TRUE and sets both scanout pixmaps `prime_pixmap` and
`prime_pixmap_back`.

When setting a mode, if `prime_pixmap` is defined, modesetting
driver will call drmMode_InitSharedPixmapFlipping(), which if
flipping is enabled will call drmMode_SharedPixmapPresent() on
scanout_pixmap_back.

drmMode_SharedPixmapPresent() requests that for the source to
present on the given buffer using master->PresentSharedPixmap(). If
it succeeds, it will then attempt to flip to that buffer using
drmMode_SharedPixmapFlip(). Flipping shouldn't fail, but if it
does, it will raise a warning and try drmMode_SharedPixmapPresent() again on the next vblank using
drmMode_SharedPixmapPresentOnVBlank().

master->PresentSharedPixmap() could fail, in most cases because
there is no outstanding damage on the mscreenpix tracked by the
shared pixmap. In this case, drmMode_SharedPixmapPresent() will
attempt to use master->RequestSharedPixmapNotifyDamage() to request
for the source driver to call slave->SharedPixmapNotifyDamage() in
response to damage on mscreenpix. This will ultimately call
to retry
on the next vblank after accumulating damage.

\texttt{drmmode\_SharedPixmapFlip()} sets up page flip event handler by
packing struct vblank\_event\_args with the necessary parameters, and
registering \texttt{drmmode\_SharedPixmapVBlankEventHandler()} and
\texttt{drmmode\_SharedPixmapVBlankEventAbort()} with the modesetting DRM
event handler queue. Then, it uses the \texttt{drmModePageFlip()} to flip on
the next vblank and raise an event.

\texttt{drmmode\_SharedPixmapPresentOnVBlank()} operates similarly to
\texttt{drmmode\_SharedPixmapFlip()}, but uses \texttt{drmWaitVBlank()} instead of
\texttt{drmModePageFlip()} to raise the event without flipping.

On the next vblank, DRM will raise an event that will ultimately be
handled by \texttt{drmmode\_SharedPixmapVBlankEventHandler()}. If we flipped,
it will update \texttt{prime\_ pixmap} and \texttt{prime\_ pixmap\_ back} to reflect that
\texttt{frontTarget} is now being displayed, and use
\texttt{drmmode\_SharedPixmapPresent(backTarget)} to start the process again
on the now-hidden shared pixmap. If we didn't flip, it will just
use \texttt{drmmode\_SharedPixmapPresent(frontTarget)} to start the process
again on the still-hidden shared pixmap.

Note that presentation generally happens asynchronously, so with
these changes alone tearing is reduced, but we can't always
guarantee that the present will finish before the flip. These
changes are meant to be paired with changes to the sink DRM driver
that makes flips wait on fences attached to dmabuf backed buffers.
The source driver is responsible for attaching the fences and
signaling them when presentation is finished.

Note that because presentation is requested in response to a
vblank, PRIME sources will now conform to the sink's refresh rate.

At teardown, \texttt{pScrPriv\_rrDisableSharedPixmapFlipping()} will be
called, making its way to \texttt{drmmode\_FiniSharedPixmapFlipping()}.
There, the event handlers for \texttt{prime\_ pixmap} and \texttt{prime\_ pixmap\_ back}
are aborted, freeing the left over parameter structure. Then,
\texttt{prime\_ pixmap} and \texttt{prime\_ pixmap\_ back} are unset as scanout pixmaps.

Register and tear down slave damage per-scanout pixmap instead of
per-crtc.

\textbf{v1: Initial commit}
\textbf{v2: Renamed PresentTrackedFlippingPixmap to PresentSharedPixmap}
\hspace{1em}Renamed flipSeq to flip_seq
Warn if flip failed
Use SharedPixmapNotifyDamage to retry on next vblank after damage
v3: Refactor to accomodate moving (rr)StartFlippingPixmapTracking and
(rr)(Enable/Disable)SharedPixmapFlipping to rrScrPrivRec from ScreenRec
Do damage tracking on both scanout pixmaps
v4: Tweaks to commit message
v5: Revise for internal storage of prime pixmap ptrs
Move disabling for reverse PRIME from source commit to here
Use drmmode_set_target_scanout_pixmap*() to set scanout pixmaps
internally to EnableSharedPixmapFlipping().
Don't support flipping if ms->drmmode.pageflip == FALSE.
Move flipping_active check to this commit

typesetting: Always tear down scanout pixmap

drmmode_set_scanout_pixmap_(cpu/gpu) would only do teardown if ppix ==
NULL. This meant that if there were consecutive calls to
SetScanoutPixmap(ppix != NULL) without calls to SetScanoutPixmap(ppix ==
NULL) in between, earlier calls would be leaked. RRReplaceScanoutPixmap()
does this today.

Instead, when setting a scanout pixmap, always do teardown of the existing
scanout pixmap before setting up the new one. Then, if there is no new one
to set up, stop there.

This maintains the previous behavior in all cases except those with
multiple consecutive calls to SetScanoutPixmap(ppix != NULL).

modesetting: Internal storage of scanout pixmaps

modesetting relied on randr_crtc->scanout_pixmap being consistent with
calls to SetScanoutPixmap, which is very fragile and makes a lot of
assumptions about the caller’s behavior.

For example, RRReplaceScanoutPixmap(), when dropping off with !size_fits,
will set randr_crtc->scanout_pixmap = NULL and then call SetScanoutPixmap.
Without this patch, drmmode_set_scanoutPixmap_(cpu/gpu) will think that
there is no scanout pixmap to tear down, because it’s already been set to
NULL.

By keeping track of the scanout pixmap in its internal state, modesetting
can avoid these types of bugs and reduce constraints on calling
conventions.

randr/xf86: Add PRIME Synchronization / Double Buffer

Changes PRIME to use double buffering and synchronization if all required driver functions are available.

rrcrtc.c:
Changes rrSetupPixmapSharing() to use double buffering and synchronization in the case that all required driver functions are available. Otherwise, falls back to unsynchronized single buffer.

Changes RRCrtcDetachScanoutPixmap() to properly clean up in the case of double buffering.

Moves StopPixmapTracking() from rrDestroySharedPixmap() to RRCrtcDetachScanoutPixmap().

Changes RRReplaceScanoutPixmap() to fail if we are using double buffering, as it would need a second ppix parameter to function with double buffering, and AFAICT no driver I've implemented double buffered source support in uses RRReplaceScanoutPixmap().

randrstr.h:
Adds scanout_pixmap_back to struct _rrCrtc to facilitate PRIME double buffering.

xf86Crtc.h:
Adds current_scanout_back to _xf86Crtc to facilitate detection of changes to it in xf86RandR12CrtcSet().

xf86RandR12.c:
Changes xf86RandR12CrtcSet() to detect changes in scanout_pixmap_back.

Adds scanout_pixmap_back to struct _rrCrtc to facilitate PRIME double buffering.
v3: Refactor to accommodate moving (rr)StartFlippingPixmapTracking and (rr)(Enable/Disable)SharedPixmapFlipping to rrScrPrivRec from ScreenRec
Add fallback if flipping funcs fail
v4: Detach scanout pixmap when destroying scanout_pixmap_back, to avoid dangling pointers in some drivers
v5: Disable RRReplaceScanoutPixmap for double-buffered PRIME, it would need an ABI change with support for 2 pixmaps if it were to be supported, but AFAICT no driver that actually supports double-buffered PRIME uses it.
Refactor to use rrEnableSharedPixmapFlipping() as a substitute for rrCrtcSetScanoutPixmap() in the flipping case.
Remove extraneous pSlaveScrPriv from DetachScanoutPixmap()
Remove extraneous protopix and pScrPriv from rrSetupPixmapSharing()

xf86: Add PRIME flipping functions to Screen

Adds typedefs for (*RRStartFlippingPixmapTrackingProcPtr), (*RREnableSharedPixmapFlippingProcPtr), and (*RRDisableSharedPixmapFlippingProcPtr) in randrstr.h.

Adds typedefs for (*PresentSharedPixmapProcPtr), (*SharedPixmapNotifyDamageProcPtr), (*RequestSharedPixmapNotifyDamageProcPtr), and (*StopFlippingPixmapTrackingProcPtr) in scrnintstr.h.

Adds RR(Enable/Disable)SharedPixmapFlipping, and RRStartFlippingPixmapTracking to rrScrPrivRec.

Adds StopFlippingPixmapTracking, PresentSharedPixmap, SharedPixmapNotifyDamage, and RequestSharedPixmapNotifyDamage to ScreenRec.

rrScrPrivRec used for functions that use RandR-private data types, and ScreenRec used for the rest.

RREnableSharedPixmapFlipping will allow the sink driver to setup for flipping between two shared pixmaps.

RRDisableSharedPixmapFlipping will allow the sink driver to do teardown associated with flipping between two shared pixmaps.
(RRStart/Stop)FlippingPixmapTracking are merely the double-buffered equivalents of (Start/Stop)PixmapTracking, allowing the source driver to do whatever setup and teardown necessary for presenting on the two shared pixmaps.

PresentSharedPixmap is a function exposed by the source driver for the X server or sink driver to call to request a present on a given shared pixmap. This way, presents can be driven by the sink's vblank instead of a timer or similar mechanism.

SharedPixmapNotifyDamage and RequestSharedPixmapNotifyDamage are OPTIONAL (even for double-buffered PRIME) functions exposed by the sink driver and the source driver, respectively. By calling master->RequestSharedPixmapNotifyDamage(ppix), the sink driver can request for the source driver to call slave->SharedPixmapNotifyDamage(ppix) in response to damage on the master screen pixmap tracked by ppix.

v1: Initial commit  
v2: Rename PresentTrackedFlippingPixmap to PresentSharedPixmap  
    Add SharedPixmapNotifyDamage / RequestSharedPixmapNotifyDamage  
v3: Add RRCrtePtr as a parameter to StartFlippingPixmapTracking

xwayland-input: Fake crossing to rootwin

This partially reverts commit c1565f3.

When the pointer moves from an X11 window to a Wayland native window, no LeaveNotify event is emitted which can lead to various unexpected behaviors like tooltips remaining visible after the pointer has left the window.

Yet the pointer_handle_leave() is called and so is the DIX CheckMotion() but since the pointer enters a Wayland native window with no other Wayland window matching, DoEnterLeaveEvents() does not get invoked and therefore no LeaveNotify event is sent to the X11 client at the time the pointer leaves the window for a Wayland native surface.

Restore the XYToWindow() handler in xwayland-input that was previously removed with commit c1565f3 and use that handler to pretend that the pointer entered the root window in this case so that the LeaveNotify event is emitted.

res: Fix accounting of redirected window pixmaps for Composite

The previous change removed the special case that matched resources of CompositeClientWindowType and walked back from that to the window pixmap. That was intentional, since that logic was broken anyway. CCWTs don't map 1:1 to references on the backing pixmap; a window redirected
by multiple clients (say, by the server since it's on the synthetic
visual, and then manually by a compositor) would have a window pixmap
refcount of 1, but would have those bytes accounted twice.

The right thing is to have Composite wrap window accounting, and add the
Pixmap bytes once and only once for the redirection reference.

Note that the view from the client can still be non-intuitive in the
face of Composite. xcompmgr, for example, holds _two_ references to
each window pixmap (one each from CompositeNameWindowPixmap and
RenderCreatePicture), so a synthetic-visual window will have its bytes
split 2/3 to xcompmgr and 1/3 to the server-client. Nothing to be done
about that, and at least this way we're not over-accounting.

res: Simplify QueryClientPixmapBytes

I suspect this code predates the common resource hooks for computing
sizes. It's ugly in any case since the Resource extension shouldn't
need to know which extensions can take a reference on pixmaps. Instead,
let's just walk every resource for the client and sum up all the pixmap
bytes that way.

This might be slightly slower since we're calling the size func once for
every resource. On the other hand, it might be slightly faster since we
only walk the resource table once instead of 3-5 times. Probably a
wash, and not really a performance path in any case.

The screen block and wakeup handlers are the only ones which provide a well known ordering between the wrapping layers; placing these as close as possible to the server blocking provides a way for the driver to control the flow of execution correctly.

Switch the shadow code to run in the screen block handler so that it now occurs just before the server goes to sleep.

Switch glamor to call down to the driver after it has executed its own block handler piece, in case the driver needs to perform additional flushing work after glamor has called glFlush.

These changes ensure that the following modules update the screen in the correct order:

- animated cursors        (uses RegisterBlockAndWakeupHandlers dynamically)
- composite               (dynamic wrapping)
- misprite                (dynamic wrapping)
- shadow                  (static wrapping)
- glamor                  (static wrapping)
- driver                  (static wrapping)

It looks like there's still a bit of confusion between composite and misprite; if composite updates after misprite, then it's possible you'd exit the block handler chain with the cursor left hidden. To fix that, misprite should be wrapping during ScreenInit time and not unwrapping. And composite might as well join in that fun, just to make things consistent.

[v2] Unwrap BlockHandler in shadowCloseScreen (ajax)
[v3] ephyr: Use screen block handler for flushing changes

ephyr needs to make sure it calls glXSwapBuffers after glamor finishes its rendering. As the screen block handler is now called last, we have to use that instead of a registered block/wakeup handler to make sure the GL rendering is done before we copy it to the front buffer.

glx: avoid memory leak when using indirect rendering
When multiple processes are using GL with indirect rendering a race condition can make drawables refcount never drop to zero.

This situation could happen when there are many X clients using indirect GLX:

1 - client1: calls glxMakeCurrent

2 - client2: calls glxMakeCurrent
   This is the first context switch for this client. So old_context_tag=0

3 - client1: calls glxRender
   For the client, its context is already current.
   For the server side lastGLContext points to client2's context.

xrandrprovider: Do not use separate lists for unbound / source / offload slaves

A single provider can be both a offload and source slave at the same time, the use of separate lists breaks in this case e.g. :

xrandr --listproviders
Providers: number : 2
Provider 0: id: 0x7b cap: 0xf, Source Output, Sink Output, Source Offload, Sink Offload crtc: 3 outputs: 2 associated providers: 0 name:modesetting
Provider 1: id: 0x46 cap: 0xf, Source Output, Sink Output, Source Offload, Sink Offload crtc: 2 outputs: 5 associated providers: 0 name:modesetting
xrandr --setprovidersourceoutput 0x7b
xrandr --listproviders
Providers: number : 2
Provider 0: id: 0x7b cap: 0xf, Source Output, Sink Output, Source Offload, Sink Offload crtc: 3 outputs: 2
associated providers: 1 name:modesetting
Provider 1: id: 0x46 cap: 0xf, Source Output, Sink Output, Source Offload, Sink Offload crtc: 2 outputs: 5
associated providers: 1 name:modesetting

xrandr --setprovideroffloadsink 0x7b
xrandr --listproviders
Providers: number : 3
Provider 0: id: 0x7b cap: 0xf, Source Output, Sink Output, Source Offload, Sink Offload crtc: 3 outputs: 2
associated providers: 2 name:modesetting
Provider 1: id: 0x46 cap: 0xf, Source Output, Sink Output, Source Offload, Sink Offload crtc: 2 outputs: 5
associated providers: 2 name:modesetting
Provider 2: id: 0x46 cap: 0xf, Source Output, Sink Output, Source Offload, Sink Offload crtc: 2 outputs: 5
associated providers: 2 name:modesetting

Not good. The problem is that the provider with id 0x46 now is on both
the output_slave_list and the offload_slave_list of the master screen.

This commit fixes this by unifying all 3 lists into a single slaves list.

Note that this does change the struct _Screen definition, so this is an ABI
break. I do not expect any of the drivers to actually use the removed / changed
fields so a recompile should suffice.

xwayland: Restore wl_display_roundtrip() in InitInput

This partially revert commit 984be78

The rountrip in Xwayland's InitInput() is unlikely the culprit for the crash reported in bug 95337, even though it's triggered from InitInput().

Startup goes like this:

xwl_screen_init()
xwl_output_create()
wL_display_roundtrip()
InitInput()
wL_display_roundtrip()
ConnectionInfo initialized
What happens in bug 95337 is that some output data is already available when we reach InitInput()'s wl_display_roundtrip() and therefore we end up trying to update the ConnectionInfo's data from RR routines before ConnectionInfo is actually initialized.

Removing the wl_display_roundtrip() from InitInput() will not fix the issue (although it would make it less likely to happen), because xwl_screen_init() also does a wl_display_roundtrip() after creating the output, so the race that led to bug 95337 remains.

However, re-setting the xwl_screen->expecting_event to 0 again in InitInput() still doesn't seem right, so this part is not restored (thus a partial revert).

Allow compile-time selection of a fallback input driver

A new --with-fallback-input-driver=foo option allows selecting a
fallback driver for the server if the driver configured for the device
is not found. Note that this only applies when the device has a driver
assigned and that module fails to load, devices without a driver are
ignored as usual.

This avoids the situation where a configuration assigns e.g. the
synaptics driver but that driver is not available on the system,
resulting in a dead device. A fallback driver can at least provides some
functionality.
This becomes more important as we move towards making other driver true leaf nodes that can be installed/uninstalled as requested. Specifically, wacom and synaptics, a config that assigns either driver should be viable even when the driver itself is not (yet) installed on the system.

It is up to the distributions to make sure that the fallback driver is always installed. The fallback driver can be disabled with --without-fallback-input-driver and is disabled by default on non-Linux systems because we don't have generic drivers on those platforms. Default driver on Linux is libinput, evdev is the only other serious candidate here.

Sample log output:

```
[  3274.421] (II) config/udev: Adding input device SynPS/2 Synaptics TouchPad (/dev/input/event4)

xwayland: add a server sync before repeating keys

Key repeat is handled by the X server, but input events need to be processed and forwarded by the Wayland compositor first.

Make sure the Wayland compositor is actually processing events, to avoid repeating keys in Xwayland while the Wayland compositor cannot deal with input events for whatever reason, thus not dispatching key release events, leading to repeated keys while the user has already released the key.

xkb: add hook to allow/deny AccessX key repeat

The xserver generates the key repeat by itself.

But when used with another server processing inputs first (e.g. a Wayland compositor), the other server may be busy dealing with some other things and not queue up key release events in time.

Add a vfunc in XkbSrvInfo to possibly add a check before re-emitting a keypress event in the AccessX timer handler, so that the key repeat has a chance to be denied if the server processing the input is not ready.

dix: Don't update current time in the middle of input event processing

In patch 137ac094e7ab8c871f3b36e40ad826ac797f0e26, Adam moved an expensive call to UpdateCurrentTime out of the main dispatch loop. That's a good change as the original fix from Chase was a bit expensive. However, it breaks grab processing and so a couple of the calls to UpdateCurrentTime need to be removed.

Input event processing can generate a stream of events; a button press that activates a grab will send a press followed by a sequence of enter/leave events. All of these should have the same time stamp on the wire as they occur at the 'same' time.

More importantly, the grab time recorded in the device is pulled from currentTime after all of the events are delivered, so if currentTime doesn't match the time in the device event, then future grab modifications will fail as the time marked in the device will be 'later' than the grab time known to the client (which is defined as the timestamp from the activating input event).

A bit of history here -- it used to be that currentTime was driven *entirely* by input events; those timestamps didn't even have to be related to the system time in any way. Then we started doing ICCCM stuff and people got confused when PropertyNotify events would have the same timestamp even when delivered minutes apart because no input events were delivered.

We added code in the server to go update the time, but only if no input events were pending (so that the clock "wouldn't" go backwards). The only places where this is necessary is in request processing which may generate an event with a timestamp, and there only at the very top of the request processing code so that the whole request would be processed at the 'same time', just like events.

xwayland: Use the CLOCK_MONOTONIC clock

By default the X server will try CLOCK_MONOTONIC_COARSE before CLOCK_MONOTONIC, while A Wayland compositor may only support getting their timestamps from the CLOCK_MONOTONIC clock. This causes various issues since it may happen that a timestamp from CLOCK_MONOTONIC retrieved before a sending an X request will still be "later" than the timestamp the X server than gets after receiving the request, due to the fact that CLOCK_MONOTONIC_COARSE has a lower resolution.

To avoid these issues, make Xwayland always use CLOCK_MONOTONIC, so that it becomes possible for Wayland compositor only supporting
CLOCK_MONOTONIC and X server to use the same clock.

Create a threaded mechanism for input [v7]

The current SIGIO signal handler method, used at generation of input events,
has a bunch of oddities. This patch introduces an alternative way using a
thread, which is used to select() all input device file descriptors.

A mutex was used to control the access to input structures by the main and input
threads. Two pipes to emit alert events (such hotplug ones) and guarantee the
proper communication between them was also used.

glamor: Preserve GL_RED bits in R channel when destination is GL_RED [v2]

A1 and A8 pixmaps are usually stored in the Red channel to conform with more recent GL versions. When using these pixmaps as mask values, that works great. When using these pixmaps as source values, then the value we want depends on what the destination looks like.

For RGBA or RGB destinations, then we want to use the Red channel for A values and leave RGB all set to zero.

For A destinations, then we want to leave the R values in the Red channel so that they end up in the Red channel of the output.

This patch adds a helper function, glamor_bind_texture, which performs the glBindTexture call along with setting the swizzle parameter correctly for the Red channel. The swizzle parameter for the Alpha channel doesn't depend on the destination as it's safe to leave it always swizzled from the Red channel.

This fixes incorrect rendering in firefox for this page:
v2: Add change accidentally left in patch for missing
glDisable(GL_COLOR_LOGIC_OP).

damage: Make damageRegionProcessPending take a damage not a drawable

In the case where there's no damage monitor on the drawable, we look that fact up twice: once before rendering to decide whether to compute damage, and again after to decide whether to append it. This is wasted effort, as the layer below us is effectively not allowed to change whether there's a damage monitor for the drawable, but there's no way
the compiler can know that.

Instead, look it up once up front, and change the check macros and damageRegionProcessPending to take a damage not a drawable.

v2: Explicitly pass pDamage to the macros as well (Michel Dänzer)

dix: Push UpdateCurrentTimeIf down out of the main loop

This was added in:

commit 312910b4e34215aaa50fc0c6092684d5878dc32f
Author: Chase Douglas <chase.douglas@canonical.com>
Date:   Wed Apr 18 11:15:40 2012 -0700

Update currentTime in dispatch loop

Unfortunately this is equivalent to calling GetTimeInMillis() once per request. In the absolute best case (as on Linux) you're only hitting the vDSO; on other platforms that's a syscall. Either way it puts a pretty hard ceiling on request throughput.

Instead, push the call down to the requests that need it; basically, grab processing and event generation.

xbk: after changing the keymap, force an indicator update

When NumLock is on and a new keymap is applied, the next modifier state change will turn off that LED (but leave the state enabled). The cause for this is a bit convoluted:

* the SLI explicitState is copied from the current state in ProcXkbGetKbdByName. Thus, if NumLock is on, that state is 0x2.
* on the next modifier key press (e.g. Shift), XkbApplyState() calls into
XkbUpdateIndicators() -> XkbUpdateLedAutoState() to update SLIs (if any) for the currently changed modifier. But it does so with a mask only for the changed modifier (i.e. for Shift).
* XkbUpdateLedAutoState() calculates the state based on this mask and ends up with 0 because we don't have a Shift LED and we masked out the others.
* XkbUpdateLedAutoState() compares that state with the previous state (which is still 0x2) and then proceeds to turn the LED off

This doesn't happen in the normal case because either the mask encompasses all modifiers or the state matches of the masked-out modifiers matches the old state.

Avoid this issue by forcing an SLI update after changing the keymap. This updates the sli->effectiveState and thus restores everything to happy working order.

xfree86: Make xf86SetDDCproperties work more than once (v2)

We can call this more than once via xf86OutputSetEDID since hotplug is actually a thing in RANDR 1.2, but xf86RegisterRootWindowProperty merely adds the data to a list to be applied to the root at CreateWindow time, so calls past the first (for a given screen) would have no effect until server regen.

Once we've initialised pScrn->pScreen is filled in, so we can just set the property directly.

glx: Implement GLX_EXT_libglvnd (v2)
For the dri2 backend, we depend on xfree86 already, so we can walk the options for the screen looking for a vendor string from xorg.conf. For the swrast backend we don't have that luxury, so just say mesa. This extension isn't really meaningful on Windows or OSX yet (since libglvnd isn't really functional there yet), so on those platforms we don't say anything and return BadValue for the token from QueryServerString.

v2: Use xnf* allocators when parsing options (Eric and Emil)

glx: Use __glXInitExtensionEnableBits in all backends (v2)

On xquartz this enables SGI_make_current_read, which is a mostly harmless lie as CGL doesn't implement it, as well as SGIX_pbuffer, which is fine because no pbuffer-enabled configs are created.

On xwin this enables SGIX_pbuffer and ARB_multisample in all cases. Again this is harmless if the backend doesn't support the features, since no fbconfigs will be created to expose them.

It also adds SGIX_visual_select_group to both xquartz and xwin. Amusingly, both were filling in the appropriate field in the fbconfig already.

present: Only requeue for next MSC after flip failure

This code was added to deal with the driver present hook failing, in
which case we need to wait for the next MSC before executing the presentation.

However, it could also take effect in cases where the driver incorrectly thinks the current MSC matches the target one (e.g. due to the kernel interface only supporting 32-bit MSC values), in which case it could result in the presentation getting requeued over and over.

To prevent such issues, check specifically for the target MSC immediately following the current MSC.

xfree86: Font modules aren't a real thing

There are no longer any loadable font modules (not that they ever did much in the first place), so stop pretending they're a defined ABI surface.

Author: Dave Airlie <airlied@gmail.com>
Date: Tue Feb 9 16:54:22 2016 +1000

present: fail flipping if we have any slave outputs

Due to the way present currently works, we don't ever check with the
secondary adapters if we can flip at all.

We shouldn't flip if the secondary adapters are attached to the pixmap currently, however using the current check_flip callback isn't possible as it passes the Window to the driver (something we shouldn't be doing), so the slave driver can never get it's own screen ptr back.

For now to fix the problem just block flips if we have any slaves configured. We can fix the ABI up later, but this fix can be backported to stable.

    glamor: Replace "finish access" shader with texture swizzling.

    For pictures without alpha, and for most other formats for GLES2, we
    would make a temporary FBO, make another temporary texture, upload our
    GLAMOR_MEMORY pixmap to the texture, then run the "finish access" shader
    across it to swizzle its values around into the temporary FBO (which we
    would use for a single Render operation and then throw away).

    We can simplify everything by using GL_ARB_texture_swizzle (or its
    GLES3 counterpart). It's just not worth the complexity to try to
    improve the performance of this already low-performance path (SHM
    pixmaps + Render) on GLES2.

glamor: Drop the REVERT_UPLOADING_1_5_5_5 path.

There was only a pretty special case that could have even worked -- you've got a GLES2 renderer, you've got a SHM pixmap, it's 1555 (not the usual 565 for 16-bit), and you're little endian (BE was broken, since GL's 5_5_5_1 picks the 1 bit from the lowest bit of the short, and on BE we weren't doing the conversion path that swaps around the channels). This is just not worth the complexity.

drive/ephyr: map host X server's keymap into Xephyr, if supported

Currently Xephyr doesn't inherit host X server's keymap, which
may lead to keymap mismatches when using a non-US keyboard in a
window inside Xephyr. This patch makes Xephyr change its keymap
to match host X server's one (unless XKB support is disabled),
using xcb-xkb to retrieve the needed XKB controls.
This implementation is analogous to Xnest one at commit 83fe4235.

config/udev: distinguish between real keyboards and other key devices

This patch introduces a new flag ATTR_KEY for hotplugged input devices,
so we can better distinguish between real keyboards (i.e. devices with
udev property ID_INPUT_KEYBOARD="1") and other key input devices like
lid switches, power buttons, etc.

All supported hotplug backends (udev, hal, and wscons) will set both
flags ATTR_KEY and ATTR_KEYBOARD for real keyboards, but udev backend
will set ATTR_KEY, but not ATTR_KEYBOARD, for non-keyboard key input
devices (hal and wscons will set both flags in any case). With this
distinction, kdrive input hotplugging mechanism will be allowed to only
grab real keyboards, as other key input devices are currently not
supported.

In order to don't break current behaviour, this patch will replace all
ATTR_KEYBOARD occurrences with ATTR_KEY in hw/xfree86/common/xf86Xinput.c.
ephyr: enable option -sw-cursor by default in multi-seat mode

Option -seat passed to Xephyr requires -sw-cursor to be passed as well, otherwise the mouse cursor will remain invisible for the given seat. This patch takes care of enabling -sw-cursor if -seat is passed.

kdrive: add options to set default XKB properties

This patch introduces convenient command-line options -xkb-rules, -xkb-model, -xkb-layout, -xkb-variant, and -xkb-options, to set default values for these properties.

These options can be handful for cases in which compile-time default values don't match user locale, since kdrive doesn't support InputClass matching rules yet and not all Linux distros provide default rules to store these values in udev properties (which by the way is a discouraged practice).

kdrive: introduce input hot-plugging support for udev and hal backends (#33140)

This patch introduces input hot-plugging support for kdrive-based applications in multi-seat context. This feature is enabled by passing -seat option with desired seat name. All keyboard/mouse devices assigned to that seat will be automatically grabbed by kdrive.
It supports udev and hal backends for input hot-plugging support. Another patches may be required for wscons backend.

Author: Michel Dänzer <michel.daenzer@amd.com>
Date:   Thu Feb 18 18:23:47 2016 +0900

present: Only update screen pixmap from flip pixmap once per unflip

present_unflip may be called several times from present_check_flip_window during the same unflip. We can only copy to the screen pixmap the first time, otherwise we may scribble over other windows. The flip pixmap contents don't get updated after the first time anyway.

Fixes at least the following problems, which were introduced by commit 806470b9 ("present: Copy unflip contents back to the Screen Pixmap"): On xfwm4 without compositing, run glxgears and put its window into full-screen mode to start flipping. While in full-screen, open the xfwm4 window menu by pressing Alt-Space. The window menu was invisible most of the time because it was getting scribbled over by a repeated unflip copy.
When switching a flipping window out of fullscreen, a repeated unflip copy could leave artifacts of the flip pixmap on the desktop.

commit b4ac7b142fa3c536e9b283cf3d4b94d82c03aac6
Author: Michel Dänzer <michel.daenzer@amd.com>
Date: Wed Feb 24 16:52:59 2016 +0900

present: Only requeue if target MSC is not reached after an unflip

While present_pixmap decrements target_msc by 1 for present_queue_vblank,
it leaves the original vblank->target_msc intact. So incrementing the
latter for requeuing resulted in the requeued presentation being
executed too late.

Also, no need to requeue if the target MSC is already reached.

This further reduces stutter when a popup menu appears on top of a
flipping fullscreen window.
present: Requeue if flip driver hook fails and target MSC not reached

For flipping, we wait for the MSC before the target MSC and then call the driver flip hook. If the latter fails, we have to wait for the target MSC before falling back to a copy, or else it's executed too early.

Fixes glxgears running at unbounded framerate (not synchronized to the refresh rate) in fullscreen if the driver flip hook fails.

Fix build on Cygwin by ensuring WIN32 check triggers only on MinGW

The type of fd_mask was changed in Cygwin 2.4.0 headers from 'long' to 'unsigned long'. This exposes an existing problem with winauth.c, which includes Xwindows.h (which includes windows.h, which defines WIN32), before including osdep.h, which causes the now conflicting definition of fd_mask in osdep.h to be exposed:

In file included from ../os/osdep.h:198:18: error: conflicting types for ‘fd_mask’ typedef long int fd_mask; /usr/include/sys/select.h:46:23: note: previous declaration of ‘fd_mask’ was here typedef unsigned long fd_mask;

Adjust the include guards in osdep.h to make sure we only use WIN32 guarded code when not compiling for Cygwin (i.e. WIN32 && !_CYGWIN_)

This isn’t a very elegant, but unfortunately appears to be the best solution, since it doesn’t seem to be possible to write the test in a positive form.

Future work: Should also audit of all the other uses of WIN32 in xserver, and make sure they are correct.

Author: Daniel Stone <daniels@collabora.com>
Date: Fri Feb 12 16:36:59 2016 +0000

dix: Add hybrid full-size/empty-clip mode to SetRootClip

216bdcb735 removed the SetRootClip call in the XWayland output-hotplug handler when running rootless (e.g. as a part of Weston/Mutter), since the root window has no storage, so generating exposures will result in writes to invalid memory.

Unfortunately, preventing the segfault also breaks sprite confinement. SetRootClip updates winSize and borderSize for the root window, which when combined with RRScreenSizeChanged calling ScreenRestructured, generates a new sprite-confinement area to update it to the whole screen.

Removing this call results in the window geometry being reported correctly, but winSize/borderSize never changing from their values at startup, i.e. out of sync with the root window geometry / screen information in the connection info / XRandR.

This patch introduces a hybrid mode, where we update winSize and borderSize for the root window, enabling sprite confinement to work correctly, but keep the clip emptied so exposures are never generated.

glx: Fix GLX_EXT_create_context_es2_profile support

As of v4 of this extension, any GLES version number may be requested (to enable GLES3 and later). To comply with this, simply remove the API version checks and leave it to the DRI driver to validate. This happens to also enable using GLES1 in direct contexts, so if that's the dire situation you find yourself in, your client driver at least stands a chance of working.

v4 also specifies that both extension strings should be advertised for compatibility with clients written against v1 of the extension spec, so add the es_profile bit to the extension list and enable it whenever we would enable es2_profile.

commit 25eca80265654cfbf8768024e027426fede0918
Author: Michel Dänzer <michel.daenzer@amd.com>
Date:   Fri Jan 15 18:22:21 2016 +0900

present: Handle wraparound when comparing MSC values

When a window moves from one CRTC to another, present_window_to_crtc_msc updates window_priv->msc_offset according to the delta between the current MSC values of the old and new CRTC:

  window_priv->msc_offset += new_msc - old_msc;

window_priv->msc_offset is initially 0, so if new_msc < old_msc, window_priv->msc_offset wraps around and becomes a large number. If the
window_msc parameter passed in is small (in particular if it's 0, such as is the case when the client just wants to know the current window MSC value), the returned CRTC MSC value may still be a large number. In that case, the existing MSC comparisons in pixmap_present weren't working as intended, resulting in scheduling a wait far into the future when the target MSC had actually already passed. This would result in the client (e.g. the Chromium browser) hanging when moving its window between CRTC.

In order to fix this, introduce msc_is_equal_or_after helper functions which take the wraparound into account for comparing two MSC values.

xfree86: add NoMatchFoo directives for InputClass sections

InputClass sections use various MatchFoo directives to decide which device to apply to. This usually works fine for specific snippets but has drawbacks for snippets that apply more generally to a multitude of devices.

This patch adds a NoMatchFoo directive to negate a match, thus allowing snippets that only apply if a given condition is not set. Specifically, this allows for more flexible fallback driver matching, it is now possible to use a snippet that says "assign driver foo, but only if driver bar wasn't already assigned to it". For example:

Section "InputClass"
  Identifier "libinput for tablets"
  MatchIsTablet "true"
  NoMatchDriver "wacom"
  Driver "libinput"
EndSection

The above only assigns libinput to tablet devices if wacom isn't already assigned to this device, making it possible to select a specific driver by installing/uninstalling it.

Author: Bob Ham <bob.ham@collabora.com>
Date: Fri Dec 4 12:30:47 2015 +0000

xserver: Fix configure.ac check for libsystemd/-daemon

The configure script looks for the libsystemd-daemon pkg-config module. If the configure script finds it, the script will add libsystemd-daemon to a list of modules which are used to consolidate CFLAGS and LIBS.

The check for libsystemd-daemon was altered to fallback to libsystemd if libsystemd-daemon was not found (libsystemd-daemon was brought into libsystemd). Unfortunately, the configure script still adds "libsystemd-daemon" to the list of modules to consolidate, instead of "libsystemd". With this patch, we set a variable depending on which pkg-config module is found and add that to the module list instead.

Changes since v1:
- Rearranged logic so that we do a versioned check for libsystemd first, then look for libsystemd-daemon.
- Cleaned up the check a bit, only performing the module checks if we don't have --with-systemd-daemon=no, in a similar style to --with-dtrace.
- Changed the variable name to LIBSYSTEMD_DAEMON as per feedback.

Date: Sun Jul 1 18:49:25 2012 +0100

x86emu: Correctly handle 0x66 prefix for some instructions

(Sorry for double posting)

I repost this patch because I havn't got any replies from maintainers since I posted the initial patch back in March.

Some instructions are not emulated correctly by x86emu when they are prefixed by the 0x66 opcode.
I've identified problems in the emulation of these intructions: ret, enter, leave, iret and some forms of call.

Most of the time, the problem is that these instructions should push or pop 32-bit values to/from the stack, instead of 16bit, when they are prefixed by the 0x66 special opcode.

The SeaBIOS project aims to produce a complete legacy BIOS implementation as well as a VGA option ROM, entirely written in C and using the GCC compiler.

In 16bit code produced by the GCC compiler, the 0x66 prefix is used almost everywhere. This patch is necessary to allow the SeaBIOS VGA option ROM to function with Xorg when using the vesa driver.

SeaBIOS currently use postprocessing on the ROM assembly output to replace the affected instruction with alternative unaffected instructions. This is obviously not very elegant, and this fix in x86emu would be more appropriate.

v2: - Decrement BP instead of EBP in accordance with the Intel Manual
   - Assign EIP instead of IP when poping the return address from the stack in 32-bit operand size mode in ret_far_IMM, ret_far, and iret
   - When poping EFLAGS from the stack in iret in 32-bit operand size mode, apply some mask to preserve Read-only flags.
v3: - Rebase

Author: Keith Packard <keithp@keithp.com>
Date: Wed Nov 11 22:02:02 2015 -0800

os: Add NotifyFd interfaces

This provides a callback-based interface to monitor file descriptors beyond the usual client and device interfaces.

Modules within the server using file descriptors for reading and/or writing can call

    Bool SetNotifyFd(int fd, NotifyFdProcPtr notify_fd, int mask, void *data);

mask can be any combination of X_NOTIFY_READ and X_NOTIFY_WRITE.

When 'fd' becomes readable or writable, the notify_fd function will be called with the 'fd', the ready conditions and 'data' values as arguments.

When the module no longer needs to monitor the fd, it will call

    void RemoveNotifyFd(int fd);

RemoveNotifyFd may be called from the notify function.

Author: Jonas Ådahl <jadahl@gmail.com>
Date:   Wed Oct 7 12:01:53 2015 +0800

xwayland: Always update the `wl_pointer` cursor on pointer focus

In Wayland, a client (in this case XWayland) should set the cursor surface when it receives pointer focus. Not doing this will leave the cursor at whatever it was previously.

When running on XWayland, the X server will not be the entity that controls what actual pointer cursor is displayed, and it won't be notified about the pointer cursor changes done by the Wayland compositor. This causes X11 clients running via XWayland to end up with incorrect pointer cursors because the X server believes that, if the cursor was previously set to the cursor C, if we receive Wayland pointer focus over window W which also has the pointer cursor C, we do not need to update it. This
will cause us to end up with the wrong cursor if cursor C was not the same one that was already set by the Wayland compositor.

This patch works around this by, when receiving pointer focus, getting the private mipointer struct changing the "current sprite" pointer to an invalid cursor in order to trigger the update path next time a cursor is displayed by dix.

xfree86: fix minor memory leak

xf86*StrOption returns a strdup
glamor: Delay making pixmaps shareable until we need to.

If a pixmap isn't getting exported as a dmabuf, then we don't need to make an EGLImage/GBM bo for it. This should reduce normal pixmap allocation overhead, and also lets the driver choose non-scanout formats which may be much higher performance.

On Raspberry Pi, where scanout isn't usable as a texture source, this improves x11perf -copypixwin100 from about 4300/sec to 5780/sec under xcompmgr -a, because we no longer need to upload our x11perf window to a tiled temporary in order to render it to the screen.

v2: Just use pixmap->usage_hint instead of a new field. Drop the changes that started storing gbm_bos in the pixmap priv due to lifetime issues.
v3: Fix a missing gbm_bo_destroy() on the pixmap-from-fd success path.

glamor: Make glamor_get_name_from_bo static.

This GBM import path was introduced in 10.2, which we already require.

Date:   Thu Nov 5 16:35:56 2015 -0800
glamor: Fix segfault in fallback picture uploading.

If the source/mask pixmap is a pixmap that doesn't have an FBO attached, and it doesn't match the Render operation's size, then we'll composite it to a CPU temporary (not sure why). We would take the PictFormatShort from the source Picture, make a pixmap of that depth, and try to look up the PictFormat description from the depth and the PictFormatShort. However, the screen's PictFormats are only attached to the screen's visuals' depths. So, with an x2r10g10b10 short format (depth 30), we wouldn't find the screen's PictFormat for it (associated with depth 32).

Instead of trying to look up from the screen, just use the pFormat that came from our source picture. The only time we need to look up a PictFormat when we're doing non-shader gradients, which we put in a8r8g8b8.

os: make sure the clientsWritable fd_set is initialized before use
In $\text{WaitForSomething()}$, the $\text{fd\_set\ clients\Writable}$ may be used uninitialized when the boolean $\text{AnyClientsWriteBlocked}$ is set in the $\text{WakeupHandler()}$. This leads to a crash in $\text{FlushAllOutput()}$ after x11proto's commit 2c94cdbe453be641246cc8b9a876da9799bee1ce7.

The problem did not manifest before because both the $\text{XFD\_SIZE}$ and the maximum number of clients were set to 256. As the $\text{connection\Translation\table}$ was initialized for the 256 clients to 0, the test on the index not being 0 was aborting before dereferencing the client #0.

As of commit 2c94cdbe453be641246cc8b9a876da9799bee1ce7 in x11proto, the $\text{XFD\_SIZE}$ got bumped to 512. This lead the $\text{Output\Pending\ fd\_set}$ to have any fd above 256 to be uninitialized which in turns lead to reading an index after the end of the $\text{Connection\Translation\table}$. This index would then be used to find the client corresponding to the fd marked as pending writes and would also result to an out-of-bound access which would usually be the fatal one.

Fix this by zeroing the $\text{clients\Writable\ fd\_set}$ at the beginning of $\text{WaitForSomething()}$. In this case, the bottom part of the loop, which would indirectly call $\text{FlushAllOutput}$, will not do any work but the next call to select will result in the execution of the right codepath. This is exactly what we want because we need to know the writable clients before handling them. In the end, it also makes sure that the fds above $\text{MaxClient}$ are initialized, preventing the crash in $\text{FlushAllOutput()}$.

Thanks to everyone involved in tracking this one down!

randr: make RROutputChanged change the main protocol screen not the gpu screen

We only set changes on the main protocol screen as, for example
in RRSetChanged() and RRTellChanged(), therefore we should follow the same logic when reporting that an output changed in RROutputChanged().

This means that RRTellChanged() will then update the relevant timestamps also when events come from gpu screens.

commit 2092f12a243b9f7682f542b593b77c96d455ec89
Author: Hans de Goede <hdegoede@redhat.com>
Date:   Wed Oct 21 11:36:06 2015 +0200

linux: Do not call FatalError from xf86CloseConsole

FatalError ends up calling xf86CloseConsole itself, so calling FatalError from within xf86CloseConsole is not a good idea.

Make switch_to log errors using xf86Msg(X_WARNING, ...) and return success (or failure).

This makes switch_to match the other error checking done in xf86CloseConsole which all logs warnings and continues.

Add checking of the return value in xf86OpenConsole and call FatalError there when switch_to fails, to preserve the error-handling behavior of xf86OpenConsole.

hurd: fix xorg-wrapper build

hurd does not have any PATH_MAX limitation. misc.h provides a default value which is fine here.

fonts: Continue when font calls return Suspended more than once

Patch 3ab6cd31ebd8095b2948034fcej5b645422d8da fixed Xinerama interactions with font servers by not putting clients to sleep multiple times. However, it introduced additional changes dealing with libXfont routine returning Suspended more than once for the same request. This additional change was to abandon processing of the current request and free the closure data by jumping to 'xinerama_sleep' in each of the functions.

Font library functions shouldn't return Suspended more than once, except for ListFontsWithInfo, which produces multiple replies, and thus ends up returning Suspended many times during processing.

With the jump to xinerama_sleep occurring after the first reply was processed, the closure for the request was freed and future calls into the ListFontsWithInfo callback resulted in dereferencing freed memory.

This patch removes the added branches, reverting the code to its previous behaviour, which permitted multiple Suspended returns and simply waited for the client to be signaled again so that the callback could continue processing the request.

XQuartz: Fix how we calculate the height of the OSX menu bar

+[NSScreen mainScreen] does not mean the primary display. It used to mean the one with the key window. When "Displays have separate spaces" is enabled, it means the active screen, the one whose menu bar is mostly opaque. As such, it may not be the screen whose lower-left corner is located at (0, 0). That's why its max-Y is not necessarily comparable to its height. That only works for the primary display.

This code could use [[NSScreen screens] firstObject]. This is always the primary display, the one whose lower-left corner is at (0, 0).

Once that's done, the above change should be reverted. The height of the visible frame would be the full height of the screen minus the menu bar _and_ the Dock _if_ the Dock is along the bottom of the screen.

Actually, there's a theoretically-simpler approach: use -[NSMenu menuBarHeight]. That replaces a long-deprecated method +[NSMenuView menuBarHeight]. However, there was a bug in Tiger that led to the former not working while the latter still worked. I haven't actually checked recently.

CrossOver's still-kicking X server code uses this code, which tries all of the above:

