it's always initialised to something.
Move linked libraries to _LIBADD, which somehow escaped my attention. Make
inclusion of drm/libxazzlelinuxdrm.a dependent on DRI.
s/VERSION/VBE_VERSION/;
Axe this redundant dir.
All Xizzle-specific: axe hw/xizzle/Xi, shuffle link order, fix list of
required modules to be vaguely sane, add some pertinent libs/incs.

bug #230 Revert to Xinerama 1.1 In order to make a "quick" release it has been decided that the priority is to preserve the server's internal API/ABI so that third-party drivers that depend on symbols like noPanoramiXExtension, etc., would not need to be recompiled. Too bad gcc on Linux doesn't support ELF's weak symbols as that would have been a reasonable solution for preserving the ABI. N.B.: While symbols, i.e.
functions and variables revert to the old name, I did not revert build names, i.e. -DXINERAMA, to the old -DPANORAMIX. There was no need, and it's just a build issue that has no impact on the binary output of the build.

Forced commit: Previous commit included the removal of the 8192 scanline
limit on offscreen memory in the fbdev case. I remember daenzer (who
originally put that code in) saying he wasn't sure of it, and there
doesn't seem to be any reason for that limit given how acceleration is
done.

commit b27729ec88f5d4153a0debfe2347bbed022329ba
Author: Eric Anholt <anholt@freebsd.org>
Date: Thu Jan 8 08:16:24 2004 +0000

- Add a new UploadToScratch kaa hook for putting the data for a single
  pixmap into temporary offscreen storage. Subsequent UploadToScratch may
clobber the data of previous ones. This allows hardware acceleration of
  composite operations on glyphs.
- Add a new UploadToScreen kaa hook for doing the actual moving of data to
  framebuffer. This would allow us to do things like hostdata blits or
  memcpys to agp and then blit.
- Add an UploadToScreen on ATI which is just memcpys, but which will be
  replaced with a hostdata blit soon.
- Add UploadToScratch on ATI and reserve 64k of scratch space. This
  provided a 3x speedup of rgb24text on my Radeon.

Disconnect the sis300 driver. I've never managed to fix it, and it breaks the build on PPC.

Speed things up slightly by removing Z values from emitted vertices and by emitting as a tri fan rather than a tri list. A rect list would save an additional vertex (out of 4) per rectangle, but there's no measurable speed difference and the tri fan may be useful when transforms come into play.

- Don't forget to UNINIT miComputeCompositeRegion's regions
- Fix a bit of whitespace nearby.

- Correctly set the texture coordinate set source for the second texture unit.
- Re-enable Radeon's Composite accel now that fonts work again.

- Call appropriate Done function for Composite.
- Don't allow src transforms for Copy acceleration.
- Minor whitespace fixes.
- Add more Composite operations, including Saturate, to Radeon Composite accel. I don't 100% trust that the math works for Saturate, but I can't tell from existing information.
- Fix texture pitch fallback checks.
- Fallback when src or mask have transforms.
- Disable Radeon Composite accel until the offset thing is fixed.
- Set offscreenPitch to 64 on Radeon thanks to new information and a kaa fix. Fixes acceleration at width!=1024.

- Add new Composite hook for kdrive drivers, which only ensures that the pixmaps are offscreen and don't have alpha maps. It is the last case checked before going to software fallback
- Use the new Composite hook in the ati driver to implement acceleration of most Composites that get done in an xcompmgr environment on r100 series cards. It is only available when using the DRM. There are still some
corruption issues, but the DRI is still non-default and I need to get
this into version control.

Merge dri-0-1-branch to trunk. Notable changes:
- Add libdrm and libdri. Portions of the DRI extension are stubbed out.
- Use the DRM in the ATI driver when available. This provides a minor
  performance improvement in x11perf, and opens the possibility of using
  the 3d hardware for acceleration in the future.
- Implement solid fill acceleration for Composite in KAA.
- Implement Blend hook for Composite and use it on r128.
- Fix a bug of mine that resulted in overuse of offscreen memory.
- Fix many miscellaneous bugs in ATI driver and add PCI IDs.

First pass at "Standard" Xinerama. The sources for this came from Heather
Lanigan's xinerama tree on Sourceforge.Net. No attempt has been made to
handle previous, non-standard versions of the protocol. Nor has any
attempt been made to preserve the ABI of previous versions -- that part
will be added at a later time, and then probably only on systems that
have nice object/linker semantics, e.g. ELF systems with weak symbols.

Add initial SiS 300-series (300, 305, 540, 630, 730) driver based off of
the ATI driver. It suffers from hw/sw synchronization problems, it
looks like, but may be good enough to work on Render acceleration
experiments. Committing it as-is so I don't lose it again.

- Fix confusion of depth/bitsPerPixel in ati_draw.c
- Disable acceleration with 24bpp due to apparent broken acceleration.
  Accel at 24bpp was the cause of the crashes when people tried to use
  any depth over 16. XFree86 doesn't support 24 either.
- Disable at < 8bpp, too.
- Add the other Rage 128 PCI IDs.
- Remove unnecessary setting of scissor registers (only default scissor
  gets used).

- Add PCI information (device/vendor id, bus location) to KdCardAttr to
  help with ati, and future DRM drivers.
- Add new "ati" kdriver driver. It has ancestry in the r128 driver from
  andersca, but took a detour through being the WIP SiS 300 driver on the
  way. It supports Radeons (tested on QD VIVO and 7500) and Rage 128.
  Current limitations include that it requires depth 16 and that the
  other Rage 128 PCI IDs aren't included yet.

Ok, Composite extension is semi-working; when no-one asks for redirection, the server seems to act as before. With RedirectSubwindows (root, automatic), the server looks just like a regular X server. Now to go rewrite the (currently lame) compositing manager to get some real action on the screen.

commit 28bcd2efd134bf6a3daa0738c9155b36cd84168
Avoid attempting acceleration on non-screen formats (for now)
Offscreen allocator API changes.

Use same assumptions as layergc about what layer kind is appropriate for
unwrapping pixmap operations. This makes sure the accelerated code gets
invoked for pixmaps
Add pixmap migration support to kaa. Can't quite automatically migrate
pixmaps off-screen, but soon we will. Can kick objects out of video
memory. Move per-screen linked list pointers to pixmap private. Wrap
Composite in preparation for migrating pixmaps. Have kasync ignore
drawable type so that pixmaps trigger sync Add KdOffscreenFini to
cleanup on server reset. Switch off screen area to have only a 'save'
function; moving objects to off screen memory is done by saving then
freeing the area.

-Wall fixes. Might have fixed VESA based DPMS code as a result

Check for off-screen pixmap support in KaaDrawableIsOffscreenPixmap. -Wall
fixes. Allocate pixmap private space only for screens with off-screen
 pixmap support

-Wall fixes. Support off-screen pixmaps

Initial revision

136. Fix bug that prevented fbman from using the last partial scanline of a
Mach64 framebuffer (Marc La France).
135. Make ATI Mach64 FIFO cache integrity testing optional (Marc La
134. Export ATI Mach64 hardware overlay as an XVideo adaptor (derived from GATOS project, Egbert Eich, Marc La France).
133. Reorganise ATI Mach64 support into separate source files (Marc La France).
132. Refine atimisc's decoding of the panel mode on server entry in an attempt to reduce the effect of atyfb bugs (Marc La France).
131. Make Rage128 and Radeon XVideo available even when 2D acceleration is disabled (Marc La France).
130. There is no longer any need to require hardware cursors during Rage128 and Radeon XVideo displays (Marc La France).
129. Initialise v4l's XVideo adaptors last (Marc La France).
128. Reduce cut&paste effects by adding more helpers to Xv (derived from #5645, Bjrn Augustsson, Marc La France).
127. Centralise a region comparison primitive into 'mi' and use it instead of local definitions throughout the server (Marc La France).
126. DPMSExtension & XvExtension driver cleanups (Marc La France).

    Add image transformation and sub-pixel ordering to Render

commit a2637ba1f6c8417a48e95c9b65542e696ba0e8c0
319. Moved LdPreLib define after the vendor/OS specific config files as it may depend on setting done there (Egbert Eich).
318. Several fixes for cross compile environment (Egbert Eich).
317. Added code to allow for building of static only libraries with -fPIC for platforms which require it (Egbert Eich).
316. Added `-m32' to gcc flags as default for ia32 builds when gcc version is >= 3.1. This allows building a 32 bit Version of X on 64bit x86-64 (Egbert Eich).
315. Changed direct calls of ld to gcc-nostdlib' for Linux (Egbert Eich).
314. Changed calls to as to 'gcc -c -x assembler-with-cpp' for Linux (Egbert Eich).
313. Added `-fno-strict-aliasing' flag to gcc version >= 3.1 (Egbert Eich). Strict requires that one address must not contain pointers to different types - a feature heavily used by X (Egbert Eich).
312. Fixed a core dump problem in libXtt (?) (Egbert Eich).
311. Removed '#pragma pack' from structures that contain function pointers in x86emu. This causes problems on gcc 3.1 for ia64 (Egbert Eich).
310. Added defines for missing X types to saverproto.h (Egbert Eich).
309. Fixed compiler warings generated by gcc >= 3.1 in mesa drivers (Egbert Eich).
308. For platforms that allow both 32 and 64 bit libraries to be executed split Xlib i18n modules path into
    <libpath>/X11R6/lib/X11/locale/lib/common and
    <libpath>/X11R6/lib/X11/locale/lib64/common. 'lib64' has been defined to be the default path for 64bit shared libraries on these platforms (Egbert Eich).
306. Fixed code in cfb that didn't comply with C sequence rules. Modern C compilers tend to be more aggressive on code reordering (Egbert Eich).
305. Changed arguments of NoopDDA() from VarArgs to void. Handling of VarArgs by gcc isn't compatible with the way it was used on certain platforms (Egbert Eich).
304. Added support for 32bit pixmaps for 24bit overlay framebuffers in fb overlay code (Egbert Eich).
303. Fixed kdrive to print a meaningful error message instead of just core dump when no matching graphics cards is found (Egbert Eich).
302. fixed portability bug in xwd (Andreas Schwab <schwab@suse.de>)
301. fixed X Server crash, which happended each time a proportional iso10646 font was loaded with xtt backend (Yong Li <rigel863@yahoo.com>)
300. Added some ARM specific fixes to compiler.h (Uli Hecht).
299. Added a virtual 'dummy' driver (Egbert Eich).
298. Fixed core dump when certain access functions are not set in xf86Bus.c (Egbert Eich).
297. Fixed problem where SIGIO could be disabled after a server reset.
296. Added configurable list of devices the xf86Misc extension is allowed to change the mouse device to (Egbert Eich).
295. Changed default mouse type to 'auto' when generating config file with --configure (Egbert Eich).
294. Made sure keyboard modifier settings are consistent after exit from DGA when the xkb extension is used (Egbert Eich).
293. Disabled keyboard processing when Xserver is suspended by power management. This allows effective locking of laptops when stolen (Egbert Eich).
292. Added/improved options for lockfile syncing (Egbert Eich).
291. Added support for backup copy of Xserver logfile (Egbert Eich).
290. Fixed GetTimeInMillis() to use deltas instead of absolute time returned by gettimeofday(). This ensures time is monotonic in X (Egbert Eich).
289. Fixed xf86Misc extension to allow modification of Expps2 mice (Egbert Eich).
288. Made code in xf86MiscExt.c more readable (Egbert Eich).
287. Fixed PCI CardBus bridge handling (Egbert Eich).
286. Added code to reenable PCI bus mastering after coming back from a VT switch to radeon driver (Charl P. Botha <http://cpbotha.net/>) (Egbert Eich).
285. Dito for r128 driver (M. Harris).
284. Dito for glint and mga driver (Egbert Eich).
282. Set rgbBits to 8 for all HiQV chips in chips driver (Egbert Eich).
281. Moved initialization of accel functions past initialization of offscreen fb manager in chips driver (Egbert Eich).
280. Fixed initialization of video in chips driver (?)..
279. Fixed HALlib problem restoring text mode on G550 (Egbert Eich).
278. Restructured and included Matrox's Merged Framebuffer changes to mga driver (Egbert Eich).
277. G450/550 clockchip programming fixes (Matrox).
276. Fixed HW Cursor for HALlib frame granularity (Egbert Eich).
275. Enabling 2D accel in 24-bit for neomagic 2360 and 2380 (Egbert Eich).
274. Added support for builtin 1024x480 mode of Sony subnotebooks for Neomagic driver (Egbert Eich).
272. Fixed RAC function registration in S3 driver (Egbert Eich).
271. Added some voodoo to screen initialization of S3 driver (Egbert Eich).
270. Fixed vbe/int10 support in SMI driver. It used to core dump when BIOS was not usable (Egbert Eich).
269. Separated BRIGHTNESS and and CAPTURE_BRIGHTNESS video attributes in smi driver: CAPTURE_BRIGHTNESS refers to the capture chip (ie. Philips SAA7110) while BRIGHTNESS controls the video overlay of the SMI chip itself (Egbert Eich).
268. Disable automatic loading of DRI when running SUN fb as this is
inconsistent with other drivers (Thorsten Kukuk).

267. Fixed Gamma/Brightness code in trident driver (Egbert Eich).

266. Added FpDelay debugging option (Egbert Eich).

265. Fixed Cursor/VT switch support for vmware driver (Egbert Eich).

264. Fixed Blit problems in vmware driver when running KDE (Egbert Eich).

263. Added RENDER support to vmware driver (Egbert Eich).

262. Added C&T 69030 to extrapci.ids (Egbert Eich).

261. Improved mouse autodetection code (Egbert Eich).

260. Restructured int10 code so that vm86 and x86emu support can be loaded as modules. Implemented heuristic to try vm86 first and fall back to x86emu. This allows 32 bit Xservers to run on x86_64 on 64-bit kernel without vm86 support (Egbert Eich).

259. Restructured elf loader: determine which section to load from elfheader flags (Egbert Eich).

258. Adding RENDER Support to RAC (Egbert Eich).

257. Using borderClip instead of borderSize region for redisplay function in miext/shadow code to avoid core dumps when vt switched away (Egbert Eich).

256. Replacing sprintf() by snprintf() in lbxproxy to eliminate possible buffer overrun exploits (Egbert Eich).

255. KP_Decimal fixes to Czech and Slovak keyboards (Jan Holesovsky <kendy@suse.cz>) (Egbert Eich).

144. Fix the neomagic driver so that it saves/restores the palette (#4452, Ken Hornstein).
143. Fix a palette saving bug in the vgahw module (#4452, Ken Hornstein).
142. Fix a typo in Xfbdev.man (#4446, Juliusz Chroboczek).
141. Major updates to the savage driver, including:
   - DDC support
   - I2C support
   - XVideo YUV overlay support for Savage/MX and Savage/IX
   - DGA support
   - yanks Ani Joshi's depth/bitsPerPixel patch for searching the BIOS
   - fixes interactions with frame buffer and SVGATextMode consoles; VT switching now seems quite reliable for almost everyone
   - yanks unused options
   - adds new options for hacks to deal with the status register hangs
   - adds one special case memory configuration for Savage 4
   - adds support for doublescan modes (320x240 works)
   - adds LCD panel detection
   - fixes a panning bug at depth 24 (panning must be to even pixels)
   - adds a workaround for bugs in the latest ProSavage BIOSes (#4445, 4448, Tim Roberts).
140. Make 'X -configure' use the long monitor name when present in the DDC info (#4444, Andrew C. Aitchison).
139. Make glxinfo respect $DISPLAY (#4443, Meelis Roos).
138. Fix TrueType font problems in 4.0.2 (#4439, Juliusz Chroboczek).
137. Document the "DisplaySize" keyword in the XF86Config man page (#4438, Andrew C. Aitchison).

SIL OPEN FONT LICENSE Version 1.1 - 26 February 2007

PREAMBLE
The goals of the Open Font License (OFL) are to stimulate worldwide
development of collaborative font projects, to support the font creation
efforts of academic and linguistic communities, and to provide a free and
open framework in which fonts may be shared and improved in partnership
with others.

The OFL allows the licensed fonts to be used, studied, modified and
redistributed freely as long as they are not sold by themselves. The
fonts, including any derivative works, can be bundled, embedded,
redistributed and/or sold with any software provided that any reserved
names are not used by derivative works. The fonts and derivatives,
however, cannot be released under any other type of license. The
requirement for fonts to remain under this license does not apply
to any document created using the fonts or their derivatives.

DEFINITIONS
"Font Software" refers to the set of files released by the Copyright
Holder(s) under this license and clearly marked as such. This may
include source files, build scripts and documentation.

"Reserved Font Name" refers to any names specified as such after the
copyright statement(s).

"Original Version" refers to the collection of Font Software components as
distributed by the Copyright Holder(s).

"Modified Version" refers to any derivative made by adding to, deleting,
or substituting -- in part or in whole -- any of the components of the
Original Version, by changing formats or by porting the Font Software to a
new environment.

"Author" refers to any designer, engineer, programmer, technical
writer or other person who contributed to the Font Software.

PERMISSION & CONDITIONS
Permission is hereby granted, free of charge, to any person obtaining
a copy of the Font Software, to use, study, copy, merge, embed, modify,
redistribute, and sell modified and unmodified copies of the Font
Software, subject to the following conditions:

1) Neither the Font Software nor any of its individual components,
in Original or Modified Versions, may be sold by itself.
2) Original or Modified Versions of the Font Software may be bundled, redistibuted and/or sold with any software, provided that each copy contains the above copyright notice and this license. These can be included either as stand-alone text files, human-readable headers or in the appropriate machine-readable metadata fields within text or binary files as long as those fields can be easily viewed by the user.

3) No Modified Version of the Font Software may use the Reserved Font Name(s) unless explicit written permission is granted by the corresponding Copyright Holder. This restriction only applies to the primary font name as presented to the users.

4) The name(s) of the Copyright Holder(s) or the Author(s) of the Font Software shall not be used to promote, endorse or advertise any Modified Version, except to acknowledge the contribution(s) of the Copyright Holder(s) and the Author(s) or with their explicit written permission.

5) The Font Software, modified or unmodified, in part or in whole, must be distributed entirely under this license, and must not be distributed under any other license. The requirement for fonts to remain under this license does not apply to any document created using the Font Software.

TERMINATION
This license becomes null and void if any of the above conditions are not met.

DISCLAIMER
THE FONT SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OF COPYRIGHT, PATENT, TRADEMARK, OR OTHER RIGHT. IN NO EVENT SHALL THE COPYRIGHT HOLDER BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, INCLUDING ANY GENERAL, SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF THE USE OR INABILITY TO USE THE FONT SOFTWARE OR FROM OTHER DEALINGS IN THE FONT SOFTWARE.

MOZILLA PUBLIC LICENSE

Version 1.1

-----------

1. Definitions.

1.0.1. "Commercial Use" means distribution or otherwise making the Covered Code available to a third party.

1.1. "Contributor" means each entity that creates or contributes to the creation of Modifications.

1.2. "Contributor Version" means the combination of the Original Code, prior Modifications used by a Contributor, and the Modifications made by that particular Contributor.

1.3. "Covered Code" means the Original Code or Modifications or the combination of the Original Code and Modifications, in each case including portions thereof.

1.4. "Electronic Distribution Mechanism" means a mechanism generally accepted in the software development community for the electronic transfer of data.

1.5. "Executable" means Covered Code in any form other than Source Code.

1.6. "Initial Developer" means the individual or entity identified as the Initial Developer in the Source Code notice required by Exhibit A.

1.7. "Larger Work" means a work which combines Covered Code or portions thereof with code not governed by the terms of this License.

1.8. "License" means this document.

1.8.1. "Licensable" means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently acquired, any and all of the rights conveyed herein.

1.9. "Modifications" means any addition to or deletion from the substance or structure of either the Original Code or any previous Modifications. When Covered Code is released as a series of files, a
Modification is:
   A. Any addition to or deletion from the contents of a file containing Original Code or previous Modifications.

   B. Any new file that contains any part of the Original Code or previous Modifications.

1.10. "Original Code" means Source Code of computer software code which is described in the Source Code notice required by Exhibit A as Original Code, and which, at the time of its release under this License is not already Covered Code governed by this License.

1.10.1. "Patent Claims" means any patent claim(s), now owned or hereafter acquired, including without limitation, method, process, and apparatus claims, in any patent Licensable by grantor.

1.11. "Source Code" means the preferred form of the Covered Code for making modifications to it, including all modules it contains, plus any associated interface definition files, scripts used to control compilation and installation of an Executable, or source code differential comparisons against either the Original Code or another well known, available Covered Code of the Contributor's choice. The Source Code can be in a compressed or archival form, provided the appropriate decompression or de-archiving software is widely available for no charge.

1.12. "You" (or "Your") means an individual or a legal entity exercising rights under, and complying with all of the terms of, this License or a future version of this License issued under Section 6.1. For legal entities, "You" includes any entity which controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. Source Code License.

2.1. The Initial Developer Grant.
The Initial Developer hereby grants You a world-wide, royalty-free, non-exclusive license, subject to third party intellectual property claims:
   (a) under intellectual property rights (other than patent or trademark) Licensable by Initial Developer to use, reproduce, modify, display, perform, sublicense and distribute the Original Code (or portions thereof) with or without Modifications, and/or as part of a Larger Work; and
(b) under Patents Claims infringed by the making, using or
selling of Original Code, to make, have made, use, practice,
sell, and offer for sale, and/or otherwise dispose of the
Original Code (or portions thereof).

(c) the licenses granted in this Section 2.1(a) and (b) are
effective on the date Initial Developer first distributes
Original Code under the terms of this License.

(d) Notwithstanding Section 2.1(b) above, no patent license is
granted: 1) for code that You delete from the Original Code; 2)
separate from the Original Code; or 3) for infringements caused
by: i) the modification of the Original Code or ii) the
combination of the Original Code with other software or devices.

2.2. Contributor Grant.
Subject to third party intellectual property claims, each Contributor
hereby grants You a world-wide, royalty-free, non-exclusive license

(a) under intellectual property rights (other than patent or
trademark) Licensable by Contributor, to use, reproduce, modify,
display, perform, sublicense and distribute the Modifications
created by such Contributor (or portions thereof) either on an
unmodified basis, with other Modifications, as Covered Code
and/or as part of a Larger Work; and

(b) under Patent Claims infringed by the making, using, or
selling of Modifications made by that Contributor either alone
and/or in combination with its Contributor Version (or portions
of such combination), to make, use, sell, offer for sale, have
made, and/or otherwise dispose of: 1) Modifications made by that
Contributor (or portions thereof); and 2) the combination of
Modifications made by that Contributor with its Contributor
Version (or portions of such combination).

(c) the licenses granted in Sections 2.2(a) and 2.2(b) are
effective on the date Contributor first makes Commercial Use of
the Covered Code.

(d) Notwithstanding Section 2.2(b) above, no patent license is
granted: 1) for any code that Contributor has deleted from the
Contributor Version; 2) separate from the Contributor Version;
3) for infringements caused by: i) third party modifications of
Contributor Version or ii) the combination of Modifications made
by that Contributor with other software (except as part of the
Contributor Version) or other devices; or 4) under Patent Claims
infringed by Covered Code in the absence of Modifications made by
that Contributor.

3. Distribution Obligations.

3.1. Application of License.
The Modifications which You create or to which You contribute are governed by the terms of this License, including without limitation Section 2.2. The Source Code version of Covered Code may be distributed only under the terms of this License or a future version of this License released under Section 6.1, and You must include a copy of this License with every copy of the Source Code You distribute. You may not offer or impose any terms on any Source Code version that alters or restricts the applicable version of this License or the recipients' rights hereunder. However, You may include an additional document offering the additional rights described in Section 3.5.

3.2. Availability of Source Code.
Any Modification which You create or to which You contribute must be made available in Source Code form under the terms of this License either on the same media as an Executable version or via an accepted Electronic Distribution Mechanism to anyone to whom you made an Executable version available; and if made available via Electronic Distribution Mechanism, must remain available for at least twelve (12) months after the date it initially became available, or at least six (6) months after a subsequent version of that particular Modification has been made available to such recipients. You are responsible for ensuring that the Source Code version remains available even if the Electronic Distribution Mechanism is maintained by a third party.

3.3. Description of Modifications.
You must cause all Covered Code to which You contribute to contain a file documenting the changes You made to create that Covered Code and the date of any change. You must include a prominent statement that the Modification is derived, directly or indirectly, from Original Code provided by the Initial Developer and including the name of the Initial Developer in (a) the Source Code, and (b) in any notice in an Executable version or related documentation in which You describe the origin or ownership of the Covered Code.

3.4. Intellectual Property Matters
(a) Third Party Claims.
If Contributor has knowledge that a license under a third party's intellectual property rights is required to exercise the rights granted by such Contributor under Sections 2.1 or 2.2, Contributor must include a text file with the Source Code distribution titled "LEGAL" which describes the claim and the party making the claim in sufficient detail that a recipient will
know whom to contact. If Contributor obtains such knowledge after the Modification is made available as described in Section 3.2, Contributor shall promptly modify the LEGAL file in all copies Contributor makes available thereafter and shall take other steps (such as notifying appropriate mailing lists or newsgroups) reasonably calculated to inform those who received the Covered Code that new knowledge has been obtained.

(b) Contributor APIs.
If Contributor’s Modifications include an application programming interface and Contributor has knowledge of patent licenses which are reasonably necessary to implement that API, Contributor must also include this information in the LEGAL file.

(c) Representations.
Contributor represents that, except as disclosed pursuant to Section 3.4(a) above, Contributor believes that Contributor’s Modifications are Contributor’s original creation(s) and/or Contributor has sufficient rights to grant the rights conveyed by this License.

3.5. Required Notices.
You must duplicate the notice in Exhibit A in each file of the Source Code. If it is not possible to put such notice in a particular Source Code file due to its structure, then You must include such notice in a location (such as a relevant directory) where a user would be likely to look for such a notice. If You created one or more Modification(s) You may add your name as a Contributor to the notice described in Exhibit A. You must also duplicate this License in any documentation for the Source Code where You describe recipients’ rights or ownership rights relating to Covered Code. You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Code. However, You may do so only on Your own behalf, and not on behalf of the Initial Developer or any Contributor. You must make it absolutely clear than any such warranty, support, indemnity or liability obligation is offered by You alone, and You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of warranty, support, indemnity or liability terms You offer.

3.6. Distribution of Executable Versions.
You may distribute Covered Code in Executable form only if the requirements of Section 3.1-3.5 have been met for that Covered Code, and if You include a notice stating that the Source Code version of the Covered Code is available under the terms of this License, including a description of how and where You have fulfilled the obligations of Section 3.2. The notice must be conspicuously included
in any notice in an Executable version, related documentation or collateral in which You describe recipients' rights relating to the Covered Code. You may distribute the Executable version of Covered Code or ownership rights under a license of Your choice, which may contain terms different from this License, provided that You are in compliance with the terms of this License and that the license for the Executable version does not attempt to limit or alter the recipient's rights in the Source Code version from the rights set forth in this License. If You distribute the Executable version under a different license You must make it absolutely clear that any terms which differ from this License are offered by You alone, not by the Initial Developer or any Contributor. You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of any such terms You offer.

3.7. Larger Works.
You may create a Larger Work by combining Covered Code with other code not governed by the terms of this License and distribute the Larger Work as a single product. In such a case, You must make sure the requirements of this License are fulfilled for the Covered Code.

4. Inability to Comply Due to Statute or Regulation.

If it is impossible for You to comply with any of the terms of this License with respect to some or all of the Covered Code due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be included in the LEGAL file described in Section 3.4 and must be included with all distributions of the Source Code. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

5. Application of this License.

This License applies to code to which the Initial Developer has attached the notice in Exhibit A and to related Covered Code.

6. Versions of the License.

6.1. New Versions.
Netscape Communications Corporation ("Netscape") may publish revised and/or new versions of the License from time to time. Each version will be given a distinguishing version number.

6.2. Effect of New Versions.
Once Covered Code has been published under a particular version of the License, You may always continue to use it under the terms of that version. You may also choose to use such Covered Code under the terms of any subsequent version of the License published by Netscape. No one other than Netscape has the right to modify the terms applicable to Covered Code created under this License.

6.3. Derivative Works.
If You create or use a modified version of this License (which you may only do in order to apply it to code which is not already Covered Code governed by this License), You must (a) rename Your license so that the phrases "Mozilla", "MOZILLAPL", "MOZPL", "Netscape", "MPL", "NPL" or any confusingly similar phrase do not appear in your license (except to note that your license differs from this License) and (b) otherwise make it clear that Your version of the license contains terms which differ from the Mozilla Public License and Netscape Public License. (Filling in the name of the Initial Developer, Original Code or Contributor in the notice described in Exhibit A shall not of themselves be deemed to be modifications of this License.)

7. DISCLAIMER OF WARRANTY.

COVERED CODE IS PROVIDED UNDER THIS LICENSE ON AN "AS IS" BASIS, WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, WARRANTIES THAT THE COVERED CODE IS FREE OF DEFECTS, MERCANTABLE, FIT FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE COVERED CODE IS WITH YOU. SHOULD ANY COVERED CODE PROVE DEFECTIVE IN ANY RESPECT, YOU (NOT THE INITIAL DEVELOPER OR ANY OTHER CONTRIBUTOR) ASSUME THE COST OF ANY NECESSARY SERVICING, REPAIR OR CORRECTION. THIS DISCLAIMER OF WARRANTY CONSTITUTES AN ESSENTIAL PART OF THIS LICENSE. NO USE OF ANY COVERED CODE IS AUTHORIZED HEREUNDER EXCEPT UNDER THIS DISCLAIMER.

8. TERMINATION.

8.1. This License and the rights granted hereunder will terminate automatically if You fail to comply with terms herein and fail to cure such breach within 30 days of becoming aware of the breach. All sublicenses to the Covered Code which are properly granted shall survive any termination of this License. Provisions which, by their nature, must remain in effect beyond the termination of this License shall survive.

8.2. If You initiate litigation by asserting a patent infringement claim (excluding declaratory judgment actions) against Initial Developer or a Contributor (the Initial Developer or Contributor against whom You file such action is referred to as "Participant") alleging that:
(a) such Participant's Contributor Version directly or indirectly infringes any patent, then any and all rights granted by such Participant to You under Sections 2.1 and/or 2.2 of this License shall, upon 60 days notice from Participant terminate prospectively, unless if within 60 days after receipt of notice You either: (i) agree in writing to pay Participant a mutually agreeable reasonable royalty for Your past and future use of Modifications made by such Participant, or (ii) withdraw Your litigation claim with respect to the Contributor Version against such Participant. If within 60 days of notice, a reasonable royalty and payment arrangement are not mutually agreed upon in writing by the parties or the litigation claim is not withdrawn, the rights granted by Participant to You under Sections 2.1 and/or 2.2 automatically terminate at the expiration of the 60 day notice period specified above.

(b) any software, hardware, or device, other than such Participant's Contributor Version, directly or indirectly infringes any patent, then any rights granted to You by such Participant under Sections 2.1(b) and 2.2(b) are revoked effective as of the date You first made, used, sold, distributed, or had made, Modifications made by that Participant.

8.3. If You assert a patent infringement claim against Participant alleging that such Participant's Contributor Version directly or indirectly infringes any patent where such claim is resolved (such as by license or settlement) prior to the initiation of patent infringement litigation, then the reasonable value of the licenses granted by such Participant under Sections 2.1 or 2.2 shall be taken into account in determining the amount or value of any payment or license.

8.4. In the event of termination under Sections 8.1 or 8.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or any distributor hereunder prior to termination shall survive termination.

9. LIMITATION OF LIABILITY.

UNDER NO CIRCUMSTANCES AND UNDER NO LEGAL THEORY, WHETHER TORT (INCLUDING NEGLIGENCE), CONTRACT, OR OTHERWISE, SHALL YOU, THE INITIAL DEVELOPER, ANY OTHER CONTRIBUTOR, OR ANY DISTRIBUTOR OF COVERED CODE, OR ANY SUPPLIER OF ANY OF SUCH PARTIES, BE LIABLE TO ANY PERSON FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES OF ANY CHARACTER INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF GOODWILL, WORK STOPPAGE, COMPUTER FAILURE OR MALFUNCTION, OR ANY AND ALL OTHER COMMERCIAL DAMAGES OR LOSSES, EVEN IF SUCH PARTY SHALL HAVE BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. THIS LIMITATION OF
LIABILITY SHALL NOT APPLY TO LIABILITY FOR DEATH OR PERSONAL INJURY RESULTING FROM SUCH PARTY’S NEGLIGENCE TO THE EXTENT APPLICABLE LAW PROHIBITS SUCH LIMITATION. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THIS EXCLUSION AND LIMITATION MAY NOT APPLY TO YOU.

10. U.S. GOVERNMENT END USERS.

11. MISCELLANEOUS.

This License represents the complete agreement concerning subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. This License shall be governed by California law provisions (except to the extent applicable law, if any, provides otherwise), excluding its conflict-of-law provisions. With respect to disputes in which at least one party is a citizen of, or an entity chartered or registered to do business in the United States of America, any litigation relating to this License shall be subject to the jurisdiction of the Federal Courts of the Northern District of California, with venue lying in Santa Clara County, California, with the losing party responsible for costs, including without limitation, court costs and reasonable attorneys’ fees and expenses. The application of the United Nations Convention on Contracts for the International Sale of Goods is expressly excluded. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not apply to this License.

12. RESPONSIBILITY FOR CLAIMS.

As between Initial Developer and the Contributors, each party is responsible for claims and damages arising, directly or indirectly, out of its utilization of rights under this License and You agree to work with Initial Developer and Contributors to distribute such responsibility on an equitable basis. Nothing herein is intended or shall be deemed to constitute any admission of liability.

13. MULTIPLE-LICENSED CODE.
Initial Developer may designate portions of the Covered Code as "Multiple-Licensed". "Multiple-Licensed" means that the Initial Developer permits you to utilize portions of the Covered Code under Your choice of the NPL or the alternative licenses, if any, specified by the Initial Developer in the file described in Exhibit A.

EXHIBIT A -Mozilla Public License.

GNU LESSER GENERAL PUBLIC LICENSE
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts
as the successor of the GNU Library Public License, version 2, hence
the version number 2.1.]

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
Licenses are intended to guarantee your freedom to share and change
free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some
specially designated software packages--typically libraries--of the
Free Software Foundation and other authors who decide to use it. You
can use it too, but we suggest you first think carefully about whether
this license or the ordinary General Public License is the better
strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use,
not price. Our General Public Licenses are designed to make sure that
you have the freedom to distribute copies of free software (and charge
for this service if you wish); that you receive source code or can get
it if you want it; that you can change the software and use pieces of
it in new free programs; and that you are informed that you can do
these things.

To protect your rights, we need to make restrictions that forbid
distributors to deny you these rights or to ask you to surrender these
rights. These restrictions translate to certain responsibilities for
you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you. You must make sure that they, too, receive or can get the source
code. If you link other code with the library, you must provide
complete object files to the recipients, so that they can relink them
with the library after making changes to the library and recompiling
it. And you must show them these terms so they know their rights.
We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.
In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of
running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library,
and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.
5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever
changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable “work that uses the Library”, as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined
library, provided that the separate distribution of the work based on
the Library and of the other library facilities is otherwise
permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work
based on the Library, uncombined with any other library
facilities. This must be distributed under the terms of the
Sections above.

b) Give prominent notice with the combined library of the fact
that part of it is a work based on the Library, and explaining
where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute
the Library except as expressly provided under this License. Any
attempt otherwise to copy, modify, sublicense, link with, or
distribute the Library is void, and will automatically terminate your
rights under this License. However, parties who have received copies,
or rights, from you under this License will not have their licenses
terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not
signed it. However, nothing else grants you permission to modify or
distribute the Library or its derivative works. These actions are
prohibited by law if you do not accept this License. Therefore, by
modifying or distributing the Library (or any work based on the
Library), you indicate your acceptance of this License to do so, and
all its terms and conditions for copying, distributing or modifying
the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the
Library), the recipient automatically receives a license from the
original licensor to copy, distribute, link with or modify the Library
subject to these terms and conditions. You may not impose any further
restrictions on the recipients' exercise of the rights granted herein.
You are not responsible for enforcing compliance by third parties with
this License.

11. If, as a consequence of a court judgment or allegation of patent
infringement or for any other reason (not limited to patent issues),
conditions are imposed on you (whether by court order, agreement or
otherwise) that contradict the conditions of this License, they do not
excuse you from the conditions of this License. If you cannot
distribute so as to satisfy simultaneously your obligations under this
License and any other pertinent obligations, then as a consequence you
may not distribute the Library at all. For example, if a patent
license would not permit royalty-free redistribution of the Library by
all those who receive copies directly or indirectly through you, then
the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status
of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.
This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.
"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of,
publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution
notices within Derivative Works that You distribute, alongside
or as an addendum to the NOTICE text from the Work, provided
that such additional attribution notices cannot be construed
as modifying the License.

You may add Your own copyright statement to Your modifications and
may provide additional or different license terms and conditions
for use, reproduction, or distribution of Your modifications, or
for any such Derivative Works as a whole, provided Your use,
reproduction, and distribution of the Work otherwise complies with
the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise,
any Contribution intentionally submitted for inclusion in the Work
by You to the Licensor shall be under the terms and conditions of
this License, without any additional terms or conditions.
Notwithstanding the above, nothing herein shall supersede or modify
the terms of any separate license agreement you may have executed
with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade
names, trademarks, service marks, or product names of the Licensor,
except as required for reasonable and customary use in describing the
origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or
agreed to in writing, Licensor provides the Work (and each
Contributor provides its Contributions) on an "AS IS" BASIS,
WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or
implied, including, without limitation, any warranties or conditions
of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A
PARTICULAR PURPOSE. You are solely responsible for determining the
appropriateness of using or redistributing the Work and assume any
risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory,
whether in tort (including negligence), contract, or otherwise,
unless required by applicable law (such as deliberate and grossly
negligent acts) or agreed to in writing, shall any Contributor be
liable to You for damages, including any direct, indirect, special,
incidental, or consequential damages of any character arising as a
result of this License or out of the use or inability to use the
Work (including but not limited to damages for loss of goodwill,
work stoppage, computer failure or malfunction, or any and all
other commercial damages or losses), even if such Contributor
has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing
the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
License is intended to guarantee your freedom to share and change free
software--to make sure the software is free for all its users. This
General Public License applies to most of the Free Software
Foundation's software and to any other program whose authors commit to
using it. (Some other Free Software Foundation software is covered by
the GNU Library General Public License instead.) You can apply it to
your programs, too.

When we speak of free software, we are referring to freedom, not
price. Our General Public Licenses are designed to make sure that you
have the freedom to distribute copies of free software (and charge for
this service if you wish), that you receive source code or can get it
if you want it, that you can change the software or use pieces of it
in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid
anyone to deny you these rights or to ask you to surrender the rights.
These restrictions translate to certain responsibilities for you if you
distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether
gratis or for a fee, you must give the recipients all the rights that
you have. You must make sure that they, too, receive or can get the
source code. And you must show them these terms so they know their
rights.

We protect your rights with two steps: (1) copyright the software, and
(2) offer you this license which gives you legal permission to copy,
distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain
that everyone understands that there is no warranty for this free
software. If the software is modified by someone else and passed on, we
want its recipients to know that what they have is not the original, so
that any problems introduced by others will not reflect on the original
Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a) You must cause the modified files to carry prominent notices
stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your
cost of physically performing source distribution, a complete
machine-readable copy of the corresponding source code, to be
distributed under the terms of Sections 1 and 2 above on a medium
customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer
to distribute corresponding source code. (This alternative is
allowed only for noncommercial distribution and only if you
received the program in object code or executable form with such
an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for
making modifications to it. For an executable work, complete source
code means all the source code for all modules it contains, plus any
associated interface definition files, plus the scripts used to
control compilation and installation of the executable. However, as a
special exception, the source code distributed need not include
anything that is normally distributed (in either source or binary
form) with the major components (compiler, kernel, and so on) of the
operating system on which the executable runs, unless that component
itself accompanies the executable.

If distribution of executable or object code is made by offering
access to copy from a designated place, then offering equivalent
access to copy the source code from the same place counts as
distribution of the source code, even though third parties are not
compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program
except as expressly provided under this License. Any attempt
otherwise to copy, modify, sublicense or distribute the Program is
void, and will automatically terminate your rights under this License.
However, parties who have received copies, or rights, from you under
this License will not have their licenses terminated so long as such
parties remain in full compliance.