```
NSScreen* primaryScreen = [[NSScreen screens] objectAtIndex:0];
aquaMenuBarHeight = [[NSApp mainMenu] menuBarHeight];
if (!aquaMenuBarHeight) aquaMenuBarHeight = [NSMenuView menuBarHeight];
```
if (!aquaMenuBarHeight) aquaMenuBarHeight =
NSHeight([primaryScreen frame]) - NSMaxY([primaryScreen visibleFrame]);

commit f6cc23f9bfe8804204fa103f98b9447387b94040
Author: Fredrik Höglund <fredrik@kde.org>
Date: Thu Sep 10 23:33:20 2015 +0200

present: Don't stash the MSC value when present_get_ust_msc fails

Otherwise we stash an uninitialized value, and later use it to compute
the msc_offset for the window. Also initialize ust and crtc_msc so we
never use uninitialized values when present_get_ust_msc fails.

This fixes clients getting stuck waiting indefinitely for an idle
event when a CRTC is turned off.

xwayland-input: Always set the xkb group index on modifiers events

While we have keyboard focus, the server’s xkb code is already locking and latching modifiers appropriately while processing keyboard events.

Since there is no guaranteed order between wl_keyboard key and modifiers events, if we got the modifiers event with a locked or latched modifier and then process the key press event for that modifier we would wrongly unlock/unlatch. To prevent this, we ignore locked and latched modifiers while any of our surfaces has keyboard focus.

But we always need to set the xkb group index since this might be triggered programatically by the wayland compositor at any time.

Reviewed-by: Daniel Stone <daniels@collabora.com>

xkb: Keyboard mouse button emulation should not suppress other keyboard events

With this change, when a key mapped to an action to emulate mouse button presses and releases is held down, other keys pressed during that time are still processed normally. This is a prerequisite for proper support of ISOLock.

xkb: Suppress autorepeat for Set and Lock of Mods, Groups, and Controls

The autorepeat for these actions was not correctly implemented, as the key repeat would be mistakenly interpreted as key releases. Rather than fixing this, this change simply disables autorepeat for Set/Lock actions, for two reasons:
- Autorepeating Set/Lock keys make complicate the interactions of actions.

- Autorepeating Set/Lock keys have no apparent benefit, but hurt in the real world for layouts such as de(neo): Neo has a Level5 shift on the LSGT key, and a Level5 lock on Level5 of the same key. This is unusable if LSGT autorepeats. However, disabling autorepeat for key LSGT completely is not ideal for users that have a "usual" layout besides Neo, where LSGT carries symbols.

x86emu: Fix some set-but-not-used warnings.

libxf86config: libxf86config_internal -> libxf86config

Now since the installable libxf86config is gone, rename libxf86config_internal to libxf86config.

The library used by the Xserver to read and parse the configuration file could be built so that it could be installed as a separate lib and used by external programs.

Apparently there has not been any interest in this for quite a while as this library has been broken for a long time now in the sense that it was calling functions provided by the Xserver which were not implemented for the external library.

Since this library is useless as it is anyway when built let's drop support for it.

This is ofourdan/xwayland, minus:

xwayland: Always update the wl_pointer cursor on pointer focus

which was rejected for ABI and design issues.

os/xdmcp: Just send XDMCP keepalive packets once every three minutes

There was a complicated scheme to increase the time between keepalives from 3 minutes up to as much as 24 hours in an attempt to reduce network traffic from idle X terminals. X terminals receiving X traffic, or receiving user input would use the 3 minute value; X terminals without any network traffic would use a longer value.

However, this was actually broken -- any activity in the X server, either client requests or user input, would end up resetting the keepalive timeout, so a user mashing on the keyboard would never discover that the XDMCP master had disappeared and have the session terminated, which was precisely the design goal of the XDMCP keepalive mechanism.

Instead of attempting to fix this, accept the cost of a pair of XDMCP packets once every three minutes and just perform keepalives regularly.
This will also make reworking the block and wakeup handler APIs to eliminate select masks easier.

Date: Mon Sep 21 07:16:16 2015 +0100

os/xdmcp: Remove dead 'restart' code

The X server used to wait for the user to hit a key or move the mouse before restarting the session after a keepalive failure. This, presumably, was to avoid having the X server continuously spew XDMCP protocol on the network while the XDM server was dead.

Switching into this state was removed from the server some time before XFree86 4.3.99.16, so the remaining bits of code have been dead for over a decade, and no-one ever noticed.

privates: Clear screen-specific keys during CloseScreen

The modesetting driver corrupts memory when used after a server regeneration
because not enough memory is allocated for its pixmap privates. This happens
because its call to dixRegisterScreenSpecificPrivateKey() does nothing because
key->initialized is still TRUE from the first server generation. However, the
key is not in the screen's linked list of screen-specific privates because
that's freed and reallocated during the server generation loop in dix_main().

Fix this by clearing key->initialized before CloseScreen and add a call to
dixFreeScreenSpecificPrivates() for GPU screens.

v2: Just set key->initialized to FALSE and move dixFreeScreenSpecificPrivates()
calls to after CloseScreen.

v3: Move dixFreeScreenSpecificPrivates() calls back to just before CloseScreen.

Allow system call restarts upon signal interruption

The X server frequently deals with SIGIO and SIGALRM interruptions. If process execution is inside certain blocking system calls when these signals arrive, e.g. with the kernel blocked on a contended semaphore, the system calls will be interrupted.

Some system calls are automatically restartable (the kernel re-executes them with the same parameters once the signal handler returns) but only if the signal handler allows it.

Set SA_RESTART on the signal handlers to enable this convenient behaviour.

xwayland-input: Remove our XYToWindow handler

This was built as a hack for simple Wayland compositors like Weston
which were lazy and didn't want to configure windows server-side when
moved.

Since comboboxes and menus are separate toplevel O-R windows, this hack
breaks input as it needs to be traced normally, not simply sent to the
focused window.
X11 toolkits really do need their windows to be configured correctly for their O-R windows comboboxes or menus other things, so let's fix the lazy compositors and remove this.

I have tested this patch with both Weston and Mutter and neither of them require any changes, and it fixes comboboxes and menus.

If somebody then wants to revert 73698d4, that's fine by me, so we reduce the amount of API that DDXen have.

modesetting: fix up output naming convention

A user on a nouveau-driven card ran into a problem where DVI-D-1 and DVI-I-1 were aliasing. The simplest fix is to provide the full connector names. While we're at it, rename the output names to match what is in the kernel, and start counting the connectors from 1 rather than 0. The only deviation is HDMI vs HDMI-A, which kept its original name.

This will break backwards compatibility with existing xorg.conf's that reference output names, but the alternative is to create a separate counting system, further disconnecting from the kernel names.

remove bogus \ escapes

some X manuals use then escape sequence \ when they want to render a slash. That's bad because \ is not a slash but an italic correction, never producing any output, having no effect at all in terminal output, and only changing spacing in a minor way in typeset output.

Date:   Tue Jul 7 18:19:50 2015 +0200

configurable maximum number of clients

Make the maximum number of clients user configurable, either from the command line or from xorg.conf
This patch works by using the MAXCLIENTS (raised to 512) as the maximum allowed number of clients, but allowing the actual limit to be set by the user to a lower value (keeping the default of 256).

There is a limit size of 29 bits to be used to store both the client ID and the X resources ID, so by reducing the number of clients allowed to connect to the X server, the user can increase the number of X resources per client or vice-versa.

Parts of this patch are based on a similar patch from Adam Jackson <ajax@redhat.com>

This now requires at least xproto 7.0.28

   glamor: Take transforms into account when preparing for a fallback.

This function takes the start x/y and the destination's width/height,
so it only works if there's no transform. We could potentially
transform this box and take its bounds with some rounding, but this at
least gets us to read out enough data.

Note that this does the same overshoot on destination pictures with a
transform attached, but that seems unlikely to be used any way.

 glamor: Use the actual picture's format when uploading memory pixmaps.

 The pixmap->picture is just the *last* picture attached to the pixmap, so
 you'd potentially be looking at the wrong one when trying to
 temporarily upload to avoid a composite fallback.

 There's some trickiness in glamor_render.c when we're dealing with the
 upload of a GLAMOR_MEMORY pixmap as both the source and mask using
 different formats, where we smash the source's format to a new value
 so that the mask can use the same uploaded bits. Dropping most of
 that should be safe, since it will be uploaded as the source first, so
 the smashed format will still be used.

Author: Eric Anholt <eric@anholt.net>
Date:   Tue Jun 30 16:20:18 2015 -0700

glamor: Ask the server to always allocate our private.

This avoids a lot of screwing around to attach our privates later.  It means that non-glamor pixmaps now gain 120 bytes of glamor privates on 64-bit (which has quite a bit of fixable bloat), and glamor pixmaps take one less pointer of storage (not counting malloc overhead).

Note that privates start out zero-filled, which matches the callocs we were doing when making our own privates, and in the case of an fb pixmap that has a priv where it didn't before, the type ends up being GLAMOR_MEMORY as we would want.

v2: Clarify that the GLAMOR_MEMORY enum must be 0 (as it was previously), so that the new pixmap private behavior is as expected.  Suggested by keithp.

glx: Implement GLX_ARB_context_flush_control

This extension allows clients to opt out of the implicit glFlush on context release, which is quite nice for performance for clients using multiple contexts. The server doesn't really need to be aware of the client's decision, at least for direct contexts, but it does need to not reject the context attribute out of hand.

This patch won't do anything unless built against a Mesa that defines the __DRI2_FLUSH_CONTROL extension (and a new enough glxext.h, but that's been there since 10.3 at least).

render: Hide/unexport some implementation details
One of the lacking features with output offloading was that screen rotation didn't work at all.

This patch makes 0/90/180/270 rotation work with USB output and GPU outputs.

When it allocates the shared pixmap it allocates it rotated, and any updates to the shared pixmap are done using a composite path that does the rotation. The slave GPU then doesn't need to know about the rotation and just displays the pixmap.
rewrite the sync dirty helper to use the dst pixmap, and
avoid any strange hobbits and rotations.

This breaks ABI in two places.

hw/xwin: printf format fixes for WPARAM and LPARAM types

Some Win32 API types are different fundamental types in the 32-bit and 64-bit

This problem is then further compounded by the fact that whilst both 32-bit
Cygwin and 32-bit MinGW use the ILP32 data model, 64-bit MinGW uses the LLP64
data model, but 64-bit Cygwin uses the LP64 data model.

This makes it impossible to write printf format specifiers which are correct for
all those targets, so we use some macros to provide the correct specifier for
the target.

LPARAM and WPARAM are integer types which can contain a pointer
LPARAM is long in ILP32 and long long in LLP64
WPARAM is unsigned int in ILP32 and unsigned long long in LLP64

Generally, these are just used to pass integer parameters, so for simplicity,
cast to int and use an int-compatible format

In the specific case of WM_CHANGECHAIN, they are used to pass HWND, so cast to
that type and print using an appropriate format.

mi: fix typo in warning about overflowing queue

Debian bug#726041
xserver: fix build with glamor disabled.

This fixes modesetting when glamor is disabled.

glamor: Use GL_ARB_debug_output to log GL errors.

This should help people debugging when glamor does something stupid on their driver.

glamor: Add an assert to catch the previous bug.

Fixes regressions since Eric's "don't make an FBO for the glyph atlas" change. The al upload was a fallback, as expected. However, fallback
reads use glReadPixels() because there's no glGetTexSubImage2D() to match glTexSubImage2D(). We were just binding the 0 FBO value, so the glReadPixels() would throw a GL error instead of getting any data. After the fallback was done we'd write back the undefined data to the atlas, blowing away the entire rest of the atlas because we didn't specify any bounds on our prepare.

To fix the fallbacks to actually work, we'd need a prepare path that allocates some memory do a full glGetTexImage() into, then memcpy out of that. Instead, just dodge the general fallback by implementing the specific upload we need to do here, which should also be *much* faster at uploading all glyphs since it's not readpixels/texsubimaging back and forth.

v3: Use CopyPlane to a temp pixmap for the upload

modesetting: Implement page flipping support for Present.

Based on code by Keith Packard, Eric Anholt, and Jason Ekstrand.

v2:
- Fix double free and flip_count underrun (caught by Mario Kleiner).
- Don't leak flip_vblank_event on the error_out path (Mario).
- Use the updated ms_flush_drm_events API (Mario, Ken).

v3: Hack around DPMS shenanigans. If all monitors are DPMS off, then
there is no active framebuffer; attempting to pageflip will hit the
error_undo paths, causing us to drmModeRmFB with no framebuffer,
which confuses the kernel into doing full modesets and generally
breaks things. To avoid this, make ms_present_check_flip check that
some CRTC's are enabled and DPMS on. This is an ugly hack that would
get better with atomic modesetting, or some core Present work.

v4:
- Don't do pageflipping if CRTC's are rotated (caught by Jason Ekstrand).
- Make pagelfipping optional (Option "PageFlip" in xorg.conf.d), but
  enabled by default.

v5: Initialize num_crtcs_on to 0 (caught by Michel Dänzer).

[airlied: took over]

v6: merge async flip support from Mario Kleiner
free sequence after failed vblank queue
handle unflip while DPMS'ed off (Michel)
move flip tracking into its own structure, and
fix up reference counting issues, and add comments.

Date: Sun Feb 8 17:21:58 2015 -0800

modesetting: Improve the ms_flush_drm_events() API.

Previously, ms_flush_drm_events() returned a boolean value, and it was very easy to interpret the meaning incorrectly. Now, we return an integer value.

The possible outcomes of this call are:
- poll() raised an error (formerly TRUE, now -1 - poll's return value)
- poll() said there are no events (formerly TRUE, now 0).
- drmHandleEvent() raised an error (formerly FALSE, now the negative value returned by drmHandleEvent).
- An event was successfully handled (formerly TRUE, now 1).

The nice part is that this allows you to distinguish errors (< 0), nothing to do (= 0), and success (1). We no longer conflate errors with success.

v2: Change ms_present_queue_vblank to < 0 instead of <= 0, fixing an unintentional behavior change. libdrm may return EBUSY if it's received EINTR for more than a second straight; just keep retrying in that case. Suggested by Jasper St. Pierre.

systemd-logind: do not rely on directed signals

Right now, Xorg does not install DBus matches for "PauseDevice" / "ResumeDevice". Therefore, it should usually not receive those DBus signals from logind. It is just a coincidence that systemd-logind sends those signals in a directed manner right now. Therefore, dbus-daemon bypasses the broadcast matches.

However, this is not ABI and Xorg should not rely on this. systemd-logind is free to send those signals as broadcasts, in which case Xorg will freeze the VT. Fix this by always installing those matches.

glamor: Skip actual FBO setup in our glyph atlas.

VC4 (and many GLES2 renderers) can't render to GL_ALPHA, so our pixmap would end up as GLAMOR_MEMORY and our dereference of the FBO would setfault. Instead, tell the pixmap creation that we don't need an FBO at all. Our glyph upload path was already glTexImage for non-a1, and a more general software fallback for a1 (since the glyph is also in system memory).

commit f4c3cac010cffe0980905e6edd8ed7baf0aff91b
Xi: call UpdateDeviceState() even when the client is missing

The client window can be closed in the middle of a touch sequence, e.g. Qt 4 closes popup windows on MousePress and Qt 5.5 will do it on TouchBegin. In this case the state of mouse buttons will not be updated on TouchEnd because ProcessTouchEvent() calls UpdateDeviceState() only when the event has been sent to the client. It results in a stuck left mouse button.

This patch leads to calling UpdateDeviceState() in case the client can't be found.

dix: Send KeyPress and KeyRelease events to the XACE_KEY_AVAIL hook

While it's documented in the XACE spec, the XACE_KEY_AVAIL hook is currently never actually invoked by the xserver.

This hook was added in 13c6713c82 (25 Aug 2006), but as the keyboard processing was moved into XKB, the hook was forgotten and silently dropped. The code calling this hook was removed by 7af53799e (4 Jan 2009), but it was probably already unused before that.

This patch re-adds support for this hook. The "count" hook parameter is unused.

systemd-logind: Only use systemd-logind integration together with keepTTY

systemd-logind integration does not work when starting X on a new tty, as
that detaches X from the current session and after that systemd-logind revokes
all rights any already open fds and refuses to open new fds for X.

This means that currently e.g. "startx -- vt7" breaks, and breaks badly,
requiring ssh access to the system to kill X.

The fix for this is easy, we must not use systemd-logind integration when
not using KeepTTY, or iow we may only use systemd-logind integration together
with KeepTTY.

linux: Add a may_fail parameter to linux_parse_vt_settings

linux_parse_vt_settings() was split out of xf86OpenConsole so that it can
be called earlier during systemd-logind init, but it is possible to run
the xsxserver in such a way that xf86OpenConsole() is never used.

The FatalError calls in linux_parse_vt_settings() may stop the Xorg xsxserver
from working when e.g. no /dev/tty0 is present in such a setup.

This commit adds a may_fail parameter to linux_parse_vt_settings() which
can be used to make linux_parse_vt_settings() fail silently with an error
return in this case, rather than calling FatalError().

Date: Wed Jan 21 09:31:39 2015 +0100

linux: Add linux_parse_vt_settings and linux_get_keeptty helpers

systemd-logind integration does not work when starting X on a new tty, as
that detaches X from the current session and after that systemd-logind revokes
all rights on any already open fds and refuses to open new fds for X.

This means that currently e.g. "startx -- vt7" breaks, and breaks badly,
requiring ssh access to the system to kill X.

The fix for this is easy, we must not use systemd-logind integration when
not using KeepTty, or iow we may only use systemd-logind integration together
with KeepTty.

But the final KeepTty value is not known until the code to chose which vtno to
run on has been called, which currently happens after initializing
systemd-logind.

This commit is step 1 in fixing the "startx -- vt7" breakage, it factors out
the linux xf86OpenConsole bits which set xf86Info.vtno and keepTty so that
these can be called earlier. Calling this earlier is safe as this code has
no side effects other than setting xf86Info.vtno and keepTty.

Note this basically only moves a large chunk of xf86OpenConsole() into
linux_parse_vt_settings() without changing a single line of it, this is
hard to see in the diff because the indentation level has changed.

backtrace.c: Fix word cast to a pointer
backtrace.c uses a word size provided by libunwind. In some architectures like MIPS, libunwind makes that word size 64-bit for all variants of the architecture.

In the lines #90 and #98, backtrace.c tries to do a cast to a pointer, which fails in all MIPS variants with 32-bit pointers, like MIPS32 or MIPS64 n32, because it's trying to do a cast from a 64-bit wide variable to a 32-bit pointer:

Making all in os
make[2]: Entering directory `/home/test/test/1/output/build/xserver_xorg-server-1.15.1/os'
   CC    WaitFor.lo
   CC    access.lo
   CC    auth.lo
   CC    backtrace.lo
backtrace.c: In function `xorg_backtrace':
backtrace.c:90:20: error: cast to pointer from integer of different size [-Werror=int-to-pointer-cast]
   if (dladdr((void *)(pip.start_ip + off), &dlinfo) &&
   dlinfo.dli_fname &&
^   backtrace.c:98:13: error: cast to pointer from integer of different size [-Werror=int-to-pointer-cast]
   (void *)(pip.start_ip + off));
^ cc1: some warnings being treated as errors
make[2]: *** [backtrace.lo] Error 1
make[2]: *** Waiting for unfinished jobs....

Making the cast to a pointer-sized integer, and then to a pointer fixes the problem.

os: support new implicit local user access mode [CVE-2015-3164 2/3]

If the X server is started without a `-auth` argument, then it gets started wide open to all local users on the system.

This isn't a great default access model, but changing it in Xorg at this point would break backward compatibility.

Xwayland, on the other hand is new, and much more targeted in scope. It could, in theory, be changed to allow the much more secure default of a "user who started X server can connect clients to that server."

This commit paves the way for that change, by adding a mechanism for DDXs to opt-in to that behavior. They merely need to call

LocalAccessScopeUser()

in their init functions.

A subsequent commit will add that call for Xwayland.

Date: Tue May 5 14:18:54 2015 +1000

dix: Add unaccelerated valulators to the ValuatorMask

Allows a mask to carry both accelerated and unaccelerated motion at the same time.

This is required for xf86-input-libinput where the pointer acceleration happens in libinput already, but parts of the server, specifically raw events and DGA rely on device-specific unaccelerated data.
To ease integration add this as a second set to the ValuatorMask rather than extending all APIs to carry a second, possibly NULL set of valuators.

Note that a valuator mask should only be used in either accel/unaccel or standard mode at any time. Switching requires either a valuator_mask_zero() call or unsetting all valuators one-by-one. Trying to mix the two will produce a warning.

The server has a shortcut for changing a mask with the valuator_mask_drop_unaccelerated() call. This saves us from having to loop through all valuators on every event, we can just drop the bits we know we don't want.

Author: Alan Coopersmith <alan.coopersmith@oracle.com>
Import reallocarray() from OpenBSD

Wrapper for realloc() that checks for overflow when multiplying arguments together, so we don't have to add overflow checks to every single call. For documentation on usage, see:
http://www.openbsd.org/cgi-bin/man.cgi/OpenBSD-current/man3/calloc.3

Signed-off-by: Alan Coopersmith <alan.coopersmith@oracle.com>
Acked-by: Matt Turner <mattst88@gmail.com>

Add XNFcallocarray() to allow xnfcalloc() to check for overflow

The xnfcalloc() macro took two arguments but simply multiplied them together without checking for overflow and defeating any overflow checking that calloc() might have done. Let's not do that.

The original XNFcalloc() function is left for now to preserve driver ABI, but is marked as deprecated so it can be removed in a future round of ABI break/cleanup.

Signed-off-by: Alan Coopersmith <alan.coopersmith@oracle.com>
Reviewed-by: Matt Turner <mattst88@gmail.com>

Let calloc handle multiplication

It's going to multiply anyway, so if we have non-constant values, might as well let it do the multiplication instead of adding another multiply, and good versions of calloc will check for & avoid overflow in the process.

systemd-logind: don't second guess D-Bus default timeout

At the moment, the X server uses a non-default timeout for D-Bus messages to systemd-logind. The only timeouts normally used with D-Bus are:

1) Infinite
2) Default

Anything else is just as arbitrary as Default, and so rarely makes sense to use instead of Default.

Put another way, there's little reason to be fault tolerant against a local root running daemon (logind), that in some configurations, the X server already depends on for proper functionality.

This commit changes systemd-logind to just use the default timeouts.

systemd-logind: filter out non-signal messages from message filter

It's possible to receive a message reply in the message filter if a previous message call timed out locally before the reply arrived.

The message_filter function only handles signals, at the moment, and does not properly handle message replies.

This commit changes the message_filter function to filter out all non-signal messages, including spurious message replies.

mi: Partial pie-slice filled arcs may need more space for spans

The mi filled arc code estimates that a filled arc will produce no more spans than the arc is tall. This is true for most arcs except for pie-slice arcs strictly between 180 and 360 degrees where the missing portion of the arc faces up or down such that we get two spans on some scanlines.

For those, we need to reserve room for another height/2 spans. This patch just does it for all partial pie-sliced arcs to make the test easier to understand; it's just over-allocating a bit of memory, so that's safe.

xfree86: Add GPU screens even if there are no active GDevs

xf86platformProbeDev creates GPU screens for any platform devices that were not matched by a GDev in the loop above, but only if there was at least one device. This means that it's impossible to configure a device as a GPU screen if there is only one platform device that matches that driver.

Instead, create a GPU screen (if possible) for any platform device that was not claimed by the GDev loop.

xfree86: Fix xf86_check_platform_slot's handling of PCI

If a PCI entity is found, xf86_check_platform_slot performs a device ID check against the xf86_platform_device passed in. However, it just returns immediately without checking the rest of the entities first. This leads to this situation happening:

1. The nvidia driver creates an entity 0 with bus.type == BUS_PCI
2. The intel driver creates entity 1 for its platform device, opening /dev/dri/card0
3. xf86platformProbeDev calls probeSingleDevice on the Intel platform device, which calls doPlatformProbe, which calls xf86_check_platform_slot.
4. xf86_check_platform_slot compares the Intel platform device against the
NVIDIA PCI entity. Since they don't have the same device ID, it returns TRUE.

5. doPlatformProbe calls xf86ClaimPlatformSlot, which creates a duplicate entity for the Intel one.

Fix this by only returning FALSE if the PCI ID matches, and continuing the loop otherwise. In the scenario above, this allows it to continue on to find the Intel platform device that matches the second entity.

glamor: Just set the logic op to what we want at the start of all rendering.

By dropping the unconditional logic op disable at the end of rendering, this fixes GL errors being thrown in GLES2 contexts (which don't have logic ops). On desktop, this also means a little less overhead per draw call from taking one less trip through the glEnable/glDisable switch statement of doom in Mesa.

The exchange here is that we end up taking a trip through it in the XV, Render, and gradient-generation paths. If the glEnable() is actually costly, we should probably cache our logic op state in our screen, since there's no way the GL could make that switch statement as cheap as the caller caching it would be.

v2: Don't forget to set the logic op in Xephyr's drawing.

Don't allow both RandR XINERAMA and pseudoramiX XINERAMA extensions to register

Prevent RRXinerama from activating if PseudoramiX is, so we don't get XINERAMA
listed twice in the list of extensions. I think this is otherwise benign, as
the PseudoramiX XINERAMA gets registered first and thus handles all requests.

Perhaps AddExtension() ought to warn us if the extension name is already
registered?

This appears to be a long-standing bug seen in XQuartz, and now in XWin as well.

Future work: Perhaps since RRXinerama isn't actually doing anything useful but
faking it when we have one screen, it seems that the PseudoramiX code could be
also used in that case.

xkb: Don't swap XkbSetGeometry data in the input buffer

The XkbSetGeometry request embeds data which needs to be swapped when the
server and the client have different endianess.

_XkbSetGeometry() invokes functions that swap these data directly in the
input buffer.

However, ProcXkbSetGeometry() may call _XkbSetGeometry() more than once
(if there is more than one keyboard), thus causing on swapped clients the
same data to be swapped twice in memory, further causing a server crash
because the strings lengths on the second time are way off bounds.

To allow _XkbSetGeometry() to run reliably more than once with swapped
clients, do not swap the data in the buffer, use variables instead.

modesetting: Update the cursor without hiding it

In the new KMS APIs, the legacy drmModeSetCursor ioctl actually waits for a vblank after changing the cursor image before returning, meaning that the X server, in attempting to hide the cursor before updating its image, actually makes that hide *visible* for a full vblank.

It's unknown why the X server does this by default, but turn it off.

If we're with a legacy driver that doesn't support the modern drmModeSetCursor by waiting for a vblank before returning, we're going to get a tiny bit of tearing on the cursor plane. But between tearing with a new cursor image and tearing with a blank cursor image, I'd rather the former.

The only proper solution to this is an atomic ioctl that page flips all planes, including the cursor plane, at vblank time and at the same time.

xfree86: rename Xorg.bin to Xorg

If the suid wrapper is enabled, /usr/bin/Xorg is just a shell script that
execs either /usr/libexec/Xorg.bin directly or the Xorg.wrap binary which then
execeve's /usr/libexec/Xorg.bin.

Either way, we end up with Xorg.bin, which is problematic for two reasons:
* ps shows the command as Xorg.bin
* _COMM and _EXE in systemd's journal will both show Xorg.bin as well

There's not much we can do about the path, but having the actual command stay
as Xorg means better compatibility to existing scripts. And, the reason for
this path: the command
  journalctl _COMM=Xorg
works universally, regardless of whether the wrapper is used or not.

commit b51f804b1ca826699296aff9de27d19257d78dae
Author: Kenneth Graunke <kenneth@whitecape.org>
Date: Thu Dec 18 17:22:00 2014 -0800

present: If present_queue_vblank() fails, do present_execute().

Previously, if present_queue_vblank() failed, we simply dropped the present request on the floor, and returned an error. This was rather mean to clients - after presenting, they wait for a PresentComplete event to come back. But since the present never happens, they end up waiting forever, and lock up in poll().

This patch falls back to present_execute if present_queue_vblank fails. We still print a debugging message to warn when queueing fails, which allows us to continue debugging problems, but makes Present robust enough to not lock up people's compositing manager when vblank bugs happen.

v2: Don't do present_queue_vblank() /and/ present_execute() (a bug that snuck in during last minute tidying).

    Signed-off-by: Keith Packard <keithp@keithp.com>
Call to DDX SwapBuffers requires address of int, not unsigned int

When the local types used to walk the DBE request were changed, this
changed the type of the parameter passed to the DDX SwapBuffers API,
but there wasn't a matching change in the API definition.

At this point, with the API frozen, I just stuck a new variable in
with the correct type. Because we've already bounds-checked nStuff to
be smaller than UINT32_MAX / sizeof(DbeSwapInfoRec), we know it will
fit in a signed int without overflow.

Free existing EGL image when assigning new one

When reallocating the framebuffer on screen resize, the old EGL image
was getting leaked. Check for an existing EGL image and free it in
this case.

Remove redundant reference to screen pixmap EGL image

There's no reason to store this in the egl screen private as the
screen pixmap will always hold a reference to it anyways.

* The front buffer
* The intel driver's flip buffer
* pixmaps under DRI3

This patch unifies the second two by having glamor_destroy_pixmap always destroy any associated EGL image. This allows us to stop storing the back_pixmap pointer in glamor as that was only used to make sure that buffer was freed at server reset time.

v2: check for valid pixmap_priv before using it in glamor_egl_destroy_pixmap_image

glx: Add safe_{add,mul,pad} (v3) [CVE-2014-8093 4/6]

These are paranoid about integer overflow, and will return -1 if their
operation would overflow a (signed) integer or if either argument is
negative.

Note that RenderLarge requests are sized with a uint32_t so in principle
this could be sketchy there, but dix limits bigreqs to 128M so you
shouldn't ever notice, and honestly if you're sending more than 2G of
rendering commands you're already doing something very wrong.

Xi: unvalidated lengths in Xinput extension [CVE-2014-8095]

Multiple functions in the Xinput extension handling of requests from clients failed to check that the length of the request sent by the client was large enough to perform all the required operations and thus could read or write to memory outside the bounds of the request buffer.

This commit includes the creation of a new REQUEST_AT_LEAST_EXTRA_SIZE macro in include/dix.h for the common case of needing to ensure a request is large enough to include both the request itself and a minimum amount of extra data following the request header.

dbe: unvalidated lengths in DbeSwapBuffers calls [CVE-2014-8097]

ProcDbeSwapBuffers() has a 32bit (n) length value that it uses to read from a buffer. The length is never validated, which can lead to out of bound reads, and possibly returning the data read from out of bounds to the misbehaving client via an X Error packet.

SProcDbeSwapBuffers() swaps data (for correct endianness) before handing it off to the real proc. While doing the swapping, the length field is not validated, which can cause memory corruption.

v2: reorder checks to avoid compilers optimizing out checks for overflow that happen after we'd already have done the overflowing multiplications.

dix: integer overflow in GetHosts() [CVE-2014-8092 2/4]

GetHosts() iterates over all the hosts it has in memory, and copies them to a buffer. The buffer length is calculated by iterating over all the hosts and adding up all of their combined length. There is a potential integer overflow, if there are lots and lots of hosts (with a combined length of > ~4 gig). This should be possible by repeatedly calling ProcChangeHosts() on 64bit machines with enough memory.

This patch caps the list at 1mb, because multi-megabyte hostname lists for X access control are insane.

unchecked malloc may allow unauthed client to crash Xserver [CVE-2014-8091]

authdes_ezdecode() calls malloc() using a length provided by the connection handshake sent by a newly connected client in order to authenticate to the server, so should be treated as untrusted.

It didn't check if malloc() failed before writing to the newly allocated buffer, so could lead to a server crash if the server fails to allocate memory (up to UINT16_MAX bytes, since the len field is a CARD16 in the X protocol).

  present: Fix use of vsynced pageflips and honor PresentOptionAsync. (v4)

Pageflips for Pixmap presents were not synchronized to vblank on drivers with support for PresentCapabilityAsync, due to some missing init for vblank->sync_flips. The PresentOptionAsync
flag was completely ignored for pageflipped presents.

Vsynced flips only worked by accident on the intel-ddx, as that
driver doesn't have PresentCapabilityAsync support.

On nouveau-ddx, which supports PresentCapabilityAsync, this
always caused non-vsynced pageflips with pretty ugly tearing.

This patch fixes the problem, as tested on top of XOrg 1.16.2
on nouveau and intel.

v4: Add additional PresentCapabilityAsync caps check, as
suggested by Eric Anholt.

Please also apply to XOrg 1.17 and XOrg 1.16.2 stable.

Applying on top of XOrg 1.16.2 requires cherry-picking
commit 2051514652481a83bd7cf22e57cb0fc40333f33
which trivially fixes lack of support for protocol option

present: Avoid crashes in DebugPresent(), a bit more info.

DebugPresent() crashed the server when a dri3 drawable
was closed while a pageflipped present was still pending,
due to vblank->window-> Null-Ptr deref, so debug builds
caused new problems to debug.

E.g.,

    glXSwapBuffers(...);
    glXDestroyWindow(...);
    -> Pageflip for non-existent window completes -> boom.

Also often happens when switching desktop compositor on/off
due to Present unflips, or when logging out of session.

Also add info if a Present is queued for copyswap or pageflip,
if the present is vsynced, and the serial no of the Present
request, to aid debugging of pageflip and vsync issues. The
serial number is useful as Mesa’s dri3/present backend encodes its sendSBC in the serial number, so one can easily correlate server debug output with Mesa and with the SBC values returned to actual OpenGL client applications via OML_sync_control and INTEL_swap_events extension, makes debugging quite a bit more easy.

Please also cherry-pick this for a 1.16.x stable update.

glx: Fix crash when a client exits without deleting GL contexts

With the previous patches applied, we now have crash due to use-after-free when a client exits without deleting all it's GL contexts

On client exit, CloseDownClient first calls glxClientCallback() with ClientStateGone, which calls __glXFreeContext() directly.

Subsequently CloseDownClient() frees all the clients resources, which leads to ContextGone() being called for a context resource where the context has already
been freed.

Fix this by modifiying glXClientCallback() to free the context resource.

Also make __glXFreeContext() static, as calling it directly leads to this problem, instead the context resource should be released.

With the previous patches applied, this can be demonstrated with e.g. glxinfo, which doesn't delete it's context before exit.

Revert "glx: Simplify glXDestroyContext"

This reverts commit 7f5adf73a0f9a951a6df201532b4031d38054369.

This seems to miss the whole point of the idExists flag, as it makes the lifetime of that being true the same as the lifetime of the Context resource.

The previously current context tag is always given in a MakeContextCurrent
request, even if that context tag is no longer valid (for example, the context has been deleted), so this leads to BadContextTag errors.

See fd.o bug #30089 for the makecurrenttest.c testcase, and some discussion of previous manifestations of this bug.

hw/xwin: Fix hang on shutdown when we own the clipboard.

If we are the clipboard owner when we are shutdown, we recieve a WM_RENDERALLFORMATS, to render the clipboard, so it's contents will remain available to other applications. Unfortunately, this is far too late to do anything useful with, as the server is waiting for the clipboard thread to exit, and so can't process requests to convert clipboard contents.

Change so we just do nothing on WM_RENDERALLFORMATS. (I'm not convinced that WM_RENDERALLFORMATS has ever worked usefully, in any case).

(To make this work, I guess we would need to rearrange the way shutdown works completely: first synchronously stop the clipboard, then stop the X server)
We also then receive a WM_DRAWCLIPBOARD, perhaps telling us that the available clipboard formats have changed (as ones which haven't been rendered are now removed), but the clipboard owner is now the system, not us, which we have to arrange to ignore.

hw/xwin: Fix clipboard thread restart

It seems that the clipboard thread restart mechanism has been broken for a while, which can be demonstrated using XDMCP with KDM (e.g. to a Kubutunu 12.04 host)

KDM kills all attached clients, including the clipboard integration client, which restarts, but then exits on WM_QUIT.

Using PostQuitMessage() in WM_DESTROY is unhelpful, as we may not actually be quitting the thread, if we just destroyed the window because the clipboard thread is about to retry, because he WM_QUIT message sticks around, and is noticed the next time we look at the window message queue and confuses us into thinking we need to quit.

Sending a WM_DESTROY is apparently never correct anyhow, see [1]

So:

1/ Use DestroyWindow() to destroy the clipboard messaging window when cleaning up for retry or exit in winClipboardProc (the clipboard thread main proc)

2/ Send a special WM_WM_QUIT message in winClipboardWindowDestroy() from the X server thread when the X server is resetting.

3/ When processing that WM_WM_QUIT message in the clipboard thread, cause the clipboard window to PostQuitMessage(), which causes the clipboard thread to exit.

hw/xwin: Improve reliability of clipboard X->Windows pastes

Sometimes, particularly with large clipboard pastes to Windows, we could end up waiting for the timeout to expire, rather than pasting the data.

Various changes to improve reliability:

1. Use XFlush() not XSync() in winProcessXEventsTimeout().

It makes no sense to ensure we have received replies to outstanding requests if we are going to wait for them using select()

2. Add XFlush() to winClipboardProc()

Make sure we have sent any requests before we wait using select()

3. Don't use FD_ISSET() to check which fd is ready

This looks like a Cygwin select() bug in that it sometimes returns 0 with an empty fd set before the timeout expires, but a fd appears to be ready.

Add select() return value to debug output when we are warning that this has happened.

4. Drain event queues before entering select()

Unconditionally drain event queues before entering select(). This seems to be the recommended way of writing select() and X event processing loops.

winClipboardFlushXEvents() checks using XPending(), and winClipboardFlushWindowsMessageQueue() checks using PeekMessage() so this is safe against blocking, but means that may not need to enter select() at all sometimes.

hw/xwin: Retrieve TARGETS to avoid unnecessary failing conversion attempts

It looks like the change in a9aca218f557c723e637287272819a7c17174e1e had some unforseen consequences.

If the X11 selection contents are not convertable to COMPOUND_TEXT, UTF8_STRING or STRING format (for example, if it is an image), after those conversion attempts have failed, we sit in winProcessXEventsTimeout() until the timeout expires.

It also seems that maybe gnuplot doesn't respond correctly to this sequence of conversion requests and doesn't reply to some of them, which also causes us to sit in winProcessXEventsTimeout() until the timeout expires.

The Windows application which has requested the clipboard contents via GetClipboardContents() is blocked until we return from WM_RENDERFORMAT, so sitting waiting for this timeout to expire should be avoided.

So instead, explicitly request conversion to the TARGETS target, choose the most preferred format, and request conversion to that.

Also: if there is no owned selection, there is nothing to paste, so don't bother trying to convert it.

dix: Untwist transformAbsolute logic, eliminate uninitialized value warnings

transformAbsolute has a pretty simple job, that of running the X/Y
values from a device through the transformation matrix. The tricky bit
comes when the current device state doesn't include one of the
values. In that case, the last delivered value is back-converted to
device space and used instead.

The logic was twisted though, confusing GCC's uninitialized value
detection logic and emitting warnings.

This has been fixed by changing the code to:

1) Detect whether the ValuatorMask includes X/Y values
2) If either are missing, back-convert the current values into ox/oy
3) When X/Y are present, set ox/oy to the current value
4) Transform
5) Store X/Y values if changed or if they were set before.

composite: Skip SetWindowPixmap when pixmap isn't changing

Check the current window pixmap to see if it matches the new pixmap and avoid calling SetWindowPixmap in that case.

x11perf -ucreate highlights an instance where compCreateWindow reassigns the same Pixmap to the Window. Currently this triggers an expensive invalidation of the entire window hierarchy, making sure that DRI2 clients are kept informed of the handle changes. However, as the backing Pixmap for the Window is actually unchanged, there is no need to
Skip SetCursor when vtSema is FALSE.

Consider below sequence -
1) Cursor is removed : isUp will be FALSE if HW cursor is set.
2) VT switched away from X : vtSema becomes FALSE.
3) xf86CursorSetCursor is called with non-null CursorPtr :
   Saves the passed in CursorPtr, fallbacks to SW cursor and invokes
   spriteFuncs->SetCursor which saves the area under cursor and restores
   the cursor. This sets isUp to TRUE and as vtSema is FALSE saved data
   is garbage.
4) VT switched to X : vtSema becomes TRUE. xf86Cursor enable fb access
   is called which will remove the SW cursor, i.e copies saved data in #3
   to screen.

This results to momentary garbage data on screen. Hence when !vtSema
skip spriteFuncs->SetCursor.

X.Org Bug 85313 <https://bugs.freedesktop.org/show_bug.cgi?id=85313>

modesetting: Add support for DRI2 with glamor.

This is derived from the intel driver DRI2 code, with swapchain and
pageflipping dropped, functions renamed, and vblank event management
shared code moved to a vblank.c for reuse by Present.

This allows AIGLX to load, which means that you get appropriate
visuals exposed in GL, along with many extensions under
direct-rendering that require presence in GLX (which aren't supported
in glxdriswrast.c).
v2: Drop unused header includes in pageflip.c, wrap in #ifdef GLAMOR. Drop triple-buffering, which was totally broken in practice (I'll try to fix this later). Fix up some style nits. Document the general flow of pageflipping and why, rename the DRI2 frame event type enums to reflect what they're for, and handle them in a single switch statement so you can understand the state machine more easily.

v3: Drop pageflipping entirely -- it's unstable on my Intel laptop (not that the normal 2D driver is stable with pageflipping for me), and I won't get it fixed before the merge window. It now passes all of the OML_sync_control tests from Jamey and Theo (except for occasional warns in timing -fullscreen -divisor 2).

v4: Fix doxygen at the top of vblank.c

dri2: Automatically fill in the driver name if the DDX doesn't provide it.

This will be used by the modesetting driver to support DRI2 across all hardware that can support glamor, and could potentially be used by other drivers that have to support DRI2 on sets of hardware with multiple Mesa drivers.

This logic is the same as what's present in the Mesa driver loader, except for the lack of nouveau_vieux support (which requires a predicate on the device).

v2: Fix duplicated assignment of info->driverName.

Signed-off-by: Eric Anholt <eric@anholt.net>
dri2: Import a copy of Mesa's PCI ID -> driver name mappings.

This comes from Mesa commit acdcef6788beaa2a1532e13ff84c3e246b8025ed

Previously, each driver had to tell DRI2 what GL driver object should be loaded. Originally for a 2D driver that was a matter of giving the constant string for the vendor name, same as the driver's name. For a driver that's trying to handle multiple generations of hardware with different Mesa driver filenames, the driver had to bake in a mapping from PCI ID to the appropriate driver name in Mesa, which seems like a pretty awful layering violation (and one that was fixed with DRI3)

As of January, Mesa now handles the mapping from a DRI fd to the driver name on its own, but the AIGLX loader still relies on DRI2 for choosing the filename. Instead of propagating the PCI ID list from each 2D driver to the modesetting driver, import a central copy of the PCI ID list so that drivers can stop handling this themselves. (Some day, when AIGLX transitions to EGL, we can drop the DRI2 filename setup entirely).

    glamor: Free converted bits in _glamor_upload_bits_to_pixmap_texture fast path

    When uploading bits to a texture which need reformatting to match a
    supported GL format, a temporary buffer is allocated to hold the
    reformatted bits. This gets freed in the general path, but is not
    freed in the fast path because that includes an early return before
    the call to free.

    This patch removes the early return and places the general case under
    an 'else' block, so that both paths reach the call to free.

glamor: Don't free memory we are going to use.

glamor_color_convert_to_bits() returns its second argument on
success, NULL on error, and need_free_bits already makes sure that
"bits" aliasing converted_bits is freed in the success case.
Looks like the memory leak that was supposed to be fixed in
6e50bfa706cd3ab884ec933b1f17c221a6208aa4 only occurred in the error
case.

commit 16a32c53f6e9ad1f3284d4596edfa33e9efb740e
Author: Alan Coopersmith <alan.coopersmith@oracle.com>
Date: Thu Oct 9 05:42:09 2014 -0700

If fork fails in System(), don't fallthrough to exec()

In the unlikely event of a failure in creating processes, signal
masks will fall from the panels above you. Secure your mask before
telling your child what to do, since it won't exist, and you will
instead cause the server itself to be replaced by a shell running
the target program.

Found by Coverity #53397: Missing break in switch
Execution falls through to the next case statement or default;
this might indicate a common typo.
In System: Missing break statement between cases in switch statement (CWE-484)

mi: Mark the span blit routines as _X_COLD

On gcc, __attribute__((cold)) means:

- consider calls to the function to be unlikely for branch prediction
- optimize the function for size
- emit the function in a dedicated cold text section

It's not worth deleting these routines even though there are no longer
in-tree consumers, but we can at least keep them out of i$ at runtime.

Author: Keith Packard <keithp@keithp.com>
Use unique display name for each xi2 test program [v3]

make -j 8 check was sporadically failing in different xi2 tests.
After adding the asserts in the previous commit to catch xkb failure it became easier to catch the failures and see that multiple tests were running at once trying to write to /tmp/server-(null).xkm and then delete it, and interfering with each other.

Putting a unique string into the display variable let them each write to their own file and not interfere with others.

v2: Fix Linux bits:

Add #include <errno.h> to get a declaration of program_invocation_name on Linux.

Use only the last portion of the pathname so that the resulting display name doesn't contain any slashes.

v3: use program_invocation_short_name on Linux

This is the same as program_invocation_name, except is has stripped off any path prefix.

Author: Alan Coopersmith <alan.coopersmith@oracle.com>
Date: Sun Sep 21 09:49:05 2014 -0700

Abort xi2 tests if ActivateDevice() fails

I was getting segfaults in xi2 tests from trying to copy XKB keyboard state to NULL pointers with a stack of:
key=key@entry=0) at xkbActions.c:1189
sendevent=sendevent@entry=0 \'000\') at devices.c:420
at protocol-xiquerydevice.c:338

which turned out to be due to xkbcomp failure, which was logged in the test logs as:
XKB: Failed to compile keymap
Keyboard initialization failed. This could be a missing or incorrect setup of xkeyboard-config.

but which was overlooked because the ActivateDevice() return code wasn't checked and the tests went forward assuming the structures were all correctly initialized. This catches the failure closer to the point of failure, to save debugging time.

glamor: Remove shader-based trapezoid implementation. Fixes Bug 76213.

I can’t find any performance benefit to using the GL path and the code renders this trapezoid incorrectly:

```
  top: FIXED   29.50 
  bottom: FIXED   30.00 
   left top: POINT    0.00,   29.50 
   left bottom: POINT    0.00,   30.50 
   right top: POINT -127.50,   29.50 
   right bottom: POINT   52.50,   30.00 
```

This should render a solid line from 0,30 to 52,30 but draws nothing.

The code also uses an area computation for trapezoid coverage which does not conform to the Render specification which requires a specific point sampling technique.

glamor: Handle compositing from large to small pixmaps

glamor_composite_largepixmap_region is given the job of dealing with compositing between a mixture of large and small pixmaps. However, it was assuming that the destination pixmap was large and fetching members of the large structure even for small pixmaps.

This manifested with assertion failures when compositing from a large pixmap to a small pixmap.

Fixed by using the pixmap size for the destination block size for small pixmaps.

present: Clear pending flip pixmaps at CloseScreen

If a flip is active at server reset time, the associated window will get destroyed which will queue an unflip operation. If that isn't synchronous, then it won't have finished by the time CloseScreen is called.

Calling present_flip_idle will signal the fence and remove the reference to the fence and pixmap, freeing these in the X server and allowing a DRM client to clean up as well.

This also rewords other comments in present_flip_destroy, removing scary words about needing synchronous operation (everything in this function is synchronous now) and describing what effect we actually need from present_set_abort_flip.

loader: Remove compatibility with ancient XFree86 version numbering
Pretty sure I'm guilty of adding this. I think I was thinking of trying to be compatible with some really old binary-only driver that I had vague aspirations of reverse-engineering, but since I haven't gotten around to it in the intervening decade...

xwayland: Implement throttling for surfaces based on the frame event

This implements simple throttling that keeps us to one attach per frame. There isn't really an active performance benefit, since the buffers will be redrawn only once per frame anyway, but it does cut down on the chatty network traffic. Since the Wayland sockets might fill up as well, the cut down on the volume of data we send out also provides us with a big stability benefit.

Namely, mutter is a lot more stable running gtkperf, a fairly intensive X11 application, after this change.

xwayland-input: Fix a crasher for a race with the Wayland compositor

If something quickly maps and unmaps a window, then we'll immediately create and destroy the Wayland surface that corresponds to that window. If our mouse pointer is over the window when the surface is created, we'll receive a enter on the window.

Since resource creation and destruction is not synchronous, that
means that the compositor will queue up an event for a resource that's eventually destroyed. On the client-side, when we receive this message, we note that the resource isn't allocated, and get a NULL surface in our enter handler. We immediately try to dereference this, and then crash.

This was caused by running gtkperf while moving the window a lot.

os/log: adjust gcc version conditions for #pragma
In commit e67f2d7e0f9189beb2907fa06cffe5ec7f35f22 ("gcc 4.2.1 doesn't support #pragma GCC diagnostic ignored"), some compile time conditionals were added around the #pragma usage. Those conditionals ensure that the #pragma are not used on gcc <= 4.2.

However, the usage of #pragma diagnostic inside functions was only added in gcc 4.6, and a build failure is therefore experienced with gcc 4.5:

log.c: In function 'LogInit':
log.c:199:9: error: #pragma GCC diagnostic not allowed inside functions
log.c:201:9: warning: format not a string literal, argument types not checked
log.c:212:9: error: #pragma GCC diagnostic not allowed inside functions
log.c:214:17: warning: format not a string literal, argument types not checked

$ ./host/usr/bin/powerpc-linux-gnu-gcc -v
[...]
gcc version 4.5.2 (Sourcery G++ Lite 2011.03-38)

This patch therefore adjusts the compile time conditionals to make sure the #pragma is not used on gcc <= 4.5, and only used on gcc >= 4.6.

hw/xwin/glx: When generating shims, limit the considered features to GL version <=1.2

This fixes a problem when using Khronos registry data since the change of 2013-08-16 removed glBlend(Color|Equation) from GL1.2 and added them to GL_ARB_imaging.

If shim generation considers all features, no shims are generated for glBlend(Color|Equation) as they are first emitted for GL 1.4 (which we ignore as shims are only generated for GL version <=1.2), then emission for GL_ARB_imaging is skipped as they have already been emitted.

Also improve feature name matching so it is exact, not on an initial substring, so 'GL_ARB_texture_compression_bptc' and 'GL_ARB_texture_compression_rgtc' aren't matched by 'GL_ARB_texture_compression'.

Merge branch 'modesetting-import' into master

This reintroduces a "hardware" driver to the xfree86 directory. Unlike the drivers that xorg used to include in the source tree, that needed independent release schedules to get hardware support out the door, the modesetting driver shouldn't change much as new hardware gets released. A lot of what this driver needs to do is just keep up with server ABI changes.

This import was done by taking xf86-video-modesetting-0.9.0, and running this script with 'git-filter-branch -f --tree-filter ~/bin/modesetting-filter':

mkdir -p hw/xfree86/drivers/modesetting
rm -f README autogen.sh configure.ac Makefile.am .gitignore
rm -f man/Makefile.am
ephyr: set screen size & origin from host X server output's CRTC geometry

If a given output is passed via new -output option, Xephyr will query host X server for its info. If the following conditions are met:

a. RandR extension is enabled in host X server;
   b. supported RandR version in host X server is 1.2 or newer;
   c. the given output name is valid;
   d. the given output is connected;

then Xephyr will get output's CRTC geometry and use it to set its own screen size and origin. It's just like starting Xephyr in fullscreen mode, but restricted to the given output's CRTC geometry (fake "Zaphod mode").

This is the main feature needed for Xephyr-based single-card multiseat setups where we don't have separate screens to start Xephyr in fullscreen mode safely.

Date: Tue Aug 19 15:57:22 2014 -0500

fb: Fix invalid bpp for 24bit depth window

We have a hack in fb layer for a 24bpp screen to use 32bpp images, and
fbCreateWindow() replaces its drawable.bitsPerPixel field appropriately. But, the problem is that it always replaces when 32bpp is passed. If the depth is 32, this results in bpp < depth, which is actually invalid.

Meanwhile, fbCreatePixmap() has a more check and it creates with 24bpp only when the passed depth <= 24 for avoiding such a problem.

This oneliner patch just adds the similar check in fbCreateWindow().
This (hopefully) fixes the long-standing broken graphics mess of cirrus KMS with 24bpp.

dri3: Don't enable the DRI3 extension unless some screen supports it

There's no reason to advertise this extension unless one of the hardware drivers actually supports it. Not listing it means it's slightly easier for users to tell what's going on.

On the other hand, not listing it means we may have applications that only check for the extension and not for appropriate per-screen support. I don't think that's a real risk as DRI3 is only useful for systems with deep knowledge of the hardware.

BellProc: Send bell event on core protocol bell when requested

XKB allows to override the BellProc() ringing the 'keyboard bell': instead an event is sent to an X client which can perform an appropriate action.
In most cases this effectively prevents the core protocol bell from ringing: if no BellProc() is set for the device, no attempt is made to ring a bell.
This patch ensures that an XKB bell event is sent also when the core protocol bell is rung end thus an appropriate action can be taken by a client.

Author: Keith Packard <keithp@keithp.com>
Date:   Sun Jul 20 18:53:52 2014 -0700

    present: Make window MSC offset 0 initially

    The MSC offset used by a window is adjusted as the window moves
between screens, and between shown/unshown. The value shouldn't
matter, but it's helpful for debugging to have window MSC values be
the same as the CRTC MSC at first.

    This patch introduces a unique CRTC value so that Present can detect
the first time a window is a PresentPixmap destination and set the MSC
offset to zero, rather than using the fake MSC value as the previous
window MSC.

miext/shadow: Remove ancient backwards-compatibility hack

Here's a trip down memory lane. Back when we merged kdrive we adopted
kdrive's version of shadow, which used damage directly instead of
hand-rolling it. However a couple of Xorg drivers referred to the
accumulated damage region in the shadow private directly, so I added a
hack to copy the damage region around.

That was 9148d8700b7c5afac2644e5820c57c509378f93ce, back in early 2006.
Eight years is unusually patient for me. The neomagic and trident drivers
were still relying on this, but they've been modified to ask the damage
code for the region instead.

xfree86: Simplify a bunch of OS and arch conditionals

All of this is inside #ifdef __GNUC__, between that and configure.ac we can assume there's a unixy thing under us. Given that there's no real
reason to limit the arch paths to particular OSes, so let's not.

The final #elif here, combined with the ones before it, effectively said
"if not (alpha amd64 sparc* mips* ppc* arm* nds32 m68k sh hppa s390 m32r)",
and as the comment above it hints, it's meant to cover i386 (and happens to
also cover i866). Flip the conditional around to be sensible.

glamor: Fix temp picture coordinates in glamor_composite_clipped_region

To understand this patch, let's start at the protocol interface where the relationship between the coordinate spaces is documented:

static Bool
_glamor_composite(CARD8 op,
   PicturePtr source,
   PicturePtr mask,
   PicturePtr dest,
   INT16 x_source,
   INT16 y_source,
   INT16 x_mask,
   INT16 y_mask,
   INT16 x_dest, INT16 y_dest,
   CARD16 width, CARD16 height, Bool fallback)

The coordinates are passed to this function directly off the wire and are all relative to their respective drawables. For Windows, this means that they are relative to the upper left corner of the window, in whatever pixmap that window is getting drawn to.

_glamor_composite calls miComputeCompositeRegion to construct a clipped region to actually render to. In reality, miComputeCompositeRegion clips only to the destination these days; source clip region based clipping would have to respect the transform, which isn't really possible. The returned region is relative to the screen in which dest lives; offset by dest->drawable.x and dest->drawable.y.

What is important to realize here is that, because of clipping, the composite region may not have the same position within the destination drawable as x_dest, y_dest. The protocol coordinates now exist solely to 'pin' the three objects together.

extent->x1,y1 Screen origin of clipped operation
width,height Extents of the clipped operation
x_dest,y_dest Unclipped destination-relative operation coordinate
x_source,y_source Unclipped source-relative operation coordinate
x_mask, y_mask           Unclipped mask-relative operation coordinate

One thing we want to know is what the offset is from the original operation origin to the clipped origin

Destination drawable relative coordinates of the clipped operation:

\[ x_{\text{dest clipped}} = \text{extents->x1} - \text{dest->drawable.x} \]
\[ y_{\text{dest clipped}} = \text{extents->y1} - \text{dest->drawable.y} \]

Offset from the original operation origin:

\[ x_{\text{off clipped}} = x_{\text{dest clipped}} - x_{\text{dest}} \]
\[ y_{\text{off clipped}} = y_{\text{dest clipped}} - y_{\text{dest}} \]

Source drawable relative coordinates of the clipped operation:

\[ x_{\text{source clipped}} = x_{\text{source}} + x_{\text{off clipped}}; \]
\[ y_{\text{source clipped}} = y_{\text{source}} + y_{\text{off clipped}}; \]

Mask drawable relative coordinates of the clipped operation:

\[ x_{\text{mask clipped}} = x_{\text{source}} + x_{\text{off clipped}}; \]
\[ y_{\text{mask clipped}} = y_{\text{source}} + y_{\text{off clipped}}; \]

This is where the original code fails -- it doesn't subtract the destination drawable location when computing the distance that the operation has been moved by clipping. Here's what it does when constructing a temporary source picture:

```c
temp_src =
    glamor_convert_gradient_picture(screen, source,
        extent->x1 + x_source - x_dest,
        extent->y1 + y_source - y_dest,
        width, height);
...

x_temp_src = -extent->x1 + x_dest;
y_temp_src = -extent->y1 + y_dest;
```

glamor_convert_gradient_picture needs source drawable relative coordinates, but that is not what it's getting; it's getting screen-relative coordinates for the destination, adjusted by the distance between the provided source and destination operation coordinates. We want \( x_{\text{source clipped}} \) and \( y_{\text{source clipped}} \):

\[ x_{\text{source clipped}} = x_{\text{source}} + x_{\text{off clipped}} \]
\[ = x_{\text{source}} + x_{\text{dest clipped}} - x_{\text{dest}} \]
\[ = x_{\text{source}} + \text{extents->x1} - \text{dest->drawable.x} - x_{\text{dest}} \]
x_temp_src/y_temp_src are supposed to be the coordinates of the original operation translated to the temporary picture:

\[
x_{\text{temp\_src}} = x_{\text{source}} - x_{\text{source\_clipped}};
\]
\[
y_{\text{temp\_src}} = y_{\text{source}} - y_{\text{source\_clipped}};
\]

Note that x_source_clipped/y_source_clipped will never be less than x_source/y_source because all we're doing is clipping. This means that x_temp_src/y_temp_src will always be non-positive; the original source coordinate can never be strictly *inside* the temporary image or we could have made the temporary image smaller.

\[
x_{\text{temp\_src}} = x_{\text{source}} - x_{\text{source\_clipped}}
= x_{\text{source}} - (x_{\text{source}} + x_{\text{off\_clipped}})
= -x_{\text{off\_clipped}}
= x_{\text{dest}} - x_{\text{dest\_clipped}}
= x_{\text{dest}} - (\text{extent}->\text{x1} - \text{dest}->\text{drawable}.x)
\]

Again, this is off by the destination origin within the screen coordinate space.

The code should look like:

```
temp_src =
  glamor_convert_gradient_picture(screen, source, 
  extent->\text{x1} + x_{\text{source}} - x_{\text{dest}} - \text{dest}->\text{drawable}.x, 
  extent->\text{y1} + y_{\text{source}} - y_{\text{dest}} - \text{dest}->\text{drawable}.y, width, height);
```

ephyr: Free damage structure at server reset time

The usual mechanism for freeing a damage structure when the pixmap is destroyed does not work for the screen pixmap as it isn't freed in the normal way.

The existing driver cleanup function, scrfini, is called after the wrapped CloseScreen functions, including damageCloseScreen, are called and thus ephyr can't free the damage structure at that point.

Deal with this by providing an early CloseScreen hook in KdCloseScreen which ephyr can use to free the damage structure before damage itself shuts down.

hw/xfree86: Fix block handler wrapping in xf86Rotate

xf86Rotate, it was delaying unwrapping the BlockHandler until after calling xf86RotateRedisplay. If there was a software cursor on the screen, the redisplay operation would cause cursor to be removed from the frame buffer and the misprite block handler to be inserted into the block handler chain with the misprite screen private saved block handler now set to xf86RotateBlockHandler.

When xf86RotateRedisplay returned, xf86RotateBlockHandler would then set screen->BlockHandler to its saved value, call down and then reset screen->BlockHandler to xf86RotateBlockHandler. miSpriteBlockHandler would never be called after that, which meant that the software cursor will now disappear from the screen whenever rendering overlapped and would only reappear when the cursor was moved.

To correct this, all that is needed is to move the restoration of screen->BlockHandler to the top of xf86RotateBlockHandler, before the call to xf86RotateRedisplay.

Revert "dix: fix up coordinate scaling when external monitors are present"

This reverts commit d90b5f83010248be65b2039b0b2d0b9e6a4e93cf.

Reverting for two reasons:
* the scaling does not work on devices that don't advertise resolution, and
  the default resolution used (100 units/mm) is higher than most devices,
  resulting in a significant slowdown of the touchpads.
* the scaling is still affected by resolution changing. The patch worked
  before acceleration but since it maps into resolution-dependent dx/dy
  coordinates the acceleration may distort the movement after the fact. So the
  same input data generates different movements depending on the resolution.
  This can't easily be fixed for all affected devices as synaptics has its own
  velocity calculation method whereas wacom doesn't. So anything in the server
  won't work for both at the same time.

Revert this for now, until a more integrated solution can be implemented.

xfree86: Only support one sysconfigdir

When the X server is compiled with --prefix set to something other than /usr,
then it ends up with a nonstandard sysconfigdir in its .pc file. This causes
various other components to install their xorg.conf.d snippets there.

However, the X server first looks for /usr/share/X11/xorg.conf.d before looking
in sysconfigdir. That means that if the system administrator installed anything
that created that path, the user's custom sysconfigdir is not searched.

Rather than doing that, just look in the configured sysconfdir and nowhere else.
xfree86: don't force the screensaver off on DPMS unblank, merely suggest it

Commit 41d4beb2616c43f1a1b8694733e85bae70de59a added symmetry to the screensaver/DPMS invocations so that one (en|dis)ables the other. Having dependencies between DPMS and the screensaver is subject to further arguments, but in this particular case using SCREENSAVER_FORCER is detrimental. SCREENSAVER_FORCER(ScreenSaverReset) resets the idle time for all devices on DPMS unblank.

It prevents at least one use-case that GNOME tries to implement: GNOME displays a notification before suspending. If the display is currently blanked, GNOME lights it up to display the message. With the original patch in place DPMS unblank also resets the device idle times, thus restarting the timeout ad infinitum.

Switch this to a more suggestive SCREENSAVER_OFF(ScreenSaverReset). This keeps the symmetry in blanking mode (DPMS and screensaver turn each other on/off as expected) but does not reset the idle time on the devices.

xfree86: Introduce OutputClass configuration

The OutputClass section provides a way to match output devices to a set of given attributes and configure them. For now, only matching by kernel driver name is supported. This can be used to determine what DDX module to load for non-PCI output devices. DDX modules can ship an xorg.conf.d snippet (e.g. in /usr/share/X11/xorg.conf.d) that looks like this:

```
Section "OutputClass"
  Identifier "NVIDIA Tegra open-source driver"
  MatchDriver "tegra"
  Driver "opentegra"
EndSection
```

This will cause any device that's driven by the kernel driver named "tegra" to use the "opentegra" DDX module.

See the OUTPUTCLASS section in xorg.conf(5) for more details.

xfree86: Make driver matching consistent

Most of the driver enumeration functions take an array and a maximum number of entries that they are allowed to fill in. Upon success, they return the number of entries filled in. This allows them to be easily used to consecutively.

One exception is the xf86MatchDriverFromFiles() function, which doesn't return a value, so callers have to manually search the array for the first empty entry.

This commit modifies the xf86MatchDriverFromFiles() to behave the same way as others, which makes it easier to deal with.

dri2: Invalidate DRI2Buffers upon SetWindowPixmap updates

When transitioning to a redirected or unredirected Window, the Composite layer modifies the Window's Pixmap. However, the DRI2Buffer for the Drawable is still pointing to the backing bo of the old Pixmap with the result that rendering goes astray.

This now also effects DRI2 Drawables that are touched by PresentPixmap.

present: restore screen pixmap when aborting a flip

If a 2D application is started on top of a fullscreen 3D application, which is flipping, then we need to stop flipping and restore the root window, and possibly the flip window, to using the screen pixmap. Normally this would be done as part of an unflip. However, in the case that there is a pending flip there is no mechanism to abort so the unflip is deferred until the pending flip completes. This provides a window of opportunity for the 2D application to draw to the wrong pixmap.

Restore the screen pixmap at the point a pending flip is marked as aborted, thus avoiding this issue.

dix: fix up coordinate scaling when external monitors are present

The goal of all this is to get an x/y motion reflecting the motion on the device, i.e. a circle on the device is a circle on the screen.

This is currently done by scaling the y coordinate depending on the screen ratio vs device ratio. Depending on that ratio the movement on the y axis may be accelerated (ratio < 1) or slowed (ratio > 1). This leads to the weird effect that changing the screen ratio by plugging a new monitor changes the speed of the touchpad.

Use a different algorithm: calculate the physical movement on the device, map that to the same-ish distance on the screen, then convert that back into a
device-specific vector. This way we get the same mapping regardless of the current screen dimensions.

Since the pointer accel code doesn't take device resolution into account, make sure we apply our crazy mapping before we accelerate. This way we accelerate resolution-independent.

  glamor: Share code for put_image handling.

  The difference between the two is that XF86 has the clip helper that lets you upload less data when rendering video that's clipped. I don't think that's really worth the trouble, especially in a world of compositors, so I've dropped it to get to shared code.
It turns out the clipping code was broken on xf86-video-intel anyway. To reproduce, run without a compositor, and use another window to clip the top half of your XV output on the glamor XV adapter: the rendering got confused about which half of the window was being drawn to.

glamor: Add accelerated stipple support

This copies the stipple to a 8bpp pixmap and uses that to paint the
texture from.

v2: Create deep stipple pixmap without GLAMOR_CREATE_FBO_NO_FBO

v3: Fix stipple origin sign (matches tiles now). Track changes
to original stipple with damage. This isn't required by the
X spec, but java appears to depend on it, so we'll just do it.
When Glamor switches to 8bpp bitmaps, we'll be able to render
directly from them and not need this anymore.

v4: Review comments from Eric:
* Remove stray whitespace change
* Avoid "large" pixmap for stipple by using GLAMOR_CREATE_NO_LARGE
* Wrap to 80 columns

v5: Don't crash when stipple damage tracker is destroyed

The stipple damage tracker is automatically destroyed when the
associated stipple pixmap is destroyed. When this happens, just
clear the pointer from the GC rather than calling
glamor_invalidate_stipple; that function would call
DamageUnregister on the now invalid stipple damage pointer and
crash.

glamor: Add glamor_program based 0-width dashed lines

This makes sure the pixelization for dashed lines matches non-dashed
lines, while also speeding them up.

v2: Switch to glamor_make_current

v3: Create dash pattern pixmap without GLAMOR_CREATE_FBO_NO_FBO

v4: Adopt suggestions from Eric's review:

- Drops power-of-two alignment of our line vertex data, simplifying
  the code.

- Stops reading from the VBO. While on keithp's and my machines the
  VBO is mapped cached, on many implementations it will be mapped WC,
  making those reads extremely expensive.

- Style fixes (line wrapping, spaces around operators).

v5: Adopt suggestions from Markus' review:

- Use max when computing zero-width dashed line length.

  Don't open code max here.

- Embed CoordModePrevious into VBO writing for dashed lines
Instead of pre-computing the coord mode previous results, just embed this in the loop which fills the vertex buffer. Saves re-writing the request buffer, and shortens the code a bit.

v6: Export glamor_destroy_gc for UXA

UXA needs to call glamor_destroy_gc from its GCFuns, so export it.

mi: don't process events from disabled devices (#77884)

Once a device is disabled, it doesn't have a sprite pointer anymore. If an event is still in the queue and processed after DisableDevice finished, a dereference causes a crash. Example backtrace (crash forced by injecting an event at the right time):

(EE) 15: ? (?+0x29) [0x29]

xf86VTSwitch() calls ProcessInputEvents() before disabling a device, and DisableDevice() calls mieqProcessInputEvents() again when flushing touches and button events. Between that and disabling the device (which causes new events to be refused) there is a window where events may be triggered and enqueued. On the next call to PIE that event is processed on a now defunct device, causing the crash.

The simplest fix to this is to discard events from disabled devices. We flush the queue often enough before disabling that when we get here, we really don't care about the events from this device.

present: Queue flips for later execution

When a flip (or unflip) is pending and a flip request comes in, leave it queued until the pending flip completes and then execute it.

This fixes a bug where an application submitting back-to-back present_pixmap requests for sequential frames would alternate between flipping and copying as the pending flip would cause the new present_pixmap request to not use a flip.

dix: fix pixmap leak on server reset

The server is leaking a pixmap (created by CreateDefaultStipple()) on reset. The leak is caused by some X Server graphics contexts not being freed on reset by the machine independent cursor code in the server, which in turn is caused by the cursor cleanup code (miSpriteDeviceCursorCleanup()) not being called.
Ensures the DeviceCursorCleanup() function is called when the associated
input device is closed on server reset.

glx: Require at least one True/DirectColor visual

Mesa no longer supports rendering to anything less. GLX 1.2 requires that the server advertise at least one GLX visual. GLX 1.3 and 1.4 are more subtle: they require at least one fbconfig capable of window rendering, and _also_ require that window-capable fbconfigs have a non-zero value for the GLX_VISUAL_ID. In either case we should refuse to init GLX if there's not at least one GL-capable visual on at least one screen.

Xi: block SIGIOs while copying device classes around

I've been seeing sporadic (anywhere from once every few days to 3-4 times a day) crashes and freezes in X. The problematic behaviour isn't always the same, but I chose a particular incident to debug, and found that X was segfaulting in updateMotionHistory, on line 575 of dix/getevents.c.

After some further investigation, I found that the bug was being triggered when a SIGIO was received in DeepCopyPointerClasses, between the AllocValuatorClass call (line 540) and updating the to->valuator pointer (line 545). AllocValuatorClass calls realloc() on to->valuator, so between these lines, it's not guaranteed to point to allocated memory.

It seems the SIGIO handler is calling updateMotionHistory, which is reading the memory pointed to by to->valuator and getting a wrong value for last_motion, which updates buff to point to wildly the wrong place and thus generates a segfault when a memcpy() is done into buff.

I am attaching a patch which I've been running on that machine for the past three days, and haven't yet observed any more crashing or freezing behaviour. The patch simply calls OsBlockSIGIO while DeepCopyDeviceClasses is in progress, as the state of the X server's device data structures is not guaranteed to be in a consistent state during that time.

os: automatically switch to sigsafe logging when needed

If we're smart enough to warn, we should be smart enough to just pass it through to the right function. Worst case we lose some formatting specifiers which pnprintf will complain about anyway. And in most cases it won't matter.
This requires renaming pnprintf to vpnprintf and changing the size_t to int to be compatible with Xvsnprintf. pnprintf is internal only, the others are exported API so we can't change them as easily.

Date:   Fri Apr 25 20:25:56 2014 -0700

glamor: Work around libXfont when it fails to use defaultChar

GetGlyphs is supposed to always return the full list of characters
when there is a default character available. However, if an
application opens a 16-bit two dimensional font and then draws with
8-bit requests, the bitmapGetGlyphs function in libXfont versions up
through 1.4.7 will return zero glyphs if there is no 0th row.

While this is a bug in libXfont and should be fixed there, it's easy
to protect glamor from it by simply falling through to the case that
handles GetGlyphs failures for fonts without a default character.

systemd-logind: let the logind code decide whether to close a fd

We can only request one fd per device from systemd-logind. If a fd is re-used by the same device, releasing the fd from one device doesn't mean we can close it. The systemd code knows when it's really released, so let it close the fd.

Test case: xorg.conf section for an input device with hotplugging enabled. evdev detects the duplicate and closes the hotplugged device, which closes the fd. The other instance of evdev thinks the fd is still valid so now you're playing a double lottery. First, which client(s) will get the evdev fd? Second, which requests will be picked up by evdev and which ones will be picked up by the client? You'll never know, but the fun is in finding out.

Date:   Thu Apr 3 11:19:14 2014 -0300

xfree86: add new key MatchSeat to xorg.conf sections "Device", "Screen", and "ServerLayout"

This patch introduces a new key MatchSeat in xorg.conf (also applies to
any .conf file in xorg.conf.d). It will allow targeting a given
"Device", "Screen", and/or "ServerLayout" section to a particular
seat only (specified by option "-seat" in X server command line),
so that other seats won't be affected.

Without this patch, one needs to write a separate xorg.conf.custom
file and pass it to X server via "-config" option, if one wants that
these settings only apply for the right seat. However, in some cases,
this solution is undesirable or even impossible (e.g. when using GDM,
which doesn't allow X server command line customization).

Example file (/etc/X11/xorg.conf.d/seat1.conf), which would be ignored
by X server unless it was started with "-seat seat1" option:

Section "Device"
  Identifier "card0"
Driver "nvidia"
Option "NoLogo" "True"
MatchSeat "seat1"
EndSection

xfree86: allow fallback to PCI bus probe for graphics devices on non-seat0 X servers (#66851)

Currently non-seat0 X servers only probe platform bus for graphics devices, which is OK for most KMS-compliant drivers. However, for non-KMS drivers (like NVIDIA proprietary ones), graphics devices can't be reached by platform bus probe, resulting in a "No devices detected" error.

This patch allows a fallback to PCI bus probe for non-seat0 X servers in case no platform bus graphics device is found.

xfree86: int10: Fix build on ARM

Commit 7353ec7cb66c235b03e59e35425201429c83ee72 "xfree86: Switch int10 code to stdint types" uses designated initializers to setup the fields of the X86EMU_pioFuncs.

This breaks compilation on ARM, since out{b,w,l}() are redefined using the preprocessor and therefore cause the compiler to complain about non-existent fields being assigned to.

It seems like the compiler.h header that contains these redefinitions isn't actually needed in xf86x86emu.c, so the easiest "fix" is to not include it.

Add a command line argument for disabling indirect GLX.
The attack surface for indirect GLX is huge, and it's of no use to most people (if you get an indirect GL context, you're better served by a immediate X error than actually trying to use an indirect GL context and finding out that it doesn't support doing anything you want, slowly). This flag gives you a chance to disable indirect GLX in environments where you just don't need it.

I put in both the '+' and '-' arguments right now, so that it's easy to patch the value to change the default policy.

glamor: Fix coordinates handling for composite source/mask pictures

There were actually two issues with the original code I believe, the first is that the call to glamor_convert_gradient_picture wasn't properly referencing the coordinates of the source/mask pictures. The second, was that the updated references (x_temp/y_temp) were also improperly set, they should always be 0 because the temp pictures are new ones that start at (0, 0). The reason it worked in certain cases and it didn't in others (notably the tray icons) was due to the numbers working out based on the call to glamor_composite. In the cases that it did work extent->x1 would equal x_dest and extent->y1 would equal y_dest, making it so what was actually passed into glamor_convert_gradient_picture and the settings for x_temp/y_temp were correct. However, for the case when extent->x1 wouldn't equal x_dest and extent->y1 wouldn't equal y_dest (for example with the tray icons) then the wrong parameters get passed into glamor_convert_gradient_picture and x_temp/y_temp are set improperly.

Fixes issues with tray icons not appearing properly in certain cases.

Author: Eric Anholt <eric@anholt.net>
Date:   Wed Apr 9 11:25:32 2014 -0700

glx: Refactor DRI2CopyRegion calls.
I needed to add some code to each one, so it's a good time to make a helper func.
glx: Unconditionally clear lastGLContext on loseCurrent().

This hook calls unbindContext in the DRI driver interface, which unsets the dispatch table, regardless of whether the context argument was the current one or not.

glx: Move GLX MakeCurrent lastGLContext updates next to makeCurrent().

We want to make sure that lastGLContext is set correctly during makeCurrent, because we may have recursive GL context changes in the DRI2 interfaces due to glamor.

glx: Move the GLX variable caching what GL context is current to dix.

GLX is trying to track whether the context it wants is current, to avoid the glFlush() (and the rest of the overhead) that occurs on all MakeCurrent calls. However, its cache can be incorrect now that glamor exists. This is a step toward getting glamor to coordinate with GLX.
commit f12221cbd8ff33070fa2ca086bcef7ed32115f0e

commit e924034269532979f1e88947ee9c33d30461edae
Author: Eric Anholt <eric@anholt.net>
Date:   Mon Apr 21 10:56:38 2014 -0700

glamor: Fix accelerated rendering of GTK's ARGB vs xBGR composites.

There is some complicated code to support tweaking the format as we upload from a SHM pixmap (aka the GTK icon cache), but if we weren't sourcing from a SHM pixmap we just forgot to check that the formats matched at all.

We could potentially be a little more discerning here (xRGB source and ARGB mask would be fine, for example), but this will all change with texture views anyway, so just get the rendering working for 1.16 release.

Fixes the new rendercheck gtk_argb_xbgr test.

v2: Squash in keithp's fix for checking that we have a non-NULL pixmap, and reword the comment even more.

xfixes: Forbid manipulating clip for source-only pictures (#28968)

Just throw BadPicture instead of crashing. It's not currently a
meaningful thing to do anyway, RenderSetPictureRectangles would error if
you tried (which this patch changes to BadPicture as well for
consistency). The problem with trying to do it is if the clip is
specified as a pixmap then we try to convert it to a region, and
->BitmapToRegion requires a ScreenPtr, and source-only pictures don't
have one.

I can imagine a use for client clip on source-only pictures, so if we
really wanted to allow this, probably the way forward is to always store
the clip as a region internally, and when setting the clip _from_ a
 pixmap, look up BitmapToRegion relative to the pixmap not the picture.
But since clearly nobody can be relying on it working...

shadowfb: Port to miext/damage (#31303, #65547)

Somewhat shocking how much simpler this is, isn't it? We no longer need
 to wrap the screen or GC or Picture, because damage does it for us,
 which is doubly great since the old shadowfb code didn't wrap _enough_
 things (border updates and Render glyphs, at least). The only real
difference now between this and shadow is a) shadow will let you track
arbitrary pixmaps, and b) shadow's update hook runs off the BlockHandler
whereas shadowfb is immediate.

Tested on nouveau.

DRI2SwapBuffers: Fix uninitialized target SBC.

Fixes Piglit test "swapbuffersmsc-return swap_interval 0".

Ensure that *swap_target gets initialized on any 'return Success' path, even if the swap request can't be completed by the driver and the server falls back to a simple blit. That path can also be triggered by setting swap_interval to 0, which disables sync to vertical retrace.

We originally found this bug because for some reason SDL2 automatically sets swap_interval to 0, when we were trying to test OML_sync_control in an SDL2 test application. We then discovered that the above-mentioned Piglit test has been failing for the same reason since it was
DRI2SwapBuffers: Don't reuse swap_target variable.

swap_target is an out-parameter that needs to be set to the value that SBC will take on after this SwapBuffers request completes.

However, it was also being used as a temporary variable to hold the MSC at which the SwapBuffers request got scheduled to occur. This confusion makes it harder to reason about whether swap_target is being set correctly for its out-parameter usage. (Hint: It isn't.)

For the latter use, it makes more sense to use the existing target_msc variable, which already has the right value unless target_msc, divisor, and remainder are all 0, in which case we can set it using swap_interval as usual.

configure.ac: Remove check for WAYLAND_SCANNER_RULES

This makes configure fail if the wayland autoconf macros aren't found. We don't need the scanner for shm-only xwayland so just drop this line for now.

commit 3119aae80782b7ff5613c719fbcc8a01feab1134
Author: Gaetan Nadon <memsize@videotron.ca>
Date: Fri Apr 4 14:59:21 2014 -0400

test: create a link to the generated hw/xfree86/sdksyms.c at build time

Automake 1.14 gives us warning about source code specified in _SOURCES that comes from directories other than the current one. It suggests to enable the subdir-objects feature which only supports code in sub directories.

The test directory needs source from hw/xfree86 which is neither under test nor under a sub directory of test. In 1.14 we get a warning, in 2.0 it will break as it will overwrite the object code in xfree86.

The solution in this case is to create a link to hw/xfree86/sdksyms.c at build time. It's just like any other built source file.

There are no links created in git.

Add a return value to load_cursor_argb() to allow it to report failure

load_cursor_argb() may need to be able to fail and have the server fall back to a software cursor in at least the following circumstances.
1) The hardware can only support some ARGB cursors and this does not just depend on cursor size.
2) Virtual hardware may not wish to pass through a cursor to the host at a particular time but may wish to accept the same cursor at another time. This patch adds a return value to the API and makes the server do the software fall-back on failure.

Xwayland DDX

Started out as an Xorg module to be used from Xorg drivers to let Xorg run under a wayland server. The idea was to be able to reuse the 2D acceleration from the Xorg driver. Now with glamor being credible, a better plan is to just make Xwayland its own DDX, similar to Xwin and Xquartz. This is a much better fit, as much of the code in the original approach had to hack around Xorg doing Xorg things like take over the VT, probe input devices and read config files. Another big win
is that Xwayland doesn't need to be setuid root.

The Xwayland support for DRI3, Glamor and render nodes was done by Axel Davy <axel.davy@ens.fr>, who also did a lot of work on the rebase to the Xwayland DDX.

    Revert "xkb: ProcesssPointerEvent must work on the VCP if it gets the VCP"

This was the wrong fix to the problem, and it triggered a change in XKB
behavior: previously a button event would unlock a latched modifier, now it
doesn't anymore.
https://bugs.freedesktop.org/show_bug.cgi?id=73155

Note that the new behavior is is strictly spec compliant but we've had the
other behavior for a long time so we shouldn't break it.

The bug this patch originally fixed was a null-pointer dereference when
releasing button events on server shutdown. This was addressed by the commit
below, so the need for this patch has gone away anyway.

dri3: Allow asynchronous implementation for dri3_open

By passing the client pointer to the dri3_open implementation, we allow the clients to implement the open callback asynchronously. If the client ignore count is positive after returning from dri3_open, we assume that authentication is in progress and doesn't send the reply. The code to send the reply is moved into a helper function, which the implementation can call upon receiving its authentication reply.

composite: Add exception mechanism for implicit redirection policy

Normally composite will decide to add implicit redirection when a window with an alternate visual is a parent of a window with a regular visual or vice versa. This uses extra pixmap memory and incurs an extra copy. This exception mechanism provides a way for a DDX to override this if the DDX knows that its acceleration architecture will render correctly.

The relevant case is that of an RGB window reparented into a ARGB parent frame window. If the DDX knows that the acceleration architecture in use will pad the alpha channel to opaque when rendering to the RGB window, the implicit redirection can be avoided.

This patch adds a new composite function:

   CompositeRegisterImplicitRedirectionException()

which lets a DDX register a pair of parent and child window visuals, that will not be implicitly redirected even if the normal policy would have made that choice.

Make XYToWindow a screen function

This allows DDXen to override the window picking to account for native windows not seen by the X server. The bulk of the picking logic is exposed as a new helper function, miSpriteTrace(). This function completes the sprite trace filled out by the caller, and can be set up to start the search from a given toplevel window.

mi: Hush extension initialization (#75870)

Printing these as ErrorF is fairly obnoxious, since it means the non-hardware servers now spew stuff to the console for entirely routine events. And actually, printing these at all is fairly obnoxious, since a) we're printing a line for every extension, whether it's enabled or not, and b) we're not actually initializing the extension at this point.

fb: fix fast-path blt detection

The width parameter is used to disable the blit fast-path (memcpy) when
source and destination rows overlap in memory. This check was added in [0].

Unfortunately, the calculation to determine if source and destination
lines overlapped was incorrect:
(1) it converts width from pixels to bytes, but width is actually in
    bits, not pixels.
(2) it adds this byte offset to dst/srcLine, which implicitly converts
    the offset from bytes to sizeof(FbBits).

Fix both of these by converting addresses to byte pointers and width
to bytes and doing comparisons on the resulting byte address.

For example:
A 32-bpp 1366 pixel-wide row will have
width = 1366 * 32 = 43712 bits
bpp = 32
(bpp >> 3) = 4
width * (bpp >> 3) = 174848 FbBits
(FbBits *)width => 699392 bytes

So, "careful" was true if the destination line was within 699392 bytes,
instead of just within its 1366 * 4 = 5464 byte row.

This bug causes us to take the slow path for large non-overlapping rows
that are "close" in memory. As a data point, XGetImage(1366x768) on my
ARM chromebook was taking ~140 ms, but with this fixed, it now takes
about 60 ms.
XGetImage() -> exaGetImage() -> fbGetImage -> fbBlt()

Author: Adam Jackson <ajax@redhat.com>
Date:   Thu Apr 21 16:37:11 2011 -0400

fb: Fix memcpy abuse

The memcpy fast path implicitly assumes that the copy walks
left-to-right. That's not something memcpy guarantees, and newer glibc
on some processors will indeed break that assumption. Since we walk a
line at a time, check the source and destination against the width of
the blit to determine whether we can be sloppy enough to allow memcpy.
Having done this, we can remove the check for !reverse as well.

v3: Convert to byte units

This first checks to make sure the blt is byte aligned, converts all of the data to byte units and then compares for byte address range overlap between source and dest.

Glamor has a mode where pixmaps will be constructed from numerous
small FBOs. This allows testing of the tiled pixmap code without needing to create huge pixmaps.

However, the render glyph code assumed that it could create a pixmap large enough for the glyph atlas. Instead of attempting to fix that (which would be disruptive and not helpful), I've added a new pixmap creation usage, GLAMOR_CREATE_NO_LARGE which forces allocation of a single large FBO.

Now that we have pixmaps with varying FBO sizes, I then went around and fixed the few places using the global FBO max size and replaced that with the per-pixmap FBO tiling sizes, which were already present in each large pixmap.

Xephyr has been changed to pass GLAMOR_CREATE_NO_LARGE when it creates the screen pixmap as it doesn't want to deal with tiling either.

mi: miPutImage with XYPixmap failed at depth 32 on 64-bit machines

The X server still has 'unsigned long' in a few places to hold 32 bit values. One of those is in miPutImage where it's holding the temporary planemask for XYPixmap format images.

It computed the highest plane in the source image with 1 << (depth - 1). On 64-bit machines, taking that value and storing it in an unsigned long promotes it to a signed 64-bit value (0xffffffff80000000).

Then, it loops over that value, shifting one bit right each time, waiting for it to go to zero. That takes 64 iterations, and ends up with some mystic planemask values *and* walking off the end of the source image data and out into space.

A simple cast is all that is required to compute the correct initial plane mask (0x0000000080000000), at which point the loop operates correctly once again.

Checking the fbPutImage code, I note that this same bug was fixed in 2006 by Aaron Plattner in commit f39fd4242902eaa862321d39337f429dd14ebacf

commit dc48bd653c7e1013e2d69e3f59ae3ebc0e893473
systemd-logind: Monitor systemd-logind going away

When we're using server managed-fds through systemd-logind, systemd-logind *must* keep running while we are using it, as it does things like drmSetMaster and drmDropMaster for us on vt-switch.

On a systemd-logind restart, we cannot simply re-connect since we will then get a different fd for the /dev/dri/card# node, and we've tied a lot of state to the old fd. I've discussed this with the systemd people, and in the future there may be a restart mechanism were systemd-logind passed fds from the old logind to the new logind. But for now there answer is simply: "Don't restart systemd-logind", and there never really is a good reason to restart it.

So to ensure unpleasentness if people do decide to restart systemd-logind anyways (or when it crashes), monitor logind going away and make this a fatal error. This avoids getting a hard-hung machine on the next vt-switch and will hopefully quickly educate users to not restart systemd-logind while they have an X session using it active.

commit d9fdac5faa648a10653e18dcb602646f3e22e522
Merge: 99bee6c054 0e5d2996ac
Default font path: remove the check for ${sysconfdir}/X11/fontpath.d

The location ${sysconfdir}/X11/fontpath.d is unknown at configuration time (only at make time) as evidenced by the configuration output:

    checking for ${prefix}/etc/X11/fontpath.d... no

Unlike font-util for the X fonts, there is no mechanism to query where fontpath.d is. Fedora have chosen /etc/X11 and others have followed, but this is not a standard. It might also be installed at another location, it may or may not be under the xserver installation prefix. We just don't know. Debian does not use this at all.

Distros are using --with-default-path when they support fontpath.d, so they never relied on the server default as it never worked.

The patch essentially is a noop, which leaves the door open for anyone who could potentially provide a reliable implementation of choosing fontpath.d when applicable.

Date: Wed Sep 7 14:00:56 2011 +0100

hw/xwin: Minimize redraw events after resizing/moving windows in multiwindow mode

In multiwindow mode the modal moving/resizing of windows causes a lot of redraw events to be sent to the X clients after the user releases the mouse button.

During the moving/resizing client windows are not redrawn as long as the mouse button is pressed, but all redraw/resizing events are queued and executed step after step after the moving/resizing ends.

Some clients collect and combine multiple redraw or resizing events, other
clients (e.g. xterm) simply execute each redraw or sizing event.

The enclosed patch minimizes the events for clients to only one event after the
user releases the mouse button to end the moving/resizing. This improves the
user experience and reduces strange screen flickerings, especially on slow
platforms.

The enclosed patch modifies winmultiwindowwndproc.c such that the windows events
WM_ENTERSIZEMOVE and WM_EXITSIZEMOVE that are sent by Windows when the modal
window resizing/moving begins or ends are considered. Only after WM_EXITSIZEMOVE
is the redraw/resizing executed.

commit 4c9a20072552c52b37d3bd73e7a7e9b9cb8b4993
Author: Eric Anholt <eric@anholt.net>
Date:   Fri Jan 10 23:43:09 2014 +0800

glamor: Allow nested mapping of pixmaps.
The common pattern is to do nested if statements making calls to prepare_access() and then pop those mappings back off in each set of braces. Some cases checked for src == dst to avoid leaking mappings, but others didn't. Others didn't even do the nested mappings, so a failure in the outer map would result in trying to umap the inner and failing.

By allowing nested mappings, we can fix both problems by not requiring the care from the caller, plus we can allow a simpler nesting of all the prepares in one if statement.

v2: Add a comment about nested unmap behavior, and just reuse the glamor_access_t enum.

    config_odev*: Use XNF alloc functions

    config_odev* functions are called in code-paths were we already use XNF* functions in other places, so which are not oom safe already.

    Besides that oom is something which should simply never happen, so aborting when it does is as good a response as any other.

    While switching to XNF functions also fixup an unchecked strdup case.

    Note the function prototypes are kept unchanged, as they are part of the server ABI.
Xorg: Add a suid root wrapper

With the recent systemd-logind changes it is possible to install the Xorg binary without suid root rights and still have everything working as it should *if* the user only has cards which are supported by kms.

This commit adds a little suid root wrapper, which is a bit weird, first we strip the suid-root bit of the Xorg binary, and then we add a wrapper?

The function of this wrapper is to see if a system still needs root-rights, if it does not (it supports kms and the kms drivers are properly loaded), then it will immediately drop all elevated rights before executing the real Xorg binary. If it finds (some) cards which don't support kms, or no cards at all, then it will execute the Xorg server with elevated rights so that ie the nvidia binary driver and the vesa driver can keep working normally.

To make it possible for security conscious users who don't need the root rights to completely remove the wrapper, Xorg is started in a 3 step process when the wrapper is enabled during build time:

1) A simple shell script which checks if the wrapper is there, if it is it executes the wrapper, if not it directly executes the real Xorg binary

2) The wrapper gets executed, does its checks, normally drops all elevated rights and then executes the real Xorg binary

3) The real Xorg binary does its thing

This allows distributions to put the wrapper binary in a separate package, and will allow users to remove this package. IE the plan with Fedora is to make "legacy" drivers depend on the wrapper pkg, and since our default install contains some legacy drivers it will be part of the default install, but users can later yum remove it (which will also automatically remove the legacy driver packages as those won't work without it anyways).

The wrapper is loosely modelled after the existing Debian Xwrapper, it uses the same config-file + config-file format, and also allows restricting Xserver execution (through the wrapper) to console users only.

There also is a new needs_root_rights config file directive, which can
be used to override the auto-detection the wrapper does.

Hopefully this will allow Debian to replace their own wrapper with this upstream one.

v2:
- Add a simple comment about what the function does.
- Use get_vbo_space()'s return in trapezoids, instead of dereffing glamor_priv->vb (by Markus Wick).
- Fix the double-unmapping by moving put_vbo_space() outside of flush_composite_rects().
- Remove the rest of the composite_vbo_offset usage, and just always use get_vbo_space()'s return value.

v3:
- Fix failure to put_vbo_space in traps when no prims were generated.
- Unbind the VBO from put_vbo_space(). Keeps callers from forgetting to do so.

v4:
- Split out some changes into the previous 3 commits while trying to track down a regression.
- Fix regression due to rebase fail where glamor_priv->vbo_offset wasn't incremented.

v5:
- Fix GLES2 VBO sizing.
- Add a comment about resize behavior.
- Move glamor_vbo.c init code to glamor_vbo.c from
glamor_render.c. (Derived from Markus's changes, but the GLES2 fix dropped almost all of the code in the functions).

v6:
- Drop the initial BufferData on GLES2 (it happens at put() time).
- Don't forget to set vbo_offset to the size on GLES2.
- Use char * instead of void * in the cast to return the vbo_offset.
- Resize the default FBO to 512kb, to be similar to previous behavior. +1.66124% +/- 0.284223% (n=679) on aa10text.

systemd-logind: Fix vt-enter not working when using a legacy video driver

If there is only a single non kms video device (tested with the vesa driver), then we will never get a resume signal for a drm node, so also call vtenter
when we get a resume for an input device.

Notes:
1) vtenter checks if it is ok to do the vtenter, so if there are kms video
devices the calls for input device resumes are a nop
2) This assumes that there will always be at least one server event fd
supporting input device. Since all non legacy input-drivers will be patched
to supported server fds this seems a safe assumption.

Author: Andrew Eikum <aeikum@codeweavers.com>
Date:   Mon Dec 30 09:15:41 2013 -0600

dix: Clear any existing selections before initializing privates

If there is a selection left over from a previous execution of the
main loop, and that selection has privates allocated for it, the X
server will crash. This is because dixResetPrivates() resets the
privates refcounts to zero without accounting for the reference held
by the selection object. When the selection is then deleted in
InitSelections() after the call to dixResetPrivates(), the refcount
for its privates type goes negative and bad things happen.

To fix this, we should delete any existing selections before calling
dixResetPrivates(). This will properly release the selection's
privates and avoid the crash.
A more thorough description of the problem and a test case to reproduce the crash is available at a previous mail: "Negative Selection devPrivates refcount?"

xf86Xinput: Modify API for server-managed fd support

With systemd-logind support, the xserver, rather than the drivers will be
responsible for opening/closing the fd for input devices.

This commit adds a new capabilities field to the InputDriverRec and a
XI86_DRV_CAP_SERVER_FD flag for drivers to indicate that they support server
managed fds.

This commit adds a new XI86_SERVER_FD flag to indicate to drivers when the
server is managing the fd and they should not open/close it. Note that even
if drivers declare they support server managed fds there is no guarantee they
will actually get them.
Since this changes the input driver ABI, this commit bumps it.

systemd-logind tracks devices by their chardev major + minor numbers, since we are breaking ABI anyways also add major and minor fields for easy storage / retrieval of these.

linux: xf86OpenConsole: Don’t detach from controlling tty when it is our vt

Detaching from our controlling tty makes little sense when it is the same as the vt we’re asked to run on. So automatically assume -keeptty in this case.

This is useful to do because when not running as root the server can only make various VT related ioctls when it does not detach from the tty.

V2: Add check for link from output to crtc before optimizing out a CrtcSet call

The function RRCrtcSet call checks to see if the config being set is already configured, but, doesn't check that the selected outputs are connected to the crtc before skipping. This means that the following sequence will omit the final CrtcSet call to the driver:

CRTC c1 connect to output o
CRTC c2 connect to output o
CRTC c1 connect to output o

This change adds the check to ensure that each of the calls are made to the driver.

Fix test/os to work on Solaris

Due to bad decisions made decades ago at AT&T, on SVR4 OS'es the signal() function resets the signal handler before calling the signal handler (equivalent to sigaction flag SA_RESETHAND). This is why the X server has a OsSignal() helper function in os/utils.c that uses the portable POSIX sigaction function to provide BSD/Linux semantics in a signal() style API, so we switch to use that in this test case, allowing it to pass on Solaris.

modesetting: try and use hotspot cursor support
modesetting: move closing fd to after we check outputs

On something like cirrus, start X, then attempt to start a second X while the first is running, if fbdev is installed it'll fail hard.

Xi: check for invalid modifiers for XI2 passive grabs

The other values are checked correctly, but if a modifier was outside the allowed range, it would go unnoticed and cause a out-of-bounds read error for any mask equal or larger than 256. The DetailRec where we store the grab masks is only sized to 8 * sizeof(Mask).

test: remove source file from hashtabletest LDADD

LDADD is for libraries and not for source code.

Introduced in commit: ccb3e78124fb05defd0e9b438746b79d84dfe3ae

The code previously tried to compute the offset of a field in the
valuator by subtracting the address of the valuator from the _value_ of the field (rather than the field's address). The correct way to do it would have been (note the &'s):