5. You are not required to accept this License, since you have not
signed it. However, nothing else grants you permission to modify or
distribute the Program or its derivative works. These actions are
prohibited by law if you do not accept this License. Therefore, by
modifying or distributing the Program (or any work based on the
Program), you indicate your acceptance of this License to do so, and
all its terms and conditions for copying, distributing or modifying
the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the
Program), the recipient automatically receives a license from the
original licensor to copy, distribute or modify the Program subject to
these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to
address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

**NO WARRANTY**

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

**END OF TERMS AND CONDITIONS**

**How to Apply These Terms to Your New Programs**

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.
To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than `show w' and `show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program `Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License.

[This is the first released version of the Lesser GPL.  It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.
For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain
special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification").
"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.
For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which
must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the
Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.
It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

   a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

   b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent
infringement or for any other reason (not limited to patent issues),
conditions are imposed on you (whether by court order, agreement or
otherwise) that contradict the conditions of this License, they do not
excuse you from the conditions of this License. If you cannot
distribute so as to satisfy simultaneously your obligations under this
License and any other pertinent obligations, then as a consequence you
may not distribute the Library at all. For example, if a patent
license would not permit royalty-free redistribution of the Library by
all those who receive copies directly or indirectly through you, then
the only way you could satisfy both it and this License would be to
refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any
particular circumstance, the balance of the section is intended to apply,
and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any
patents or other property right claims or to contest validity of any
such claims; this section has the sole purpose of protecting the
integrity of the free software distribution system which is
implemented by public license practices. Many people have made
generous contributions to the wide range of software distributed
through that system in reliance on consistent application of that
system; it is up to the author/donor to decide if he or she is willing
to distribute software through any other system and a licensee cannot
impose that choice.

This section is intended to make thoroughly clear what is believed to
be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in
certain countries either by patents or by copyrighted interfaces, the
original copyright holder who places the Library under this License may add
an explicit geographical distribution limitation excluding those countries,
so that distribution is permitted only in or among countries not thus
excluded. In such case, this License incorporates the limitation as if
written in the body of this License.

13. The Free Software Foundation may publish revised and/or new
versions of the Lesser General Public License from time to time.
Such new versions will be similar in spirit to the present version,
but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library
specifies a version number of this License which applies to it and
"any later version", you have the option of following the terms and
conditions either of that version or of any later version published by
the Free Software Foundation. If the Library does not specify a
license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the
"copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year>  <name of author>

This library is free software; you can redistribute it and/or
modify it under the terms of the GNU Lesser General Public
License as published by the Free Software Foundation; either
version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public
License along with this library; if not, write to the Free Software
Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the library, if
necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the
library `Frob' (a library for tweaking knobs) written by James Random Hacker.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).
"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate
as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify
the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include
the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

   TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

   "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

   "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.
"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity
on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one
of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a
result of this License or out of the use or inability to use the
Work (including but not limited to damages for loss of goodwill,
work stoppage, computer failure or malfunction, or any and all
other commercial damages or losses), even if such Contributor
has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing
the Work or Derivative Works thereof, You may choose to offer,
and charge a fee for, acceptance of support, warranty, indemnity,
or other liability obligations and/or rights consistent with this
License. However, in accepting such obligations, You may act only
on Your own behalf and on Your sole responsibility, not on behalf
of any other Contributor, and only if You agree to indemnify,
defend, and hold each Contributor harmless for any liability
incurred by, or claims asserted against, such Contributor by reason
of your accepting any such warranty or additional liability.

PCRE2 LICENCE
-------------

PCRE2 is a library of functions to support regular expressions whose syntax and semantics are as close as possible to those of the Perl 5 language.

Release 10 of PCRE2 is distributed under the terms of the "BSD" licence, as specified below. The documentation for PCRE2, supplied in the "doc" directory, is distributed under the same terms as the software itself. The data in the testdata directory is not copyrighted and is in the public domain.

The basic library functions are written in C and are freestanding. Also included in the distribution is a just-in-time compiler that can be used to optimize pattern matching. This is an optional feature that can be omitted when the library is built.

```
<P>THIS SOFTWARE IS AVAILABLE UNDER A DUAL LICENSE MODEL: CDDL 1.0 and GPL v2</p>
```
1.2. "Contributor Version" means the combination of the Original Software, prior Modifications used by a Contributor (if any), and the Modifications made by that particular Contributor.

1.3. "Covered Software" means (a) the Original Software, or (b) Modifications, or (c) the combination of files containing Original Software with files containing Modifications, in each case including portions thereof.

1.4. "Executable" means the Covered Software in any form other than Source Code.

1.5. "Initial Developer" means the individual or entity that first makes Original Software available under this License.

1.6. "Larger Work" means a work which combines Covered Software or portions thereof with code not governed by the terms of this License.

1.7. "License" means this document.
1.8. "Licensable" means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently acquired, any and all of the rights conveyed herein.

1.9. "Modifications" means the Source Code and Executable form of any of the following:

A. Any file that results from an addition to, deletion from or modification of the contents of a file containing Original Software or previous Modifications;

B. Any new file that contains any part of the Original Software or previous Modification; or

C. Any new file that is contributed or otherwise made available under the terms of this License.

1.10. "Original Software" means the Source Code and Executable form of computer software code that is originally released under this License.
1.11. "Patent Claims" means any patent claim(s), now owned or hereafter acquired, including without limitation, method, process, and apparatus claims, in any patent Licensable by grantor.

1.12. "Source Code" means (a) the common form of computer software code in which modifications are made and (b) associated documentation included in or with such code.

1.13. "You" (or "Your") means an individual or a legal entity exercising rights under, and complying with all of the terms of, this License. For legal entities, "You" includes any entity which controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. License Grants.

2.1. The Initial Developer Grant. Conditioned upon Your compliance with Section 3.1 below and subject to third party intellectual property claims, the Initial Developer hereby grants You a world-wide, royalty-free, non-exclusive license:
<p>(a) under intellectual property rights (other than patent or trademark) Licensable by Initial Developer, to use, reproduce, modify, display, perform, sublicense and distribute the Original Software (or portions thereof), with or without Modifications, and/or as part of a Larger Work; and</p>

<p>(b) under Patent Claims infringed by the making, using or selling of Original Software, to make, have made, use, practice, sell, and offer for sale, and/or otherwise dispose of the Original Software (or portions thereof).</p>

<p>(c) The licenses granted in Sections 2.1(a) and (b) are effective on the date Initial Developer first distributes or otherwise makes the Original Software available to a third party under the terms of this License.</p>

<p>(d) Notwithstanding Section 2.1(b) above, no patent license is granted: (1) for code that You delete from the Original Software, or (2) for infringements caused by: (i) the modification of the Original Software, or (ii) the combination of the Original Software with other software or devices.</p>

<p>2.2. Contributor Grant.</p>

Conditioned upon Your compliance with Section 3.1 below and subject to third party intellectual property claims, each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:
(a) under intellectual property rights (other than patent or trademark) Licensable by Contributor to use, reproduce, modify, display, perform, sublicense and distribute the Modifications created by such Contributor (or portions thereof), either on an unmodified basis, with other Modifications, as Covered Software and/or as part of a Larger Work; and

(b) under Patent Claims infringed by the making, using, or selling of Modifications made by that Contributor either alone and/or in combination with its Contributor Version (or portions of such combination), to make, use, sell, offer for sale, have made, and/or otherwise dispose of: (1) Modifications made by that Contributor (or portions thereof); and (2) the combination of Modifications made by that Contributor with its Contributor Version (or portions of such combination).

The licenses granted in Sections 2.2(a) and 2.2(b) are effective on the date Contributor first distributes or otherwise makes the Modifications available to a third party.

Notwithstanding Section 2.2(b) above, no patent license is granted: (1) for any code that Contributor has deleted from the Contributor Version; (2) for infringements caused by: (i) third party modifications of Contributor Version, or (ii) the combination of Modifications made by that Contributor with other software (except as part of the Contributor Version) or other devices; or (3) under Patent Claims infringed by Covered Software in the absence of Modifications made by that Contributor.
3. Distribution Obligations.

3.1. Availability of Source Code.

Any Covered Software that You distribute or otherwise make available in Executable form must also be made available in Source Code form and that Source Code form must be distributed only under the terms of this License. You must include a copy of this License with every copy of the Source Code form of the Covered Software You distribute or otherwise make available. You must inform recipients of any such Covered Software in Executable form as to how they can obtain such Covered Software in Source Code form in a reasonable manner on or through a medium customarily used for software exchange.

3.2. Modifications.

The Modifications that You create or to which You contribute are governed by the terms of this License. You represent that You believe Your Modifications are Your original creation(s) and/or You have sufficient rights to grant the rights conveyed by this License.

3.3. Required Notices.

You must include a notice in each of Your Modifications that identifies You as the Contributor of the Modification. You may not remove or alter any copyright, patent or trademark notices contained within the Covered Software, or any notices of licensing or any descriptive text giving attribution to any Contributor or the Initial Developer.

3.4. Application of Additional Terms.
You may not offer or impose any terms on any Covered Software in Source Code form that alters or restricts the applicable version of this License or the recipients' rights hereunder. You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, you may do so only on Your own behalf, and not on behalf of the Initial Developer or any Contributor. You must make it absolutely clear that any such warranty, support, indemnity or liability obligation is offered by You alone, and You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of warranty, support, indemnity or liability terms You offer.

3.5. Distribution of Executable Versions.

You may distribute the Executable form of the Covered Software under the terms of this License or under the terms of a license of Your choice, which may contain terms different from this License, provided that You are in compliance with the terms of this License and that the license for the Executable form does not attempt to limit or alter the recipient's rights in the Source Code form from the rights set forth in this License. If You distribute the Covered Software in Executable form under a different license, You must make it absolutely clear that any terms which differ from this License are offered by You alone, not by the Initial Developer or Contributor. You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of any such terms You offer.

You may create a Larger Work by combining Covered Software with other code not governed by the terms of this License and distribute the Larger Work as a single product. In such a case, You must make sure the requirements of this License are fulfilled for the Covered Software.
4. Versions of the License.

4.1. New Versions.

Sun Microsystems, Inc. is the initial license steward and may publish revised and/or new versions of this License from time to time. Each version will be given a distinguishing version number. Except as provided in Section 4.3, no one other than the license steward has the right to modify this License.

4.2. Effect of New Versions.

You may always continue to use, distribute or otherwise make the Covered Software available under the terms of the version of the License under which You originally received the Covered Software. If the Initial Developer includes a notice in the Original Software prohibiting it from being distributed or otherwise made available under any subsequent version of the License, You must distribute and make the Covered Software available under the terms of the version of the License under which You originally received the Covered Software. Otherwise, You may also choose to use, distribute or otherwise make the Covered Software available under the terms of any subsequent version of the License published by the license steward.

4.3. Modified Versions.

When You are an Initial Developer and You want to create a new license for Your Original Software, You may create and use a modified version of this License if You:

(a) rename the license and remove any references to the name of the license steward (except to note that the license differs from this License); and (b) otherwise make it clear that the license contains terms which differ from this License.
5. DISCLAIMER OF WARRANTY.

COVERED SOFTWARE IS PROVIDED UNDER THIS LICENSE ON AN "AS IS" BASIS, WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, WARRANTIES THAT THE COVERED SOFTWARE IS FREE OF DEFECTS, MERCHANTABILITY, FIT FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE COVERED SOFTWARE IS WITH YOU. SHOULD ANY COVERED SOFTWARE PROVE DEFECTIVE IN ANY RESPECT, YOU (NOT THE INITIAL DEVELOPER OR ANY OTHER CONTRIBUTOR) ASSUME THE COST OF ANY NECESSARY SERVICING, REPAIR OR CORRECTION. THIS DISCLAIMER OF WARRANTY CONSTITUTES AN ESSENTIAL PART OF THIS LICENSE. NO USE OF ANY COVERED SOFTWARE IS AUTHORIZED HEREUNDER EXCEPT UNDER THIS DISCLAIMER.

6. TERMINATION.

6.1. This License and the rights granted hereunder will terminate automatically if You fail to comply with terms herein and fail to cure such breach within 30 days of becoming aware of the breach. Provisions which, by their nature, must remain in effect beyond the termination of this License shall survive.

6.2. If You assert a patent infringement claim (excluding declaratory judgment actions) against Initial Developer or a Contributor (the Initial Developer or Contributor against whom You assert such claim is referred to as "Participant") alleging that the Participant Software (meaning the Contributor Version where the Participant is a Contributor or the Original Software where the Participant is the Initial Developer) directly or indirectly infringes any patent, then any and all rights granted directly or indirectly to You by such Participant, the Initial Developer (if the Initial Developer is not the Participant) and all Contributors under
Sections 2.1 and/or 2.2 of this License shall, upon 60 days notice from Participant terminate prospectively and automatically at the expiration of such 60 day notice period, unless if within such 60 day period You withdraw Your claim with respect to the Participant Software against such Participant either unilaterally or pursuant to a written agreement with Participant.

In the event of termination under Sections 6.1 or 6.2 above, all end user licenses that have been validly granted by You or any distributor hereunder prior to termination (excluding licenses granted to You by any distributor) shall survive termination.

7. LIMITATION OF LIABILITY.

UNDER NO CIRCUMSTANCES AND UNDER NO LEGAL THEORY, WHETHER TORT (INCLUDING NEGLIGENCE), CONTRACT, OR OTHERWISE, SHALL YOU, THE INITIAL DEVELOPER, ANY OTHER CONTRIBUTOR, OR ANY DISTRIBUTOR OF COVERED SOFTWARE, OR ANY SUPPLIER OF ANY OF SUCH PARTIES, BE LIABLE TO ANY PERSON FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES OF ANY CHARACTER INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOST PROFITS, LOSS OF GOODWILL, WORK STOPPAGE, COMPUTER FAILURE OR MALFUNCTION, OR ANY AND ALL OTHER COMMERCIAL DAMAGES OR LOSSES, EVEN IF SUCH PARTY SHALL HAVE BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. THIS LIMITATION OF LIABILITY SHALL NOT APPLY TO LIABILITY FOR DEATH OR PERSONAL INJURY RESULTING FROM SUCH PARTY’S NEGLIGENCE TO THE EXTENT APPLICABLE LAW PROHIBITS SUCH LIMITATION. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES SUCH LIMITATION, SO THIS EXCLUSION AND LIMITATION MAY NOT APPLY TO YOU.

8. U.S. GOVERNMENT END USERS.

The Covered Software is a commercial item, as that term is defined in 48 C.F.R. 2.101 (Oct. 1995), consisting of commercial computer software; (as
that term is defined at 48 C.F.R. &sect;252.227-7014(a)(1) and &ldquo;commercial computer software documentation&rdquo; as such terms are used in 48 C.F.R. 12.212 (Sept. 1995). Consistent with 48 C.F.R. 12.212 and 48 C.F.R. 227.7202-1 through 227.7202-4 (June 1995), all U.S. Government End Users acquire Covered Software with only those rights set forth herein. This U.S. Government Rights clause is in lieu of, and supersedes, any other FAR, DFAR, or other clause or provision that addresses Government rights in computer software under this License.

9. MISCELLANEOUS.

This License represents the complete agreement concerning subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. This License shall be governed by the law of the jurisdiction specified in a notice contained within the Original Software (except to the extent applicable law, if any, provides otherwise), excluding such jurisdiction’s conflict-of-law provisions. Any litigation relating to this License shall be subject to the jurisdiction of the courts located in the jurisdiction and venue specified in a notice contained within the Original Software, with the losing party responsible for costs, including, without limitation, court costs and reasonable attorneys’ fees and expenses. The application of the United Nations Convention on Contracts for the International Sale of Goods is expressly excluded. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not apply to this License. You agree that You alone are responsible for compliance with the United States export administration regulations (and the export control laws and regulation of any other countries) when You use, distribute or otherwise make available any Covered Software.

10. RESPONSIBILITY FOR CLAIMS.

As between Initial Developer and the Contributors, each party is responsible for claims and damages arising, directly
or indirectly, out of its utilization of rights under this
License and You agree to work with Initial Developer and
Contributors to distribute such responsibility on an equitable
basis. Nothing herein is intended or shall be deemed to
constitute any admission of liability.

<h3>The GNU General Public License (GPL) Version 2, June 1991</h3>

<p> Copyright (C) 1989, 1991 Free Software Foundation, Inc.
59 Temple Place, Suite 330, Boston, MA 02111-1307 USA
</p>

<p> Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.
</p>

<p> <b>Preamble</b>
</p>

<p> The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
License is intended to guarantee your freedom to share and change
free software--to make sure the software is free for all its users.
This General Public License applies to most of the Free Software
Foundation's software and to any other program whose authors commit
to using it. (Some other Free Software Foundation software is covered
by the GNU Library General Public License instead.) You can apply it
to your programs, too.
When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.
<p><b>TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION</b></p>

<ul style="margin-left:0; padding-left:0; border-left:0">
<li>This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".</li>
<li>Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.</li>
<li>You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.</li>
<li>You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.</li>
<li>You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:</li>
</ul>
a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under
the scope of this License.
</p>
</li>

<li>
<p>
<b>3.</b> You may copy and distribute the Program (or a work based
on it, under Section 2) in object code or executable form under
the terms of Sections 1 and 2 above provided that you also do one
of the following:
</p>
<ul>
<li>
<p>
a) Accompany it with the complete corresponding machine-readable
source code, which must be distributed under the terms of Sections
1 and 2 above on a medium customarily used for software interchange; or,
</p>
</li>
<li>
<p>
b) Accompany it with a written offer, valid for at least three years,
to give any third party, for a charge no more than your cost of
physically performing source distribution, a complete machine-readable
copy of the corresponding source code, to be distributed under the
terms of Sections 1 and 2 above on a medium customarily used for
software interchange; or,
</p>
</li>
<li>
<p>
c) Accompany it with the information you received as to the offer to
distribute corresponding source code. (This alternative is allowed
only for noncommercial distribution and only if you received the
program in object code or executable form with such an offer, in
accord with Subsection b above.)
</p>
</li>
</ul>

<p>
The source code for a work means the preferred form of the work for
making modifications to it. For an executable work, complete source
code means all the source code for all modules it contains, plus any
associated interface definition files, plus the scripts used to control
compilation and installation of the executable. However, as a special
exception, the source code distributed need not include anything that
is normally distributed (in either source or binary form) with the
major components (compiler, kernel, and so on) of the operating system
</p>
on which the executable runs, unless that component itself accompanies
the executable.
</p>
<p>
If distribution of executable or object code is made by offering access
to copy from a designated place, then offering equivalent access to
copy the source code from the same place counts as distribution of the
source code, even though third parties are not compelled to copy the
source along with the object code.
</p>
</li>
<li>
<p>
<b>4.</b> You may not copy, modify, sublicense, or distribute the
Program except as expressly provided under this License. Any attempt
otherwise to copy, modify, sublicense or distribute the Program is void,
and will automatically terminate your rights under this License. However,
parties who have received copies, or rights, from you under this License
will not have their licenses terminated so long as such parties remain
in full compliance.
</p>
</li>
<li>
<p>
<b>5.</b> You are not required to accept this License, since you have
not signed it. However, nothing else grants you permission to modify or
distribute the Program or its derivative works. These actions are prohibited
by law if you do not accept this License. Therefore, by modifying or
distributing the Program (or any work based on the Program), you indicate
your acceptance of this License to do so, and all its terms and conditions
for copying, distributing or modifying the Program or works based on it.
</p>
</li>
<li>
<p>
<b>6.</b> Each time you redistribute the Program (or any work based on the
Program), the recipient automatically receives a license from the original
licensor to copy, distribute or modify the Program subject to these terms
and conditions. You may not impose any further restrictions on the recipients’
exercise of the rights granted herein. You are not responsible for enforcing
compliance by third parties to this License.
</p>
</li>
<p><b>7.</b> If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.</p>

<p>If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.</p>

<p>It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.</p>

<p>This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.</p>

<p><b>8.</b> If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.</p>
9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.
In no event unless required by applicable law or agreed to in writing will any copyright holder, or any other party who may modify and/or redistribute the program as permitted above, be liable to you for damages, including any general, special, incidental or consequential damages arising out of the use or inability to use the program (including but not limited to loss of data or data being rendered inaccurate or losses sustained by you or third parties or a failure of the program to operate with any other programs), even if such holder or other party has been advised of the possibility of such damages.

End of terms and conditions

How to apply these terms to your new programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

One line to give the program's name and a brief idea of what it does.

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification"). Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

   b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

   c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide
a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

   a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for
making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you
may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author
to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

[This is the first released version of the library GPL. It is

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
Licenses are intended to guarantee your freedom to share and change
free software--to make sure the software is free for all its users.

This license, the Library General Public License, applies to some
specially designated Free Software Foundation software, and to any
other libraries whose authors decide to use it. You can use it for
your libraries, too.

When we speak of free software, we are referring to freedom, not
price. Our General Public Licenses are designed to make sure that you
have the freedom to distribute copies of free software (and charge for
this service if you wish), that you receive source code or can get it
if you want it, that you can change the software or use pieces of it
in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid
anyone to deny you these rights or to ask you to surrender the rights.
These restrictions translate to certain responsibilities for you if
you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you. You must make sure that they, too, receive or can get the source
code. If you link a program with the library, you must provide
complete object files to the recipients so that they can relink them
with the library, after making changes to the library and recompiling
it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright
the library, and (2) offer you this license which gives you legal
permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain
that everyone understands that there is no warranty for this free
library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don’t assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.
Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

GNU LIBRARY GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy,
and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   a) The modified work must itself be a software library.

   b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

   c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

   d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

      (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library
with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not.
Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.
c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or

Open Source Used In Field Network Director for Virtual Machine Installation 4.7.1 36978
distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients’ exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the
original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF
END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Library General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Library General Public License for more details.

You should have received a copy of the GNU Library General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

COMMON DEVELOPMENT AND DISTRIBUTION LICENSE (CDDL) Version 1.1

1. Definitions.

1.1. "Contributor" means each individual or entity that creates or contributes to the creation of Modifications.

1.2. "Contributor Version" means the combination of the Original Software, prior Modifications used by a Contributor (if any), and the Modifications made by that particular Contributor.

1.3. "Covered Software" means (a) the Original Software, or (b) Modifications, or (c) the combination of files containing Original Software with files containing Modifications, in each case including portions thereof.

1.4. "Executable" means the Covered Software in any form other than Source Code.

1.5. "Initial Developer" means the individual or entity that first makes Original Software available under this License.

1.6. "Larger Work" means a work which combines Covered Software or portions thereof with code not governed by the terms of this License.

1.7. "License" means this document.

1.8. "Licensable" means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently acquired, any and all of the rights conveyed herein.

1.9. "Modifications" means the Source Code and Executable form of
any of the following:

A. Any file that results from an addition to, deletion from or modification of the contents of a file containing Original Software or previous Modifications;

B. Any new file that contains any part of the Original Software or previous Modification; or

C. Any new file that is contributed or otherwise made available under the terms of this License.

1.10. "Original Software" means the Source Code and Executable form of computer software code that is originally released under this License.

1.11. "Patent Claims" means any patent claim(s), now owned or hereafter acquired, including without limitation, method, process, and apparatus claims, in any patent Licensable by grantor.

1.12. "Source Code" means (a) the common form of computer software code in which modifications are made and (b) associated documentation included in or with such code.

1.13. "You" (or "Your") means an individual or a legal entity exercising rights under, and complying with all of the terms of, this License. For legal entities, "You" includes any entity which controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. License Grants.

2.1. The Initial Developer Grant.

Conditioned upon Your compliance with Section 3.1 below and subject to third party intellectual property claims, the Initial Developer hereby grants You a world-wide, royalty-free, non-exclusive license:

(a) under intellectual property rights (other than patent or trademark) Licensable by Initial Developer, to use, reproduce, modify, display, perform, sublicense and distribute the Original Software (or portions thereof), with or without Modifications, and/or as part of a Larger Work; and
(b) under Patent Claims infringed by the making, using or selling of
Original Software, to make, have made, use, practice, sell, and
offer for sale, and/or otherwise dispose of the Original Software
(or portions thereof).

(c) The licenses granted in Sections 2.1(a) and (b) are effective on
the date Initial Developer first distributes or otherwise makes the
Original Software available to a third party under the terms of this
License.

(d) Notwithstanding Section 2.1(b) above, no patent license is
granted: (1) for code that You delete from the Original Software, or
(2) for infringements caused by: (i) the modification of the
Original Software, or (ii) the combination of the Original Software
with other software or devices.

2.2. Contributor Grant.

Conditioned upon Your compliance with Section 3.1 below and subject
to third party intellectual property claims, each Contributor hereby
grants You a world-wide, royalty-free, non-exclusive license:

(a) under intellectual property rights (other than patent or
trademark) Licensable by Contributor to use, reproduce, modify,
display, perform, sublicense and distribute the Modifications
created by such Contributor (or portions thereof), either on an
unmodified basis, with other Modifications, as Covered Software
and/or as part of a Larger Work; and

(b) under Patent Claims infringed by the making, using, or selling
of Modifications made by that Contributor either alone and/or in
combination with its Contributor Version (or portions of such
combination), to make, use, sell, offer for sale, have made, and/or
otherwise dispose of: (1) Modifications made by that Contributor (or
portions thereof); and (2) the combination of Modifications made by
that Contributor with its Contributor Version (or portions of such
combination).

(c) The licenses granted in Sections 2.2(a) and 2.2(b) are effective
on the date Contributor first distributes or otherwise makes the
Modifications available to a third party.

(d) Notwithstanding Section 2.2(b) above, no patent license is
granted: (1) for any code that Contributor has deleted from the
Contributor Version; (2) for infringements caused by: (i) third
party modifications of Contributor Version, or (ii) the combination
of Modifications made by that Contributor with other software
(except as part of the Contributor Version) or other devices; or (3)
under Patent Claims infringed by Covered Software in the absence of Modifications made by that Contributor.

3. Distribution Obligations.

3.1. Availability of Source Code.

Any Covered Software that You distribute or otherwise make available in Executable form must also be made available in Source Code form and that Source Code form must be distributed only under the terms of this License. You must include a copy of this License with every copy of the Source Code form of the Covered Software You distribute or otherwise make available. You must inform recipients of any such Covered Software in Executable form as to how they can obtain such Covered Software in Source Code form in a reasonable manner on or through a medium customarily used for software exchange.

3.2. Modifications.

The Modifications that You create or to which You contribute are governed by the terms of this License. You represent that You believe Your Modifications are Your original creation(s) and/or You have sufficient rights to grant the rights conveyed by this License.

3.3. Required Notices.

You must include a notice in each of Your Modifications that identifies You as the Contributor of the Modification. You may not remove or alter any copyright, patent or trademark notices contained within the Covered Software, or any notices of licensing or any descriptive text giving attribution to any Contributor or the Initial Developer.

3.4. Application of Additional Terms.

You may not offer or impose any terms on any Covered Software in Source Code form that alters or restricts the applicable version of this License or the recipients’ rights hereunder. You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, you may do so only on Your own behalf, and not on behalf of the Initial Developer or any Contributor. You must make it absolutely clear that any such warranty, support, indemnity or liability obligation is offered by You alone, and You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of warranty, support, indemnity or liability terms You offer.
3.5. Distribution of Executable Versions.

You may distribute the Executable form of the Covered Software under the terms of this License or under the terms of a license of Your choice, which may contain terms different from this License, provided that You are in compliance with the terms of this License and that the license for the Executable form does not attempt to limit or alter the recipient's rights in the Source Code form from the rights set forth in this License. If You distribute the Covered Software in Executable form under a different license, You must make it absolutely clear that any terms which differ from this License are offered by You alone, not by the Initial Developer or Contributor. You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of any such terms You offer.

You may create a Larger Work by combining Covered Software with other code not governed by the terms of this License and distribute the Larger Work as a single product. In such a case, You must make sure the requirements of this License are fulfilled for the Covered Software.

4. Versions of the License.

4.1. New Versions.

Oracle is the initial license steward and may publish revised and/or new versions of this License from time to time. Each version will be given a distinguishing version number. Except as provided in Section 4.3, no one other than the license steward has the right to modify this License.

4.2. Effect of New Versions.

You may always continue to use, distribute or otherwise make the Covered Software available under the terms of the version of the License under which You originally received the Covered Software. If the Initial Developer includes a notice in the Original Software prohibiting it from being distributed or otherwise made available under any subsequent version of the License, You must distribute and make the Covered Software available under the terms of the version of the License under which You originally received the Covered Software. Otherwise, You may also choose to use, distribute or otherwise make the Covered Software available under the terms of any subsequent version of the License published by the license steward.
4.3. Modified Versions.

When You are an Initial Developer and You want to create a new license for Your Original Software, You may create and use a modified version of this License if You: (a) rename the license and remove any references to the name of the license steward (except to note that the license differs from this License); and (b) otherwise make it clear that the license contains terms which differ from this License.

5. DISCLAIMER OF WARRANTY.

COVERED SOFTWARE IS PROVIDED UNDER THIS LICENSE ON AN "AS IS" BASIS, WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, WARRANTIES THAT THE COVERED SOFTWARE IS FREE OF DEFECTS, MERCHANTABLE, FIT FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE COVERED SOFTWARE IS WITH YOU. SHOULD ANY COVERED SOFTWARE PROVE DEFECTIVE IN ANY RESPECT, YOU (NOT THE INITIAL DEVELOPER OR ANY OTHER CONTRIBUTOR) ASSUME THE COST OF ANY NECESSARY SERVICING, REPAIR OR CORRECTION. THIS DISCLAIMER OF WARRANTY CONSTITUTES AN ESSENTIAL PART OF THIS LICENSE. NO USE OF ANY COVERED SOFTWARE IS AUTHORIZED HEREUNDER EXCEPT UNDER THIS DISCLAIMER.

6. TERMINATION.

6.1. This License and the rights granted hereunder will terminate automatically if You fail to comply with terms herein and fail to cure such breach within 30 days of becoming aware of the breach. Provisions which, by their nature, must remain in effect beyond the termination of this License shall survive.

6.2. If You assert a patent infringement claim (excluding declaratory judgment actions) against Initial Developer or a Contributor (the Initial Developer or Contributor against whom You assert such claim is referred to as "Participant") alleging that the Participant Software (meaning the Contributor Version where the Participant is a Contributor or the Original Software where the Participant is the Initial Developer) directly or indirectly infringes any patent, then any and all rights granted directly or indirectly to You by such Participant, the Initial Developer (if the Initial Developer is not the Participant) and all Contributors under Sections 2.1 and/or 2.2 of this License shall, upon 60 days notice from Participant terminate prospectively and automatically at the expiration of such 60 day notice period, unless if within such 60 day period You withdraw Your claim with respect to the Participant Software against such Participant either unilaterally or pursuant to a written agreement with Participant.
6.3. If You assert a patent infringement claim against Participant alleging that the Participant Software directly or indirectly infringes any patent where such claim is resolved (such as by license or settlement) prior to the initiation of patent infringement litigation, then the reasonable value of the licenses granted by such Participant under Sections 2.1 or 2.2 shall be taken into account in determining the amount or value of any payment or license.

6.4. In the event of termination under Sections 6.1 or 6.2 above, all end user licenses that have been validly granted by You or any distributor hereunder prior to termination (excluding licenses granted to You by any distributor) shall survive termination.

7. LIMITATION OF LIABILITY.

UNDER NO CIRCUMSTANCES AND UNDER NO LEGAL THEORY, WHETHER TORT (INCLUDING NEGLIGENCE), CONTRACT, OR OTHERWISE, SHALL YOU, THE INITIAL DEVELOPER, ANY OTHER CONTRIBUTOR, OR ANY DISTRIBUTOR OF COVERED SOFTWARE, OR ANY SUPPLIER OF ANY OF SUCH PARTIES, BE LIABLE TO ANY PERSON FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES OF ANY CHARACTER INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF GOODWILL, WORK STOPPAGE, COMPUTER FAILURE OR MALFUNCTION, OR ANY AND ALL OTHER COMMERCIAL DAMAGES OR LOSSES, EVEN IF SUCH PARTY SHALL HAVE BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. THIS LIMITATION OF LIABILITY SHALL NOT APPLY TO LIABILITY FOR DEATH OR PERSONAL INJURY RESULTING FROM SUCH PARTY'S NEGLIGENCE TO THE EXTENT APPLICABLE LAW PROHIBITS SUCH LIMITATION. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THIS EXCLUSION AND LIMITATION MAY NOT APPLY TO YOU.

8. U.S. GOVERNMENT END USERS.

The Covered Software is a "commercial item," as that term is defined in 48 C.F.R. 2.101 (Oct. 1995), consisting of "commercial computer software" (as that term is defined at 48 C.F.R. § 252.227-7014(a)(1)) and "commercial computer software documentation" as such terms are used in 48 C.F.R. 12.212 (Sept. 1995). Consistent with 48 C.F.R. 12.212 and 48 C.F.R. 227.7202-1 through 227.7202-4 (June 1995), all U.S. Government End Users acquire Covered Software with only those rights set forth herein. This U.S. Government Rights clause is in lieu of, and supersedes, any other FAR, DFAR, or other clause or provision that addresses Government rights in computer software under this License.

9. MISCELLANEOUS.
This License represents the complete agreement concerning subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. This License shall be governed by the law of the jurisdiction specified in a notice contained within the Original Software (except to the extent applicable law, if any, provides otherwise), excluding such jurisdiction's conflict-of-law provisions. Any litigation relating to this License shall be subject to the jurisdiction of the courts located in the jurisdiction and venue specified in a notice contained within the Original Software, with the losing party responsible for costs, including, without limitation, court costs and reasonable attorneys' fees and expenses. The application of the United Nations Convention on Contracts for the International Sale of Goods is expressly excluded. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not apply to this License. You agree that You alone are responsible for compliance with the United States export administration regulations (and the export control laws and regulation of any other countries) when You use, distribute or otherwise make available any Covered Software.

10. RESPONSIBILITY FOR CLAIMS.

As between Initial Developer and the Contributors, each party is responsible for claims and damages arising, directly or indirectly, out of its utilization of rights under this License and You agree to work with Initial Developer and Contributors to distribute such responsibility on an equitable basis. Nothing herein is intended or shall be deemed to constitute any admission of liability.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]
Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of
any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.
The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

^L

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification").

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the
Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or
collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.
When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a
copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

   a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

   b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.
8. You may not copy, modify, sublicense, link with, or distribute
the Library except as expressly provided under this License. Any
attempt otherwise to copy, modify, sublicense, link with, or
distribute the Library is void, and will automatically terminate your
rights under this License. However, parties who have received copies,
or rights, from you under this License will not have their licenses
terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not
signed it. However, nothing else grants you permission to modify or
distribute the Library or its derivative works. These actions are
prohibited by law if you do not accept this License. Therefore, by
modifying or distributing the Library (or any work based on the
Library), you indicate your acceptance of this License to do so, and
all its terms and conditions for copying, distributing or modifying
the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the
Library), the recipient automatically receives a license from the
original licensor to copy, distribute, link with or modify the Library
subject to these terms and conditions. You may not impose any further
restrictions on the recipients’ exercise of the rights granted herein.
You are not responsible for enforcing compliance by third parties with
this License.

11. If, as a consequence of a court judgment or allegation of patent
infringement or for any other reason (not limited to patent issues),
conditions are imposed on you (whether by court order, agreement or
otherwise) that contradict the conditions of this License, they do not
excuse you from the conditions of this License. If you cannot
distribute so as to satisfy simultaneously your obligations under this
License and any other pertinent obligations, then as a consequence you
may not distribute the Library at all. For example, if a patent
license would not permit royalty-free redistribution of the Library by
all those who receive copies directly or indirectly through you, then
the only way you could satisfy both it and this License would be to
refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under
any particular circumstance, the balance of the section is intended to
apply, and the section as a whole is intended to apply in other
circumstances.

It is not the purpose of this section to induce you to infringe any
patents or other property right claims or to contest validity of any
such claims; this section has the sole purpose of protecting the
integrity of the free software distribution system which is
implemented by public license practices. Many people have made
generous contributions to the wide range of software distributed
through that system in reliance on consistent application of that
system; it is up to the author/donor to decide if he or she is willing
to distribute software through any other system and a licensee cannot
impose that choice.

This section is intended to make thoroughly clear what is believed to
be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in
certain countries either by patents or by copyrighted interfaces, the
original copyright holder who places the Library under this License
may add an explicit geographical distribution limitation excluding those
countries, so that distribution is permitted only in or among
countries not thus excluded. In such case, this License incorporates
the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new
versions of the Lesser General Public License from time to time.
Such new versions will be similar in spirit to the present version,
but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library
specifies a version number of this License which applies to it and
"any later version", you have the option of following the terms and
conditions either of that version or of any later version published by
the Free Software Foundation. If the Library does not specify a
license version number, you may choose any version ever published by
the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free
programs whose distribution conditions are incompatible with these,
write to the author to ask for permission. For software which is
copyrighted by the Free Software Foundation, write to the Free
Software Foundation; we sometimes make exceptions for this. Our
decision will be guided by the two goals of preserving the free status
of all derivatives of our free software and of promoting the sharing
and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO
WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW.
EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR
OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY
KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE
IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR
PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE
LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME
THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN
WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY
AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU
FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR
CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE
LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING
RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A
FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF
SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH
DAMAGES.

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest
possible use to the public, we recommend making it free software that
everyone can redistribute and change. You can do so by permitting
redistribution under these terms (or, alternatively, under the terms
of the ordinary General Public License).

To apply these terms, attach the following notices to the library.
It is safest to attach them to the start of each source file to most
effectively convey the exclusion of warranty; and each file should
have at least the "copyright" line and a pointer to where the full
notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year>  <name of author>

This library is free software; you can redistribute it and/or
modify it under the terms of the GNU Lesser General Public
License as published by the Free Software Foundation; either
version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU
Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public
License along with this library; if not, write to the Free Software
Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA
Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.
"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   You must give any other recipients of the Work or Derivative Works a copy of this License; and
   You must cause any modified files to carry prominent notices stating that You changed the files; and
   You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices
that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of Your accepting any such warranty or additional liability.

The New Image Compression Test Set - Jan 2008
http://www.imagecompression.info/test_images

The images historically used for compression research (lena, barbra, pepper etc...) have outlived their useful life and
its about time they become a part of history only. They are too small, come from data sources too old and are
available in only 8-bit precision.
These images have been carefully selected to aid in image compression algorithm research and evaluation. These are photographic images chosen to come from a wide variety of sources and each one picked to stress different aspects of algorithms. Images are available in 8-bit, 16-bit and 16-bit linear variations, RGB and gray.

Images are available without any prohibitive copyright restrictions.

These images are (c) their respective owners. You are granted full redistribution and publication rights on these images provided:

1. The origin of the pictures must not be misrepresented; you must not claim that you took the original pictures. If you use, publish or redistribute them, an acknowledgment would be appreciated but is not required.
2. Altered versions must be plainly marked as such, and must not be misinterpreted as being the originals.

*******************************************************************************
**     Background
*******************************************************************************

libjpeg-turbo is a JPEG image codec that uses SIMD instructions (MMX, SSE2,
NEON) to accelerate baseline JPEG compression and decompression on x86, x86-64, and ARM systems. On such systems, libjpeg-turbo is generally 2-4x as fast as libjpeg, all else being equal. On other types of systems, libjpeg-turbo can still outperform libjpeg by a significant amount, by virtue of its highly-optimized Huffman coding routines. In many cases, the performance of libjpeg-turbo rivals that of proprietary high-speed JPEG codecs.

libjpeg-turbo implements both the traditional libjpeg API as well as the less powerful but more straightforward TurboJPEG API. libjpeg-turbo also features colorspace extensions that allow it to compress from/decompress to 32-bit and big-endian pixel buffers (RGBX, XBGR, etc.), as well as a full-featured Java interface.

libjpeg-turbo was originally based on libjpeg/SIMD, an MMX-accelerated derivative of libjpeg v6b developed by Miyasaka Masaru. The TigerVNC and VirtualGL projects made numerous enhancements to the codec in 2009, and in early 2010, libjpeg-turbo spun off into an independent project, with the goal of making high-speed JPEG compression/decompression technology available to a broader range of users and developers.

*******************************************************************************
**     License
*******************************************************************************

Most of libjpeg-turbo inherits the non-restrictive, BSD-style license used by libjpeg (see README.) The TurboJPEG wrapper (both C and Java versions) and associated test programs bear a similar license, which is reproduced below:

libjpeg-turbo includes two APIs that can be used to compress and decompress JPEG images:

TurboJPEG API: This API provides an easy-to-use interface for compressing and decompressing JPEG images in memory. It also provides some functionality that would not be straightforward to achieve using the underlying libjpeg API, such as generating planar YUV images and performing multiple simultaneous lossless transforms on an image. The Java interface for libjpeg-turbo is written on top of the TurboJPEG API.

libjpeg API: This is the de facto industry-standard API for compressing and decompressing JPEG images. It is more difficult to use than the TurboJPEG API but also more powerful. The libjpeg API implementation in libjpeg-turbo is both API/ABI-compatible and mathematically compatible with libjpeg v6b. It can also optionally be configured to be API/ABI-compatible with libjpeg v7 and v8 (see below.)

There is no significant performance advantage to either API when both are used to perform similar operations.

Installation Directory

This document assumes that libjpeg-turbo will be installed in the default directory /opt/libjpeg-turbo on Unix and Mac systems and c:\libjpeg-turbo[-gcc][64] on Windows systems. If your installation of libjpeg-turbo resides in a different directory, then adjust the instructions accordingly.

Replacing libjpeg at Run Time

Un*x

If a Un*x application is dynamically linked with libjpeg, then you can replace
libjpeg with libjpeg-turbo at run time by manipulating LD_LIBRARY_PATH. For instance:

[Using libjpeg]
> time cjpeg <vgl_5674_0098.ppm >vgl_5674_0098.jpg
real  0m0.392s
user  0m0.074s
sys   0m0.020s

[Using libjpeg-turbo]
> export LD_LIBRARY_PATH=/opt/libjpeg-turbo/{lib}:$LD_LIBRARY_PATH
> time cjpeg <vgl_5674_0098.ppm >vgl_5674_0098.jpg
real  0m0.109s
user  0m0.029s
sys   0m0.010s

({lib} = lib32 or lib64, depending on whether you wish to use the 32-bit or the 64-bit version of libjpeg-turbo.)

System administrators can also replace the libjpeg symlinks in /usr/lib* with links to the libjpeg-turbo dynamic library located in /opt/libjpeg-turbo/{lib}. This will effectively accelerate every application that uses the libjpeg dynamic library on the system.

Windows
-------

If a Windows application is dynamically linked with libjpeg, then you can replace libjpeg with libjpeg-turbo at run time by backing up the application's copy of jpeg62.dll, jpeg7.dll, or jpeg8.dll (assuming the application has its own local copy of this library) and copying the corresponding DLL from libjpeg-turbo into the application's install directory. The official libjpeg-turbo binary packages only provide jpeg62.dll. If the application uses jpeg7.dll or jpeg8.dll instead, then it will be necessary to build libjpeg-turbo from source (see "libjpeg v7 and v8 API/ABI Emulation" below.)

The following information is specific to the official libjpeg-turbo binary packages for Visual C++:

-- jpeg62.dll requires the Visual C++ 2008 C run-time DLL (msvcr90.dll). msvcr90.dll ships with more recent versions of Windows, but users of older Windows releases can obtain it from the Visual C++ 2008 Redistributable Package, which is available as a free download from Microsoft's web site.

-- Features of the libjpeg API that require passing a C run-time structure, such as a file handle, from an application to the library will probably not work with jpeg62.dll, unless the application is also built to use the Visual C++ 2008 C run-time DLL. In particular, this affects jpeg_stdio_dest() and
Mac applications typically embed their own copies of the libjpeg dylib inside the (hidden) application bundle, so it is not possible to globally replace libjpeg on OS X systems. Replacing the application’s version of the libjpeg dylib would generally involve copying libjpeg.*.dylib from libjpeg-turbo into the appropriate place in the application bundle and using install_name_tool to repoint the libjpeg-turbo dylib to its new directory. This requires an advanced knowledge of OS X and would not survive an upgrade or a re-install of the application. Thus, it is not recommended for most users.

Using libjpeg-turbo in Your Own Programs

For the most part, libjpeg-turbo should work identically to libjpeg, so in most cases, an application can be built against libjpeg and then run against libjpeg-turbo. On Un*x systems and Cygwin, you can build against libjpeg-turbo instead of libjpeg by setting

```
CPATH=/opt/libjpeg-turbo/include
and
LIBRARY_PATH=/opt/libjpeg-turbo/{lib}
```

({lib} = lib32 or lib64, depending on whether you are building a 32-bit or a 64-bit application.)

If using MinGW, then set

```
CPATH=/c/libjpeg-turbo-gcc[64]/include
and
LIBRARY_PATH=/c/libjpeg-turbo-gcc[64]/lib
```

Building against libjpeg-turbo is useful, for instance, if you want to build an application that leverages the libjpeg-turbo colorspace extensions (see below.) On Un*x systems, you would still need to manipulate LD_LIBRARY_PATH or create appropriate symlinks to use libjpeg-turbo at run time. On such systems, you can pass -R /opt/libjpeg-turbo/[lib] to the linker to force the use of libjpeg-turbo at run time rather than libjpeg (also useful if you want to leverage the colorspace extensions), or you can link against the libjpeg-turbo static library.

To force a Un*x or MinGW application to link against the static version of libjpeg-turbo, you can use the following linker options:
Open Source Used In Field Network Director for Virtual Machine Installation 4.7.1 37015

On OS X, simply add /opt/libjpeg-turbo/lib/libjpeg.a to the linker command line.

To build Visual C++ applications using libjpeg-turbo, add c:\libjpeg-turbo[64]\include to the system or user INCLUDE environment variable and c:\libjpeg-turbo[64]\lib to the system or user LIB environment variable, and then link against either jpeg.lib (to use the DLL version of libjpeg-turbo) or jpeg-static.lib (to use the static version of libjpeg-turbo.)

Colors space Extensions

libjpeg-turbo includes extensions that allow JPEG images to be compressed directly from (and decompressed directly to) buffers that use BGR, BGRX, RGBX, XBGR, and XRGB pixel ordering. This is implemented with ten new colorspace constants:

```
JCS_EXT_RGB   /* red/green/blue */
JCS_EXT_RGBX  /* red/green/blue/x */
JCS_EXT_BGR   /* blue/green/red */
JCS_EXT_BGRX  /* blue/green/red/x */
JCS_EXT_XBGR  /* x/blue/green/red */
JCS_EXT_XRGB  /* x/red/green/blue */
JCS_EXT_RGBA  /* red/green/blue/alpha */
JCS_EXT_BGRA  /* blue/green/red/alpha */
JCS_EXT_ABGR  /* alpha/blue/green/red */
JCS_EXT_ARGB  /* alpha/red/green/blue */
```

Setting cinfo.in_color_space (compression) or cinfo.out_color_space (decompression) to one of these values will cause libjpeg-turbo to read the red, green, and blue values from (or write them to) the appropriate position in the pixel when compressing from/decompressing to an RGB buffer.

Your application can check for the existence of these extensions at compile time with:

```
#define JCS_EXTENSIONS
```

At run time, attempting to use these extensions with a libjpeg implementation that does not support them will result in a "Bogus input colorspace" error. Applications can trap this error in order to test whether run-time support is available for the colorspace extensions.

When using the RGBX, BGRX, XBGR, and XRGB colorspaces during decompression, the X byte is undefined, and in order to ensure the best performance, libjpeg-turbo
can set that byte to whatever value it wishes. If an application expects the X byte to be used as an alpha channel, then it should specify JCS_EXT_RGBA, JCS_EXT_BGRA, JCS_EXT_ABGR, or JCS_EXT_ARGB. When these colorspace constants are used, the X byte is guaranteed to be 0xFF, which is interpreted as opaque.

Your application can check for the existence of the alpha channel colorspace extensions at compile time with:

```c
#ifdef JCS_ALPHA_EXTENSIONS
```

jcstest.c, located in the libjpeg-turbo source tree, demonstrates how to check for the existence of the colorspace extensions at compile time and run time.

===================================
libjpeg v7 and v8 API/ABI Emulation
===================================

With libjpeg v7 and v8, new features were added that necessitated extending the compression and decompression structures. Unfortunately, due to the exposed nature of those structures, extending them also necessitated breaking backward ABI compatibility with previous libjpeg releases. Thus, programs that were built to use libjpeg v7 or v8 did not work with libjpeg-turbo, since it is based on the libjpeg v6b code base. Although libjpeg v7 and v8 are still not as widely used as v6b, enough programs (including a few Linux distros) made the switch that there was a demand to emulate the libjpeg v7 and v8 ABIs in libjpeg-turbo. It should be noted, however, that this feature was added primarily so that applications that had already been compiled to use libjpeg v7+ could take advantage of accelerated baseline JPEG encoding/decoding without recompiling. libjpeg-turbo does not claim to support all of the libjpeg v7+ features, nor to produce identical output to libjpeg v7+ in all cases (see below.)

By passing an argument of --with-jpeg7 or --with-jpeg8 to configure, or an argument of -DWITH_JPEG7=1 or -DWITH_JPEG8=1 to cmake, you can build a version of libjpeg-turbo that emulates the libjpeg v7 or v8 ABI, so that programs that are built against libjpeg v7 or v8 can be run with libjpeg-turbo. The following section describes which libjpeg v7+ features are supported and which aren't.

Support for libjpeg v7 and v8 Features:
---------------------------------------

Fully supported:

-- libjpeg: IDCT scaling extensions in decompressor
libjpeg-turbo supports IDCT scaling with scaling factors of 1/8, 1/4, 3/8, 1/2, 5/8, 3/4, 7/8, 9/8, 5/4, 11/8, 3/2, 13/8, 7/4, 15/8, and 2/1 (only 1/4 and 1/2 are SIMD-accelerated.)
-- libjpeg: arithmetic coding

-- libjpeg: In-memory source and destination managers
See notes below.

-- cjjpeg: Separate quality settings for luminance and chrominance
Note that the libjpeg v7+ API was extended to accommodate this feature only
for convenience purposes. It has always been possible to implement this
feature with libjpeg v6b (see rdswitch.c for an example.)

-- cjjpeg: 32-bit BMP support

-- cjjpeg: -rgb option

-- jpegtran: lossless cropping

-- jpegtran: -perfect option

-- jpegtran: forcing width/height when performing lossless crop

-- rdjpgcom: -raw option

-- rdjpgcom: locale awareness

Not supported:

NOTE: As of this writing, extensive research has been conducted into the
usefulness of DCT scaling as a means of data reduction and SmartScale as a
means of quality improvement. The reader is invited to peruse the research at
http://www.libjpeg-turbo.org/About/SmartScale and draw his/her own conclusions,
but it is the general belief of our project that these features have not
demonstrated sufficient usefulness to justify inclusion in libjpeg-turbo.

-- libjpeg: DCT scaling in compressor
cinfo.scale_num and cinfo.scale_denom are silently ignored.
There is no technical reason why DCT scaling could not be supported when
emulating the libjpeg v7+ API/ABI, but without the SmartScale extension (see
below), only scaling factors of 1/2, 8/15, 4/7, 8/13, 2/3, 8/11, 4/5, and
8/9 would be available, which is of limited usefulness.

-- libjpeg: SmartScale
cinfo.block_size is silently ignored.
SmartScale is an extension to the JPEG format that allows for DCT block
sizes other than 8x8. Providing support for this new format would be
feasible (particularly without full acceleration.) However, until/unless
the format becomes either an official industry standard or, at minimum, an
accepted solution in the community, we are hesitant to implement it, as there is no sense of whether or how it might change in the future. It is our belief that SmartScale has not demonstrated sufficient usefulness as a lossless format nor as a means of quality enhancement, and thus, our primary interest in providing this feature would be as a means of supporting additional DCT scaling factors.

-- libjpeg: Fancy downsampling in compressor
cinfo.do_fancy_downsampling is silently ignored.
This requires the DCT scaling feature, which is not supported.

-- jpegtran: Scaling
This requires both the DCT scaling and SmartScale features, which are not supported.

-- Lossless RGB JPEG files
This requires the SmartScale feature, which is not supported.

What About libjpeg v9?
-----------------------

libjpeg v9 introduced yet another field to the JPEG compression structure (color_transform), thus making the ABI backward incompatible with that of libjpeg v8. This new field was introduced solely for the purpose of supporting lossless SmartScale encoding. Further, there was actually no reason to extend the API in this manner, as the color transform could have just as easily been activated by way of a new JPEG colorspace constant, thus preserving backward ABI compatibility.

Our research (see link above) has shown that lossless SmartScale does not generally accomplish anything that can't already be accomplished better with existing, standard lossless formats. Thus, at this time, it is our belief that there is not sufficient technical justification for software to upgrade from libjpeg v8 to libjpeg v9, and therefore, not sufficient technical justification for us to emulate the libjpeg v9 ABI.

=================================================================================

In-Memory Source/Destination Managers
=================================================================================

By default, libjpeg-turbo 1.3 and later includes the jpeg_mem_src() and jpeg_mem_dest() functions, even when not emulating the libjpeg v8 API/ABI. Previously, it was necessary to build libjpeg-turbo from source with libjpeg v8 API/ABI emulation in order to use the in-memory source/destination managers, but several projects requested that those functions be included when emulating the libjpeg v6b API/ABI as well. This allows the use of those functions by programs that need them without breaking ABI compatibility for programs that don't, and it allows those functions to be provided in the "official"
libjpeg-turbo binaries.

Those who are concerned about maintaining strict conformance with the libjpeg v6b or v7 API can pass an argument of --without-mem-srcdst to configure or an argument of -DWITH_MEM_SRCDST=0 to CMake prior to building libjpeg-turbo. This will restore the pre-1.3 behavior, in which jpeg_mem_src() and jpeg_mem_dest() are only included when emulating the libjpeg v8 API/ABI.

On Un*x systems, including the in-memory source/destination managers changes the dynamic library version from 62.0.0 to 62.1.0 if using libjpeg v6b API/ABI emulation and from 7.0.0 to 7.1.0 if using libjpeg v7 API/ABI emulation.

Note that, on most Un*x systems, the dynamic linker will not look for a function in a library until that function is actually used. Thus, if a program is built against libjpeg-turbo 1.3+ and uses jpeg_mem_src() or jpeg_mem_dest(), that program will not fail if run against an older version of libjpeg-turbo or against libjpeg v7- until the program actually tries to call jpeg_mem_src() or jpeg_mem_dest(). Such is not the case on Windows. If a program is built against the libjpeg-turbo 1.3+ DLL and uses jpeg_mem_src() or jpeg_mem_dest(), then it must use the libjpeg-turbo 1.3+ DLL at run time.

Both cjpeg and djpeg have been extended to allow testing the in-memory source/destination manager functions. See their respective man pages for more details.

*******************************************************************************
** Mathematical Compatibility
*******************************************************************************

For the most part, libjpeg-turbo should produce identical output to libjpeg v6b. The one exception to this is when using the floating point DCT/IDCT, in which case the outputs of libjpeg v6b and libjpeg-turbo are not guaranteed to be identical (the accuracy of the floating point DCT/IDCT is constant when using libjpeg-turbo’s SIMD extensions, but otherwise, it can depend heavily on the compiler and compiler settings.)

While libjpeg-turbo does emulate the libjpeg v8 API/ABI, under the hood, it is still using the same algorithms as libjpeg v6b, so there are several specific cases in which libjpeg-turbo cannot be expected to produce the same output as libjpeg v8:

-- When decompressing using scaling factors of 1/2 and 1/4, because libjpeg v8 implements those scaling algorithms a bit differently than libjpeg v6b does, and libjpeg-turbo’s SIMD extensions are based on the libjpeg v6b behavior.

-- When using chrominance subsampling, because libjpeg v8 implements this with its DCT/IDCT scaling algorithms rather than with a separate
downsampling/upsampling algorithm.

-- When using the floating point IDCT, for the reasons stated above and also because the floating point IDCT algorithm was modified in libjpeg v8a to improve accuracy.

-- When decompressing using a scaling factor > 1 and merged (AKA "non-fancy" or "non-smooth") chrominance upsampling, because libjpeg v8 does not support merged upsampling with scaling factors > 1.

*******************************************************************************
**     Performance Pitfalls
*******************************************************************************

===============
Restart Markers
===============

The optimized Huffman decoder in libjpeg-turbo does not handle restart markers in a way that makes the rest of the libjpeg infrastructure happy, so it is necessary to use the slow Huffman decoder when decompressing a JPEG image that has restart markers. This can cause the decompression performance to drop by as much as 20%, but the performance will still be much greater than that of libjpeg. Many consumer packages, such as PhotoShop, use restart markers when generating JPEG images, so images generated by those programs will experience this issue.

===============================================
Fast Integer Forward DCT at High Quality Levels
===============================================

The algorithm used by the SIMD-accelerated quantization function cannot produce correct results whenever the fast integer forward DCT is used along with a JPEG quality of 98-100. Thus, libjpeg-turbo must use the non-SIMD quantization function in those cases. This causes performance to drop by as much as 40%. It is therefore strongly advised that you use the slow integer forward DCT whenever encoding images with a JPEG quality of 98 or higher.

OVERVIEW
========

This package contains C software to implement JPEG image encoding, decoding, and transcoding. JPEG (pronounced "jay-peg") is a standardized compression method for full-color and gray-scale images. JPEG's strong suit is compressing photographic images or other types of images that have smooth color and brightness transitions between neighboring pixels. Images with sharp lines or other abrupt features may not compress well with JPEG, and a higher JPEG quality may have to be used to avoid visible compression artifacts with such images.

JPEG is lossy, meaning that the output pixels are not necessarily identical to the input pixels. However, on photographic content and other "smooth" images, very good compression ratios can be obtained with no visible compression artifacts, and extremely high compression ratios are possible if you are willing to sacrifice image quality (by reducing the "quality" setting in the compressor.)

This software implements JPEG baseline, extended-sequential, and progressive compression processes. Provision is made for supporting all variants of these processes, although some uncommon parameter settings aren't implemented yet. We have made no provision for supporting the hierarchical or lossless processes defined in the standard.

We provide a set of library routines for reading and writing JPEG image files, plus two sample applications "cjpeg" and "djpeg", which use the library to perform conversion between JPEG and some other popular image file formats. The library is intended to be reused in other applications.

In order to support file conversion and viewing software, we have included considerable functionality beyond the bare JPEG coding/decoding capability; for example, the color quantization modules are not strictly part of JPEG decoding, but they are essential for output to colormapped file formats or colormapped displays. These extra functions can be compiled out of the

example.c Sample code for calling the JPEG library.
structure.txt Overview of the JPEG library's internal structure.
coderules.txt Coding style rules --- please read if you contribute code.
library if not required for a particular application.

We have also included "jpegtran", a utility for lossless transcoding between different JPEG processes, and "rdjpgcom" and "wrjpgcom", two simple applications for inserting and extracting textual comments in JFIF files.

The emphasis in designing this software has been on achieving portability and flexibility, while also making it fast enough to be useful. In particular, the software is not intended to be read as a tutorial on JPEG. (See the REFERENCES section for introductory material.) Rather, it is intended to be reliable, portable, industrial-strength code. We do not claim to have achieved that goal in every aspect of the software, but we strive for it.

We welcome the use of this software as a component of commercial products. No royalty is required, but we do ask for an acknowledgement in product documentation, as described under LEGAL ISSUES.

LEGAL ISSUES
============

In plain English:

1. We don't promise that this software works. (But if you find any bugs, please let us know!)
2. You can use this software for whatever you want. You don't have to pay us.
3. You may not pretend that you wrote this software. If you use it in a program, you must acknowledge somewhere in your documentation that you've used the IJG code.

In legalese:

The authors make NO WARRANTY or representation, either express or implied, with respect to this software, its quality, accuracy, merchantability, or fitness for a particular purpose. This software is provided "AS IS", and you, its user, assume the entire risk as to its quality and accuracy.

This software is copyright (C) 1991-2012, Thomas G. Lane, Guido Vollbeding. All Rights Reserved except as specified below.

Permission is hereby granted to use, copy, modify, and distribute this software (or portions thereof) for any purpose, without fee, subject to these conditions:
(1) If any part of the source code for this software is distributed, then this README file must be included, with this copyright and no-warranty notice unaltered; and any additions, deletions, or changes to the original files must be clearly indicated in accompanying documentation.
(2) If only executable code is distributed, then the accompanying
documentation must state that "this software is based in part on the work of the Independent JPEG Group".

(3) Permission for use of this software is granted only if the user accepts full responsibility for any undesirable consequences; the authors accept NO LIABILITY for damages of any kind.

These conditions apply to any software derived from or based on the IJG code, not just to the unmodified library. If you use our work, you ought to acknowledge us.

Permission is NOT granted for the use of any IJG author's name or company name in advertising or publicity relating to this software or products derived from it. This software may be referred to only as "the Independent JPEG Group's software".

We specifically permit and encourage the use of this software as the basis of commercial products, provided that all warranty or liability claims are assumed by the product vendor.

The Unix configuration script "configure" was produced with GNU Autoconf. It is copyright by the Free Software Foundation but is freely distributable. The same holds for its supporting scripts (config.guess, config.sub, ltmain.sh). Another support script, install-sh, is copyright by X Consortium but is also freely distributable.

The IJG distribution formerly included code to read and write GIF files. To avoid entanglement with the Unisys LZW patent, GIF reading support has been removed altogether, and the GIF writer has been simplified to produce "uncompressed GIFs". This technique does not use the LZW algorithm; the resulting GIF files are larger than usual, but are readable by all standard GIF decoders.

We are required to state that "The Graphics Interchange Format(c) is the Copyright property of CompuServe Incorporated. GIF(sm) is a Service Mark property of CompuServe Incorporated."

REFERENCES

We recommend reading one or more of these references before trying to understand the innards of the JPEG software.

Adjacent articles in that issue discuss MPEG motion picture compression, applications of JPEG, and related topics.) If you don't have the CACM issue handy, a PostScript file containing a revised version of Wallace's article is available at http://www.ijg.org/files/wallace.ps.gz. The file (actually a preprint for an article that appeared in IEEE Trans. Consumer Electronics) omits the sample images that appeared in CACM, but it includes corrections and some added material. Note: the Wallace article is copyright ACM and IEEE, and it may not be used for commercial purposes.

A somewhat less technical, more leisurely introduction to JPEG can be found in "The Data Compression Book" by Mark Nelson and Jean-loup Gailly, published by M&T Books (New York), 2nd ed. 1996, ISBN 1-55851-434-1. This book provides good explanations and example C code for a multitude of compression methods including JPEG. It is an excellent source if you are comfortable reading C code but don't know much about data compression in general. The book's JPEG sample code is far from industrial-strength, but when you are ready to look at a full implementation, you've got one here...

The JPEG standard does not specify all details of an interchangeable file format. For the omitted details we follow the "JFIF" conventions, revision 1.02. JFIF 1.02 has been adopted as an Ecma International Technical Report and thus received a formal publication status. It is available as a free download in PDF format from http://www.ecma-international.org/publications/techreports/E-TR-098.htm. A PostScript version of the JFIF document is available at http://www.ijg.org/files/jfif.ps.gz. There is also a plain text version at http://www.ijg.org/files/jfif.txt.gz, but it is missing the figures.

The TIFF 6.0 file format specification can be obtained by FTP from ftp://ftp.sgi.com/graphics/tiff/TIFF6.ps.gz. The JPEG incorporation scheme found in the TIFF 6.0 spec of 3-June-92 has a number of serious problems. IJG does not recommend use of the TIFF 6.0 design (TIFF Compression tag 6). Instead, we recommend the JPEG design proposed by TIFF Technical Note #2 (Compression tag 7). Copies of this Note can be obtained from
http://www.ijg.org/files/. It is expected that the next revision of the TIFF spec will replace the 6.0 JPEG design with the Note's design. Although IJG's own code does not support TIFF/JPEG, the free libtiff library uses our library to implement TIFF/JPEG per the Note.

FILE FORMAT WARS
=================

The ISO/IEC JTC1/SC29/WG1 standards committee (also known as JPEG, together with ITU-T SG16) currently promotes different formats containing the name "JPEG" which are incompatible with original DCT-based JPEG. IJG therefore does not support these formats (see REFERENCES). Indeed, one of the original reasons for developing this free software was to help force convergence on common, interoperable format standards for JPEG files. Don't use an incompatible file format!
(In any case, our decoder will remain capable of reading existing JPEG image files indefinitely.)

This file provides an overview of the architecture of the IJJ JPEG software; that is, the functions of the various modules in the system and the interfaces between modules. For more precise details about any data structure or calling convention, see the include files and comments in the source code.

We assume that the reader is already somewhat familiar with the JPEG standard. The README file includes references for learning about JPEG. The file libjpeg.txt describes the library from the viewpoint of an application programmer using the library; it’s best to read that file before this one. Also, the file coderules.txt describes the coding style conventions we use.

In this document, JPEG-specific terminology follows the JPEG standard:
A "component" means a color channel, e.g., Red or Luminance.
A "sample" is a single component value (i.e., one number in the image data).
A "coefficient" is a frequency coefficient (a DCT transform output number).
A "block" is an 8x8 group of samples or coefficients. 
An "MCU" (minimum coded unit) is an interleaved set of blocks of size 
determined by the sampling factors, or a single block in a 
noninterleaved scan.

We do not use the terms "pixel" and "sample" interchangeably. When we say 
pixel, we mean an element of the full-size image, while a sample is an element 
of the downsampled image. Thus the number of samples may vary across 
components while the number of pixels does not. (This terminology is not used 
rigorously throughout the code, but it is used in places where confusion would 
otherwise result.)

*** System features ***

The IJG distribution contains two parts:
* A subroutine library for JPEG compression and decompression.
* cjpeg/djpeg, two sample applications that use the library to transform 
  JFIF JPEG files to and from several other image formats.
cjpeg/djpeg are of no great intellectual complexity: they merely add a simple 
  command-line user interface and I/O routines for several uncompressed image 
  formats. This document concentrates on the library itself.

We desire the library to be capable of supporting all JPEG baseline, extended 
sequential, and progressive DCT processes. Hierarchical processes are not 
supported.

The library does not support the lossless (spatial) JPEG process. Lossless 
JPEG shares little or no code with lossy JPEG, and would normally be used 
without the extensive pre- and post-processing provided by this library. 
We feel that lossless JPEG is better handled by a separate library.

Within these limits, any set of compression parameters allowed by the JPEG 
spec should be readable for decompression. (We can be more restrictive about 
what formats we can generate.) Although the system design allows for all 
parameter values, some uncommon settings are not yet implemented and may 
never be; nonintegral sampling ratios are the prime example. Furthermore, 
we treat 8-bit vs. 12-bit data precision as a compile-time switch, not a 
run-time option, because most machines can store 8-bit pixels much more 
compactly than 12-bit.

By itself, the library handles only interchange JPEG datastreams --- in 
picular the widely used JFIF file format. The library can be used by 
surrounding code to process interchange or abbreviated JPEG datastreams that 
are embedded in more complex file formats. (For example, libtiff uses this 
library to implement JPEG compression within the TIFF file format.)

The library includes a substantial amount of code that is not covered by the 
JPEG standard but is necessary for typical applications of JPEG. These
functions preprocess the image before JPEG compression or postprocess it after decompression. They include colorspace conversion, downsampling/upsampling, and color quantization. This code can be omitted if not needed.

A wide range of quality vs. speed tradeoffs are possible in JPEG processing, and even more so in decompression postprocessing. The decompression library provides multiple implementations that cover most of the useful tradeoffs, ranging from very-high-quality down to fast-preview operation. On the compression side we have generally not provided low-quality choices, since compression is normally less time-critical. It should be understood that the low-quality modes may not meet the JPEG standard's accuracy requirements; nonetheless, they are useful for viewers.

*** Portability issues ***

Portability is an essential requirement for the library. The key portability issues that show up at the level of system architecture are:

1. Memory usage. We want the code to be able to run on PC-class machines with limited memory. Images should therefore be processed sequentially (in strips), to avoid holding the whole image in memory at once. Where a full-image buffer is necessary, we should be able to use either virtual memory or temporary files.

2. Near/far pointer distinction. To run efficiently on 80x86 machines, the code should distinguish "small" objects (kept in near data space) from "large" ones (kept in far data space). This is an annoying restriction, but fortunately it does not impact code quality for less brain-damaged machines, and the source code clutter turns out to be minimal with sufficient use of pointer typedefs.

3. Data precision. We assume that "char" is at least 8 bits, "short" and "int" at least 16, "long" at least 32. The code will work fine with larger data sizes, although memory may be used inefficiently in some cases. However, the JPEG compressed datastream must ultimately appear on external storage as a sequence of 8-bit bytes if it is to conform to the standard. This may pose a problem on machines where char is wider than 8 bits. The library represents compressed data as an array of values of typedef JOCTET. If no data type exactly 8 bits wide is available, custom data source and data destination modules must be written to unpack and pack the chosen JOCTET datatype into 8-bit external representation.

*** System overview ***

The compressor and decompressor are each divided into two main sections: the JPEG compressor or decompressor proper, and the preprocessing or
postprocessing functions. The interface between these two sections is the image data that the official JPEG spec regards as its input or output: this data is in the colorspace to be used for compression, and it is downsampled to the sampling factors to be used. The preprocessing and postprocessing steps are responsible for converting a normal image representation to or from this form. (Those few applications that want to deal with YCbCr downsampled data can skip the preprocessing or postprocessing step.)

Looking more closely, the compressor library contains the following main elements:

Preprocessing:
* Color space conversion (e.g., RGB to YCbCr).
* Edge expansion and downsampling. Optionally, this step can do simple smoothing --- this is often helpful for low-quality source data.

JPEG proper:
* MCU assembly, DCT, quantization.
* Entropy coding (sequential or progressive, Huffman or arithmetic).

In addition to these modules we need overall control, marker generation, and support code (memory management & error handling). There is also a module responsible for physically writing the output data --- typically this is just an interface to fwrite(), but some applications may need to do something else with the data.

The decompressor library contains the following main elements:

JPEG proper:
* Entropy decoding (sequential or progressive, Huffman or arithmetic).
* Dequantization, inverse DCT, MCU disassembly.

Postprocessing:
* Upsampling. Optionally, this step may be able to do more general rescaling of the image.
* Color space conversion (e.g., YCbCr to RGB). This step may also provide gamma adjustment [ currently it does not ].
* Optional color quantization (e.g., reduction to 256 colors).
* Optional color precision reduction (e.g., 24-bit to 15-bit color).
  [This feature is not currently implemented.]

We also need overall control, marker parsing, and a data source module. The support code (memory management & error handling) can be shared with the compression half of the library.

There may be several implementations of each of these elements, particularly in the decompressor, where a wide range of speed/quality tradeoffs is very useful. It must be understood that some of the best speedups involve merging adjacent steps in the pipeline. For example, upsampling, color space conversion, and color quantization might all be done at once when using a
low-quality ordered-dither technique. The system architecture is designed to allow such merging where appropriate.

Note: it is convenient to regard edge expansion (padding to block boundaries) as a preprocessing/postprocessing function, even though the JPEG spec includes it in compression/decompression. We do this because downsampling/upsampling can be simplified a little if they work on padded data: it's not necessary to have special cases at the right and bottom edges. Therefore the interface buffer is always an integral number of blocks wide and high, and we expect compression preprocessing to pad the source data properly. Padding will occur only to the next block (8-sample) boundary. In an interleaved-scan situation, additional dummy blocks may be used to fill out MCUs, but the MCU assembly and disassembly logic will create or discard these blocks internally. (This is advantageous for speed reasons, since we avoid DCTing the dummy blocks. It also permits a small reduction in file size, because the compressor can choose dummy block contents so as to minimize their size in compressed form. Finally, it makes the interface buffer specification independent of whether the file is actually interleaved or not.) Applications that wish to deal directly with the downsampled data must provide similar buffering and padding for odd-sized images.

*** Poor man's object-oriented programming ***

It should be clear by now that we have a lot of quasi-independent processing steps, many of which have several possible behaviors. To avoid cluttering the code with lots of switch statements, we use a simple form of object-style programming to separate out the different possibilities.

For example, two different color quantization algorithms could be implemented as two separate modules that present the same external interface; at runtime, the calling code will access the proper module indirectly through an "object".

We can get the limited features we need while staying within portable C. The basic tool is a function pointer. An "object" is just a struct containing one or more function pointer fields, each of which corresponds to a method name in real object-oriented languages. During initialization we fill in the function pointers with references to whichever module we have determined we need to use in this run. Then invocation of the module is done by indirection through a function pointer; on most machines this is no more expensive than a switch statement, which would be the only other way of making the required run-time choice. The really significant benefit, of course, is keeping the source code clean and well structured.

We can also arrange to have private storage that varies between different implementations of the same kind of object. We do this by making all the module-specific object structs be separately allocated entities, which will
be accessed via pointers in the master compression or decompression struct. The "public" fields or methods for a given kind of object are specified by a commonly known struct. But a module's initialization code can allocate a larger struct that contains the common struct as its first member, plus additional private fields. With appropriate pointer casting, the module's internal functions can access these private fields. (For a simple example, see jdatast.c, which implements the external interface specified by struct jpeg_destination_mgr, but adds extra fields.)

(Of course this would all be a lot easier if we were using C++, but we are not yet prepared to assume that everyone has a C++ compiler.)

An important benefit of this scheme is that it is easy to provide multiple versions of any method, each tuned to a particular case. While a lot of precalculation might be done to select an optimal implementation of a method, the cost per invocation is constant. For example, the upsampling step might have a "generic" method, plus one or more "hardwired" methods for the most popular sampling factors; the hardwired methods would be faster because they'd use straight-line code instead of for-loops. The cost to determine which method to use is paid only once, at startup, and the selection criteria are hidden from the callers of the method.

This plan differs a little bit from usual object-oriented structures, in that only one instance of each object class will exist during execution. The reason for having the class structure is that on different runs we may create different instances (choose to execute different modules). You can think of the term "method" as denoting the common interface presented by a particular set of interchangeable functions, and "object" as denoting a group of related methods, or the total shared interface behavior of a group of modules.

*** Overall control structure ***

We previously mentioned the need for overall control logic in the compression and decompression libraries. In IJG implementations prior to v5, overall control was mostly provided by "pipeline control" modules, which proved to be large, unwieldy, and hard to understand. To improve the situation, the control logic has been subdivided into multiple modules. The control modules consist of:

1. Master control for module selection and initialization. This has two responsibilities:

1A. Startup initialization at the beginning of image processing.
   The individual processing modules to be used in this run are selected and given initialization calls.

1B. Per-pass control. This determines how many passes will be performed
and calls each active processing module to configure itself appropriately at the beginning of each pass. End-of-pass processing, where necessary, is also invoked from the master control module.

Method selection is partially distributed, in that a particular processing module may contain several possible implementations of a particular method, which it will select among when given its initialization call. The master control code need only be concerned with decisions that affect more than one module.

2. Data buffering control. A separate control module exists for each inter-processing-step data buffer. This module is responsible for invoking the processing steps that write or read that data buffer.

Each buffer controller sees the world as follows:

\[
\text{input data} \Rightarrow \text{processing step A} \Rightarrow \text{buffer} \Rightarrow \text{processing step B} \Rightarrow \text{output data}
\]

|              |               |
|------------------ controller ------------------

The controller knows the dataflow requirements of steps A and B: how much data they want to accept in one chunk and how much they output in one chunk. Its function is to manage its buffer and call A and B at the proper times.

A data buffer control module may itself be viewed as a processing step by a higher-level control module; thus the control modules form a binary tree with elementary processing steps at the leaves of the tree.

The control modules are objects. A considerable amount of flexibility can be had by replacing implementations of a control module. For example:

* Merging of adjacent steps in the pipeline is done by replacing a control module and its pair of processing-step modules with a single processing-step module. (Hence the possible merges are determined by the tree of control modules.)
* In some processing modes, a given interstep buffer need only be a "strip" buffer large enough to accommodate the desired data chunk sizes. In other modes, a full-image buffer is needed and several passes are required. The control module determines which kind of buffer is used and manipulates virtual array buffers as needed. One or both processing steps may be unaware of the multi-pass behavior.

In theory, we might be able to make all of the data buffer controllers interchangeable and provide just one set of implementations for all. In practice, each one contains considerable special-case processing for its particular job. The buffer controller concept should be regarded as an overall system structuring principle, not as a complete description of the task performed by any one controller.
*** Compression object structure ***

Here is a sketch of the logical structure of the JPEG compression library:

```
|-- Colorspace conversion
    |-- Preprocessing controller --|
    |                             |-- Downsampling
Main controller --|
    |                     |-- Forward DCT, quantize
    |-- Coefficient controller --|
    |                       |-- Entropy encoding
```

This sketch also describes the flow of control (subroutine calls) during typical image data processing. Each of the components shown in the diagram is an "object" which may have several different implementations available. One or more source code files contain the actual implementation(s) of each object.

The objects shown above are:

* Main controller: buffer controller for the subsampled-data buffer, which holds the preprocessed input data. This controller invokes preprocessing to fill the subsampled-data buffer, and JPEG compression to empty it. There is usually no need for a full-image buffer here; a strip buffer is adequate.

* Preprocessing controller: buffer controller for the downsampling input data buffer, which lies between colorspace conversion and downsampling. Note that a unified conversion/downsampling module would probably replace this controller entirely.

* Colorspace conversion: converts application image data into the desired JPEG color space; also changes the data from pixel-interleaved layout to separate component planes. Processes one pixel row at a time.

* Downsampling: performs reduction of chroma components as required. Optionally may perform pixel-level smoothing as well. Processes a "row group" at a time, where a row group is defined as Vmax pixel rows of each component before downsampling, and Vk sample rows afterwards (remember Vk differs across components). Some downsampling or smoothing algorithms may require context rows above and below the current row group; the preprocessing controller is responsible for supplying these rows via proper buffering. The downsampler is responsible for edge expansion at the right edge (i.e., extending each sample row to a multiple of 8 samples); but the preprocessing controller is responsible for vertical edge expansion (i.e., duplicating the bottom sample row as needed to make a multiple of 8 rows).

* Coefficient controller: buffer controller for the DCT-coefficient data. This controller handles MCU assembly, including insertion of dummy DCT
blocks when needed at the right or bottom edge. When performing Huffman-code optimization or emitting a multiscan JPEG file, this controller is responsible for buffering the full image. The equivalent of one fully interleaved MCU row of subsampled data is processed per call, even when the JPEG file is noninterleaved.

* Forward DCT and quantization: Perform DCT, quantize, and emit coefficients. Works on one or more DCT blocks at a time. (Note: the coefficients are now emitted in normal array order, which the entropy encoder is expected to convert to zigzag order as necessary. Prior versions of the IJG code did the conversion to zigzag order within the quantization step.)

* Entropy encoding: Perform Huffman or arithmetic entropy coding and emit the coded data to the data destination module. Works on one MCU per call. For progressive JPEG, the same DCT blocks are fed to the entropy coder during each pass, and the coder must emit the appropriate subset of coefficients.

In addition to the above objects, the compression library includes these objects:

* Master control: determines the number of passes required, controls overall and per-pass initialization of the other modules.

* Marker writing: generates JPEG markers (except for RSTn, which is emitted by the entropy encoder when needed).

* Data destination manager: writes the output JPEG datastream to its final destination (e.g., a file). The destination manager supplied with the library knows how to write to a stdio stream or to a memory buffer; for other behaviors, the surrounding application may provide its own destination manager.

* Memory manager: allocates and releases memory, controls virtual arrays (with backing store management, where required).

* Error handler: performs formatting and output of error and trace messages; determines handling of nonfatal errors. The surrounding application may override some or all of this object's methods to change error handling.

* Progress monitor: supports output of "percent-done" progress reports. This object represents an optional callback to the surrounding application: if wanted, it must be supplied by the application.

The error handler, destination manager, and progress monitor objects are defined as separate objects in order to simplify application-specific customization of the JPEG library. A surrounding application may override individual methods or supply its own all-new implementation of one of these
objects. The object interfaces for these objects are therefore treated as part of the application interface of the library, whereas the other objects are internal to the library.

The error handler and memory manager are shared by JPEG compression and decompression; the progress monitor, if used, may be shared as well.

*** Decompression object structure ***

Here is a sketch of the logical structure of the JPEG decompression library:

```
|-- Entropy decoding
   |-- Coefficient controller --|
       |                       |-- Dequantize, Inverse DCT
Main controller --|
       |                   |-- Upsampling
       |-- Postprocessing controller --|   |-- Colorspace conversion
       |                       |-- Color quantization
       |                       |-- Color precision reduction
```

As before, this diagram also represents typical control flow. The objects shown are:

* Main controller: buffer controller for the subsampled-data buffer, which holds the output of JPEG decompression proper. This controller’s primary task is to feed the postprocessing procedure. Some upsampling algorithms may require context rows above and below the current row group; when this is true, the main controller is responsible for managing its buffer so as to make context rows available. In the current design, the main buffer is always a strip buffer; a full-image buffer is never required.

* Coefficient controller: buffer controller for the DCT-coefficient data. This controller handles MCU disassembly, including deletion of any dummy DCT blocks at the right or bottom edge. When reading a multiscan JPEG file, this controller is responsible for buffering the full image. (Buffering DCT coefficients, rather than samples, is necessary to support progressive JPEG.) The equivalent of one fully interleaved MCU row of subsampled data is processed per call, even when the source JPEG file is noninterleaved.

* Entropy decoding: Read coded data from the data source module and perform Huffman or arithmetic entropy decoding. Works on one MCU per call. For progressive JPEG decoding, the coefficient controller supplies the prior coefficients of each MCU (initially all zeroes), which the entropy decoder modifies in each scan.

* Dequantization and inverse DCT: like it says. Note that the coefficients
buffered by the coefficient controller have NOT been dequantized; we merge dequantization and inverse DCT into a single step for speed reasons. When scaled-down output is asked for, simplified DCT algorithms may be used that emit fewer samples per DCT block, not the full 8x8. Works on one DCT block at a time.

* Postprocessing controller: buffer controller for the color quantization input buffer, when quantization is in use. (Without quantization, this controller just calls the upsampler.) For two-pass quantization, this controller is responsible for buffering the full-image data.

* Upsampling: restores chroma components to full size. (May support more general output rescaling, too. Note that if undersized DCT outputs have been emitted by the DCT module, this module must adjust so that properly sized outputs are created.) Works on one row group at a time. This module also calls the color conversion module, so its top level is effectively a buffer controller for the upsampling->color conversion buffer. However, in all but the highest-quality operating modes, upsampling and color conversion are likely to be merged into a single step.

* Colorspace conversion: convert from JPEG color space to output color space, and change data layout from separate component planes to pixel-interleaved. Works on one pixel row at a time.

* Color quantization: reduce the data to colormapped form, using either an externally specified colormap or an internally generated one. This module is not used for full-color output. Works on one pixel row at a time; may require two passes to generate a color map. Note that the output will always be a single component representing colormap indexes. In the current design, the output values are JSAMPLEs, so an 8-bit compilation cannot quantize to more than 256 colors. This is unlikely to be a problem in practice.

* Color reduction: this module handles color precision reduction, e.g., generating 15-bit color (5 bits/primary) from JPEG's 24-bit output. Not quite clear yet how this should be handled... should we merge it with colorspace conversion???

Note that some high-speed operating modes might condense the entire postprocessing sequence to a single module (upsample, color convert, and quantize in one step).

In addition to the above objects, the decompression library includes these objects:

* Master control: determines the number of passes required, controls overall and per-pass initialization of the other modules. This is subdivided into input and output control: jdinput.c controls only input-side processing,
while jdmaster.c handles overall initialization and output-side control.

* Marker reading: decodes JPEG markers (except for RSTn).

* Data source manager: supplies the input JPEG datastream. The source manager supplied with the library knows how to read from a stdio stream or from a memory buffer; for other behaviors, the surrounding application may provide its own source manager.

* Memory manager: same as for compression library.

* Error handler: same as for compression library.

* Progress monitor: same as for compression library.

As with compression, the data source manager, error handler, and progress monitor are candidates for replacement by a surrounding application.

*** Decompression input and output separation ***

To support efficient incremental display of progressive JPEG files, the decompressor is divided into two sections that can run independently:

1. Data input includes marker parsing, entropy decoding, and input into the coefficient controller's DCT coefficient buffer. Note that this processing is relatively cheap and fast.

2. Data output reads from the DCT coefficient buffer and performs the IDCT and all postprocessing steps.

For a progressive JPEG file, the data input processing is allowed to get arbitrarily far ahead of the data output processing. (This occurs only if the application calls jpeg_consume_input(); otherwise input and output run in lockstep, since the input section is called only when the output section needs more data.) In this way the application can avoid making extra display passes when data is arriving faster than the display pass can run. Furthermore, it is possible to abort an output pass without losing anything, since the coefficient buffer is read-only as far as the output section is concerned. See libjpeg.txt for more detail.

A full-image coefficient array is only created if the JPEG file has multiple scans (or if the application specifies buffered-image mode anyway). When reading a single-scan file, the coefficient controller normally creates only a one-MCU buffer, so input and output processing must run in lockstep in this case. jpeg_consume_input() is effectively a no-op in this situation.

The main impact of dividing the decompressor in this fashion is that we must
be very careful with shared variables in the cinfo data structure. Each variable that can change during the course of decompression must be classified as belonging to data input or data output, and each section must look only at its own variables. For example, the data output section may not depend on any of the variables that describe the current scan in the JPEG file, because these may change as the data input section advances into a new scan.

The progress monitor is (somewhat arbitrarily) defined to treat input of the file as one pass when buffered-image mode is not used, and to ignore data input work completely when buffered-image mode is used. Note that the library has no reliable way to predict the number of passes when dealing with a progressive JPEG file, nor can it predict the number of output passes in buffered-image mode. So the work estimate is inherently bogus anyway.

No comparable division is currently made in the compression library, because there isn't any real need for it.

*** Data formats ***

Arrays of pixel sample values use the following data structure:

typedef something JSAMPLE; a pixel component value, 0..MAXJSAMPLE
typedef JSAMPLE *JSAMPROW; ptr to a row of samples
typedef JSAMPROW *JSAMPARRAY; ptr to a list of rows
typedef JSAMPARRAY *JSAMPIMAGE; ptr to a list of color-component arrays

The basic element type JSAMPLE will typically be one of unsigned char, (signed) char, or short. Short will be used if samples wider than 8 bits are to be supported (this is a compile-time option). Otherwise, unsigned char is used if possible. If the compiler only supports signed chars, then it is necessary to mask off the value when reading. Thus, all reads of JSAMPLE values must be coded as "GETJSAMPLE(value)", where the macro will be defined as "((value) & 0xFF)" on signed-char machines and "((int) (value))" elsewhere.

With these conventions, JSAMPLE values can be assumed to be >= 0. This helps simplify correct rounding during downsampling, etc. The JPEG standard's specification that sample values run from -128..127 is accommodated by subtracting 128 from the sample value in the DCT step. Similarly, during decompression the output of the IDCT step will be immediately shifted back to 0..255. (NB: different values are required when 12-bit samples are in use. The code is written in terms of MAXJSAMPLE and CENTERJSAMPLE, which will be defined as 255 and 128 respectively in an 8-bit implementation, and as 4095 and 2048 in a 12-bit implementation.)

We use a pointer per row, rather than a two-dimensional JSAMPLE array. This choice costs only a small amount of memory and has several benefits:
* Code using the data structure doesn't need to know the allocated width of the rows. This simplifies edge expansion/compression, since we can work in an array that's wider than the logical picture width.
* Indexing doesn't require multiplication; this is a performance win on many machines.
* Arrays with more than 64K total elements can be supported even on machines where malloc() cannot allocate chunks larger than 64K.
* The rows forming a component array may be allocated at different times without extra copying. This trick allows some speedups in smoothing steps that need access to the previous and next rows.

Note that each color component is stored in a separate array; we don't use the traditional layout in which the components of a pixel are stored together. This simplifies coding of modules that work on each component independently, because they don't need to know how many components there are. Furthermore, we can read or write each component to a temporary file independently, which is helpful when dealing with noninterleaved JPEG files.

In general, a specific sample value is accessed by code such as

```c
GETJSAMPLE(image[colorcomponent][row][col])
```

where col is measured from the image left edge, but row is measured from the first sample row currently in memory. Either of the first two indexings can be precomputed by copying the relevant pointer.

Since most image-processing applications prefer to work on images in which the components of a pixel are stored together, the data passed to or from the surrounding application uses the traditional convention: a single pixel is represented by N consecutive JSAMPLE values, and an image row is an array of (# of color components)*(image width) JSAMPLEs. One or more rows of data can be represented by a pointer of type JSAMPARRAY in this scheme. This scheme is converted to component-wise storage inside the JPEG library. (Applications that want to skip JPEG preprocessing or postprocessing will have to contend with component-wise storage.)

Arrays of DCT-coefficient values use the following data structure:

```c
typedef short JCOEF; // a 16-bit signed integer
typedef JCOEF JBLOCK[DCTSIZE2]; // an 8x8 block of coefficients
typedef JBLOCK *JBLOCKROW; // ptr to one horizontal row of 8x8 blocks
typedef JBLOCKROW *JBLOCKARRAY; // ptr to a list of such rows
typedef JBLOCKARRAY *JBLOCKIMAGE; // ptr to a list of color component arrays
```

The underlying type is at least a 16-bit signed integer; while "short" is big enough on all machines of interest, on some machines it is preferable to use "int" for speed reasons, despite the storage cost. Coefficients are grouped into 8x8 blocks (but we always use #defines DCTSIZE and DCTSIZE2 rather than
The contents of a coefficient block may be in either "natural" or zigzagged order, and may be true values or divided by the quantization coefficients, depending on where the block is in the processing pipeline. In the current library, coefficient blocks are kept in natural order everywhere; the entropy codecs zigzag or dezigzag the data as it is written or read. The blocks contain quantized coefficients everywhere outside the DCT/IDCT subsystems. (This latter decision may need to be revisited to support variable quantization a la JPEG Part 3.)

Notice that the allocation unit is now a row of 8x8 blocks, corresponding to eight rows of samples. Otherwise the structure is much the same as for samples, and for the same reasons.

On machines where malloc() can’t handle a request bigger than 64Kb, this data structure limits us to rows of less than 512 JBLOCKs, or a picture width of 4000+ pixels. This seems an acceptable restriction.

On 80x86 machines, the bottom-level pointer types (JSAMPROW and JBLOCKROW) must be declared as "far" pointers, but the upper levels can be "near" (implying that the pointer lists are allocated in the DS segment). We use a #define symbol FAR, which expands to the "far" keyword when compiling on 80x86 machines and to nothing elsewhere.

*** Suspendable processing ***

In some applications it is desirable to use the JPEG library as an incremental, memory-to-memory filter. In this situation the data source or destination may be a limited-size buffer, and we can’t rely on being able to empty or refill the buffer at arbitrary times. Instead the application would like to have control return from the library at buffer overflow/underrun, and then resume compression or decompression at a later time.

This scenario is supported for simple cases. (For anything more complex, we recommend that the application "bite the bullet" and develop real multitasking capability.) The libjpeg.txt file goes into more detail about the usage and limitations of this capability; here we address the implications for library structure.

The essence of the problem is that the entropy codec (coder or decoder) must be prepared to stop at arbitrary times. In turn, the controllers that call the entropy codec must be able to stop before having produced or consumed all the data that they normally would handle in one call. That part is reasonably straightforward: we make the controller call interfaces include "progress counters" which indicate the number of data chunks successfully processed, and
we require callers to test the counter rather than just assume all of the data was processed.

Rather than trying to restart at an arbitrary point, the current Huffman codecs are designed to restart at the beginning of the current MCU after a suspension due to buffer overflow/underrun. At the start of each call, the codec’s internal state is loaded from permanent storage (in the JPEG object structures) into local variables. On successful completion of the MCU, the permanent state is updated. (This copying is not very expensive, and may even lead to *improved* performance if the local variables can be registerized.) If a suspension occurs, the codec simply returns without updating the state, thus effectively reverting to the start of the MCU. Note that this implies leaving some data unprocessed in the source/destination buffer (ie, the compressed partial MCU). The data source/destination module interfaces are specified so as to make this possible. This also implies that the data buffer must be large enough to hold a worst-case compressed MCU; a couple thousand bytes should be enough.

In a successive-approximation AC refinement scan, the progressive Huffman decoder has to be able to undo assignments of newly nonzero coefficients if it suspends before the MCU is complete, since decoding requires distinguishing previously-zero and previously-nonzero coefficients. This is a bit tedious but probably won’t have much effect on performance. Other variants of Huffman decoding need not worry about this, since they will just store the same values again if forced to repeat the MCU.

This approach would probably not work for an arithmetic codec, since its modifiable state is quite large and couldn’t be copied cheaply. Instead it would have to suspend and resume exactly at the point of the buffer end.

The JPEG marker reader is designed to cope with suspension at an arbitrary point. It does so by backing up to the start of the marker parameter segment, so the data buffer must be big enough to hold the largest marker of interest. Again, a couple KB should be adequate. (A special "skip" convention is used to bypass COM and APPn markers, so these can be larger than the buffer size without causing problems; otherwise a 64K buffer would be needed in the worst case.)

The JPEG marker writer currently does *not* cope with suspension. We feel that this is not necessary; it is much easier simply to require the application to ensure there is enough buffer space before starting. (An empty 2K buffer is more than sufficient for the header markers; and ensuring there are a dozen or two bytes available before calling jpeg_finish_compress() will suffice for the trailer.) This would not work for writing multi-scan JPEG files, but we simply do not intend to support that capability with suspension.
*** Memory manager services ***

The JPEG library's memory manager controls allocation and deallocation of memory, and it manages large "virtual" data arrays on machines where the operating system does not provide virtual memory. Note that the same memory manager serves both compression and decompression operations.

In all cases, allocated objects are tied to a particular compression or decompression master record, and they will be released when that master record is destroyed.

The memory manager does not provide explicit deallocation of objects. Instead, objects are created in "pools" of free storage, and a whole pool can be freed at once. This approach helps prevent storage-leak bugs, and it speeds up operations whenever malloc/free are slow (as they often are). The pools can be regarded as lifetime identifiers for objects. Two pools/lifetimes are defined:

* JPOOL_PERMANENT lasts until master record is destroyed
* JPOOL_IMAGE lasts until done with image (JPEG datastream)

Permanent lifetime is used for parameters and tables that should be carried across from one datastream to another; this includes all application-visible parameters. Image lifetime is used for everything else. (A third lifetime, JPOOL_PASS = one processing pass, was originally planned. However it was dropped as not being worthwhile. The actual usage patterns are such that the peak memory usage would be about the same anyway; and having per-pass storage substantially complicates the virtual memory allocation rules --- see below.)

The memory manager deals with three kinds of object:

1. "Small" objects. Typically these require no more than 10K-20K total.
2. "Large" objects. These may require tens to hundreds of K depending on image size. Semantically they behave the same as small objects, but we distinguish them for two reasons:
   * On MS-DOS machines, large objects are referenced by FAR pointers, small objects by NEAR pointers.
   * Pool allocation heuristics may differ for large and small objects.
   Note that individual "large" objects cannot exceed the size allowed by type size_t, which may be 64K or less on some machines.
3. "Virtual" objects. These are large 2-D arrays of JSAMPLEs or JBLOCKs (typically large enough for the entire image being processed). The memory manager provides stripwise access to these arrays. On machines without virtual memory, the rest of the array may be swapped out to a temporary file.

(Note: JSAMPARRAY and JBLOCARRAY data structures are a combination of large objects for the data proper and small objects for the row pointers. For convenience and speed, the memory manager provides single routines to create these structures. Similarly, virtual arrays include a small control block and a JSAMPARRAY or JBLOCARRAY working buffer, all created with one call.)
In the present implementation, virtual arrays are only permitted to have image lifespan. (Permanent lifespan would not be reasonable, and pass lifespan is not very useful since a virtual array's raison d'être is to store data for multiple passes through the image.) We also expect that only "small" objects will be given permanent lifespan, though this restriction is not required by the memory manager.

In a non-virtual-memory machine, some performance benefit can be gained by making the in-memory buffers for virtual arrays be as large as possible. (For small images, the buffers might fit entirely in memory, so blind swapping would be very wasteful.) The memory manager will adjust the height of the buffers to fit within a prespecified maximum memory usage. In order to do this in a reasonably optimal fashion, the manager needs to allocate all of the virtual arrays at once. Therefore, there isn't a one-step allocation routine for virtual arrays; instead, there is a "request" routine that simply allocates the control block, and a "realize" routine (called just once) that determines space allocation and creates all of the actual buffers. The realize routine must allow for space occupied by non-virtual large objects. (We don't bother to factor in the space needed for small objects, on the grounds that it isn't worth the trouble.)

To support all this, we establish the following protocol for doing business with the memory manager:
1. Modules must request virtual arrays (which may have only image lifespan) during the initial setup phase, i.e., in their jinit_xxx routines.
2. All "large" objects (including JSAMPARRAYs and JBLOCKARRAYs) must also be allocated during initial setup.
3. realize_virt_arrays will be called at the completion of initial setup.

The above conventions ensure that sufficient information is available for it to choose a good size for virtual array buffers.

Small objects of any lifespan may be allocated at any time. We expect that the total space used for small objects will be small enough to be negligible in the realize_virt_arrays computation.

In a virtual-memory machine, we simply pretend that the available space is infinite, thus causing realize_virt_arrays to decide that it can allocate all the virtual arrays as full-size in-memory buffers. The overhead of the virtual-array access protocol is very small when no swapping occurs.

A virtual array can be specified to be "pre-zeroed"; when this flag is set, never-yet-written sections of the array are set to zero before being made available to the caller. If this flag is not set, never-written sections of the array contain garbage. (This feature exists primarily because the equivalent logic would otherwise be needed in jdcoefct.c for progressive JPEG mode; we may as well make it available for possible other uses.)

The first write pass on a virtual array is required to occur in top-to-bottom
order; read passes, as well as any write passes after the first one, may access the array in any order. This restriction exists partly to simplify the virtual array control logic, and partly because some file systems may not support seeking beyond the current end-of-file in a temporary file. The main implication of this restriction is that rearrangement of rows (such as converting top-to-bottom data order to bottom-to-top) must be handled while reading data out of the virtual array, not while putting it in.

*** Memory manager internal structure ***

To isolate system dependencies as much as possible, we have broken the memory manager into two parts. There is a reasonably system-independent "front end" (jmemmgr.c) and a "back end" that contains only the code likely to change across systems. All of the memory management methods outlined above are implemented by the front end. The back end provides the following routines for use by the front end (none of these routines are known to the rest of the JPEG code):

- `jpeg_mem_init`, `jpeg_mem_term` system-dependent initialization/shutdown
- `jpeg_get_small`, `jpeg_free_small` interface to malloc and free library routines (or their equivalents)
- `jpeg_get_large`, `jpeg_free_large` interface to FAR malloc/free in MSDOS machines; else usually the same as `jpeg_get_small`/`jpeg_free_small`
- `jpeg_mem_available` estimate available memory
- `jpeg_open_backing_store` create a backing-store object
- `read_backing_store`, `write_backing_store`, `close_backing_store`

On some systems there will be more than one type of backing-store object (specifically, in MS-DOS a backing store file might be an area of extended memory as well as a disk file). `jpeg_open_backing_store` is responsible for choosing how to implement a given object. The read/write/close routines are method pointers in the structure that describes a given object; this lets them be different for different object types.

It may be necessary to ensure that backing store objects are explicitly released upon abnormal program termination. For example, MS-DOS won't free extended memory by itself. To support this, we will expect the main program or surrounding application to arrange to call `self_destruct` (typically via `jpeg_destroy`) upon abnormal termination. This may require a SIGINT signal
handler or equivalent. We don't want to have the back end module install its own signal handler, because that would pre-empt the surrounding application's ability to control signal handling.

The IJG distribution includes several memory manager back end implementations. Usually the same back end should be suitable for all applications on a given system, but it is possible for an application to supply its own back end at need.

*** Implications of DNL marker ***

Some JPEG files may use a DNL marker to postpone definition of the image height (this would be useful for a fax-like scanner's output, for instance). In these files the SOF marker claims the image height is 0, and you only find out the true image height at the end of the first scan.

We could read these files as follows:
1. Upon seeing zero image height, replace it by 65535 (the maximum allowed).
2. When the DNL is found, update the image height in the global image descriptor.
   This implies that control modules must avoid making copies of the image height, and must re-test for termination after each MCU row. This would be easy enough to do.

In cases where image-size data structures are allocated, this approach will result in very inefficient use of virtual memory or much-larger-than-necessary temporary files. This seems acceptable for something that probably won't be a mainstream usage. People might have to forgo use of memory-hogging options (such as two-pass color quantization or noninterleaved JPEG files) if they want efficient conversion of such files. (One could improve efficiency by demanding a user-supplied upper bound for the height, less than 65536; in most cases it could be much less.)

The standard also permits the SOF marker to overestimate the image height, with a DNL to give the true, smaller height at the end of the first scan. This would solve the space problems if the overestimate wasn't too great. However, it implies that you don't even know whether DNL will be used.

This leads to a couple of very serious objections:
1. Testing for a DNL marker must occur in the inner loop of the decompressor's Huffman decoder; this implies a speed penalty whether the feature is used or not.
2. There is no way to hide the last-minute change in image height from an application using the decoder. Thus *every* application using the IJG library would suffer a complexity penalty whether it cared about DNL or not.

We currently do not support DNL because of these problems.
A different approach is to insist that DNL-using files be preprocessed by a separate program that reads ahead to the DNL, then goes back and fixes the SOF marker. This is a much simpler solution and is probably far more efficient. Even if one wants piped input, buffering the first scan of the JPEG file needs a lot smaller temp file than is implied by the maximum-height method. For this approach we'd simply treat DNL as a no-op in the decompressor (at most, check that it matches the SOF image height).

We will not worry about making the compressor capable of outputting DNL. Something similar to the first scheme above could be applied if anyone ever wants to make that work.

* The primary algorithm described there uses 11 multiplies and 29 adds.
* We use their alternate method with 12 multiplies and 32 adds.
* The advantage of this method is that no data path contains more than one
* multiplication; this allows a very simple and accurate implementation in
* scaled fixed-point arithmetic, with a minimal number of shifts.
*
* We also provide IDCT routines with various output sample block sizes for
* direct resolution reduction or enlargement without additional resampling:
* NxN (N=1...16) pixels for one 8x8 input DCT block.
*
* For N<8 we simply take the corresponding low-frequency coefficients of
* the 8x8 input DCT block and apply an NxN point IDCT on the sub-block
* to yield the downscaled outputs.
* This can be seen as direct low-pass downsampling from the DCT domain
* point of view rather than the usual spatial domain point of view,
* yielding significant computational savings and results at least
* as good as common bilinear (averaging) spatial downsampling.
*
* For N>8 we apply a partial NxN IDCT on the 8 input coefficients as
* lower frequencies and higher frequencies assumed to be zero.
* It turns out that the computational effort is similar to the 8x8 IDCT
* regarding the output size.
* Furthermore, the scaling and descaling is the same for all IDCT sizes.
*
* CAUTION: We rely on the FIX() macro except for the N=1,2,4,8 cases

libjpeg-turbo is a JPEG image codec that uses SIMD instructions (MMX, SSE2, NEON) to accelerate baseline JPEG compression and decompression on x86, x86-64, and ARM systems. On such systems, libjpeg-turbo is generally 2-4x as fast as libjpeg, all else being equal. On other types of systems, libjpeg-turbo can still outperform libjpeg by a significant amount, by virtue of its highly-optimized Huffman coding routines. In many cases, the performance of libjpeg-turbo rivals that of proprietary high-speed JPEG codecs.

libjpeg-turbo implements both the traditional libjpeg API as well as the less powerful but more straightforward TurboJPEG API. libjpeg-turbo also features colorspace extensions that allow it to compress from/decompress to 32-bit and big-endian pixel buffers (RGBX, XBGR, etc.), as well as a full-featured Java interface.

libjpeg-turbo was originally based on libjpeg/SIMD, an MMX-accelerated derivative of libjpeg v6b developed by Miyasaka Masaru. The TigerVNC and VirtualGL projects made numerous enhancements to the codec in 2009, and in early 2010, libjpeg-turbo spun off into an independent project, with the goal of making high-speed JPEG compression/decompression technology available to a
broader range of users and developers.

 * For conditions of distribution and use, see the accompanying README file.
 *
 * This file contains a floating-point implementation of the
 * forward DCT (Discrete Cosine Transform).
 *
 * This implementation should be more accurate than either of the integer
 * DCT implementations. However, it may not give the same results on all
* machines because of differences in roundoff behavior. Speed will depend
* on the hardware's floating point capacity.
*
* A 2-D DCT can be done by 1-D DCT on each row followed by 1-D DCT
* on each column. Direct algorithms are also available, but they are
* much more complex and seem not to be any faster when reduced to code.
*
* This implementation is based on Arai, Agui, and Nakajima's algorithm for
* scaled DCT. Their original paper (Trans. IEICE E-71(11):1095) is in
* Japanese, but the algorithm is described in the Pennebaker & Mitchell
* JPEG textbook (see REFERENCES section in file README). The following code
* is based directly on figure 4-8 in P&M.
* While an 8-point DCT cannot be done in less than 11 multiplies, it is
* possible to arrange the computation so that many of the multiplies are
* simple scalings of the final outputs. These multiplies can then be
* folded into the multiplications or divisions by the JPEG quantization
* table entries. The AA&N method leaves only 5 multiplies and 29 adds
* to be done in the DCT itself.
* The primary disadvantage of this method is that with a fixed-point
* implementation, accuracy is lost due to imprecise representation of the
* scaled quantization values. However, that problem does not arise if
* we use floating point arithmetic.

Subject: [PATCH] cjpeg: Fix OOB read caused by malformed 8-bit BMP

... in which one or more of the color indices is out of range for the
number of palette entries.

Fix partly borrowed from jpeg-9c. This commit also adopts Guido's
JERR_PPM_OUTOFRANGE enum value in lieu of our project-specific
JERR_PPM_TOOLARGE enum value.
Fixes #258

1.2.90 (1.3 beta1)

==================

[1] Added support for additional scaling factors (3/8, 5/8, 3/4, 7/8, 9/8, 5/4, 11/8, 3/2, 13/8, 7/4, 15/8, and 2) when decompressing. Note that the IDCT will not be SIMD-accelerated when using any of these new scaling factors.

[2] The TurboJPEG dynamic library is now versioned. It was not strictly necessary to do so, because TurboJPEG uses versioned symbols, and if a function changes in an ABI-incompatible way, that function is renamed and a legacy function is provided to maintain backward compatibility. However, certain Linux distro maintainers will blindly reject any library that is not versioned, so this was an attempt to make them happy.

[3] Extended the TurboJPEG Java API so that it can be used to compress a JPEG image from and decompress a JPEG image to an arbitrary position in a large image buffer.

[4] The tjDecompressToYUV() function now supports the TJFLAG_FASTDCT flag.

[5] The 32-bit supplementary package for amd64 Debian systems now provides symlinks in /usr/lib/i386-linux-gnu for the TurboJPEG libraries in /usr/lib32. This allows those libraries to be used on MultiArch-compatible systems (such as Ubuntu 11 and later) without setting the linker path.

[6] The TurboJPEG Java wrapper should now find the JNI library on Mac systems without having to pass -Djava.library.path=/usr/lib to java.

[7] TJBench has been ported to Java to provide a convenient way of validating the performance of the TurboJPEG Java API. It can be run with 'java -cp turbojpeg.jar TJBench'.

[8] cjpeg can now be used to generate JPEG files with the RGB colorspace (feature ported from jpeg-8d.)

[9] The width and height in the -crop argument passed to jpegtran can now be suffixed with "f" to indicate that, when the upper left corner of the cropping region is automatically moved to the nearest iMCU boundary, the bottom right corner should be moved by the same amount. In other words, this feature causes jpegtran to strictly honor the specified width/height rather than the specified bottom right corner (feature ported from jpeg-8d.)

[10] JPEG files using the RGB colorspace can now be decompressed into grayscale images (feature ported from jpeg-8d.)

[11] Fixed a regression caused by 1.2.1[7] whereby the build would fail with multiple "Mismatch in operand sizes" errors when attempting to build the x86 SIMD code with NASM 0.98.
The in-memory source/destination managers (jpeg_mem_src() and jpeg_mem_dest()) are now included by default when building libjpeg-turbo with libjpeg v6b or v7 emulation, so that programs can take advantage of these functions without requiring the use of the backward-incompatible libjpeg v8 ABI. The "age number" of the libjpeg-turbo library on Un*x systems has been incremented by 1 to reflect this. You can disable this feature with a configure/CMake switch in order to retain strict API/ABI compatibility with the libjpeg v6b or v7 API/ABI (or with previous versions of libjpeg-turbo.) See README-turbo.txt for more details.

Added ARM v7s architecture to libjpeg.a and libturbojpeg.a in the official libjpeg-turbo binary package for OS X, so that those libraries can be used to build applications that leverage the faster CPUs in the iPhone 5 and iPad 4.

1.2.1
=====

Creating or decoding a JPEG file that uses the RGB colorspace should now properly work when the input or output colorspace is one of the libjpeg-turbo colorspace extensions.

When libjpeg-turbo was built without SIMD support and merged (non-fancy) upsampling was used along with an alpha-enabled colorspace during decompression, the unused byte of the decompressed pixels was not being set to 0xFF. This has been fixed. TJUnitTest has also been extended to test for the correct behavior of the colorspace extensions when merged upsampling is used.

Fixed a bug whereby the libjpeg-turbo SSE2 SIMD code would not preserve the upper 64 bits of xmm6 and xmm7 on Win64 platforms, which violated the Win64 calling conventions.

Fixed a regression caused by 1.2.0[6] whereby decompressing corrupt JPEG images (specifically, images in which the component count was erroneously set to a large value) would cause libjpeg-turbo to segfault.

Worked around a severe performance issue with "Bobcat" (AMD Embedded APU) processors. The MASKMOVQDQU instruction, which was used by the libjpeg-turbo SSE2 SIMD code, is apparently implemented in microcode on AMD processors, and it is painfully slow on Bobcat processors in particular. Eliminating the use of this instruction improved performance by an order of magnitude on Bobcat processors and by a small amount (typically 5%) on AMD desktop processors.

Added SIMD acceleration for performing 4:2:2 upsampling on NEON-capable ARM platforms. This speeds up the decompression of 4:2:2 JPEGs by 20-25% on such platforms.
[7] Fixed a regression caused by 1.2.0[2] whereby, on Linux/x86 platforms running the 32-bit SSE2 SIMD code in libjpeg-turbo, decompressing a 4:2:0 or 4:2:2 JPEG image into a 32-bit (RGBX, BGRX, etc.) buffer without using fancy upsampling would produce several incorrect columns of pixels at the right-hand side of the output image if each row in the output image was not evenly divisible by 16 bytes.

[8] Fixed an issue whereby attempting to build the SIMD extensions with Xcode 4.3 on OS X platforms would cause NASM to return numerous errors of the form “'%/define' expects a macro identifier”.

[9] Added flags to the TurboJPEG API that allow the caller to force the use of either the fast or the accurate DCT/IDCT algorithms in the underlying codec.

1.2.0
=====

[1] Fixed build issue with YASM on Unix systems (the libjpeg-turbo build system was not adding the current directory to the assembler include path, so YASM was not able to find jsimdefg.inc.)

[2] Fixed out-of-bounds read in SSE2 SIMD code that occurred when decompressing a JPEG image to a bitmap buffer whose size was not a multiple of 16 bytes. This was more of an annoyance than an actual bug, since it did not cause any actual run-time problems, but the issue showed up when running libjpeg-turbo in valgrind. See http://crbug.com/72399 for more information.

[3] Added a compile-time macro (LIBJPEG_TURBO_VERSION) that can be used to check the version of libjpeg-turbo against which an application was compiled.

[4] Added new RGBA/BGRA/ABGR/ARGB colorspace extension constants (libjpeg API) and pixel formats (TurboJPEG API), which allow applications to specify that, when decompressing to a 4-component RGB buffer, the unused byte should be set to 0xFF so that it can be interpreted as an opaque alpha channel.

[5] Fixed regression issue whereby DevIL failed to build against libjpeg-turbo because libjpeg-turbo's distributed version of jconfig.h contained an INLINE macro, which conflicted with a similar macro in DevIL. This macro is used only internally when building libjpeg-turbo, so it was moved into config.h.

[6] libjpeg-turbo will now correctly decompress erroneous CMYK/YCCK JPEGs whose K component is assigned a component ID of 1 instead of 4. Although these files are in violation of the spec, other JPEG implementations handle them correctly.

[7] Added ARM v6 and ARM v7 architectures to libjpeg.a and libturbojpeg.a in the official libjpeg-turbo binary package for OS X, so that those libraries can
be used to build both OS X and iOS applications.

1.1.90 (1.2 beta1)
==================

[1] Added a Java wrapper for the TurboJPEG API. See java/README for more details.

[2] The TurboJPEG API can now be used to scale down images during decompression.

[3] Added SIMD routines for RGB-to-grayscale color conversion, which significantly improves the performance of grayscale JPEG compression from an RGB source image.

[4] Improved the performance of the C color conversion routines, which are used on platforms for which SIMD acceleration is not available.

[5] Added a function to the TurboJPEG API that performs lossless transforms. This function is implemented using the same back end as jpegtran, but it performs transcoding entirely in memory and allows multiple transforms and/or crop operations to be batched together, so the source coefficients only need to be read once. This is useful when generating image tiles from a single source JPEG.

[6] Added tests for the new TurboJPEG scaled decompression and lossless transform features to tjbench (the TurboJPEG benchmark, formerly called "jpgtest").

[7] Added support for 4:4:0 (transposed 4:2:2) subsampling in TurboJPEG, which was necessary in order for it to read 4:2:2 JPEG files that had been losslessly transposed or rotated 90 degrees.

[8] All legacy VirtualGL code has been re-factored, and this has allowed libjpeg-turbo, in its entirety, to be re-licensed under a BSD-style license.

[9] libjpeg-turbo can now be built with YASM.

[10] Added SIMD acceleration for ARM Linux and iOS platforms that support NEON instructions.

[11] Refactored the TurboJPEG C API and documented it using Doxygen. The TurboJPEG 1.2 API uses pixel formats to define the size and component order of the uncompressed source/destination images, and it includes a more efficient version of TJBUFSIZE() that computes a worst-case JPEG size based on the level of chrominance subsampling. The refactored implementation of the TurboJPEG API now uses the libjpeg memory source and destination managers, which allows the
TurboJPEG compressor to grow the JPEG buffer as necessary.

[12] Eliminated errors in the output of jpegtran on Windows that occurred when the application was invoked using I/O redirection (jpegtran <input.jpg >output.jpg).

[13] The inclusion of libjpeg v7 and v8 emulation as well as arithmetic coding support in libjpeg-turbo v1.1.0 introduced several new error constants in jerror.h, and these were mistakenly enabled for all emulation modes, causing the error enum in libjpeg-turbo to sometimes have different values than the same enum in libjpeg. This represents an ABI incompatibility, and it caused problems with rare applications that took specific action based on a particular error value. The fix was to include the new error constants conditionally based on whether libjpeg v7 or v8 emulation was enabled.

[14] Fixed an issue whereby Windows applications that used libjpeg-turbo would fail to compile if the Windows system headers were included before jpeglib.h. This issue was caused by a conflict in the definition of the INT32 type.

[15] Fixed 32-bit supplementary package for amd64 Debian systems, which was broken by enhancements to the packaging system in 1.1.

[16] When decompressing a JPEG image using an output colorspace of JCS_EXT_RGBX, JCS_EXT_BGRX, JCS_EXT_XBGR, or JCS_EXT_XRGB, libjpeg-turbo will now set the unused byte to 0xFF, which allows applications to interpret that byte as an alpha channel (0xFF = opaque).

1.1.1
=====

[1] Fixed a 1-pixel error in row 0, column 21 of the luminance plane generated by tjEncodeYUV().

[2] libjpeg-turbo's accelerated Huffman decoder previously ignored unexpected markers found in the middle of the JPEG data stream during decompression. It will now hand off decoding of a particular block to the unaccelerated Huffman decoder if an unexpected marker is found, so that the unaccelerated Huffman decoder can generate an appropriate warning.

[3] Older versions of MinGW64 prefixed symbol names with underscores by default, which differed from the behavior of 64-bit Visual C++. MinGW64 1.0 has adopted the behavior of 64-bit Visual C++ as the default, so to accommodate this, the libjpeg-turbo SIMD function names are no longer prefixed with an underscore when building with MinGW64. This means that, when building libjpeg-turbo with older versions of MinGW64, you will now have to add -fno-leading-underscore to the CFLAGS.
[4] Fixed a regression bug in the NSIS script that caused the Windows installer build to fail when using the Visual Studio IDE.

[5] Fixed a bug in jpeg_read_coefficients() whereby it would not initialize cinfo->image_width and cinfo->image_height if libjpeg v7 or v8 emulation was enabled. This specifically caused the jpegoptim program to fail if it was linked against a version of libjpeg-turbo that was built with libjpeg v7 or v8 emulation.

[7] Eliminated errors in the output of cjpeg on Windows that occurred when the application was invoked using I/O redirection (cjpeg <inputfile >output.jpg).

1.1.0

[1] The algorithm used by the SIMD quantization function cannot produce correct results when the JPEG quality is >= 98 and the fast integer forward DCT is used. Thus, the non-SIMD quantization function is now used for those cases, and libjpeg-turbo should now produce identical output to libjpeg v6b in all cases.

[2] Despite the above, the fast integer forward DCT still degrades somewhat for JPEG qualities greater than 95, so the TurboJPEG wrapper will now automatically use the slow integer forward DCT when generating JPEG images of quality 96 or greater. This reduces compression performance by as much as 15% for these high-quality images but is necessary to ensure that the images are perceptually lossless. It also ensures that the library can avoid the performance pitfall created by [1].

[3] Ported jpgtest.cxx to pure C to avoid the need for a C++ compiler.

[5] The Windows distribution packages now include the libjpeg run-time programs (cjpeg, etc.)

[6] All packages now include jpgtest.

[8] Added two new TurboJPEG API functions, tjEncodeYUV() and tjDecompressToYUV(), to replace the somewhat hackish TJ_YUV flag.
1.0.90 (1.1 beta1)

[1] Added emulation of the libjpeg v7 and v8 APIs and ABIs. See README-turbo.txt for more details. This feature was sponsored by CamTrace SAS.

[3] Grayscale bitmaps can now be compressed from/decompressed to using the TurboJPEG API.

[4] jpgtest can now be used to test decompression performance with existing JPEG images.

[5] If the default install prefix (/opt/libjpeg-turbo) is used, then 'make install' now creates /opt/libjpeg-turbo/lib32 and /opt/libjpeg-turbo/lib64 sym links to duplicate the behavior of the binary packages.

[6] All symbols in the libjpeg-turbo dynamic library are now versioned, even when the library is built with libjpeg v6b emulation.

[7] Added arithmetic encoding and decoding support (can be disabled with configure or CMake options)

[8] Added a TJ_YUV flag to the TurboJPEG API, which causes both the compressor and decompressor to output planar YUV images.

[9] Added an extended version of tjDecompressHeader() to the TurboJPEG API, which allows the caller to determine the type of subsampling used in a JPEG image.

[10] Added further protections against invalid Huffman codes.

1.0.1

[1] The Huffman decoder will now handle erroneous Huffman codes (for instance, from a corrupt JPEG image.) Previously, these would cause libjpeg-turbo to crash under certain circumstances.

[2] Fixed typo in SIMD dispatch routines that was causing 4:2:2 upsampling to be used instead of 4:2:0 when decompressing JPEG images using SSE2 code.

[3] configure script will now automatically determine whether the INCOMPLETE_TYPES_BROKEN macro should be defined.
1.0.0
=====

[1] 2983700: Further FreeBSD build tweaks (no longer necessary to specify --host when configuring on a 64-bit system)

[2] Created symlinks in the Unix/Linux packages so that the TurboJPEG include file can always be found in /opt/libjpeg-turbo/include, the 32-bit static libraries can always be found in /opt/libjpeg-turbo/lib32, and the 64-bit static libraries can always be found in /opt/libjpeg-turbo/lib64.

[3] The Unix/Linux distribution packages now include the libjpeg run-time programs (cjpeg, etc.) and man pages.

[6] Include distribution package for Cygwin

[7] No longer necessary to specify --without-simd on non-x86 architectures, and unit tests now work on those architectures.

libjpeg-turbo is a JPEG image codec that uses SIMD instructions (MMX, SSE2, NEON) to accelerate baseline JPEG compression and decompression on x86, x86-64, and ARM systems. On such systems, libjpeg-turbo is generally 2-4x as fast as libjpeg, all else being equal. On other types of systems, libjpeg-turbo can still outperform libjpeg by a significant amount, by virtue of its highly-optimized Huffman coding routines. In many cases, the performance of libjpeg-turbo rivals that of proprietary high-speed JPEG codecs.

libjpeg-turbo implements both the traditional libjpeg API as well as the less powerful but more straightforward TurboJPEG API. libjpeg-turbo also features colorspace extensions that allow it to compress from/decompress to 32-bit and big-endian pixel buffers (RGBX, XBGR, etc.), as well as a full-featured Java interface.

libjpeg-turbo was originally based on libjpeg/SIMD, an MMX-accelerated derivative of libjpeg v6b developed by Miyasaka Masaru. The TigerVNC and VirtualGL projects made numerous enhancements to the codec in 2009, and in early 2010, libjpeg-turbo spun off into an independent project, with the goal of making high-speed JPEG compression/decompression technology available to a broader range of users and developers.