```c
assert(((void *) &v->axisVal - (void *) v) % sizeof(double) == 0);
assert(((void *) &v->axes - (void *) v) % sizeof(double) == 0);
```

That's essentially what the offsetof() macro does. Using offsetof() has the added benefit of not using void pointer arithmetic and therefore silencing a warning on some compilers.

glamor: Fix linking of the gradient shaders on GLES2.

GLES2 sensibly doesn't allow you to attach multiple shaders for the same stage to a single program. This means we have to attach the whole thing in one glShaderSource call.
glamor: Don't bother keeping references to shader stages for gradients.
They never get reattached to any other program, so saving them to unreference later is a waste of code.

glamor: Fix typo in setting v_position's attrib location.
Assuming it was the first attribute assigned by the GL, it would have ended up with location 0 anyway.

glamor: Move shader precision stuff from build time to shader compile time.
This is the last desktop-versus-ES2 build ifdef in core glamor.

glamor: Unifdef the picture-format-to-format-and-type functions.
glamor: Move glamor_get_tex_format_type_from_pictformat to a .c file.

A pair of 150 lines of inlined switch statements in a header file is crazy.

We only ask for GL_RGB on desktop GL as far as I can see, but now if GLES2 did happen to ask for GL_RGB it would return a cache index instead of -1.

glamor: Pass pixmaps around to unifdef glamor_iformat_for_depth().

v2: Just pass in the PicturePtr to glamor_pict_format_is_compatible() (suggestion by keithp)
 glamor: Add a screen argument to drop an ifdef from glamor_set_alu().

dix: fix button state check before changing a button mapping

dev->button->down is a bitmask, not a normal array. Use the helper function to
check, we technically allow the mapping to change after the physical button
has been pressed (but not yet processed yet), so only check BUTTON_PROCESSED.

From XSetPointerMapping(3):
"If any of the buttons to be altered are logically in the down state,
XSetPointerMapping returns MappingBusy, and the mapping is not changed."

xfree86: Keep a non-seat0 X server from touching VTs (#71258)

Updated patch following Hans de Goede's advice.

If -seat option is passed with a value different from seat0, X server won't call xf86OpenConsole().

This is needed to avoid any race condition between seat0 and non-seat0 X servers. If a non-seat0 X server opens a given VT before a seat0 one which expects to open the same VT, one can get an inactive systemd-logind graphical session for seat0.

This patch was first tested in a multiseat setup with multiple video cards and works quite well.

I suppose it can also make things like DontVTSwitch and -sharevts meaningless for non-seat0 seats, so it may fix bug #69477, too.

Fixes: https://bugs.freedesktop.org/show_bug.cgi?id=71258
        https://bugs.freedesktop.org/show_bug.cgi?id=69477 (maybe)

Xi: fix modifier offset in XIPassiveGrab swapping function

The request is followed by mask_len 4-byte units, then followed by the actual modifiers.

Also fix up the swapping test, which had the same issue.
dix: Praise clients which haven't run for a while, rather than idle clients

A client which is ready, but hasn't run for a while, should receive the same benefit as one which has simply been idle for a while. Use the smart_stop_tick to see how long it has been since a client has run instead of smart_check_tick, which got reset each time a client was ready, even if it didn't get to run.

---

The signal formatting tests intentionally include code which generates warnings with the current X server warning flags. Turn the compiler warnings off.

---

Declare 'XID id' local to each scope it is used in, rather than having the first use be a function-wide declaration.
test/xi2: Clean up -Wshadow warnings

If EAGAIN == EWOULDBLOCK, only need to check errno for one of them

Solaris <sys/errno.h> has:
#define EWOULDBLOCK EAGAIN
so checking (errno == EAGAIN || errno == EWOULDBLOCK) is overkill.

This leads cppcheck 1.62 to complain:
[xserver/os/io.c:365] -> [xserver/os/io.c:365]: (style) Same expression on both sides of '||'.
[xserver/os/io.c:941] -> [xserver/os/io.c:941]: (style) Same expression on both sides of '||'.

This quiets it, and reduces the number of calls Solaris Studio cc
generates to the __errno() function to get the thread-specific errno value.

  libtool: bump minimum required version to 2.2

  LT_PREREQ([2.2])
  LT_INIT
AC_CONFIG_MACRO_DIR([m4]) is recommended to locate local macros, which is fully used starting automake 1.14.

ACLOCAL_AMFLAGS in Makefile.am is deprecated since automake 1.14. The comment is to prevent developers from removing the statement as suggested in 1.14 which would break earlier versions.

Automake 1.14 is already in use by many. This patch works on versions prior and post 1.14

Author: Peter Hutterer <peter.hutterer@who-t.net>
Date: Mon Jan 13 17:00:23 2014 +1000

os: restrict display names to digits

We call atoi() on the server's display to get the socket but otherwise use the unmodified display for log file name, xkb paths, etc. This results in Xorg:banana being the equivalent of Xorg :0, except for the log files being in /var/log/Xorg.banana.log. I'm not sure there's a good use-case for this behaviour.

Check the display for something that looks reasonable, i.e. digits only, but do allow for :0.0 (i.e. digits, followed by a period, followed by one or two digits).

Author: Zhigang Gong <zhigang.gong@intel.com>
Date:   Tue Nov 19 15:16:57 2013 +0800

Fixed some compilation warning/error or error checking.

There is one compilation error .cast int to pointer, when built without libgbm, reported by Gaetan Nadon.
And some error checking after memory allocation, reported by Seth Arnold.
There are still some similar issues in the largepixmap implementation.
They are relatively more complicate due to the heavy usage of RegionXXX APIs which may allocate implicitly. Will fix them in the future.

Fallback to pixman when trapezoid mask is big.

The trapezoid generating speed of the shader is relatively
slower when the trapezoid area is big. We fallback when
the trapezoid's width and height is bigger enough.
The big traps number will also slow down the render because
of the VBO size. We fallback if ntrap > 256

Just use the shader to generate trapezoid if PolyMode == Imprecise

The precise mode of trapezoid rendering need to sample the trapezoid on
the centre points of an \((2*n+1)\times(2*n-1)\) subpixel grid. It is computationally expensive in shader, and we use inside area ratio to replace it. The result has some difference, and we just use it if the polymode == Imprecise.

Date:   Fri Jul 20 05:52:43 2012 +0800

Change the trapezoid render to use VBO.

Because some uniform variables need to be set for every trapezoid rendering, we can not use vbo to render multi trapezoids one time, which have performance big loss. We now add attributes which contain the same value to bypass the uniform variable problem. The uniform value for one trapezoid will be set to the same value to all the vertex of that trapezoid as an attribute, then in FS, it is still a constant.

gles2: Fixed the compilation problem and some bugs.
Previous patch doesn't set the offset to zero for GLESv2 path. Now fix it.

This patch also fix a minor problem in pixmap uploading preparation. If the revert is not REVERT_NORMAL, then we don't need to prepare a fbo for it. As current mesa i965 gles2 driver doesn't support to set a A8 texture as a fbo target, we must fix this problem. As some A1/A8 picture need to be uploaded, this is the only place a A8 texture may be attached to a fbo.

This patch also enable the shader gradient for GLESv2. The reason we disable it before is that some glsl linker doesn't support link different objects which have cross reference. Now we don't have that problem.

glamor_glyphs: Don't merge extents for different lists.

If we merge all lists's extent together, than we may have some fail overlap checking. Here is a simple:
The first list has vertical "ABCD". And the second list has two char "EF". When detecting E, it can successfully find it doesn't overlap with previous glyphs. But after that, the original code will merge the previous extent with E's extent, then the extent will cover "F", so when detecting F, it will be treated as overlapped.

We can simply solve this issue by not merge extent from different list. We can union different list's extent to a global region. And then do the intersect check between that region and current glyph extent, then we can avoid that fail checking.

Date: Tue Jul 3 18:24:07 2012 +0800

glamor_copyarea: Use blitcopy if current state is not render.

Practically, for pure 2D blit, the blit copy is much faster than textured copy. For the x11perf copywinwin100, it's about 3x faster. But if we have heavy rendering/compositing, then use textured copy will get much better (>30%) performance for most of the cases.

So we simply add a data element to track current state. For rendering state we use textured copy, otherwise, we use blit copy.

commit 0706423bcfd7a589bab3b41fe9f13d0b636ecdef
Author: Zhigang Gong <zhigang.gong@linux.intel.com>
Date: Tue Jul 3 18:11:12 2012 +0800

glamor_glyphs: Use cache picture to store mask picture if possible.

By default, mask picture is newly created, and each time we need to clear the whole mask picture, and then composite glyphs to the mask picture and then composite the mask picture to destination.

Testing results shows that the filling of the mask picture takes a
big portion of the rendering time. As we don't really need to clear
the whole region, we just need to clear the real overlapped region.

This commit is to solve this issue. We split a large glyphs list to
several lists and each list is non-overlapped or overlapped.

we can reduce the length of overlapped glyphs to do the glyphs_via_mask
to 2 or 3 glyphs one time for most cases. Thus it give us a case to allocate a
small portion of the corresponding cache directly as the mask picture.
Then we can rendering the glyphs to this mask picture, and latter we
can accumulate the second steps, composite the mask to the dest with
the other non-overlapped glyphs's rendering process.
It also make us implement a batch mask cache blocks clearing
algorithm to avoid too frequently small region clearing.

If there is no any overlapping, this method will not get performance gain.
If there is some overlapping, then this algorithm can get about 15% performance
gain.

            glamor_glyphs: Detect fake or real glyphs overlap.

            To split a glyph's extent region to three sub-boxes
            as below.

            left box  2 x h
            center box (w-4) x h
            right box  2 x h

            Take a simple glyph A as an example:

```
*  
___* *___
 *****
*   *
```
The left box and right boxes are both 2 x 2. The center box is 2 x 4.

The left box has two bitmaps 0001'b and 0010'b to indicate the real inked area.
The right box also has two bitmaps 0010'b and 0001'b.

And then we can check the inked area in left and right boxes with previous glyph. If the direction is from left to right, then we need to check the previous right bitmap with current left bitmap.

And if we found the center box has overlapped or we overlap with not only the previous glyph, we will treat it as real overlapped and will render the glyphs via mask.

If we only intersect with previous glyph on the left/right edge. Then we further compute the real overlapped bits. We set a loose check criteria here, if it has less than two pixel overlapping, we treat it as non-overlapping.

With this patch, The aa10text boost fom 1660000 to 320000. Almost double the performance! And the cairo test result is the same as without this patch.

Fix a bug for trapezoid clip

We find in some cases the trapezoid will be render as a triangle and
the left edge and right edge will cross with each other just bellow
the top or over the bottom. The distance between the cross point and
the top or bottom is less than pixman_fixed_1_minus_e, so after the
fixed converted to int, the cross point has the same value with the
top or bottom and the triangle should not be affected. But in our
clip logic, the cross point will be clipped out. So add a logic
to fix this problem.

gles2_largepixmap: force clip for a non-large pixmap.

One case we need force clip when download/upload a drm_texture
 pixmap. Actually, this is only meaningful for testing purpose.
As we may set the max_fbo_size to a very small value, but the
drm texture may exceed this value but the drm texture pixmap
is not largepixmap. This is not a problem with OpenGL. But for
GLES2, we may need to call glamor_es2_pixmap_read_prepare to
create a temporary fbo to do the color conversion. Then we have
to force clip the drm pixmap here to avoid large pixmap handling
at glamor_es2_pixmap_read_prepare.

Use shader to generate the temp trapezoid mask

The old manner of trapezoid render uses pixman to generate a mask pixmap and upload it to the GPU. This effect the performance. We now use shader to generate the temp trapezoid mask to avoid the uploading of this pixmap. We implement a anti-alias manner in the shader according to pixman, which will caculate the area inside the trapezoid dividing total area for every pixel and assign it to the alpha value of that pixel. The pixman use a int-to-fix manner to approximate but the shader use float, so the result may have some difference. Because the array in the shader has optimization problem, we need to emit the vertex of every trapezoid every time, which will effect the performance a lot. Need to improve it.

Date: Mon Jun 11 01:02:30 2012 +0800

glamor_largepixmap: first commit for large pixmap.

This is the first commit to add support for large pixmap. The large here means a pixmap is larger than the texture's
size limitation thus can't fit into one single texture.

The previous implementation will simply fallback to use a in memory pixmap to contain the large pixmap which is very slow in practice.

The basic idea here is to use an array of texture to hold the large pixmap. And when we need to get a specific area of the pixmap, we just need to compute/clip the correct region and find the corresponding fbo.

We need to implement some auxiliary routines to clip every rendering operations into small pieces which can fit into one texture.

The complex part is the transformation/repeat/repeatReflect and repeat pad and their combination. We will support all of them step by step.

This commit just add some necessary data structure to represent the large pixmap, and doesn't change any rendering process. This commit doesn't add real large pixmap support.

Fix the problem of x_source and y_source causing radial error

The x_source and y_source cause some problem in gradient. The old way to handle it by recalculate P1 P2 to minus the x_source and y_source, but this causes problem in radial shader. Now we modify the manner to set the texture coordinates: (x_source, y_source) --> (x_source + width, y_source + height) to handle all the cases.

Date: Tue May 15 10:07:55 2012 +0800
Fix the problem of vertical and horizontal case error in linear gradient.

1. The vertical and horizontal judgement in linear gradient have problem when p1 point and p2 point distance is very small but the gradient pict have a transform matrix which will convert the X Y coordinates to small values. So the judgement is not suitable. Because this judgement's purpose is to assure the divisor not to be zero, so we simply it to enter horizontal judgement when p1 and p2's Y is same. Vertical case is deleted.

2. Delete the unused p1 p2 uniform variable.

Fix the problem of set the same stop several times.

Some gradient set the stops at the same position, for example: firstly 0.5 to red color and then set 0.5 to blue. This kind of setting will cause the shader work not correctly because the percentage caculating need to use the stop[i] - stop[i-1] as dividend. The previous patch we just kill some stop if the distance between them is 0. But this cause the problem that the color for next stop is wrong. We now modify to handle it in the shader to avoid the 0 as dividend.

Fixed one potential texture size mismatch problem.

There are two cases which we may use a wrong texture size.
1. A pixmap is modified by the client side after it created it. Then the pixmap's width may mismatch the original fbo/tex's size. Thus we need to check this condition when preparing upload the pixmap.

2. We provide two API to download/upload sub region of a textured pixmap. The caller may pass in a larger width then the original pixmap's size, this may happen at putimage and setspans. We need to validate the width and height when do the downloading/uploading.

Fixed a stride problem for textured_drm pixmap.

As a textured_drm pixmap has a drm bo attached to it, and
it's the DDX layer to set it stride value. In some case,
the stride value is not equal to PixmapBytePad(w, depth)
which is used within glamor.

Then if it is the case, we have two choice, one is to set
the GL_PACK_ROW_LENGTH/GL_UNPACK_ROW_LENGTH when we need
to download or upload the pixmap. The other option is to
change the pixmap's devKind to match the one glamor is using
when downloading the pixmap, and restore it to the drm stride
after uploading the pixmap.

We choose the 2nd option, as GLES doesn't support the first
method.

Author: Zhigang Gong <zhigang.gong@linux.intel.com>
Date: Mon Apr 9 20:16:07 2012 +0800

fallback_optimize: Prepare for downloading/uploading subregion.
Introduced two function `glamor_get_sub_pixmap/glamor_put_sub_pixmap`, can easily used to get and put sub region of a big textured pixmap. And it can use pbo if possible.

To support download a big textured pixmap's sub region to another pixmap's pbo, we introduce a new type of pixmap `GLAMOR_MEMORY_MAP`. This type of pixmap has a valid devPrivate.ptr pointer, and that pointer points to a pbo mapped address.

Now, we are ready to refine those `glamor_prepare_access/glamor_finish_access` pairs.

Signed-off-by: Zhigang Gong <zhigang.gong@linux.intel.com>

glamor_download_sub_pixmap_to_cpu: New function to download subregion.

Prepare to optimize the fallback path. We choose the important rendering pathes to optimzie it by using shader. For other pathes, we have to fallback. We may continue to optimize more pathes in the future, but now we have to face those fallbacks.

The original fallback is very slow and will download/upload the whole pixmap. From this commit, I will refine it to just download/upload needed part.

Date:   Fri Apr 6 17:01:57 2012 +0800

render: Enable more componentAlpha support.
Actually only PictOpAtop, PictOpAtopReverse and PictOpXor can't be implemented by using single source blending. All the other can be easily support. Slightly change the code to support them. Consider those three Ops are not frequently used in real application. We simply fallback them currently.

PictOpAtop: \[ s \times \text{mask} \times \text{dst.a} + (1 - s \times \text{a} \times \text{mask}) \times \text{dst} \]

PictOpAtopReverse: \[ s \times \text{mask} \times (1 - \text{dst.a}) + \text{dst} \times s \times \text{a} \times \text{mask} \]

PictOpXor: \[ s \times \text{mask} \times (1 - \text{dst.a}) + \text{dst} \times (1 - s \times \text{a} \times \text{mask}) \]

The two operators in the above three ops are all related to dst and the blend factors are not constant (0 or 1), it's hardly to convert it to single source blend.

Now, the rendercheck is running more smoothly.

commit 3add3750658107bd18592a8672caa8bed0c8931c
Author: Zhigang Gong <zhigang.gong@linux.intel.com>
Date:   Thu Apr 5 21:53:44 2012 +0800

gles2: Fixed color conversion for the formats except 1555 and 2101010.

This patch fixed two major problems when we do the color conversion with GLES2.

1. lack of necessary formats in FBO pool.
GLES2 has three different possible texture formats, GL_RGBA, GL_BGRA and GL_ALPHA. Previous implementation only has one bucket for all the three formats which may reuse an incorrect texture format when do the cache lookup. After this fix, we can enable fbo safely when running with GLES2.

2. Refine the format matching method in glamor_get_tex_format_type_from_pictformat.
If both reversion and swap_rb are needed, for example use GL_RGBA
to represent PICT_b8g8r8a8. Then the downloading and uploading should be handled differently.

The picture's format is PICT_b8g8r8a8,
Then the expecting color layout is as below (little endian):
0 1 2 3 : address
a r g b

Now the in GLES2 the supported color format is GL_RGBA, type is GL_UNSIGNED_TYPE, then we need to shuffle the fragment color as :
frag_color = sample(texture).argb;
before we use glReadPixel to get it back.

For the uploading process, the shuffle is a revert shuffle.
We still use GL_RGBA, GL_UNSIGNED_BYTE to upload the color to a texture, then let's see
0 1 2 3 : address
a r g b : correct colors
R G B A : GL_RGBA with GL_UNSIGNED_BYTE

Now we need to shuffle again, the mapping rule is
r = G, g = B, b = A, a = R. Then the uploading shuffle is as below:
frag_color = sample(texture).gbar;

After this commit, gles2 version can pass render check with all the formats except those 1555/2101010.

Add the feature of generating linear gradient picture by using shader.

Add the feature of generating linear gradient picture by using shader. This logic will replace the original linear gradient picture generating manner in glamor which firstly use pixman and then upload it to GPU. Compare it to the result generated by pixman, the
difference of each color component of each pixel is normally 0, sometimes 1/255, and 2/255 at most. The pixman use fixed-point but shader use float-point, so may have difference. The feature of transform matrix and 4 types of repeat modes have been supported. The array usage in shader seems slow, so use 8 uniform variables to avoid using array when stops number is not very big. This make code look verbose but the performance improved a lot.

We still have slightly performance regression compare to original pixman version. There are one further optimization opportunity which is to merge the gradient pixmap generation and the latter compositing into one shader, then we don't need to generate the extra texture, we can use the gradient value directly at the compositing shader. Hope that can beat pixman version. Will do that latter.

For DRI swap buffers.

This commit added two APIs to support the DRI swap buffer. one is glamor_egl_exchange_buffers() which can swap two pixmaps' underlying KHRimages/fbos/texs. The DDX layer should exchange the DRM bos to make them consistent to each other.

Another API is glamor_egl_create_textured_screen_ext(), which extent one more parameters to track the DDX layer's back pixmap pointer. This is for the triple buffer support. When using triple buffer, the DDX layer will keep a back pixmap rather then the front pixmap and the pixmap used by the DRI2 client. And during the closing screen stage, we have to dereference all the back pixmap's glamor resources. Thus we have to extent this API to register it when create new screen.

Fixup glx support

Renaming glamor_priv->dispatch and wrapping the access to
the dispatch table with a function that also ensured the
context was bound.
dispatch = glamor_get_dispatch(glamor_priv);
...
glamor_put_dispatch(glamor_priv);

So that we catch all places where we attempt to call into GL without context. As an optimisation we can then do glamor_get_context(); glamor_put_context() around the rendering entry points to reduce the frequency of having to restore the old context. (Along with allowing the context to be recursively acquired and making the old context part of the glamor_egl state.)

Date: Fri Feb 10 16:04:07 2012 +0800

GLX: Enable glx support.

If we are using MESA as our GL library, then both xserver's GLX and glamor are link to the same library. As xserver's GLX has its own _glapi_get/set_context/dispatch etc, and it is a simplified version derived from mesa thus is not sufficient for mesa/egl's dri loader which is used by glamor.

Then if glx module is loaded before glamoregl module, the initialization of mesa/egl/opengl will not be correct, and will fail at a very early stage, most likely fail to map the element buffer.

Two methodis to fix this problem, first is to modify the xserver's glx's glapi.c to fit mesa's requirement. The second is to put a glamor.conf as below, to the system's xorg.conf path.

Section "Module"
    Load "glamoregl"
EndSection

Then glamor will be loaded firstly, and the mesa's libglapi.so will be used. As current xserver's dispatch table is the same as mesa's, then the glx's dri loader can work without problem.

We took the second method as it don't need any change to xorg.:) Although this is not a graceful implementation as it depends on the xserver's dispatch table and the mesa's dispatch table is the same and the context set and get is using the same method. Anyway it works.
As by default, xserver will enable GLX_USE_TLS. But mesa will not enable it, you may need to enable that when build mesa.

Three pre-requirements to make this glamor version work:

0. Make sure xserver has commit 66e603, if not please pull the latest master branch.
1. Rebuild mesa by enable GLX_USE_TLS.
2. Put the glamor.conf to your system's xorg.conf path and make sure it loaded prior to glx module.

Preliminary testing shows indirect glxgears works fine.

If user want to use GLES2 for glamor by using MESA, GLX will not work correctly.

If you are not using normal MESA, for example PVR's private GLES implementation, then it should be ok to use GLES2 glamor and the GLX should work as expected. In this commit, I use gbm to check whether we are using MESA or non-mesa. Maybe not the best way.

Refine CloseScreen and FreeScreen processes.

This commit move the calling to glamour_close_screen from glamour_egl_free_screen to glamour_egl_close_screen, as this is the right place to do this.

We should detach screen fbo and destroy the corresponding KHR image at glamour_egl_close_screen stage. As latter DDX driver will call DestroyPixmap to destroy screen pixmap, if the fbo and image are still there but glamour screen private data pointer has been freed, then it causes segfault.

This commit also introduces a new flag GLAMOR_USE_EGL_SCREEN. if DDX driver is using EGL layer then should set this bit when call to glamour_init and then both glamour_close_screen and glamour_egl_close_screen will be registered correctly, DDX layer will not need to call these two functions manually. This way is also the preferred method within Xorg domain.

As interfaces changed, bump the version to 0.3.0.

Date: Fri Jan 27 13:22:12 2012 +0000

Do not reduce a composite to a copy if we need to sample outside of the source.

In order to maintain Render semantics, samples outside of the source should return CLEAR. The copy routines instead are based on the core protocol and expects the source rectangle to be wholly contained within the drawable and so does no fixup.

Fixes the rendering of GTK icons.

        glamor: check driver support GEM or not

        glamor calls DRM_IOCTL_GEM_FLINK to get a name for a buffer object.
        It only works for driver that support GEM, such as intel i915 driver.
        But for pvr driver who doesn't has GEM, we can't do it this way.

        According to Chris's comments, we check the has_gem as the following
        method:

        Here we just try to flink handle 0. If that fails with ENODEV or
        ENOTTY instead of ENOENT (or EINVAL on older kernels), set has_gem=0.

Date:   Thu Jan 19 20:47:55 2012 +0800

glamor-fbo-pool: Implement fbo cache mechanism.

We classify the cache according to the texture's format/width/height. As openGL doesn't allow us to change a texture's format/width/height after the internal texture object is already allocated, we can't
just calculate the size and then according the size to put the fbo to a bucket which is just like SNA does. We can only put the fbo to the corresponding format/width/height bucket.

This commit only support the exact size match. The following patch will remove this restriction, just need to handle the repeat/tile case when the size is not exactly match.

Should use ffs instead of ffs when decide the width/height bucket, thanks for Chris to point this out.

Date: Wed Jan 18 19:21:36 2012 +0800

glamor_fbo: Introduce glamor fbo to manage all the fb/tex.

This is the first patch to implement a fbo/tex pool mechanism which is like the sna's BO cache list. We firstly need to decouple the fbo/tex from each pixmap. The new glamor_pixmap_fbo data structure is for that purpose. It's somehow independent to each pixmap and can be reused latter by other pixmaps once it's detached from the current pixmap.

And this commit also slightly change the way to create a memory pixmap. We will not create a pixmap private data structure by default, instead we will create that structure when a memory pixmap is attaching a fbo to it.

Make sure the devPrivate.ptr of a textured pixmap is NULL.

Just in case when wrongly fallback to DDX layer and cause random memory corruption. Pointed out by Chris.

Signed-off-by: Zhigang Gong <zhigang.gong@linux.intel.com>
Export glamor_create_texture to DDX driver.

If DDX failed to create textured pixmap from its BO's handle, it can turn to call this API to create a brand new glamor rather than fallback to pure in memory pixmap.

Signed-off-by: Zhigang Gong <zhigang.gong@linux.intel.com>

Correct the logic of glamor_egl_create_textured_pixmap.

Discussed with Chris and found the previous logic is not good. Now change it in this commit, this API will just try to create a textured pixmap from the handle provided by DDX driver, if failed simply return FALSE without touch the pixmap. And the DDX driver can choose how to do next step.

Signed-off-by: Zhigang Gong <zhigang.gong@linux.intel.com>

glamor-for-ddx: Exports all rendering/drawing functions.

This commit exports all the rest rendering/drawing functions to the DDX drivers. And introduce some new pixmap type. For a pixmap which has a separated texture, we never fallback it to the DDX layer.

This commit also adds the following new functions: glamor_composite_rects, glamor_get_image_nf which are needed by UXA framework. Just a simple wrapper function of miXXX. Will consider to optimize them next few weeks.

This commit also Fixed a glyphs rendering bug pointed by Chris.

Signed-off-by: Zhigang Gong <zhigang.gong@linux.intel.com>
Enable texture dynamic uploading.

Call screen's method to create pixmap.

As we may need to fallback to DDX's rendering path during the glyphs, we have to call screen's create pixmap method to create pixmap.

Fallback if the pixmap is drm only.

Classify glamor pixmap to different types.

During the integration with intel driver, we introduce two new type of pixmap, one is TEXTURE_DRM, the other is DRM_ONLY. TEXTURE_DRM means we create a texture bind to the DRM buffer successfully. And then the texture and the external BO is consistent. DRM_ONLY means that we failed to create a texture from the external DRM BO. We need to handle those different types carefully, so we have to track them in the data structure.

Open Source Used In Field Network Director for Virtual Machine Installation 4.7.1 34019
Call glamor_create_pixmap directly in glamor rendering path.

When glamor is rendering pixmaps, and needs to create some temporary pixmap, it's better to use glamor version create pixmap directly. As if goes to external DDX's create pixmap, it may create a external DRM buffer which is not necessary. All the case within glamor scope is to create a texture only pixmap or a in memory pixmap.

Override create/destroy picture to track pict format.

When create a picture, we need to attach a pixmap to it. A pixmap only has a depth, which is not sufficant for glamor. As in openGL texture only has a few internal formats which is not sufficient to represent all the possible picture format. So we always transform the picture format to GL_RGBA. And when we need to read back the picture, we must know the original picture format. So we have to override create and destroy picture to track a pixmap's real picture format if it is attached to a picture.

Added a missed header file.

Pointed by Chris, we must add xorg-server.h at the top of each file before we include any other xorg header files. Otherwise, it may cause incorrect XID length.

This commit also fixes one compilation warning in X86_64 platform.

Author: Zhigang Gong <zhigang.gong@linux.intel.com>
Date: Wed Nov 9 16:09:03 2011 +0800

Add new version glamor_fillspans without internal fallback.

For the purpose of incrementally intergration of existing intel driver, for the GC operations we may don't want to use glamor's internal fallback which is in general much slower than the implementation in intel driver. If the parameter "fallback" is false when call the glamor_fillspans, then if glamor found it can't accelerate it then it will just return a FALSE rather than fallback to a slow path.

Xi: ungrab device when releasing a passive grab without ButtonReleaseMask (#71878)

If an touch triggers an async button grab and that grab does not have the
ButtonReleaseMask set, the TouchEnd is never delivered, deliveries is 0 and
the grab is never deactivated.

If the grab is pointer async and keyboard sync, the keyboard events are stuck
in EnqueueEvent until some other pointer event terminates the grab.

Change this to check for the number of listeners. If we're about to deliver a TouchEnd to a passive pointer grab, the number of listeners is already 1 - pointer grabs always accept so other listeners were removed.

Xi: Don't ActivateEarlyAccept POINTER_REGULAR listeners

Bug #71878 describes a bug resulting in the server ceasing to respond to keyboard input after a touch event. The problem might be the following:

DeliverTouchBeginEvent tries to deliver an event to a listener of type LISTENER_POINTER_REGULAR, taking the following if branch,

```c
if (listener->type == LISTENER_POINTER_REGULAR ||
   listener->type == LISTENER_POINTER_GRAB) {
   rc = DeliverTouchEmulatedEvent(dev, ti, ev, listener, client, win,
   grab, xi2mask);
   if (rc == Success) {
      listener->state = LISTENER_IS_OWNER;
      /* async grabs cannot replay, so automatically accept this touch */
      if (dev->deviceGrab.grab &&
         dev->deviceGrab.fromPassiveGrab &&
         dev->deviceGrab.grab->pointerMode == GrabModeAsync)
         ActivateEarlyAccept(dev, ti);
      goto out;
   }
}
```

DeliverTouchEmulatedEvent succeeds. The deviceGrab meets all three of the conditions of the inner if, enters ActivateEarlyAccept which then fails due to,

```c
BUG_RETURN(ti->listeners[0].type != LISTENER_GRAB &&
            ti->listeners[0].type != LISTENER_POINTER_GRAB);
```

That is, despite listener->type == LISTENER_POINTER_REGULAR. With my non-existent knowledge of XINPUT, it seems like the solution here might be to only ActivateEarlyAccept when listener->type == LISTENER_POINTER_GRAB.
present: recursively set window pixmaps on flip

Newly created windows inherit the pixmap of their parent, similarly, reparenting a tree inherits the pixmap of the destination tree.

Making present preserve the invariant that unredirected windows always have the same pixmap as their parent ensures that the above cases work correctly.

v2: name the recursive function to 'set_tree_pixmap' instead of 'set_window_pixmap'

glx: Convert generated code function pointer thunking

We're meant not to call these by name due to ABI. Rather than try to generate a bunch of little stub functions that do the lookup, just inline it all directly into the calling function.

This does not cache results. That's fine, this is not a performance path, and if we're atop WGL then we effectively have to do this every time anyway because wglGetProcAddress results are context-dependent.

damageext: Xineramify (v7)

v7: Don't bother making resources for the backing listeners. [keithp]

This is now slightly unlike how other resources are xineramified. We create N+1 internal damage listeners, one that's a real resource and reflects the protocol view, and then one per backend screen where the report function piles onto the protocol view. The internal listeners are not stored in the resource database directly, they just hang off the xinerama resource. We don't wrap Subtract at the dispatch level, but we do extend it for the Xinerama case to clip to the root window geometry.

As a result of the N+1 design here, the damage reports we generate are not quite minimal. However they are indistinguishable from sequential rendering events happening before the client hears damage, and we don't need to add a post-dispatch callback just for this one extension.

Add is probably (still) somewhat broken since it will only hit screen 0, but Add really only exists for DRI1's sake, and DRI1 disables itself with Xinerama enabled anyway. In the absence of a use case, I'm leaving it unwrapped under Xinerama; if someone wants to define how it ought to work, be my guest.

v2: Drop a bogus hunk from compChangeWindowAttributes [vsyrjala]
v3: s/TRUE/WhenMapped/ [jcristau]
bs: Set the screen's bs support level to WhenMapped

Since we're using RedirectAutomatic to do this, we don't actually preserve contents when unmapped.

v2: Don't say WhenMapped if Composite didn't initialize [vsyrjala]

smartsched: Tweak the default scheduler intervals

A default timeslice of 20ms means a pathological client can ruin up to two frames per scheduler tick. And a fifth of a second is just insane.

Pick two different numbers out of the hat. A 5ms slice means you can probably keep up with two or three abusive clients, and letting it burst to 15ms should give you about all the timeslice you need for a fullscreen game (that's doing server-side rendering for some reason).

If you're running on a system with a 10ms granularity on SIGALRM, then this effectively changes the intervals to 10ms and 30ms. Which is still better, just not as better.

I suspect this is about as good as we can do without actually going preemptive, which is an entire other nightmare.

dri3: Disable when Xinerama is active

Pretty sure this can't work.
dri2: Disable when Xinerama is active

Would only work on ScreenRec 0, which means it's broken.

present: Disable when Xinerama is active

Among much else Present depends on RANDR types, and RANDR isn't properly Xinerama-aware yet anyway.

glx: Fix incorrect use of dri_interface.h version defines in driver probing.

If we extend __DRI_CORE or __DRI_SWRAST in dri_interface.h to allow a new version, it shouldn't make old server code retroactively require the new version from swrast drivers.

Notably, new Mesa defines __DRI_SWRAST version 4, but we still want to be able to probe version 1 drivers, since we don't use any features beyond version 1 of the struct.
glx: Fix incorrect use of dri_interface.h version defines in extensions.

Those defines are so you can compile-time check "do I have a
dri_interface.h that defines this new field of the struct?" You don't
want the server to claim it implements the new struct just because you
installed a new copy of Mesa.

Merge remote-tracking branch 'whot/for-keith'
mieq: Bump default queue size to 512

Based on some bugzilla scraping I did around November 2012. Of xserver bugs in Red Hat bugzilla with an EQ size message in the log, the distribution looked like:

<table>
<thead>
<tr>
<th>String</th>
<th>Matches</th>
</tr>
</thead>
<tbody>
<tr>
<td>Increasing EQ size to 512</td>
<td>460</td>
</tr>
<tr>
<td>Increasing EQ size to 1024</td>
<td>52</td>
</tr>
<tr>
<td>Increasing EQ size to 2048</td>
<td>6</td>
</tr>
<tr>
<td>Increasing EQ size to 4096</td>
<td>0</td>
</tr>
</tbody>
</table>

Most of the "512" ones appear to be mostly harmless, some relatively expensive path in either rendering or resource destruction simply taking too long due to external pressures like paging or CPU contention. So let's raise the initial queue size, both to reduce the number of spurious abrt reports and to drop fewer events in all but the most pathological cases.

Stop including inline assembly .il file for Solaris Studio builds

Since all the inb/outb/etc. use in the X server itself (except for
xf86SlowBcopy) has been replaced by calls to libpciaccess, we no
longer need to pass inline assembly files to replace the gcc inline
assembly from hw/xfree86/common/compiler.h when building Xorg itself.

The .il files are still generated and installed in the SDK for the
benefit of drivers who may use them.

Binary diff of before and after showed that xf86SlowBcopy was the
only function changed across the Xorg binary and all modules built
in the Xserver build, it just calls the outb() function now instead
of having the outb instructions inlined, making it a slightly slower
bcopy.

kdrive: fix cursor jumps on CursorOffScreen behavior

This patch fixes cursor jumps when there is a grab on the Xephyr window and
the pointer moves outside the window.
So on two side-by-side 640x480 screens, a coordinate of 0/481 triggers KdCursorOffscreen.

If the delta between two screens is 0, they share the same offset for that dimension. When searching for the new screen, the loop always rules out the current screen. So we get to the second screen, trigger the conditions where dy <= 0 and decide that this new screen is the correct one. The result is that whenever KdCursorOffScreen is called, the pointer jumps to the other screen.

Change to check for dy < 0 etc. so that the cursor stays on the same screen if there is no other screen at the target location.

kdrive: modify ephyr events to use POINTER_DESKTOP and scale them to that

A multi-head Xephyr instance has the pointer stuck on one screen because of bad coordinate calculation. The coordinates passed to GetPointerEvents are per-screen, so the cursor gets stuck on the left-most screen by default.

Adjust and mark the events as POINTER_DESKTOP, so the DIX can adjust them accordingly.

xext: Fix shmint.h to not use headers outside of sdk_HEADERS

shmint.h is part of sdk_HEADERS, and so can't use anything not included in sdk_HEADERS.

busfault.h includes dix-config.h which is not. Leave the use of struct busfault in shmint.h and move the include of busfault.h to shm.c.

protocol-versions.h is not part of sdk_HEADERS, so instead of using that, just use XTRANS_SEND_FDS to choose whether to expose the fd passing requests directly.

Avoid conflicts with Solaris <sys/regset.h> defines that clash with our names

When building on Solaris with _XOPEN_SOURCE set to a recent XPG release, <stdlib.h> and other core headers start including <sys/regset.h>, which has a bunch of unfortunately named macros such as "CS", "ES", etc. for x86 & x64 registers which clash with existing variable & struct member names in Xorg - so #undef these so they don't interfere with our use.

(Yes, have filed a bug against the system headers for exposing these, but this solves the problem for building on existing releases.)

cfgconfig/APM: Add option to disable building of APM support on Linux

APM support in the Xserver was used to restore the console mode prior to a power management event. This was to ensure the mode upon suspend/resume was one that the system firmware or kernel could deal with. APM support is now largely obsolete, KMS drivers don't require a mode restoration anyhow. Therefore it should be possible to disable this feature.

(small modification by keithp - move test for XF86PM flag after check for APM, then move XF86PM flag to xorg-config.h.in)

sync: fix corner-case in triggering idle alarms
ProcessInputEvent() resets the device idle times. If idle time was higher than the lower bracket, this should trigger an event in the idle time wakeup handler.

If processing is slow, the idle time may advance past the lower bracket between the reset and the time the BlockHandler is called. In that case, we'd never schedule a wakeup to handle the event, causing us to randomly miss events.

Ran tests with a neg transition trigger on 5ms with 200 repeats of the test and it succeeded. Anything below that gets a bit tricky to make sure the server sees the same idle time as the client usleeps for.

DDX/DPMS: Call dixSaveScreens() also when screen is turned on

DMPS calls dixSaveScreens() when turned off but not when turned on. In most cases this is irrelevant as DPMS is done when a key is hit in which case dixSaveScreens() will be called to unblank anyhow. This isn't the case if we use xset (or the DPMS extension directly) to unblank.
Check screenIsSaved to make sure the state needs to be changed before calling dixSaveScreens().
ephyr: Ensure stride of private framebuffer is multiple of 4

The fb layer of X can't deal with strides that are not a multiple of 4, so when Xephyr allocates its own framebuffer it should make sure to align it.

This fixes crashes and rendering corruption when Xephyr runs in a depth that is different from the host X server and its screen size is not a multiple of 4 / depth. (This is particularly easy to trigger if you use the -resizeable option).

ephyr: hostx_screen_init(): Fix bits_per_pixel and bytes_per_line

When the depth of the Xephyr server matches that of the host X server, Xephyr simply uses the buffer associated with the XImage as its framebuffer. In this case, it is correct to get the bits_per_pixel and bytes_per_line values returned from hostx_screen_init() from the XImage.

However, when the depth doesn't match the host, Xephyr uses a private framebuffer that is periodically copied to the XImage. In this case, the returned values of bits_per_pixel and bytes_per_line should be those of the private framebuffer, not those of the XImage.

  gIx: Lie about GLX_Y_INVERTED_EXT

  Well, that was lame. The problem with reporting y inversion honestly is
  that libGL asks the driver _its_ opinion of Y inversion, which it just
  fabricates from whole cloth. So then when libGL goes to compare the
  driver's idea of fbconfigs with that of the server - a fairly dumb idea
  to begin with - nothing matches, and direct rendering fails, and
  sadness.

  So until the DRI drivers are fixed we should just continue to lie about
  Y inversion. GLX_DONT_CARE is what libGL would make up for that
  attribute if we hadn't sent it, so just send that instead.

Add interfaces to get FDs from clients over the socket

This adds two interfaces:

void SetReqFds(ClientPtr client, int req_fds)

Marks the number of file descriptors expected for this request. Call this before any request processing so that any un-retrieved file descriptors will be closed automatically.

int ReadFdFromClient(ClientPtr client)

Reads the next queued file descriptor from the connection. If this request is not expecting any more file descriptors, or if there are no more file descriptors available from the connection, then this will return -1.

Setting POINTER_SCREEN with an unset valuator mask causes a jump to 0/0. Set
the flags to 0 so we don't generate any motion on a button event.
xfree86: Find primary entity when bus types are nominally different

As of server 1.13, systems with DRM and Udev will have BUS_PLATFORM as their primary bus type. However, drivers not implementing a platformProbe function will still create entities of type BUS_PCI. We need to account for this when checking for the primary entity.

glx: convert to direct GL dispatch (v2)

We now expect to be linked against something that provides the GL API, instead of manually grubbing about in the DRI driver's dispatch table. Since the GLX we expose calls GL functions that are meant to be looked up dynamically, also add a way to thunk through to GetProcAddress.

This includes a refresh of the generated sources, which requires a correspondingly new Mesa.

The GetProcAddress stubs are at the moment merely enough to make this link against Mesa 9.2, but should really be provided for everything not in the OpenGL 1.2 ABI.

v2: Explicitly hide the GetProcAddress stubs so we can't conflict with libGL symbols; fix leading tab/space issues [anholt]

glx: Remove DRI1 AIGLX (v2)

Mesa doesn't ship DRI1 drivers as of 8.0, which is about 18 months and
three releases ago. The main reason to have wanted DRI1 AIGLX was to
get a GLX compositor working, but DRI1's (lack of) memory management API
meant that the cost of a GLX compositor was breaking direct GLX apps,
which isn't a great tradeoff.

Of the DRI1 drivers Mesa has dropped, I believe only mga stands to lose
some functionality here, since it and only it has support for
NV_texture_rectangle. Since that's required for every extant GLX
compositor I know of, I conclude that anybody with a savage, say, would
probably not notice AIGLX going away, since they wouldn't be running a
GLX compositor in the first place.

In the future we'd like to use GL in the server in a more natural way,
as just another EGL client, including in the GLX implementation itself.
Since there's no EGL implemented for DRI1 drivers, this would already
doom AIGLX on DRI1 (short of entirely forking the GLX implementation,
which I'm not enthusiastic about).

commit a48dadc98a28c969741979b70b7a639f24f4cbdbd
Author: Adam Jackson <ajax@redhat.com>
Date:   Mon Mar 21 11:59:29 2011 -0400

glx: Reimplement context tags

In that, I changed the glx client state to not explicitly track the list
of current contexts for the client (since that was what we were deriving
tags from). The bug was that I removed the code for same from
glxClientCallback without noticing that it had the side effect of
effectively de-currenting those contexts, so that ContextGone could free
them. So, if you had a client exit with a context still current, the
context's memory would leak. Not a huge deal for direct clients, but
viciously bad for indirect, since the swrast context state at the bottom
of Mesa is like 15M.

Fix this by promoting Bool isCurrent to ClientPtr currentClient, so that
we have a back-pointer to chase when walking the list of contexts when
ClientStateGone happens.

v2: Explicitly call __glXFreeContext on the ClientStateGone path. Our
current context might be one we got from EXT_import_context and whose
creating client has since died. Without the explicit call, the creating
client's FreeClientResources would not free the context because it's
still current, and the using client's FreeClientResources would not free the context because it's not an XID it created. This matches the logic from a48dadc.

sync: split updating and triggering a counter up

Now that the brackets are always the nearest change points (regardless of
transition) we need to update the counters whenever we check for any updates.

Otherwise we end up with a situation where counter->value is out of date and
an alarm doesn't trigger because we're still using the value from last time
something actually triggered.

commit e57ec99b03b2ad840c384a97ab2766ce9da0f5cc
Author: Peter Hutterer <peter.hutterer@who-t.net>
Date:   Wed Oct 16 16:31:15 2013 +1000

sync: always set the brackets (#59644)

The current code sets bracket_greater to the first trigger after the current
value, and bracket_less to the last trigger before the current value.

For example, the idle timer with three negative and three positive transitions would set this:

```
|--------|------|--|------- idle --|---|--|-----> t
pt1                pt2    pt3
```

bracket_less == nt2
bracket_greater == pt2

This is an optimization so we can skip code paths in the block/wakeup handlers if the current value doesn't meet any of the trigger requirements. Those handlers largely do a

```c
if (bracket_less is less than current value &&
    bracket_greater is greater than current value)
    return, nothing to do
```

However, unless the bracket values are updated at the correct time, the following may happen:

```
|--------------|---------- idle ------|--------> t
pt
```

In this case, neither bracket is set, we're past the pos transition and not yet at the neg transition. idle may now go past nt, but the brackets are not updated. If idle is then reset to 0, no alarm is triggered for nt. Likewise, idle may now go past pt and no alarm is triggered.

Changing an alarm or triggering an alarm will re-calculate the brackets, so this bug is somewhat random. If any other client triggers an alarm when the brackets are wrongly NULL, the recalculation will set them this bug may not appear.

This patch changes the behavior, so that the brackets are always the nearest positive or negative transitions to the current counter value. In the example above, nt will trigger a wakeup and a re-calculation of the brackets, so that going past it in the negative direction will then cause the proper alarm triggers.

Or, in Keith's words:

Timer currently past a positive trigger
    No bracket values, because no trigger in range

Timer moves backwards before the positive trigger
    Brackets not reset, even though there is now a trigger in range
Timer moves forward past the positive trigger
Trigger doesn't fire because brackets not set

Setting the LT bracket in this case will cause everything to get
re-evaluated when the sync value moves backwards before the trigger
value.

sync: if the idle time was reset, force alarms to trigger (#70476)

The time between the idle reset and the IdleTimeWakeupHandler to be called is
indeterminate. Clients with an PositiveTransition or NegativeTransition alarm
on a low threshold may miss an alarm.

Work around this by keeping a reset flag for each device. When the
WakeupHandler triggers and the reset flag is set, we force a re-calculation of
everything and pretend the current idle time is zero. Immediately after is the
next calculation with the real idle time.

Relatively reproducible test case: Set up a XSyncNegativeTransition alarm for
a threshold of 1 ms. May trigger, may not.

Avoid use-after-free in dix/dixfonts.c: doImageText() [CVE-2013-4396]
Save a pointer to the passed in closure structure before copying it and overwriting the *c pointer to point to our copy instead of the original. If we hit an error, once we free(c), reset c to point to the original structure before jumping to the cleanup code that references *c.

Since one of the errors being checked for is whether the server was able to malloc(c->nChars * itemSize), the client can potentially pass a number of characters chosen to cause the malloc to fail and the error path to be taken, resulting in the read from freed memory.

Since the memory is accessed almost immediately afterwards, and the X server is mostly single threaded, the odds of the free memory having invalid contents are low with most malloc implementations when not using memory debugging features, but some allocators will definitely overwrite the memory there, leading to a likely crash.

DMX glxproxy: Don't allocate & copy data just to free it unused

Two functions in the DMX glxproxy code loop over all the backend screens, starting at the highest numbered and counting down to the lowest.

Previously, for each screen, the code would allocate a buffer large enough to read the reply from the backend, copy that reply into the buffer, and then if it wasn't the final screen, free it. Only the buffer from the final screen is used, to pass on to the client in the reply.

This modifies it to just immediately discard the responses from the screens as we loop through it, only doing the allocate & copy
work for the one buffer we pass back to the client.

dix: don't attempt to deliver an event for a different grabtype

For an active grab, grab->eventMask can be either the core or the XI1 mask. With the overlap of event filters, calling DeliverOneGrabbedEvent(XI1) for a ProximityOut event will trigger if the client has selected for enter events - the filter is the same for both.

Thus, we end up delivering a proximity event to a client not expecting one.

Xorg binary: use install-exec-hook rather than install-exec-local

The former was explicitly designed to execute additional code after the binary has been installed. The latter can be executed in any order, hence it's current dependency on install-binPROGRAMS as a workaround.

The CYGWIN libXorg.exe.a target is an installation target rather than a post-installation one, so it should not be done as a hook. It does not depend on the Xorg executable being installed.

Automake:
"These hooks are run after all other install rules of the appropriate type, exec or data, have completed. So, for instance, it is possible to perform post-installation modifications using an install hook".

"With the -local targets, there is no particular guarantee of execution order; typically, they are run early, but with parallel make, there is no way to be sure of that".

Use $(LN_S) provided by AC_PROG_LN_S macro to create links

For better code portability.

The Xorg binary is missing the extension $(EXEEXT) in the makefile

This is not a problem on UNIX platforms, but on CYGWIN it creates a broken
link to Xorg rather than a link to Xorg.exe.

From the CYGWIN log on tinderbox, we can see that the executable Xorg.exe is installed correctly. We can see the command used to create the link:

(cd /jhbuild/install/[...]/install/bin && rm -f X && ln -s Xorg X)

Note that the "relink" makefile target correctly appends $(EXEEXT) to Xorg.

Author: Radek Doulik <rodo@novell.com>
Date: Tue Aug 13 08:45:47 2013 +0200

xnest: Ignore GetImage() error in xnestGetImage()

When an Xnest instance is not viewable it will crash when a client in
that instance calls GetImage. This is because the Xnest server will itself receives a BadMatch error.

This patch ignores the error. The application which has requested the image will receive garbage - this however is fully legal according to the specs as obscured areas will always contain garbage if there isn't some sort of backing store as discussed in https://bugs.freedesktop.org/show_bug.cgi?id=9488

The applied patch is a version from Dadek Doulik.

os: Immediately queue initial WriteToClient

If we immediately put the WriteToClient() buffer into the socket's write
queue, not only do we benefit from sending the response back to client
earlier, but we also avoid the overhead of copying the data into our own
staging buffer and causing extra work in the next select(). The write is
effectively free as typically we may only send one reply per client per
select() call, so the cost of the FlushClient() is the same.

shmget10:   26400 -> 110000
getimage10: 25000 -> 108000

shmget500:   3160 -> 13500
getimage500: 1000 -> 1010

The knock-on effect is that on a mostly idle composited desktop, the CPU
overhead is dominated by the memmove in WriteToClient, which is in turn
eliminated by this patch.

Move pseudoramiX code where it can be shared between Xwin and Xquartz

Move pseudoramiX code to a separate top-level directory. Link Xwin and Xquartz
with libPseudoramiX

I'm not sure moving this to a top-level directory is appropriate, but I'm not
sure where else it fits.

Future work: pseudoramiX can probably be consolidated with the rrxinerama code
(which I think provides fake xinerama data when real XINERAMA is disabled and we
only have one screen)

Xi: allow for XIAllowEvent requests larger than XI < 2.2 size (#68554)

XIAllowEvents changed length in XI 2.2 (for the touchid). A bug in libXi causes libXi to always use the new request length if the server supports 2.2, regardless of the client's XIQueryVersion request.

The server takes the client's XIQueryVersion request into account though, resulting in a BadLength error if a 2,[0,1] client calls XIAllowEvents on a XI 2.2+ server.

Can't fix this in libXi, so work around this in the server.

xfree86: detach scanout pixmaps when detaching output GPUs

Commit 8f4640bdb9d3988148e09a08d27e3bab1d538d6 fixed a bit of a chicken-and-egg problem by detaching GPU screens when their providers are destroyed, which happens before CloseScreen is called. However, this created a new problem: the GPU screen tears down its RandR crtc objects during CloseScreen and if one of them is active, it tries to detach the scanout pixmap then. This crashes because RRCrtcDetachScanoutPixmap tries to get the master screen's screen pixmap, but crtc->pScreen->current_master is already NULL at that point.

It doesn't make sense for an unbound GPU screen to still be scanning out its former master screen's pixmap, so detach them first when the provider is destroyed.

dix: set the valuator mask to ensure XI 1.x events have data

XI 1.x only allows for first + num valuators, so if a device sends data for valuators 0 and 2+ only (i.e. valuator 1 is missing) we still need to get the data for that from somewhere.
XI 1.x uses the hack of an unset valuator mask to get the right coordinates, i.e. we set the value but don't set the mask for it so XI2 events have the right mask.

For an absolute device in relative mode, this broke in b28a1af55cf, the value was now always 0. This wasn't visible on the cursor, only in an XI 1.x client. The GIMP e.g. sees jumps to x/0 every few events.

Drop the condition introduced in b28a1af55cf, data in valuators is always absolute, regardless of the mode.

hw/xwin: Map extra mouse buttons 1 and 2 to X buttons 8 and 9

Map extra mouse buttons 1 and 2 to X buttons 8 and 9, as conventional, leaving X buttons 6 and 7 for tilt wheel.

Also add button labels for buttons 6, 7, 8 and 9 and change btn_labels in from a dynamic allocation to a fixed one of the required size for all the labels we use.

hw/xwin: Improve WM_ENDSESSION handling using separate messaging window thread

Currently, WM_ENDSESSION just calls GiveUp() to set the DE_TERMİNATE flag. But
for the X server to exit cleanly, we also need the X server dispatch loop to be
unblocked so it can notice that DE_TERMİNATE has been set and exit, removing
it's lock file and any unix domain socket.

It appears that the system will terminate the process when the last UI thread in
that process returns from processing WM_ENDSESSION for the last top-level
window.

Since WM_ENDSESSION appears to be sent by the system via SendMessage() (synchronously) and the wndproc is called to process it in the message thread for that window (the X server thread), we can't easily terminate the X server dispatch loop from inside the WM_ENDSESSION message processing.

So, create a messaging window, a hidden, top-level window, with a separate thread to catch this message, and process it by calling GiveUp() and then blocking on a mutex until the X server dispatch loop exits.

Also, notice when this is a shutdown cancel WM_ENDSESSION message and take no action.

Allow DDX to provide a main()

XQuartz already conditionally renames main() as dix_main() so it can provide it's own main(). This isn't the ideal way of doing this, as it prevents libdix built this way from being useful with any other DDX.

So instead, always name that function dix_main(), and also provide a stub main() which just calls dix_main(), which can be overriden in the DDX.

Add a main() to XWin (XQuartz already has one, of course).

It's no longer neccessary to link XWin and XQuartz with libmain.

v2: Remove unneeded stub main hw/xwin/InitOutput.c

Commit 21ea7ebb6a1ad56f3060747af0df235ca6ff27fa
dix: scale y back instead of x up when pre-scaling coordinates

The peculiar way we handle coordinates results in relative coordinates on absolute devices being added to the last value, then that value is mapped to the screen (taking the device dimensions into account). From that mapped value we get the final coordinates, both screen and device coordinates.

To avoid uneven scaling on relative coordinates, they are pre-scaled by screen ratio:resolution:device ratio factor before being mapped. This ensures that a circle drawn on the device is a circle on the screen.

Previously, we used the ratio to scale x up. Synaptics already does its own scaling based on the resolution and that is done by scaling y down by the ratio. So we can remove the code from the driver and get approximately the same behaviour here.

Minor ABI bump, so we can remove this from synaptics.

Revert "DRI2: re-allocate DRI2 drawable if pixmap serial changes"
This reverts commit 3209b094a3b1466b579e8020e12a4f3fa78a5f3f. After a long debug session by Paul Berry, it appears that this was the commit that has been producing sporadic failures in piglit front buffer rendering tests for the last several years.

GetBuffers may return fresh buffers with invalid contents at a couple reasonable times:

- When first asked for a non-fake-front buffer.
- When the drawable size is changed, an Invalidate has been sent, and obviously the app needs to redraw the whole buffer.
- After a glXSwapBuffers(), GL allows the backbuffer to be undefined, and an Invalidate was sent to tell the GL that it should grab these appropriate new buffers to avoid stalling.

But with the patch being reverted, GetBuffers would also return fresh invalid buffers when the drawable serial number changed, which is approximately "whenever, for any reason". The app is not expecting invalid buffer contents "whenever", nor is it valid. Because the GL usually only GetBuffers after an Invalidate is sent, and the new buffer allocation only happened during a GetBuffers, most apps saw no problems. But apps that do (fake-)frontbuffer rendering do frequently ask the server for the front buffer (since we drop the fake front allocation when we're not doing front buffer rendering), and if the drawable serial got bumped midway through a draw, the server would pointlessly ditch the front *and* backbuffer full of important drawing, resulting in bad rendering.

The patch was originally to fix bugzilla:
https://bugs.freedesktop.org/show_bug.cgi?id=28365

Specifically:

To reproduce, start with a large-ish display (i.e. 1680x1050 on my laptop), use the patched glxgears from bug 28252 to add the -override option. Then run glxgears -override -geometry 640x480 to create a 640x480 window in the top left corner, which will work fine. Next, run xrandr -s 640x480 and watch the fireworks.

I've tested with an override-redirect glxgears, both with vblank sync enabled and disabled, both with gnome-shell and no window manager at all, before and after this patch. The only problem observed was that before and after the revert, sometimes when alt-tabbing to kill my gears after completing the test gnome-shell would get confused about override-redirectness of the glxgears window (according to a log message) and apparently not bother doing any further compositing.

dix: fix device scaling to use a [min,max] range.

defmin/defmax are screen coords and thus use a min-inclusive, max-exclusive range. device axes ranges are inclusive, so bump the max up by one to get the scaling right.

This fixes off-by-one coordinate errors if the coordinate matrix is used to bind the device to a fraction of the screen. It introduces an off-by-one scaling error in the device coordinate range, but since most devices have a higher resolution than the screen (e.g. a Wacom I4 has 5080 dpi) the effect of this should be limited.

This error manifests when we have numScreens > 1, as the scaling from desktop size back to screen size drops one device unit.

dix: pre-scale x by the screen:device:resolution ratio

commit 61a99aff9d33728a0b67920254d2d4d79f80cf39
   dix: pre-scale relative events from abs devices to desktop ratio (#31636)

added pre-scaling of relative coordinates coming from absolute devices to
undo uneven scaling based on the screen dimensions.

Devices have their own device width/height ratio as well (in a specific resolution) and this must be applied for relative devices as well to avoid scaling of the relative events into the device's ratio.

e.g. a Wacom Intuos4 6x9 is in 16:10 format with equal horiz/vert resolution (dpi). A movement by 1000/1000 coordinates is a perfect diagonal on the tablet and must be reflected as such on the screen.

However, we map the relative device-coordinate events to absolute screen coordinates based on the axis ranges. This results in an effective scaling of 1000/(1000 * 1.6) and thus an uneven x/y axis movement - the y axis is always faster.

So we need to pre-scale not only by the desktop dimenstions but also by the device width/height ratio _and_ the resolution ratio.

dix: call UpdateDeviceState() for emulated TouchEndEvents

ProcessTouchEvents() calls UDS for all touch events, but if the event type was switched to TouchUpdate(pending end) UDS is a noop.

Daniel Drake found this can cause stuck buttons if a touch grab is activated, rejected and the touch event is passed to a regular listener. This sequence causes the TouchEnd to be changed to TouchUpdate(pending end).

The actual TouchEnd event is later generated by the server once it is passed to the next listener. UDS is never called for this event, thus the button remains logically down.
A previous patch suggested for UDS to handle TouchUpdate events [1], however this would release the button when the first TouchEvent is processed, not when the last grab has been released (as is the case for sync pointer grabs). A client may thus have the grab on the device, receive a ButtonPress but see the button logically up in an XQueryPointer request.

This patch adds a call to UDS to TouchEmitTouchEnd(). The device state must be updated once a TouchEnd event was sent to the last grabbing listener and the number of grabs on the touchpoint is 0.

dix: fix cursor refcounting

The cursor is referenced during CopyGrab(), thus doesn't need to be handled manually anymore. It does need to be refcounted for temp grabs though.

The oldGrab handling in ProcGrabPointer is a leftover from the cursor in the grab being refcounted, but the grab itself being a static struct in the DeviceIntRec. Now that all grabs are copied, this lead to a double-free of the cursor (Reproduced in Thunderbird, dragging an email twice (or more often) causes a crash).

dix: always copy grabs, don't reference them

Introduced in xorg-server-1.13.99.901-2-g9ad0fdb. Storing the grab pointer in the listener turns out to be a bad idea. If the grab is not an active grab or an implicit grab, the pointer stored is the one to the grab attached on the window. This grab may be removed if the client calls UngrabButton or similar while the touch is still active, leaving a dangling pointer.

To avoid this, copy the grab wherever we need to reference it later. This is also what we do for pointer/keyboard grabs, where we copy the grab as soon as it becomes active.

Dix: drop DeviceIntRec's activeGrab struct

Obsolete since 4bc2761ad5ec2d0668aec639780ff8b136605f8c8. This struct existed so copying a passive grab could be simply done by
activeGrab = *grab

And thus have a copy of the GrabPtr we'd get from various sources but still be able to check device->grab for NULL.

Since 4bc2761 activeGrab is a pointer itself and points to the same memory as grabinfo->grab, leaving us with the potential of dangling pointers if either calls FreeGrab() and doesn't reset the other one.

There is no reader of activeGrab anyway, so simply removing it is sufficient.

Note: field is merely renamed to keep the ABI. Should be removed in the future.

Date: Fri Mar 1 12:52:35 2013 +1000

dix: move EmitTouchEnd to touch.c

No functional changes, this just enables it to be re-used easier.
Xi: Don't emit a TouchEnd event to a frozen device

EmitTouchEnd calls DeliverTouchEvents directly instead of through public.processInputProc. If a device is frozen, the TouchEnd is processed while the device is waiting for a XAllowEvents and thus ends the touch point (and the grab) before the client decided what to do with it. In the case of ReplayPointer, this loses the event.

This is a hack, but making EmitTouchEnd use processInputProc breaks approximately everything, especially the touch point is cleaned up during ProcessTouchEvents. Working around that is a bigger hack than this.

Signed-off-by: Peter Hutterer <peter.hutterer@who-t.net>

Xi: use public.processInputProc to replay the touch history

If a device is frozen in results to a grab, we need to enqueue the events.

This makes things complicated, and hard to follow since touch events are now replayed in the history, pushed into EnqueueEvent, then replayed later during PlayReleasedEvents in response to an XAllowEvents.

While the device is frozen, no touch events are processed, so if there is a touch client with ownership mask _below_ the grab this will delay the delivery and potentially screw gesture recognition. However, this is the behaviour we have already anyway if the top-most client is a sync pgrab or there is a sync grab active on the device when the TouchBegin was generated.

(also note, such a client would only reliably work in case of ReplayPointer anyway)

Signed-off-by: Peter Hutterer <peter.hutterer@who-t.net>
Xi: when punting to a new owner, always create TouchEnd events

If a touch is pending_finish and we just punted it to the next owner, that client must receive a TouchEnd event.

If we just punted to the last owner and that owner not a touch grab, we need to end the touch since this is the last event to be sent, and the client cannot accept/reject this.

dix: reset the OsBuffers after killing all clients

==21860== 24 bytes in 1 blocks are still reachable in loss record 85 of 397
==21860== at 0x4C2B3F8: malloc (in /usr/lib/valgrind/vgpreload_memcheck-amd64-linux.so)
==21860== by 0x61ED93: AllocateOutputBuffer (io.c:1037)
os: Reset input buffer's 'ignoreBytes' field

If a client sends a request larger than maxBigRequestSize, the server is supposed to ignore it.

Before commit cf88363d, the server would simply disconnect the client. After that commit, it attempts to gracefully ignore the request by remembering how long the client specified the request to be, and ignoring that many bytes. However, if a client sends a BigReq header with a large size and disconnects before actually sending the rest of the specified request, the server will reuse the ConnectionInput buffer without resetting the ignoreBytes field. This makes the server ignore new X clients' requests.

This fixes that behavior by resetting the ignoreBytes field when putting the ConnectionInput buffer back on the FreeInputs list.

xfree86: don't enable anything in xf86InitialConfiguration for GPU screens

There's no point in turning on outputs connected to GPU screens during initial configuration. Not only does this cause them to just display black, it also confuses clients when these screens are attached to a master screen and RandR reports that the outputs are already on.

Also, don't print the warning about no outputs being found on GPU screens, since that's expected.

dix: allow pixmap dirty helper to be used for non-shared pixmaps

this allows the pixmap dirty helper to be used for reverse optimus, where the GPU wants to copy from the shared pixmap to its VRAM copy.
xf86crtc: don't use scrn->display for gpu screens

scrn->display is a property of the main screen really, and we don't want to have the GPU screens use it for anything when picking modes or a front buffer size.

This fixes a bug where when you plugged a display link device, it would try and allocate a screen the same size as the current running one (3360x1050 in this case), which was too big for the device. Avoid doing this and just pick sizes based on what's plugged into this device.

Date:   Wed Jan 9 14:26:35 2013 +1000

randr: report changes when we disconnect a GPU slave

When we disconnect an output/offload slave set the changed bits, so a later TellChanged can do something.

Then when we remove a GPU slave device, sent change notification to the protocol screen.

This allows hot unplugged USB devices to disappear in clients.
randr: only respected changed on the protocol screen

We don't want to know about changes on the non-protocol screen, we will fix up setchanged to make sure non-protocol screens update the protocol screens when they have a change.

randr: make SetChanged modify the main protocol screen not the gpu screen

When SetChanged is called we now modify the main protocol screen, not the the gpu screen. Since changed stuff should work at the protocol level.

randr: don't directly set changed bits in randr screen

Introduce a wrapper interface so we can fix things up for multi-gpu situations later.

This just introduces the API for now.

hw/xfree86: Only report SetDesiredModes() failed if at least one modeset fails
hw/xfree86: Require only one working CRTC to start the server.

changed the logic to try to set the mode on all connected outputs rather than abort upon the first failure. The return error code was then tweaked such that it reported success if it set a mode on any crtc. However, this confuses the headless case where we never enable any crtc and also, importantly, never fail to set a crtc.

Author: Dave Airlie <airlied@gmail.com>
Date: Wed Apr 10 16:09:01 2013 +1000

xf86: fix flush input to work with Linux evdev devices.

So when we VT switch back and attempt to flush the input devices,
we don't succeed because evdev won't return part of an event,
since we were only asking for 4 bytes, we'd only get -EINVAL back.

This could later cause events to be flushed that we shouldn't have

gotten.

This is a fix for CVE-2013-1940.

Xi: fix swapped grab mode args for keyboard devices in XIGrabDevice

The protocol says that the grab_mode argument applies to the device being grabbed and paired_device_mode to the paired master device. GrabDevice() however takes in a pointer mode and a keyboard mode and so we have to swap the values according the type of device being grabbed.

xfree86: Revert workaround for drm race condition.

Revert 70739e817b2d64bc020ea491f23a3574bd6155e and mostly revert c31eac647a9ecf0fb20dc98266cadf0ba923ba14.

Further investigation shows the encountered race condition is between lightdm and plymouth-splash, as implemented in the Ubuntu distribution within the limitations of upstart's job coordination logic, and can (and should) be fixed within those limitations. Not in xserver itself.

This leaves some of the diagnostic improvements from the recent patch series, in case others run into a similar situation.

xfree86: change a log message

This path is technically executed through config/udev, but having two messages in the form "config/udev: Adding drm device" makes it appear as if the udev filters are wrong and it's trying to add the same device twice. In fact, it's only one device, only added once, but a duplicate log message.
xf86: don't hotplug output devices while VT switched.

We don't want to hotplug output devices while we are VT switched, as we get races between multiple X servers on the device open, and drm device master status. This just queues device opens until we return from VT switch.

xserver: add monitor Option "ZoomModes" [v2]

Section "Monitor"
    Identifier "a21inch"
    Option "PreferredMode" "1600x1200"
    Option "ZoomModes" "1600x1200 1280x1024 1280x1024 640x480"
EndSection

The option's effect is to search for and mark once each named mode in
the output modes list. So the specification order is free and the zoom
modes sequence follows the order of the output modes list. All marked
modes are available via the Ctrl+Alt+Keypad-{Plus,Minus} key
combination.

See also http://bugs.freedesktop.org/show_bug.cgi?id=17954.

This option has its use for combined monitor and television setups.
It allows for easy switching between 60 Hz and 50 Hz modes even when a
monitor refuses to display the input signal.

(Includes a few minor changes suggested by Aaron for v2)

modesetting: match PCI class 3, any subclass

If a device is not primary, the PCI device match fails because the xf86-video-modesetting driver looks specifically for a PCI class match of 0x30000 with a mask of 0xffffffff. This fails to match, for example, a non-primary Intel VGA device, because it is reported as having a class of 0x38000.

Fix that by ignoring the low 16 bits of the class in the pci_id_match table.

GLX/DRI2: Do not expose INTEL_swap_event without swap control

Swap events depend on the implementation of ScheduleSwap. By unconditionally enabling GLX_INTEL_swap_event we're breaking the system with drivers that don't support it because the apps are forever stuck waiting for an event that will never be delivered. So let's enable the extension only if the hooks it depends on are actually there.

    Full support of sRGB capable fbconfigs.

changes to correctly initialize the sRGB capability attribute and
transfer it between XServer and the client. Modifications include
extension string, transferring visual config attribs and fbconfig
attribs. Also, attribute is initialized in the modules which do not
really use it (xquartz and xwin).
This version advertises both ARB and EXT strings, and initializes
the capability to default value of FALSE. It has corrected required
GLX version and does not influence swrast. The sRGB capable attribute
is attached only to those configs which do have this capability.
Both ARB and EXT versions share the same GLX extension enabling bit.

xb: Fixes to LatchMods/LatchGroup

The main problem this patch addresses is that if a latch is put on multi-level key with a Latch/Lock/Set, it is possible that after all keys are released, still base modifiers are set, which typically will make the keyboard unusable. To see how it happens (without the patch), assume that key AltGr sets Mod5 when pressed by itself, and latches Mod3 when pressed together with Shift. Now press Shift, then AltGr and release both keys in reverse order. Mod3 is now latched, and the LatchMods filter remains active as the second filter. Now press AltGr; Mod5 base modifier gets set, and the Setmods filter will become active as the first filter. Release AltGr: First, the SetMods filter will set clearMods to Mod5, then the LatchMods filter will overwrite clearMods with Mod3. Result: the Mod5 base modifier will remain set. This example becomes practically relevant for the revised German standard layout (DIN 2137-1:2012-06).

Other changes implement the latch behaviour more accurately according to the specification. For example, releasing a modifier latching key can at the same time clear a locked modifier, promote another modifier that is latched to locked, and latch a third modifier. Overall, what the code does should be straightforward to compare what the XKB protocol specification demands, see the table in section 6.3.
Finally, releasing a key no longer cancels a latch that has not become pending yet. In my opinion, the specification is not clear; it speaks of "operating" a key, which the patch effectively interprets as "press" rather than "press or release". From my experience, using the latter interpretation makes latches on higher levels practically unusable. In the example given above, one would have to release AltGr always before Shift to get the Mod3-Latch. The practical relevance of latches on higher levels is once more given by the revised German standard layout.

randr: cleanup provider properly

So in the cold plug server shutdown case, we reap the resources before we call CloseScreen handlers, so the config->randr_provider is a dangling pointer when the xf86CrtcCloseScreen handler is called,

however in the hot screen unplug case, we can't rely on automatically reaped resources, so we need to clean up the provider in the xf86CrtcCloseScreen case.

This patch provides a cleanup callback from the randr provider removal into the DDX so it can cleanup properly, this then gets called by the automatic code for cold plug, or if hot unplug it gets called explicitly.

Fixes a number of random server crashes on shutdown

A fixed-mode output device like a panel will often only inform of its preferred mode through its EDID. However, the driver will adjust user specified modes for display through use of a panel-fitter allowing greater flexibility in upscaling. This is often used by games to set a low resolution for performance and use the panel fitter to fill the screen.

v2: Use the presence of the 'scaling mode' connector property as an indication that a panel fitter is attached to that pipe.

`randr`: unreff the provider shared pixmap the appropriate number of times

When an `RandR` shared pixmap is created in `rrCreateSharedPixmap`, it has a refcnt of 1. Then, `PixmapShareToSlave` bumps the refcnt to 2. However, there's no corresponding `PixmapUnshareFromSlave` where the refcnt can be decreased again, and there's no convenient common place where the refcnt can be decremented when the slave pixmap is destroyed.

Fix this by just unreffing the pixmap twice in `RRCrtcDetachScanoutPixmap`.

xfree86: Use fbdev/vesa driver on Oaktrail, Medfield, CDV rather than -intel

Instead of defaulting to -intel for Oaktrail, Medfield, and CDV chips, default to -fbdev. For Poulsbo (only), attempt to use -psb if it's installed, and fallback to fbdev otherwise. All other Intel chips should use -intel.

This fixed an issue where -intel would load on these chips and cause a boot failure. Newer -intel drivers avoid the boot hang, but it's still the wrong driver to load, so why take chances.

The patch was originally created by Stefan Dirsch for OpenSUSE. We have included it in our stable release (Ubuntu "quantal" 12.10) since December.

Short-cut the input device cleanup process during AbortServer()

If we're about to abort, we're already in the signal handler and cannot call
down to the default device cleanup routines (which reset, free, alloc, and
do a bunch of other things).

Add a new DEVICE_ABORT mode to signal a driver's DeviceProc that it must
reset the hardware if needed but do nothing else. An actual HW reset is only
required for some drivers dealing with the HW directly.

This is largely backwards-compatible, hence the input ABI minor bump only.

Drivers we care about either return BadValue on a mode that's not
DEVICE_{[INIT|ON|OFF|CLOSE]} or print an error and return BadValue. Exception
here is vmmouse, which currently ignores it and would not reset anything.
This should be fixed if the reset is required.

dix: support the transformation matrix for relative devices.

The transformation matrix we previously stored was a scaled matrix based on
the axis ranges of the device. For relative movements, the scaling is not
required (or desired).

Store two separate matrices, one as requested by the client, one as the
product of [scale . matrix . inv_scale]. Depending on the type of movement,
apply the respective matrix.

For relative movements, also drop the translation component since it doesn't
really make sense to use that bit.

dix: when shutting down slave devices, shut down xtest devices last

XTest devices are the first ones in the list, being initialised together
with the master devices. If we disable the devices in-order and a device has
a button down when being disabled, the XTest device is checked for a
required button release (xkbAccessX.c's ProcessPointerEvent). This fails if the device is already NULL.

Instead of putting the check there, disable the devices in the reverse order they are initialised. Disable physical slaves first, then xtest devices, then the master devices.

Testcase: shut down server with a button still held down on a physical device

dix: pre-scale relative events from abs devices to desktop ratio (#31636)

Absolute devices may send relative events depending on the mode (synaptics by default, wacom per option). The relative events are added to the previous position, converted into device coordinates and then scaled into desktop coordinates for pointer movement.

Because the device range must be mapped into the desktop coordinate range, this results in uneven scaling depending dimensions, e.g. on a setup with width == 2 * height, a relative movement of 10/10 in device coordinates results in a cursor movement of 20/10 (+ acceleration)

Other commonly user-visibility results:
* the touchpad changing acceleration once an external monitor as added.
* drawing a circle on a wacom tablet in relative mode gives an ellipsis in the same ratio as the desktop dimensions.

Solution: pre-scale the incoming relative x/y coordinates by width/height ratio of the total desktop size. Then add them to the previous coordinates and scale back with the previous mapping, which will undo the pre-scaling and give us the right movement.

xkb: Fix repeat behaviour of redirect and message actions

The redirect and the message action filter functions implicitly assumed that when they receive an event for the same keycode they were activated for, that this is the a release of the key that activated the filter. This is not true if the key autorepeats. Due to the incorrect assumption, the effective key repeat rate was effectively halved.

Xext: if a root window is given in XTestFakeInput, move to that

For absolute events, if the client specifies a screen number offset the coordinates by that. And add a new flag so we know when _not_ to add the screen offset in GPE.

Without this offset and the flag, GPE would simply add the offset of the current screen if POINTER_SCREEN is set.

Make xf86ValidateModes actually copy clock range list to screen pointer

Our in-house parfait 1.1 code analysis tool complained that every exit path from xf86ValidateModes() in hw/xfree86/common/xf86Mode.c leaks the storeClockRanges allocation made at line 1501 with XNFalloc.

Investigating, it seems that this code to copy the clock range list to the clockRanges list in the screen pointer is just plain insane, and according to git, has been since we first imported it from XFree86.

We start at line 1495 by walking the linked list from scrp->clockRanges until we find the end. But that was just a diversion, since we've found the end and immediately forgotten it, and thus at 1499 we know that storeClockRanges is NULL, but that's not a problem since we're going to immediately overwrite that value as the first thing in the loop.

So we move on through this loop at 1499, which takes us through the linked list from the clockRanges variable, and for every entry in that list allocates a new structure and copies cp to it. If we've not filled in the screen's clockRanges pointer yet, we set it to the first storeClockRanges we copied from cp. Otherwise, as best I can tell, we just drop it into memory and let it leak away, as parfait warned.

And then we hit the loop action, which if we haven't hit the end of the cp list, advances cp to the next item in the list, and then just
for the fun of it, also sets storeClockRanges to the ->next pointer it
has just copied from cp as well, even though it’s going to overwrite
it as the very first instruction in the loop body.

include: Add RELOCATE_PROJECTROOT to xwin-config.h header

RELOCATE_PROJECTROOT is AC_DEFINED in configure.ac, but currently has no effect
as it doesn't appear in any AC_CONFIG_HEADER header.

When packaged for Windows, we do not have a unix-style filesystem tree, where
file needed by the X server can be found in fixed, absolute paths under the
prefix (PROJECTROOT).

Instead, the filesystem tree containing files needed by the X server and clients
will be installed with the directory containing the X server executable as the root directory of that tree.

(Typically, this will be in the Program Files directory, which does not have a fixed name, as it can be moved, localized, or added to to indicate x86 or x64 binaries)

So, RELOCATE_PROJECTROOT is used to make a native Windows build of the X server look for various files (fonts, xkb data) in locations relative to the X server rather than at absolute paths, by translating those paths at run-time.

Additionally the XKEYSYMDB, XERRORDB, XLOCALEDIR env vars checked by libX11 are set appropriately for clients started by the X server.

Date: Wed Jan 9 19:32:19 2013 +0100

dix: fix error logging occuring in signal context of GetTouchEvents

GetTouchEvents is usually called in a signal context.
Calling ErrorF for the error messages leads to X complaining about log:

(EE) BUG: triggered 'if (inSignalContext)'
(EE) BUG: log.c:484 in LogVMessageVerb()
(EE) Warning: attempting to log data in a signal unsafe manner while in signal context.
Please update to check inSignalContext and/or use LogMessageVerbSigSafe() or ErrorFSigSafe().
The offending log format message is:
%: Attempted to start touch without x/y (driver bug)

xfree86: update the device state for all DGA events (#59100)

DGA only handles master devices but it does intercept slave device events as well (since the event handlers are per event type, not per device).

The DGA code must thus call into UpdateDeviceState to reset the button/key state on the slave device before it discards the remainder of the event.

Test case:
- Passive GrabModeSync on VCP
- Press button
- Enable DGA after ButtonPress
- AllowEvents(SyncPointer)
- Release button

The button release is handled by DGAProcessPointerEvent but the device state
is never updated, so the slave ends up with the button permanently down.
And since the master's button state is the union of the slave states, the
master has the button permanently down.

hw/xwin: Process one Windows message per wakeup, rather than all of them.

De-queuing Windows messages and X events happens in the same thread of execution. Draining the windows message queue can lead to the X event queue overflowing if lots of those windows messages cause X events (e.g. if a keyboard macro program has just dumped thousands of keypresses into the Windows message queue). See the mailing list thread [1] for more details.

Processing one Windows message per wakeup, rather than all of them gives the X server a chance to do stuff as well after each message.

input: Record grab pointer in TouchListener

This places a pointer to the grab related to a TouchListener directly in the TouchListener structure rather than hoping to find the grab later on using the resource ID.

Passive grabs have resource ID in the resource DB so they can be removed when a client exits, and those resource IDs get copied when activated, but implicit grabs are constructed on-the-fly and have no resource DB entry.

xkb: Do not use base group as an array index.

The base group is not brought into range and, therefore, using it as an array index crashed the X server. Also, at this place, we should ignore locked groups, but not latched groups. Therefore, use sum of base and latched groups, brought into range.

Reproducible with:
key <FK07> { 
    type= "ONE_LEVEL",
    symbols[Group1]= [ NoSymbol ],
    actions[Group1]= [ LatchGroup(group=-1, clearLocks) ]
};

And hitting F7 will exceed the group level and access arbitrary memory.

render: Unwrap early on the animated cursor BlockHandler

The loop above the previous call may end up triggering other handlers attaching to the same function slot, so unwrapping the handler after that could leave the just attached handler in a dangling but not unset state.

This issue was most visible on the XO, where destroying a window with an animated cursor set and running would trigger this inconsistent state, never calling the miSpriteBlockHandler again after the animated cursor is unset.

mi: Ensure pointer emulating touch events update the sprite

Different miPointerSpriteFuncRec implementations do a varying business at ultimately calling miPointerUpdateSprite(), this particularly fails when using the plain mi sprite on touch events, where the sprite is just moved/updated on cursor changes.

So, ensure miPointerUpdateSprite() is called generically for pointer emulating touch events as with regular motion events.

dix: Make small bitfields that store enums unsigned

Commit 31bf81772e146af79b0c456aae2159eba8b0280f changed the clientState field
from a signed int to a signed int 2-bit bitfield. The ClientState enum that is expected to be assigned to this field has four values: ClientStateInitial (0), ClientStateRunning (1), ClientStateRetained (2), and ClientStateGone (3). However, because this bitfield is signed, ClientStateRetained becomes -2 when assigned, and ClientStateGone becomes -1. This causes warnings:

```
    test.c:54:10: error: case label value exceeds maximum value for type [-Werror]
    test.c:55:10: error: case label value exceeds maximum value for type [-Werror]
```

The code here is a switch statement:

```
      switch (client->clientState) {
      case ClientStateGone:
      case ClientStateRetained:
          [...]  
      break;
      default:
          [...]  
      break;
      }
```

It also causes bizarre problems like this:

```plaintext
    client->clientState = ClientStateGone;
    assert(client->clientState == ClientStateGone); // this assert fails
```

Also change the signedness of nearby bitfields to match.

        glx/dri2: initialise api to avoid indirect rendering failing randomly

        Running glxinfo under indirect rendering would randomly fail against the
        intel driver, as it would create a context with no attribs, and then the
        api value would be passed to the driver uninitialised.

Signed-off-by: Peter Hutterer <peter.hutterer@who-t.net>
Reviewed-by: Jasper St. Pierre <jstpierre@mecheye.net>
Pass the event list through to the pointer barrier code to return it

Instead of having the pointer barrier code enqueue events separately from GetPointerEvents, pass the event list through and let it add to it.

Barriers: Support line and ray barriers

This allows clients to add barriers that extend to the edge of the screen. Clients are encouraged to use these instead of precise coordinates in these cases to help prevent pointer leaks.

Barriers: Replace complex intersection test with simpler math

Since barriers are axis-aligned, we can do the intersection test with simple interpolation rather than line-segment intersection. This also helps us out in the future when we want the barriers to extend to be rays and lines rather than just segments.

Barriers: Send an XI_BarrierLeave event when a barrier is destroyed

This ensures that we always complete an event sequence.
barriers: Clean up code

Rename a variable. This is to make the diff in the next commit cleaner.

barriers: Send a BarrierLeave event when we leave the hitbox

Additionally, add flags when the pointer is released.

barriers: Increment event ID on hit box leave

We eventually want to send a new notify event on hitbox leave, which signifies the dawn of a new barrier event ID, so it's convenient if we can put the code here.

barriers: Add a couple pixels of elbow room for the hit detection

Pointers (and the hands that drive them) aren't very precise, and the slightest amount of nudging to either side might be enough to reset the event ID, making clients think they have an entirely new hit. Allow for a slightly bigger "hit box" before these barriers get reset.
barriers: Add support for edge cases when releasing barriers

If we release a barrier, we want to ensure that we block all other barriers afterwards, rather than capping the limit to the two nearest barriers.

barriers: Don't allow releasing the pointer on other client's barriers

barriers: Don't allow destroying other client's barriers

Add support for XI2.3: Pointer barrier events and releases.

This adds support for clients that would like to get a notification every time a barrier is hit, and allows clients to temporarily release a barrier so that pointers can go through them, without having to destroy and recreate barriers.

Based on work by Chris Halse Rogers <chris.halse.rogers@canonical.com>
barriers: Reindent the constrainment hook

This is to make future diffs much cleaner. Best viewed with -w.

barriers: Switch to finding the nearest barrier client

When we add events, we eventually want to add more state to the PointerBarrierClient, so return one of these instead of the dummy public structure that's not very interesting.

barriers: Switch to an explicit hook for barrier constrainment

Rather than riding on the ConstrainCursorHarder hook, which has several issues, move to an explicit hook, which will help us with some RANDR interaction issues.

barriers: Don't loop over the server to destroy a barrier

This is completely pointless as far as I can tell.
cursor: Move pointer barrier code over to XI

In order to send events to specific windows associated with the barrier, we need to move the code that handles barriers to somewhere where it's easier to construct and send events. Rather than duplicating XSync with its XSyncSelectAlarm, re-use the existing XI infrastructure.

For now, just move a bunch of code over, rename some things, and initialize the new structures, but still consider it a separate codebase. Pointer barrier requests are still handled by XFixes, so this is a weird intermediate state. It's unknown whether we'll add explicit requests to pointer barriers inside XI.

Xi: fix touch event selection conflicts (#57301)

There are limits on which client may select for touch events on a given window, with restrictions being that no two clients can select on the same device, but narrower selections are allowed, i.e. if one client has XIAllDevices, a second client may still select for device X.
The current code had a dependency on which client selected first and which device, resulting in inconsistencies when selecting for events. Fix that, responding with the right errors regardless of who selected what first.

Author: Peter Hutterer <peter.hutterer@who-t.net>
Date:   Mon Nov 26 15:14:19 2012 +1000

dix: when deactivating pointer-only grabs, don't emulate TouchEnd events

A client with a pointer grab on a touch device must reject the touch when
detacti\ing the grab while the touch is active. However, such a rejecting must not trigger a ButtonRelease event to be emulated and sent to the client.

Set the grabbing listener's state to HAS_END, so we simply skip delivery to that client.

Date:   Mon Nov 26 12:23:54 2012 +1000

dix: only reject active grabs on ungrab and do it before actually ungrabbing

An active grab ungrabbing is the same as rejecting the grab, since the client is no longer interested in those events. So reject any touch grab, but do so before actually deactivating since we're interested in the TouchEnd for the current grabbing client.

A passive grab otoh is _not_ like rejecting a grab, since it deactivates automatically when the touch ends.

xkb: fill in keycode and event type for slow keys enablement
eventType is set for the type that triggered a XkbControlsNotify event. Technically, SlowKeys is triggered by a timer which doesn't have a matching core event type. So we used to use 0 here.

Practically, the timer is triggered by a key press + hold and cancelled when the key is released before the timeout expires. So we might as well set KeyPress (keycode) in the ControlsNotify to give clients a chance to differ between timer-triggered SlowKeys and client-triggered ones.

This is a chance in behaviour, though I suspect with little impact.

Date: Sun Jan 8 20:30:02 2012 +0000

hw/xwin: Restore non-latching modifier key state when an X window gains focus

In multiwindow mode, the state of the modifier keys was lost when a window is created (or raised) and focus moved to that window.
For example: In window A Ctrl + some key opens a window B, then in window B Ctrl + some other key triggers the next action. However after the opening of window B the Ctrl key has to be released and pressed again. If the user keeps the Ctrl key held down when the window B is opened, the next key press X will be interpreted as X and not as Ctrl+X.

Extended the function winRestoreModeKeyStates in winkeybd.c to consider not only the latching modifier keys but also the modifiers Ctrl, Shift, Alt/AltGr by using the Windows function GetAsyncKeyState.

A combined Ctrl+AltGr modifier state cannot be restored correctly, as Windows always fakes a Ctrl-L when AltGr is pressed.

hw/xwin: Allow XScreenSaverSuspend() to effect Windows screen saver or monitor power off

Reset the idle timer in the block handler if screenSaverSuspended is set.

This isn't quite a complete solution. We should also set the block timeout to something less than the idle timer timeout to ensure we will reset the idle timer before it times out if we are blocking.

The idle timer timeout is presumably the first one to expire of the screen saver activation or monitor low power or power down timeout, depending on configuration.

Unfortunately this is probably not straightforward to do. Whilst SystemParametersInfo(SPI_GETSCREENSAVETIMEOUT) is portable, apparently SPI_GETLOWPOWERTIMEOUT and SPI_GETPOWEROFFTIMEOUT are not supported by Windows versions 6.0 or later, and the interface for discovering equivalent value is complex.

This doesn't matter in the case where a media player or similar application is the one making the XScreenSaverSuspend() requests, as it will be continuously drawing, causing the X server to become unblocked often.

In the case where slide show presentation application or similar is the one making the XScreenSaverSuspend() request, this might be a problem.

Since "Powerpoint is Evil" [1], I think we'll leave it like this till someone complains :-)

vfb: Initialize the GLX extension again.

This should fix a regression in the 1.13.0 release: commit 5f5bbbe543f65c48ecbb5ccee80116a86ca3fbe86 made it use the default one when initializing extensions. However, this meant the GLX extension was not initialized anymore since it is not part of the `staticExtensions` array.

Since it is not possible to just add it to that array after commit aad428b8e21c77397c623b78706eb64b1f0e77c9, adopt an approach similar to xwin's and xquartz's and initialize the extension from vfb's `InitOutput`.

Don't use GetTouchEvents when replaying events

GetTouchEvents has plenty of side effects such as moving the pointer or updating the master device, which we don't want to happen when replaying. The only reason for calling it was to generate a DCCE event, but GetTouchEvents doesn't even do that right (we might need a DCCE event even when replaying a master event, or clients could interpret valuator data incorrectly).

This discussion is moot at the moment anyway, since DeliverTouchEvents doesn't appear to deliver DCCE events.

linux: Prefer ioctl(KDSKBMUTE, 1) over ioctl(KDSKBMODE, K_OFF)

K_OFF is a slightly broken interface, since if some other process
(cough, systemd) sets the console state to K_UNICODE then it undoes
K_OFF, and now Alt-F2 will switch terminals instead of summoning the
Gnome "run command" dialog.

KDSKBMUTE separates the "don't enqueue events" logic from the keymap, so
doesn't have this problem. Try it first, then continue falling back to
older methods.

XKB: Remove component listing support

No-one uses this - not xkbcomp, not GNOME, not KDE. The preferred way to deal with component listing (which gives you RMLVO rather than KcCGST) is to use the XML files on the client side.

Indeed, a couple of hours after making this commit, it emerged that all *.dir files built with xkbcomp 1.1.1 (released two years ago) and later have been catastrophically broken and nearly empty. So I think that's reasonable proof that no-one uses them.

commit b4e44b285ed0eeed06514215a4b01d54f40094b
Author: Carlos Garnacho <carlosg@gnome.org>
Date: Wed Oct 31 19:29:45 2012 +0100

Xi: Set modifier mask on touch events

Button mask should be out-of-band with the emulated pointer events as touch devices don't truly have "buttons". Even though, it's handy to have the modifier mask from the paired keyboard on touch events.

dix: fix redundant redeclaration warnings in dixfont

These functions are already declared in <X11/fonts/fontproto.h>. Redeclaring them just for _X_EXPORT causes tons of warnings throughout xserver, but they need to be declared somewhere to be picked up by sdksyms.sh. Doing so in a private header limits the warnings to sdksyms.c; fixing those as well would require changes to fontsproto.

xkb: ProcesssPointerEvent must work on the VCP if it gets the VCP

For button release events, the current code picks the VCK. Because that has a XKB struct, it thinks this is a PointerKeys event and proceeds to send the release event through the XTest pointer. That has no effect in normal operation as the button is never down and an attempt is silently discarded (normal event processing continues with the VCP).

On server shutdown, the XTest device is already removed, leading to a null-pointer dereference when the device is checked for whether buttons are down (XkbFakeDeviceButton button_is_down(xtest pointer)).

The current state has only worked by accident, the right approach here is to handle the VCP's event as such and not switch to the keyboard.

commit 53830281b4da096f9c13107d73ec9c76ff1d14cc
Merge: abc2ef590c 9cbcb5bd6a
Author: Keith Packard <keithp@keithp.com>
Use new pixman_glyph_cache_t API that will be in pixman 0.28.0

This new API allows glyphs to be cached in a data structure in pixman,
and entire glyph strings to be composited in one go.

Also bump pixman dependency to 0.27.2.

Results from the cairo peformance test suite running against Xvfb with
a screen size of 1680x1050@32bpp:

Author: Thierry Reding <thierry.reding@avionic-design.de>
Date: Wed Oct 17 12:11:49 2012 +0200

xf86: Fix build against recent Linux kernel

Recent Linux kernels reworked the linux/input.h header file, which is now part of the "user-space API". The include guard therefore has an additional _UAPI prefix.

Instead of adding another case to the #ifdef, drop any include guard checks and instead always undefine the BUS_* definitions on Linux.

hw/xwin: Fix various warnings in code generated by lex/yacc

Remove various redundant declarations.

Instruct lex not to generate code which isn’t going to be used, thus avoiding some unused function warnings.

Note that bison <2.5 expects stdlib.h to define _STDLIB_H if it’s been included, and avoids prototyping free/malloc in that case. Some stdlib.h (e.g. newlib) may not match precisely (e.g. defining _STDLIB_H_), so we define it after including stdlib.h to be sure, and avoid a redundant declaration warning for those symbols.

dix: fix crash on shutdown if a disabled device is still grabbed (XI1 grab)

A disabled device doesn't have a sprite (less so a sprite->win) and triggers a NULL-pointer dereference on shutdown when all active grabs are released as part of the cleanup.

Fix this by checking for sprite being non-null and setting the focus window to the NullWindow if it is. The rest of the patch just attempts to make things more readable.

xfree86: add xf86UpdateDesktopDimensions()

This call is required for external drivers (specifically NVIDIA) that do
not share the xfree86 infrastructure to update the desktop dimensions.
Without it, the driver would update the ScreenRecs but not update the total
dimensions the input code relies on for transformation.

This call is a thin wrapper around the already-existing internal call and
should be backported to all stable series servers, with the minor ABI bump.

commit 09f1e5b15b769e1122f0a8d7cae0820038992312
Author: Julien Cristau <jcristau@debian.org>
Date: Sun Oct 7 18:40:35 2012 +0200

Revert "kinput: allocate enough space for null character."

This reverts commit 5317855dd746d64ef7f473a83ca73bb20e74b6fca.

The above commit breaks Xephyr option parsing. Andrzej writes:

Xephyr -retro -keybd evdev,.device=/dev/input/event2,xkbrules=evdev,xkbmodel=evdev,xkblayout=pl -mouse
evdev,.device=/dev/input/event1 :3

results in:
<snip>

Pointer option key (device=) of value (/dev/input/event1) not assigned!
Kbd option key (device=) of value (/dev/input/event2) not assigned!
Kbd option key (xkbrules=) of value (evdev) not assigned!
Kbd option key (xkbmodel=) of value (evdev) not assigned!
Kbd option key (xkblayout=) of value (pl) not assigned!
<snip>

The effect of the patch is that the "key=value" pairs are parsed in such a way that the key is added an "equals" sign to it and we end up with keys like "device=" instead of "device". This in turn has effect on KdParsePointerOptions and KdParseKbdOptions: the key does not match any choice presented in the "switch" statement, and so "Pointer/Kbd option key (...) of value (...) not assigned!" happens, making all "key=value" options inaccessible to the user. Reverting the patch makes them available again.

Fix FlushClient to write extraBuf when provided (regression fix)

In commit:

commit 092c57ab173c8b71056f6feb3b9d04d063a46579
Author: Adam Jackson <ajax@redhat.com>
Date: Fri Jun 17 14:03:01 2011 -0400
the check for an empty output buffer was moved from one calling
location into the FlushClient implementation itself. However, this
neglected the possibility that additional data, in the form of
'extraBuf' would be passed to FlushClient from other code paths. If the
output buffer happened to be empty at that time, the extra data would
never be written to the client.

This is fixed by checking the total data to be written, which includes
both pending and extra data, instead of just the pending data.

dix: fix crash on XI 1.x grabs on disabled devices. (#54934)

If the device is disabled, the sprite window is NULL and dereferencing crashes the server.

This is only triggered for XI 1.x grabs (ProcXGrabDevice) as XI2 grabs would trigger another code path, creating a sprite for the disabled device as if detaching it (which is wrong and fixed with this patch too).

Grabbing a disabled device doesn't make sense as it won't send events anyway. However, the protocol specs do not prohibit it, so we need to keep it working.

Luckily, oldWin is only used for focus out events, which aren't necessary given that the device is disabled.

dix: fix scale_to_desktop for edge ABS events

Scale_to_desktop() converts ABS events from device coordinates to screen coordinates:
[dev_X_min, dev_X_max]  -> [screen_X_min, screen_X_max]
[dev_Y_min, dev_Y_max]  -> [screen_Y_min, screen_Y_max]

An edge ABS event with X = dev_X_max (e.g., generated from the edge of a touchscreen) will be converted to have screen X value = screen_X_max, which, however, will be filtered out when xserver tries to find proper Window to receive the event, because the range check for a Window to receive events is
\[ \text{window_X_min} \leq \text{event_screen_X} < \text{window_X_max} \]
Events with event_screen_X = screen_X_max will fail the test get and rejected by the Window.

To fix this, we change the device to screen coordinates mapping to:
[dev_X_min, dev_X_max]  -> [screen_X_min, screen_X_max-1]
[dev_Y_min, dev_Y_max]  -> [screen_Y_min, screen_Y_max-1]

dix: set the device transformation matrix

The property handler is registered after setting the property, so
dev->transform remains as all-zeros. That causes pixman_f_transform_invert()
fail (in transformAbsolute()) and invert remains as garbage. This
may then cause a cursor jump to 0,0.

Since the axes are not yet initialized here and we need to allow for drivers
changing the matrix, we cannot use the property handler for matrix
initialization, essentially duplicating the code.

Triggered by the fix to (#49347) in 749a593e49adccdf1225be28a521412ec85333f4

dix: Extend initial connection handshake for forwarding proxies

Forwarding proxies like sshd will appear to be local, even though they
aren't really. This leads to weird behaviour for extensions that truly
require running under the same OS services as the client, like MIT-SHM
and DRI2.

Add two new legal values for the initial connection's byteOrder field,
‘r’ and ‘R’. These act like ‘T’ and ‘B’ respectively, but have the side
effect of forcing the client to be treated as non-local. Forwarding
proxies should attempt to munge the first packet of the connection
accordingly; older servers will reject connections thusly munged, so the
proxy should fall back to passthrough if the munged connection attempt
fails.

xfree86: Change the semantics of driverFunc(GET_REQUIRED_HW_INTERFACES)

This is a really awkward interface, since we're calling it well before
the driver knows what device it's going to drive. Drivers with both KMS
and UMS support therefore don't know whether to say they need I/O port
access or not, and have to assume they do.

With this change we now call it only to query whether port access might
be needed; we don't use that to determine whether to call a driver's
probe function or not, instead we call them unconditionally. If the
driver doesn't check whether port access was enabled, they might crash
ungracefully. To accommodate this, we move xorgHWAccess to be explicitly
intentionally exported (sigh xf86Priv.h) so that drivers can check that
before they attempt port access.

v2: Move initial xf86EnableIO() nearer the logic that determines whether
to call it, suggested by Simon Farnsworth.

linux: Make failure to iopl non-fatal

We load the driver list, then enable I/O, then call driver probe based
on whether I/O enable succeeded. That's bad, because the loaded
security policy might forbid port access. We happen to treat that as
fatal for some reason, which means even drivers that don't need I/O
access (like kms and fbdev) don't get the chance to run. Facepalm.

How about we just make that non-fatal instead, that sounds like a much
better plan.

list: Use offsetof() and typeof() to determine member offsets within a structure

Some compilers have difficulty with the previous implementation which relies on undefined behavior according to the C standard. Using offsetof() from <stddef.h> (which most likely just uses __builtin_offsetof on modern compilers) allows us to accomplish this without ambiguity.

This fix also requires support for typeof(). If your compiler does not support typeof(), then the old implementation will be used. If you see failures in test/list, please try a more modern compiler.

v2: Added fallback if typeof() is not present.

glx: Skip multisampled configs when matching pre-existing X visuals.

In __glXScreenInit() we generate the set of GLX visuals in two steps:
first we match each pre-existing X visual with a corresponding
FBConfig, then we generate a new X visual to correspond to all the
remaining FBConfigs.

The first step is used for the two default 24-bit visuals (true color and direct color) and for the 32-bit visual. If windowsystem multisampling is enabled in Mesa, we need to ensure that none of these three visuals gets matched to a multisampled config.

Fixes a bug with windowsystem multisampling in gnome-shell. If the X server happens to match up a multisampled FBConfig to the 32-bit visual, gnome-shell will try to use it to read pixels from alpha-blended windows (such as gnome-terminal), resulting in no window appearing on screen.

Kludge -- Call RandR screen before cleaning up xf86 crtc

The core RandR screen cleanup now involves cleaning up any GPU screen associations, and those call down into DDX to clean up the driver. If the pointers from the xf86 structures back to the core randr structures are set to NULL at that point, bad things happen.

This patch "knows" that the core RandR close screen is underneath the xf86 randr close screen function, and so makes sure it gets called first.

fb: reorder Bresenham error correction to avoid overshoot.

When fbBresSolid draws a line, it can happen that after the last pixel, the Bresenham error term overflows, and fbBresSolid paints another pixel before adjusting the error term.

However, if this happens on the last pixel (len=0), this extra pixel might overshoot the boundary, and, in rare cases, lead to a segfault.

Fix this issue by adjusting for the Bresenham error term before drawing the main pixel, not after.

  os: don't unconditionally unblock SIGIO in OsReleaseSignals()

  Calling OsReleaseSignal() inside the signal handler releases SIGIO, causing
  the signal handler to be called again from within the handler.

  Practical use-case: when synaptics calls TimerSet in the signal handler,
  this causes the signals to be released, eventually hanging the server.

  dix: make sure the mask is set for emulated scroll events (#52508)

  If a device has smooth scrolling axes, but submits scroll button events, we
  convert those to motion events and update the valuators. For legacy button
  events, the valuator mask is likely unset though, causing
  add_to_scroll_valuator() to return early, leaving us with an empty mask.
  That again skipped the rest of the code and no events were generated.

  Fix it by making sure that the scroll valuator in the mask is at least
  initialized to 0.

  Broke evdev wheel emulation, introduced by
  54476b5e4461f523e935961affabc0fde12c556.

  sync: Fix logic error from b55bf248581dc66321b24b29f199f6d8c8d02db1b
That commit adds two hunks, and I _think_ they're backwards. It adds code to modify `bracket_greater` on NegativeTransition triggers, and `bracket_less` on PositiveTransition triggers. That breaks symmetry with the surrounding code; the code as of this commit could probably be simplified further.

I can't keep the sync trigger rules in my head for more than about five minutes at a time, so I'm sending this on for more eyes. RHEL 6.3's xserver is shipping with b55bf248 reverted:

https://bugzilla.redhat.com/show_bug.cgi?id=748704#c33

And there appear to be some upstream reports of the same issue:

https://bugzilla.gnome.org/show_bug.cgi?id=658955

So I'd like to get this sorted out.

randr: Fix up yet another corner case in preferred mode selection

Let's say - purely for the sake of argument, mind you - that you had a
server GPU with anemic memory bandwidth, and you walked up to it and
plugged in a monitor that was 1920x1080 because that's what happened to
be on the crash cart. Say the memory bandwidth is such that anything
larger than 1280x1024 gets filtered away. Now you're in trouble,
because the established timings section includes a 720x400 mode because
that's what DOS 80x25 is, and that happens to just about match the
physical aspect ratio.

Instead let's reuse the logic from the existing aspect-match path: pick
the larger mode of either the physical aspect ratio or 4:3.

test: always add DIX_LIB and OS_LIB on XORG builds

With --disable-xorg, We also disabled a bunch of tests because of their perceived reliance on a DDX. The cause was libtool missing some object files that never ended up in libxservertest.la. Only the xfree86 test has a true dependency on XORG.

DIX_LIB was pointing to dix.O (instead of libdix.la) when DTRACE_SPECIAL_OBJECTS was defined. libdix.la should be part of XSERVER_LIBS but dix.O is not a recognised libtool object, so it got skipped for libxservertest.a. Only in the XORG case would we add DIX_LIB and OS_LIB manually, thus forcing linkage with the dtrace-generated objects.

Fixing this by packaging up the dtrace-generated files as part of libdix.la/libos.la doesn't work for Solaris (and possible others), so simply always force linkage against the DIX_LIB/OS_LIB in the case of dtrace objects.

glx: Do not report the GLX_INTEL_swap_event extension for indirect swrast

Commit 84956ca4 bogusly adds GLX_INTEL_swap_event to the extensions reported by swrast.

"DRI2 supports this now - and already enables it explicitly - but drisw does not and should not. Otherwise toolkits like clutter will only ever SwapBuffers once and wait forever for an event that's not coming."

(A similar bug for direct swrast is already fixed in mesa commit 25620eb1)

(Not that this may be papering over the cracks somewhat, as if we do report GLX_INTEL_swap_event, some clutter apps fail with GLXBadDrawable calling GLXChangeDrawableAttributes to change the setting of GLX_BUFFER_SWAP_COMPLETE_INTEL_MASK in the GLX_EVENT_MASK, apparently after the drawable is destroyed, which suggests a bug with GLXDrawable lifetimes)

hw/xwin: Introduce winProcessXEventsTimeout() to the concept of fractions of a second

Oh this is terrible.

Currently we only compute the select timeout in whole seconds. This means if we have less than 1 second remaining, we select with a timeout of 0 (i.e. poll) which causes the task to spin, burning 100% CPU for the remaining timeout (and possibly preventing the process we are waiting for from running :S)

hw/xwin: Make winOverrideIcon() thread-safe for icon data access

winOverrideIcon() is called from the internal WM client thread.

Accessing server-internal data structures to get icon data or window hints is
not safe, as there is no lock to ensure we do not collide with these data
structures being updated in the server thread.

Rewrite so the internal client thread uses X client calls to obtain this data
safely

We used to also set the icon inside the server when the window was initially
created. For simplicity, we simply send a message to the internal WM to update
the icon when the window is created (rather than writing different icon update
code which can work in the server thread for that one case...)

extwm mode used to do the icon update in the server. I'm not sure that actually
made much sense. Let's assume the external WM client can do it instead...

v2
Make sure that WM_WM_ICON_EVENT does nothing for override-redirect windows

v3
Reinstate check that native window actually has expected properties for an X
window before trying to update it's icon; some auxiliary windows owned by the
XWin process don't, which would cause a crash

v4
Various fixes to pixmap icon conversion:
- remove left-over malloc in winScaleXimageToWindowsIcon causing a memory leak
- don't recalculate DDBitmap stride in winScaleXimageToWindowsIcon, when we already have worked it out
- properly check that XGetWindowProperty(NET_WM_ICON) returned some data
- don't try to retrieve WM_HINTS icon_mask if it isn't set
- restore accidentally dropped calculation of effBpp, stride, maskStride of output DDBitmap
- make sure imageMask is zero-initialized before we use it to mask the DDBitmap

v5
Remove a left-over unused variable

v6
Avoid XDestroyImage(NULL) crash if XGetImage failed for icon_pixmap

glx: drop GLX_LIBS from X server and workaround sdksyms.

We've had reports of two copies of the GLX bits, one in the server and one in libglx.so causing problems, I didn't understand why the X server needed a copy so drop it, however then we have to fix a missing GlxExtensionInit that comes from sdksyms, so work around it by moving that one declaration into a header that sdksyms doesn't scan.

Thanks to Jon Turney for debugging the actual problem.

(copyright header from extinit.h that seems most appropriate put on top).

hw/xwin: RANDR resize didn't occur when screen window was maximized or restored

In windowed mode, with option -resize, RANDR resize was missing when the screen window was maximized or restored.

hw/xwin: Bug fixes for screen sizing when the screen window is on a non-primary monitor

There is a bug that when the -screen option is used to specify a monitor for the screen window to be located on, but no explicit size is specified (and the -multiplemonitors option isn't specified), the screen window size is always constrained to fit the work area of the primary monitor (rather than the work area of the specified monitor)

This gives incorrect results if you want a screen the same size as your non-primary monitor (e.g. by using -screen 0 @2) and your non-primary monitor is larger than your primary monitor.

(This can be worked around by specifying -multiplemonitors and an explicit screen size the same size as the monitor (e.g. -multiplemonitors -screen 0 1600x1200@2))

Fix to use work area for the monitor specified for the screen, rather than the primary monitor work area (unless -multiplemonitors is used, in which case we continue to use the virtual desktop work area instead)

Also fix the adjustment for an autohide taskbar, so that it is only done if the taskbar is on the same monitor as the screen (or -multiplemonitors is used)

Restore extern to the declaration of __glXDRISWRastProvider

b86aa74 dropped the 'extern' from the declaration of __glXDRISWRastProvider
This turns out to be important to me, as without it, the final link only gets the tentative definition of __glXDRISWRastProvider implied by the declaration, and not the proper one from glxdriswrast.c, presumably because nothing else references anything in the object that file generates.

Revert bogus GlxPushProvider() in commit a1d41e3

a1d41e3 "Move extension initialisation prototypes into extinit.h"
also includes a change to GlxExtensionInit to install the swrast GLX provider.

Since b86aa74 "GLX: Insert swrast provider from GlxExtensionInit"
already does this (correctly, by installing the swrast provider
at the end of the chain, rather than at the beginning), and since this
would seem to have the effect of making the swrast provider the most
preferred provider, I'm guessing this wasn't intended.

xfree86: Strip dangling pointers from desiredMode

Based on the original patch by Chris Wilson, which was a better fix than mine.

We stash a copy of the desiredMode on the crtc so that we can restore it after a vt switch. This copy is a simple memcpy and so also stashes a references to the pointers contained within the desiredMode. Those pointers are freed the next time the outputs are probed and mode list rebuilt, resulting in us chasing those dangling pointers on the next mode switch.
AllocDevicePair: Ensure XKB privates are initialised

Since we call directly into XKB and may be doing so before the extension has been initialised, make sure its privates are set up first. XTest had a hack to do this itself, but seems cleaner to just make sure we do it in AllocDevicePair.

Sync: Always initialise system counter list

Sync is designed to let you add system counters before the extension has been initialised, which means the system counter list may well be full of bees. Make sure it's initialised before we add to it, to avoid the risk of fatal injury.

commit d792ac125a0462a04a930af543cbc732f8cdab7d
Author: Alan Coopersmith <alan.coopersmith@oracle.com>
Date:   Mon Jul 9 19:12:43 2012 -0700

Use C99 designated initializers in dix Replies

the initializer for the .length element of the xGetPointerMappingReply
structure uses the value of rep.nElts, but that won't be set until
after this initializer runs, so we get garbage in the length element
and clients using it will generally wedge.

Easy to verify:

   $ xmodmap -pp

Fixed by creating a local nElts variable and using that.

Remove Xorg-specific extensions from non-Xorg miinitext

miinitext.c had a completely separate codepath for non-Xorg servers, which included tests for Xorg-specific extensions such as XFree86-VidMode, which were external even to the Xorg DDX. So we can just remove them, and the associated #undefs.
Quartz: Move PseudoramiX initialisation to DDX

As PseudoramiX is a DDX-specific extension, move its loading and initialisation to hw/xquartz. This creates a QuartzExtensionInit() similar in spirit to xf86ExtensionInit.

Move the remnants of loadext.c to miinitext.c

There was nothing XFree86-specific or loader-specific about this, aside from using xf86MsgVerb instead of ErrorF.

Loader: Move ExtensionModule types to DIX

In preparation for gutting loadext.c, move the ExtensionModule struct to the DIX, and unexport ExtensionModuleList (why, why, why, why was this ever exported in the first place, tbqh).

Open Source Used In Field Network Director for Virtual Machine Installation 4.7.1 34338
Loader: Remove extension initialisation sorting

Extensions could previously declare initialisation dependencies on other extensions, which would then get nicely sorted by the loader. We only had one user for this, GLX, which had one pointless (Composite) and one possibly useful dependency (DBE). As DBE is now a built-in, it will always be sorted by GLX, so we no longer have any users for it.

Move XF86-VidMode from extmod to built-in

As with DGA, move VidMode from being part of extmod to a built-in part
of the server, if compiled as such. This is initialised from
xf86ExtensionInit rather than miinitext because it's wholly dependent on
the Xorg DDX.
DGA: Remove excessive module-induced indirection

The DGA event base used to have to be passed through a function pointer, as the code was cleaved in two with half in a module, and half in the core server. Now that's not the case, just access DGAEventBase directly.

v2: Deal with Alan's event initialization cleanups

Move DGA from extmod to built-in

Rather than leave DGA languishing in extmod, move it to be a built-in extension. As it's quite specific to the Xorg DDX, just move it sideways to the rest of the DGA code in hw/xfree86/common, and initialise it from xf86ExtensionInit, rather than miinitext.

Move SELinux from extmod to built-in

Instead of letting it languish in extmod just because we want to configure bits of it from xf86, move XSELinux to the built-in part of Xext, and do its configuration from xf86ExtensionInit.

XFree86: sdksyms: Remove unused -DXorgLoader

We no longer have anything in the tree that checks for XorgLoader. This was a fairly monumental hack: xvdi.h used to hide all its functions behind #ifdef XorgLoader, solely to avoid sdksyms.sh picking up its symbols, as it was previously a module rather than built-in.

This is no longer the case, so we can remove the define.

Move RECORD from external module to built-in

Rather than languishing in its own special module, move RECORD into the core server.

Move DBE from an external module to built-in

If DBE support is compiled in the server, just man up and build it into the server, rather than having it as an external module.

miinitext: Use ARRAY_SIZE rather than sentinel

NULL sentinels are totally lame.

v2: numExtensionModules isn't public, so keep using the provided sentinal - Keith Packard <keithp@keithp.com>
extmod: Use ARRAY_SIZE rather than sentinel

When the array gets down to size zero (which it does in later patches),
gcc complains that the index is out of bounds. Avoid this by using
ARRAY_SIZE on extensionModules instead.

Add xf86ExtensionInit for DDX extension configuration

xf86ExtensionInit is called after configuration file parsing, so it can
perform the two parts of extension initialisation currently done by
extmod: enabling and disabling of extensions through an 'omit' option,
and SELinux configuration.

Loader: Drop EXTERN_MODULE flag

EXTERN_MODULE was used to specify that we shouldn't worry about modules
lacking a ModuleData object. It was also completely unused. *shrug*

Don't make failure to -nolisten fatal

If failing to disable a protocol specified by -nolisten failed, we'd
throw a FatalError and bomb startup entirely. From poking at xtrans, it
looks like the only way we can get a failure here is because we've
specified a protocol name which doesn't exist, which probably doesn't
constitute a security risk.

And it makes it possible to start gdm even though you've built with
--disable-tcp-transport.

eephyrGLXQueryServerString: Stop making an unused copy of server_string

ephyerGLXQueryServerString() carefully allocated a buffer padded to the
word-aligned string length for sending to the client, copied the string
to it, and then forgot to use it, potentially reading a few bytes of
garbage past the end of the server_string buffer.

Since WriteToClient already handles the necessary padding, just send
it the actual length of the original server_string, and don't bother
making a padded copy.

Reliably reset signals at server init time

Each DDX currently calls OsReleaseSIGIO in case it was suspended when
the server regen started. This causes a BUG to occur if SIGIO was
*not* blocked at that time. Instead of relying on each DDX, make the
OS layer reliably reset all signal state at server init time, ensuring
that signals are suitably unblocked and that the various signal state
counting variables are set back to zero.

Signed-off-by: Keith Packard <keithp@keithp.com>

dri2/prime: allocate prime id at screen allocation time

Add a static mask of prime id and allocate them at screen time, if the driver supports the prime interfaces and is a gpu screen.

This is instead of them changing due to user controlled randr commands, as suggested by Keith.
This adds the initial prime support for dri2 offload. The main thing is when we get a connection from a prime client, we stored the information and mark all drawables from that client as prime. We then create all buffers for that drawable on the prime device dri2screen.

Then DRI2UpdatePrime is provided which drivers can call to get a shared pixmap which they can use as the front buffer. The driver is then responsible for doing the back->front copy to the shared buffer.

prime requires a compositing manager be run, but it handles the case where a window get un-redirected by allocating a new pixmap and pointing the crtc at it while the client is in that state.

Currently prime can't handle pageflipping, so always does straight copy swap,

v1.1: renumber on top of master.
v1.2: fix auth on top of master.

This is required for the prime macros.

For DRI2 in some offload cases we need to set a new pixmap on the crtc,
this hook allows dri2 to call into randr to do the necessary work to set a pixmap as the scanout pixmap for the crtc the drawable is currently on.

This is really only to be used for unredirected full screen apps in composited environments.

randr: add initial scanout pixmap support (v3)

    When randr notices a crtc configuration request for a slave device,
it checks if the slave allocated pixmap exists and is suitable,
if not it allocates a new shared pixmap from the master, shares
it to the slave, and starts the master tracking damage to it,
to keep it updated from the current front pixmap.

    If the resize means the crtc is no longer used it will destroy
the slave pixmap.

    This adds the concept of a scanout_pixmap to the randr_crtc object,
and also adds a master pixmap pointer to the pixmap object, along
with defining some pixmap helper functions for getting pixmap box/regions.
v2: split out pixmap sharing to a separate function.

xfree86: use udev to provide device enumeration for kms devices (v10)
On Linux in order for future hotplug work, we are required to interface to udev to detect device creation/removal. In order to try and get some earlier testing on this, this patch adds the ability to use udev for device enumeration on Linux.

At startup the list of drm/kms devices is probed and this info is used to load drivers.

A new driver probing method is introduced that passes the udev device info to the driver for probing.

The probing integrates with the pci probing code and will fallback to the pci probe and old school probe functions in turn.

The flags parameter to the probe function will be used later to provide hotplug and gpu screen flags for the driver to behave in a different way.

This patch changes the driver ABI, all drivers should at least be set with a NULL udev probe function after this commit.

v2: rename to platform bus, now with 100% less udev specific,

this version passes config_odev_attribs around which are an array of id/string pairs, then the udev code can attach the set of attribs it understands, the OS specific code can attach its attrib, and then the core/drivers can lookup the required attribs.

also add MATCH_PCI_DEVICES macro.

This version is mainly to address concerns raised by ajax.

v3: Address comments from Peter.
fix whitespace that snuck in.
rework to use a linked list with some core functions that xf86 wraps.

v4: add free list, fix struct whitespace.
ajax this address most of your issues?

v5: drop probe ifdef, fix logic issue

v6: some overhaul after more testing.

Implement primaryBus for platform devices.
document hotplug.h dev attribs - drop sysname attrib
fix build with udev kms disabled
make probing work like the PCI probe code,
match against bus id if one exists, or primary device.

RFC: add new bus id support "PLAT:syspath". we probably want to match on this a bit different, or use a different property maybe. I was mainly wanting this for use with specifying usb devices in xorg.conf directly, but PLAT:path could also work i suppose.

v6.1: add missing noop platform function

v7: fix two interactions with pci probing and slot claiming, prevents pci and platform trying to load two drivers for same slot.

v8: test with zaphod mode on -ati driver, fixup resulting issue clean up common probe code into another function, change busid matching to allow dropping end of strings.

v9: fix platform probing logic so it actually works.

v9.1: fix pdev init to NULL properly.

v10: address most of Keith's concerns.

commit 9d457f9c55f12106ba44c1c9db59d14f978f0ae8
Author: Keith Packard <keithp@keithp.com>
Date: Tue Jul 3 15:45:09 2012 -0700
Add screen-specific privates.

Screen-specific privates areas are only allocated for objects related to the target screen; objects allocated for other screens will not have the private space reserved. This saves memory in these objects while also allowing hot-plug screens to have additional private allocation space beyond what the core screens are using.

Drivers are encouraged to switch to this mechanism as it will reduce memory usage in multi-GPU environments, but it is only required for drivers which will be loaded after the server starts, like modesetting.

Objects providing screen-specific privates *must* be managed by the screen-specific private API when allocating or initializing privates so that the per-screen area can be initialized properly.

The objects which support screen-specific privates are:

- Windows
- Pixmaps
- GCs
- Pictures

Extending this list to include Colormaps would be possible, but require slightly more work as the default colormap is created before all colormap privates are allocated during server startup, and hence gets a bunch of special treatment.

Of particular note, glyphs are *not* capable of supporting screen-specific privates as they are global objects, not allocated on a screen-specific basis, and so each driver must be able to see their privates within the glyph.

glx: Reject creations of indirect contexts with unsupportable versions.
glx: Implement GLX_EXT_create_context_es2_profile

This patch builds on the infrastructure put in place for GLX_ARB_create_context_profile. If GLX_CONTEXT_ES2_PROFILE_BIT_EXT is specified and the requested version is 2.0, create a context with the __DRI_API_GLES2 API.

This change assumes that any DRI2 driver can handle (possibly by saying "no") seeing an API setting other than __DRI_API_OPENGL or __DRI_API_OPENGL_CORE. This allows enabling the extension any time GLX_ARB_create_context (and GLX_ARB_create_context_profile) is enabled.

v2: Clean up some comments. Note that our behavior for GLX_CONTEXT_ES2_PROFILE_BIT_EXT w/version != 2.0 matches NVIDIA’s.

glx: Implement GLX_ARB_create_context_profile

Most of the infrastructure was already in place. This just adds:

* Validate values specified with the GLX_CONTEXT_PROFILE_MASK_ARB attribute.

* Select a DRI2 "api” based on the setting of GLX_CONTEXT_PROFILE_MASK_ARB.

* Enable GLX_ARB_create_context_profile extension.

This change assumes that any DRI2 driver can handle (possibly by saying "no") seeing an API setting other than __DRI_API_OPENGL. This allows enabling this extension any time GLX_ARB_create_context is enabled.
Also, the validation code in __glXDisp_CreateContextAttribsARB is structured in a very verbose manner (using a switch-statement) to ease the addition of GLX_EXT_create_context_es2_profile.

glx: Don't request prototypes for GL extension functions

The server does not want GL extension prototypes. It never links with anything that could possibly provide implementations of these functions. It *is* the provide, and it does not provide these symbols. All this does is create hundreds of warnings like:

include/GL/glext.h:5570:45: warning: redundant redeclaration of 'glMultTransposeMatrixd' [-Wredundant-decls]
include/GL/gl.h:1940:45: note: previous declaration of 'glMultTransposeMatrixd' was here

I believe this was necessary back before the AIGLX days, but that was a long, long time ago. The warnings recently showed up with the addition of -Wredundant-decls to the CWARNFLAGS.
Look for ModuleData only in appropriate library

LoaderSymbol calls dlsym with RTLD_DEFAULT pseudo handle making it search in every loaded library. In addition glibc adds NODELETE flag to the library containing the symbol.

It's used in doLoadModule to locate <modulename>ModuleData symbol, the module's library gets the flag and is kept in memory even after it is unloaded.

This patch adds LoaderSymbolFromModule function that looks for symbol only in library specified by handle. That way the NODELETE flag isn't added.

This glibc behavior doesn't seem to be documented, but even if other implementations differ, there is no reason to search ModuleData symbol outside the module's library.

Enable no-undefined symbols mode in Solaris builds if -z parent is in ld

The Solaris linker recently added a -z parent flag for easier checking of symbol definitions in plugins against the program that loads them. If that's present, this enables it, along with -z defs to error on undefined symbols to alert us if any modules call symbols that won't be found at runtime.

This builds upon, and requires, the recent Cygwin work to build Xorg. It moves a couple more modules to be after the Xorg binary in the build order so that they can find the binary to check against, much as the Cygwin changes did (these would be modules built on Solaris but not
Cygwin).

v2: This version only sets the flags for the xorg-server build itself, and does not yet export them in xorg-server.pc to the drivers, since most of the drivers are not ready to build with -no-undefined yet.

Add dixGetGlyphs to replace GetGlyphs from libXfont to simplify linking

No other Xfont consumer used it, and this saves us from having to link callers against libXfont for one simple function when doing -no-undefined symbols builds.

The function is given a new name to avoid clashing with existing libXfont binaries, but a #define is provided to preserve the API so we don't have to fix all the callers at the same time.

randr: Catch two more potential unset rrScrPriv uses

Ricardo Salveti <ricardo.salveti@linaro.org> found one place where the randr code could use the randr screen private data without checking for null first. This happens when the X server is running with multiple screens, some of which are randr enabled and some of which are not. Applications making protocol requests to the non-randr screens can cause segfaults where the server touches the unset private structure.

I audited the code and found two more possible problem spots; the trick to auditing for this issue was to look for functions not taking a RandR data structure and where there was no null screen private check above them in the call graph.

xfree86: always enable SIGIO on OsVendorInit (#50957)

Drivers call xf86InstallSIGIOHandler() for their fd on DEVICE_ON. That function does not actually enable the signal if it was blocked to begin with. As a result, if one vt-switches away from the server (SIGIO is blocked) and then triggers a server regeneration, the signal remains blocked and input devices are dead.

Avoid this by always unblocking SIGIO when we start the server.

dix: disable all devices before shutdown

f3410b97cf9b48a47bee3d15d232f8a88e75f4ef introduced a regression on server shutdown. If any button or key was held on shutdown (ctrl, alt, backspace are usually still down) sending a raw event will segfault the server. The the root windows are set to NULL before calling CloseDownDevices().

Avoid this by disabling all devices first when shutting down. Disabled devices won't send events anymore.
Master keyboards must be disabled first, otherwise disabling the pointer will trigger DisableDevice(keyboard) and the keyboard is removed from the inputInfo.devices list and moved to inputInfo.off_devices. A regular loop through inputInfo.devices would thus jump to off_devices and not recover.

xf86i2c: add pscrn for drivers to use

This just adds a pScrn pointer into the struct for the drivers to use
instead of scrnIndex. Mostly scrnIndex is used for logging, but some
drivers use it to lookup xf86Screens, so let them stash a pScrn instead.

Removing the scrnIndex is a bit more involved and I'm not sure its worth
the effort. Doing i2c in the X server is legacy code as far as I'm concerned.

xkb: Allocate size_syms correctly when width of a type increases

The current code seems to skip syms with width less than type->num_levels when calculating the total size for the new size_syms. This leads to less space being allocated than necessary during the next phase, which is to copy over the syms to the new location. This results in an overflow leading to a crash.

Fix crash for motion events from devices without valuators

A WarpPointer request may trigger a motion event on a device without valuators. That request is ignored by GetPointerEvents but during smooth scroll emulation we dereference dev->valuators to get the number of axes.

Break out early if the device doesn't have valuators.

Date: Wed May 2 16:18:49 2012 -0700

dri2: Add DRI2GetParam request (v2)

Bump dri2proto dependency to 2.7.
Bump DRI2INFOREC_VERSION to 7.

This new protocol request effectively allows clients to perform feature detection on the DDX. The request was added in DRI2 protocol 1.4.

If I had DRI2GetParam in June 2011, when I was implementing support in the Intel DDX and Mesa for new hardware that required a new DRI2 attachment format, then I could have avoided a week of pain caused by the necessity to write a horrid feature detection hack [1] in Mesa. In the future, when the work begins to add MSAA support to the Intel DDX, having a clean way to do feature detection will allow us to avoid revisiting and expanding that hack.

[1] mesa, commit aea2236a, function intel_verify_dri2_has_hiz
v2: If driver doesn't define ds->GetParam, don't crash. Fall back to
default behavior, per keithp.

xf86/pci: fix slot claiming counting.

Currently if we claim a slot for a PCI driver, we never let it go properly,
this prevents the fallback probe from reusing the slot, even though it
isn't claimed for that pci slot.

So if you set the modesetting driver to point at a specific kms device,
that isn't a PCI device (i.e. USB dongle), then the modesetting driver
loads, the pci probe tries to bind the config slot to the primary PCI
device, however we then check the kms device bus id to discover it
isn't valid. However we don't remove the claim on the slot. Next the
old probe function is called and there is no slots to claim.

This patch fixes that and converts the pciSlotClaimed boolean into
a counter, and changes the unclaim api to take a device pointer
to remove from the entity.

commit afc153a5b4fc58ae70dc21461a71b1a8c855f06
Author: James Cloos <cloos@jhcloos.com>
Date: Tue May 8 17:55:10 2012 -0400

Fix RANDR's gamma_to_ramp().

In order to generate a 256-entry ramp in [0,65535] which covers the full
range, one must multiply eight-bit values not by 256 but rather by 257.

Many years back – well before the RANDR extension was written, and before xorg@fdo – a similar bug fix was made to the DIX for converting client-supplied eight-bit color values into sixteen-bit values.

Noticed by: Elle Stone and Graeme Gill.

Date:   Thu Apr 26 01:49:06 2012 -0500

os: Add CryptoAPI as a choice of SHA1 implementation

Both Cygwin and MinGW can use Windows' native CryptoAPI for SHA1, saving a dependency on libgcrypt or OpenSSL. The necessary functions are in ADVAPI32.DLL, which is among the default lib flags and is already used in hw/xwin for accessing the registry.
os/log: refactor logging

It is not safe to ever use an arbitrary (possibly user supplied) string as part of the format for a *sprintf() call.

For example:
1. Name a Bluetooth keyboard "%n%n%n%n%n%n%n%n"
2. Pair it with a computer running X and try to use it
3. X is not happy when trying to do the following in xf86-input-evdev:
   `xf86IDrvMsg(pInfo, X_CONFIG, "Device: %s\n", device);`
   because LogVHdrMessageVerb() has put the %n from the device name into a format string of the form:
   "evdev: %n%n%n%n%n%n%n%n: Device: %s\n"

Instead, build up a log message in place by appending successive formatted strings by snprintf'ing to the end of the previous.
a message is actually written to a log file. That is, no timestamps on stderr, or in the mem buffer. Therefore, the timestamp stringification is moved to the conditional where it is used.

Since logging uses a fixed length buffer, this patch also forces a 'n' whenever a buffer is terminated due to a too-long write request. This allows the newline detection to work even on overflow, and also cleans up the log a bit in the overflow case.

configure.ac: MinGW doesn't have setuid binaries either.

If the target platform isn't in a list of platforms we know don't use a setuid binary, we try to test if we can chown something to root.

This test possibly won't give the right answer if we are cross-compiling, which is common for the MinGW target. This patch adds MinGW to the list of platforms we know don't use a setuid binary.

dix: when disabling a device, release all buttons and keys
A suspend-induced device disable may happen before the device gets to see
the button release event. On resume, the server's internal state still has
some buttons pressed, causing inconsistent behaviour.
Force the release and the matching events to be sent to the client.

Date:   Fri Apr 27 16:31:17 2012 +1000
dix: don't emulate scroll events for non-existing axes (#47281)

Test case:
- create a device with REL_HWHEEL and ABS_X and ABS_Y. evdev 2.7.0 will set
  that up as device with 1 relative axis
- move pointer to VGA1
- xrandr --output VGA1 --off

Warps the pointer to the new spot and calls GPE with the x/y mask bits set.
When running through the loop to check for scroll event, this overruns the
axes and may try to emulate scroll events based on random garbage in the
memory. If that memory contained non-zero for the scroll type but near-zero
for the increment field, the server would hang in an infinite loop.

This was the trigger for this suggested, never-merged, patch here:

Xi: return BadValue on XIQueryVersion if the version is less than first call

Clients that use plugin systems may require multiple calls to XIQueryVersion from different plugins. The current error handling requires client-side synchronisation of version numbers.

The first call to XIQueryVersion defines the server behaviour. Once cached, always return that version number to any clients. Unless a client requests a version lower than the first defined one, then a BadValue must be returned
to be protocol-compatible.

Create a new dix touch record for an emulated touch with no listeners

As a special case, if a still physically active pointer emulated touch has no listeners and the device is explicitly grabbed for pointer events, create a new dix touch record for the grab only.

This allows for clients to "hand off" grabs. For example, when dragging a window under compiz the window decorator sees the button press and then ungrabs the implicit grab. It then tells compiz to grab the device, and compiz then moves the window with the pointer motion. This is racy, but is allowed by the input protocol for pointer events when there are no other clients with a grab on the device.

Accept touch sequence for pointer listener after second event delivery

This is a bit of unimplemented code for touchscreen pointer emulation. A pointer grabbing client currently never accepts the touch sequence. The sequence must be accepted once any touch-derived event is irrevocably delivered to a client.

The first pointer event, derived from a touch begin event, may be caught in a sync grab and then replayed. This is essentially a revocable delivery of an event. Thus, we must wait till a non-begin event is delivered.

Xext: add a generic hashtable implementation

The generic hashtable implementation adds a key-value container, that keeps the key and value inside the hashtable structure and manages their memory by itself. This data structure is best suited for fixed-length keys and values.

One creates a new hash table with ht_create and disposes it with ht_destroy. ht_create accepts the key and value sizes (in bytes) in addition to the hashing and comparison functions to use. When adding keys with ht_add, they will be copied into the hash and a pointer to the value will be returned: data may be put into this structure (or if the hash table is to be used as a set, one can just not put anything in).

The hash table comes also with one generic hashing function plus a comparison function to facilitate ease of use. It also has a custom hashing and comparison functions for hashing resource IDs with HashXID.

commit a0b0fbb83f91bb82534a0d83f2a0222567b098d
Author: Erkki Seppälä <erkki.seppala@vincit.fi>
Date:   Mon Dec 20 12:58:37 2010 +0200
dix: add hashing functions to resource.h for others to use.

The public hashing function HashResourceID uses the same hashing algorithm as resource.c uses internally, but it provides an interface that will is usable by external modules. It provides a parameter for the number of bits for the hash, instead of finding the size from its internal hash table.

commit 3ba0decbb4b55a1fd122d269e15b2b2da8ced624
Author: Erkki Seppälä <erkki.seppala@vincit.fi>
Date:   Wed Dec 8 15:30:57 2010 +0200
dix: add a mechanism for iterating through all subresources

The mechanism allows iterating even through subresources that don't have specific XID's. When such 'resources' are iterated, the XID for them will be zero. A resource type can assign an iteration function for its subresources with SetResourceTypeFindSubResFunc; by default resources are assumed not to contain subresources.

The purpose of this extension is to enable accurate accounting of the resources a resource consumes or uses.

This patch provides the subresource iteration functions for Windows and GCs.

Implemented first part of XResource extension v1.2: X_XResQueryClientIds

This patch implements a part of the XResource extension v1.2 (as specified in http://patchwork.freedesktop.org/patch/2720/ ). The request implemented is X_XResQueryClientIds.

This patch depends on the feature introduced by 1e933665b26c74196bb7c59910e6a78bcacf0e "dix: Add facilities for client ID tracking.".

This latest version also adds Doxygen-formatted comments and takes a better notice of coding conventions (as in http://www.x.org/wiki/CodingStyle ).

    Use touch state when querying pointer through core protocol

    QueryPointer is part of the core protocol. As such, it knows nothing about touch devices. Touches are converted to button 1 press, pointer motion, and button 1 release for core clients, so we should ensure the pointer state mask has button 1 set when XQueryPointer is used.

    Ensure sequential touches are pointer emulated sequentially

    Issue:
    * Two sequential touches (i.e. down, up, down, up)
    * Both are grabbed by a touch grab
    * Both have a second listener in the form of a pointer grab or selection
    * The second and first touches are rejected in that order

    The first touch must be pointer emulated before the second touch, so the second touch must be paused until the first touch is rejected or accepted and all events are delivered to pointer clients.

    This change ensures all pointer emulated events are emitted sequentially. It necessarily imposes a delay on further touch events when pointer grabs and selections are used, but there is no way around it.
Update event type when delivering end event to a pointer listener

Just like when we deliver to a touch listener, we must convert a touch end event to an update event for further clients. This also ensures that the touch record is not deleted at the end of ProcessTouchEvent().

Don't update listener after deactivating implicit pointer grab

After the pointer grab is deactivated, the touch listener record is updated at the end of DeliverTouchEmulatedEvent. However, the touch record is ended when the grab is deactivated, so the update to the listener record is in an array of memory that has been freed.

xfree86: after VT switching back, only enable previously enabled devices

If a device was enabled before the VT switch, re-enabled it. Otherwise leave it as is, there was probably a reason why it was disabled.

dix: don't BUG_WARN for button events from button-only device

Events from button-only devices still need coordinates, and they get them from scale_to_desktop(). Therefore, a dev without valuators is not a bug. However, a dev with valuators, but less than two of them still is a bug.

This was noticed when unplugging a "Creative Technology SB Arena Headset", which has some BTNs and some KEYs, but no REL or ABS valuators. It emits [BTN_3] = 0 on unplug, which would trigger the BUG_WARN.

xfree86: link modules against Xorg symbols on Cygwin

As a PE platform, all symbols in both EXEs and DLLs must be resolved at link time. As Xorg modules depend on symbols in the Xorg executable, we must build Xorg before its modules, creating an implib from the former which is used to link the latter. This implib must then be installed in order to build the drivers.
Currently only two drivers are supported on Cygwin: xf86-video-dummy (to replace Xvfb/Xfake) and xf86-video-nested (to replace Xnest/Xephyr).

XQuartz: Detect FatalErrors on startup to prevent tight crash loops

If a FatalError occurs before the server finishes launching, it will not have drained the launchd-owned DISPLAY socket, so launchd will
just relaunch it. This can cause the server to crash in a tight loop
which will spam the user with CrashReporter windows that claim focus on
appearance.

This allows users stuck in this loop to "deal" with the problem without
popping up a crash report every 10 seconds.

Xext: Add per-device SyncCounters

Previously, we only had one idle alarm that was triggered for all devices, whenever the user used any device, came back from suspend, etc.

Add system SyncCounters for each device (named "DEVICEIDLETIME x", with x being the device id) that trigger on that device only. This allows for enabling/disabling devices based on interaction with other devices.

Popular use-case: disable the touchpad when the keyboard just above the touchpad stops being idle.

sync: Use a linked list instead of an array for SysCounterList.

For driver debugging, it is helpful to know whether the driver has actually submitted an event to the server. dtrace hooks can help here.

Note that GetPointerEvents and friends may also be triggered by the server for other emulated devices, some care must be taken when analysing the results.

Additional difficulty: proximity events have a run-time assigned type, so this may make automatic detection a tad harder. If in doubt, go for any event > 64 since the only two that can have that value are ProximityIn and ProximityOut.

An example systemtap script is below:

```bash
# Compile+run with
#     stap -g xorg.stp /usr/bin/Xorg
#

function print_valuators:string(nvaluators:long, mask_in:long, valuators_in:long) {}
```c
int i;
unsigned char *mask = (unsigned char*)THIS->mask_in;
double *valuators = (double*)THIS->valuators_in;
char str[128] = {0};
char *s = str;

#define BitIsSet(ptr, bit) (((unsigned char*)(ptr))[(bit)>>3] & (1 << ((bit) & 7)))

s += sprintf(s, "nval: %d ::", (int)THIS->nvaluators);
for (i = 0; i < THIS->nvaluators; i++)
{
    s += sprintf(s, " %d: ", i);
    if (BitIsSet(mask, i))
        s += sprintf(s, "%d", (int)valuators[i]);
}

sprintf(THIS->__retvalue, "%s", str);
%
}

probe process(@1).mark("input__event")
{
    deviceid = $arg1
    type = $arg2
    detail = $arg3
    flags = $arg4
    nvaluators = $arg5

    str = print_valuators(nvaluators, $arg6, $arg7)
    printf("Event: device %d type %d detail %d flags %#x %s\n",
        deviceid, type, detail, flags, str);

Use a new sprite trace for indirect touches when all touches have physically ended

All touches of an indirect device, such as a trackpad, are sent to the
same window set. When there are no active touches, a new window set is
created; otherwise, the window set of an existing touch is copied.

The current code checks for any logically active touches. This includes
touches that have physically ended but are still logically active due to
unhandled touch grabs. Instead, we want a new window set whenever there
are no physically active touches.

This change skips over logically active but pending end touches, which
are touches that have physically ended.

Reviewed-by: Peter Hutterer <peter.hutterer@who-t.net>
Xi: Fix TouchEnd to TouchUpdate change for one accepted grab

If there is only one listener of a touch, the listener is a grab, and is accepted before the touch has ended, the current code will not end the touch record when the touch does end.

This change adds a listener state for when a touch is accepted but has not yet ended. We now keep the touch record alive in this state, but end it when the touch ends.

commit 9838b7032ea9792bec21af424e53c07078636d21
Author: Keith Packard <keithp@keithp.com>
Date:   Wed Mar 21 12:55:09 2012 -0700

Introduce a consistent coding style
This is strictly the application of the script 'x-indent-all.sh'
from util/modular. Compared to the patch that Daniel posted in
January, I've added a few indent flags:

- bap
- psl
- T PrivatePtr
- T pmWait
- T _XFUNCPROTOBEGIN
- T _XFUNCPROTOEND
- T _X_EXPORT

The typedefs were needed to make the output of sdksyms.sh match the
previous output, otherwise, the code is formatted badly enough that
sdksyms.sh generates incorrect output.

The generated code was compared with the previous version and found to
be essentially identical -- "assert" line numbers and BUILD_TIME were
the only differences found.

The comparison was done with this script:

dir1=$1
dir2=$2

for dir in $dir1 $dir2; do
  (cd $dir && find . -name '*.o' | while read file; do
dir=`dirname $file`
base=`basename $file .o`
dump=$dir/$base.dump
objdump -d $file > $dump
  done)
done

find $dir1 -name '*.dump' | while read dump; do
  otherdump=`echo $dump | sed "s;$dir1;$dir2;"`
diff -u $dump $otherdump
done

commit 2b6848fcb3f85f9ce18a6de1dc6c3ac047101aa8
Author: Sascha Hauer <s.hauer@pengutronix.de>
Date:   Sat Mar 3 14:09:26 2012 +0100

Fix non PCI device probing
When no devicename is found in the option then the driver probes by PciInfo no matter if it's valid or not. Instead of doing this use PciInfo only when it's valid and fall back to the devicename otherwise. With devicename probing use open_hw() to fall back on the KMSDEVICE environment variable or to the default device.

commit 456a001e3f7a24f443cf0bad8400d5d600e2ad46
Author: Sascha Hauer <s.hauer@pengutronix.de>
Date: Sat Mar 3 14:09:24 2012 +0100

introduce open_hw() function

probe_hw opens the hardware in the order we want it: first try devname, if this is NULL then try the KMSDEVICE environment variable and as a last fallback use "/dev/dri/card0". Instead of implementing the same code again when really opening the device move the code to a open_hw() function and let probe_hw use it.

Keep virtual core pointer touch class around if new slave doesn't have one

The VCP may have active touch grabs. The touch records must be kept so
these touch grabs may be accepted/rejected in the future. This means the
touch class list will not represent the touch class of the attached
slave device if it does not have a touch class, but we already were
breaking that assumption by keeping a separate touches array for the
VCP.

dix: reset last.scroll when resetting thevaluator (#45611)

last.scroll remained on the last-submitted scrolling value but last.valuator was changed whenever the slave device changed. The first scrolling delta after a switch was then calculated as (last.scroll - new abs value), causing erroneous scrolling events.

Test case:
- synaptics with a scrolling method enabled, other device with 3+ axes (e.g. wacom)
- scroll on touchpad
- use other device
- scroll on touchpad

The second scroll caused erroneous button press/release events.

hw/xwin: Fix winEnqueueMotion() for change in miPointersetPosition()

Commit 3b36fd1b49030ead44358945f62e5abe7f4609ee changed miPointersetPosition() to take co-ordinates as doubles, not ints, so this code as it stands is now wrong (if it ever was correct in the first place :-))

It's unclear that we can safely promote x,y to doubles, apply miPointersetPosition() which potentially constrains the cursor, and then convert back to ints.

Fortunately, this whole dance seems to be unnecessary, and we can simply remove the call to miPointersetPosition() entirely, and just QueuePointerEvents() like any other input driver.

hw/xwin: Avoid WIN_WINDOW_PROP races during Windows window destruction

The WIN_WINDOW_PROP is removed during WM_DESTROY handling, so it is not neccessary to remove it in winDestroyWindowsWindow(), and doing so opens a race condition, as we may attempt to access that property in the wndproc before the WM_DESTROY has completed.

A specific example of that race is if a WM_KILLFOCUS occurs in the window between property removal and WM_DESTROY processing, where we will attempt to apply DeleteWindowFromAnyEvents() on an invalid (null) WindowPtr.

Also guard against null WindowPtr in the WM_KILLFOCUS handler

hw/xwin: Fix AltGr key sometimes firing an additional Ctrl-L key

I also had problems with the AltGr key. These could reliably be reproduced by holding the AltGr for some seconds (causing Windows generating auto repeat events)

I discovered that the mechanism in winkeybd.c function winIsFakeCtrl_L had a problem if PeekMessage cannot obtain the next Alt_R message because it is not there yet.

I prepared a patch that remembers the last Ctrl_L event and reacts on a later Alt_R.

It was also necessary to alter the order in winWindowProc() in winwndproc.c: the invocation of winIsFakeCtrl_L had to be done
before discarding auto-repeated key presses, as winIsFakeCtrl_L() now has an internal state which must be updated by all key events.

Don't set X and Y valuators for indirect touch events

For expediency, it made sense to always have the X and Y axes set for direct touch device event propagation. The last X and Y values are stored internally. However, indirect device touch event propagation does not depend on the touch’s X and Y values. Thus, we don't need to set the values for every indirect touch event.

On top of this, the previous X and Y values aren't stored for indirect touches, so without this change the axes get erroneously set to 0.

Revert "glx: don't leak fbconfigs"

This reverts commit d26fae246d7c451b4d5ffe24fdb959d4bd00b107.

This patch free()s memory in __glXScreenDestroy which was allocated in glxdricommon (which isn't in every DDX). That breaks abstraction and causes a crash when XQuartz quits, because it results in freeing a pointer that was never allocated.

The correct fix is to do this cleanup in __glXDRIscreenDestroy.

Signed-off-by: Jeremy Huddleston <jeremyhu@apple.com>

Use event time instead of CurrentTime for grab times

When [XI,X.]AllowEvents is called, the timestamp is compared against the grab time to ensure that the request pertains to the current grab in the server. While many clients may use CurrentTime (client-side), the timestamp of the event causing the grab is also valid.

This change ensures that the server's notion of the grab time is the time of the event that activated the grab rather than the time that the grab is actually activated.

This bug was exposed through nested touch then pointer grabs.

commit ef492e9797b6d4f6bcb25e86bedc24477819fde7
Author: Chris Halse Rogers <christopher.halse.rogers@canonical.com>
Date:   Thu Jan 5 01:22:39 2012 +0000

dix: Return BadWindow rather than BadMatch from dixLookupWindow

dixLookupWindow uses dixLookupDrawable internally, which returns
BadMatch when the XID matches a non-Window drawable. Users of dixLookupWindow don't care about this, just that it's not a valid Window.

This is a generalised version of the fix for X.Org Bug 23562, where GetProperty was incorrectly returning BadMatch. Auditing other window requests, all that I checked would incorrectly return BadMatch in these circumstances. An incomplete list of calls that could incorrectly return BadMatch is: ListProperties, SetSelectionOwner, {Destroy,Map,Unmap}[,Sub]Window.

None of the callers of dixLookupWindow, except for GetProperty, check for BadMatch.

commit ff891bbf68caefc222cabb541b6b56af086ac2280
Author: Arthur Taylor <art@ified.ca>
Date: Fri Jan 6 07:21:37 2012 +0000

linux: Use K_OFF VT KB mode over K_RAW if available.

Linux kernels since 2.6.38 (March 2011) have an VT KB mode K_OFF in which special keys (like Ctrl+C) are not interpreted and input is not buffered. Use of this mode over K_RAW removes the need for a xf86ConsoleHandler to drain the VT input buffer, removing the grief it causes when it goes wrong or is (de)initialized out-of-order. (This also saves a few needless context switches per key event.)

If K_OFF is not defined or not understood by the kernel, K_RAW and the previous method is used as a fall-back.

dix: Extend initial connection handshake for forwarding proxies

Forwarding proxies like sshd will appear to be local, even though they
aren't really. This leads to weird behaviour for extensions that truly
require running under the same OS services as the client, like MIT-SHM
and DRI2.
Add two new legal values for the initial connection's byteOrder field, 'r' and 'R'. These act like 'l' and 'B' respectively, but have the side effect of forcing the client to be treated as non-local. Forwarding proxies should attempt to munge the first packet of the connection accordingly; older servers will reject connections thusly munged, so the proxy should fall back to passthrough if the munged connection attempt fails.

xorg.conf.man: Fix bad whatis entry.

Debian's QA tool "lintian" reported a bad whatis entry for the xorg.conf(.d) manpages.
It comes with the following pointers:
For manual pages that document multiple programs, functions, files, or
other things, the part before "-" should list each separated by a
comma and a space. […]

Refer to the lexgrog(1) manual page, the groff_man(7) manual page, and
the groff_mdoc(7) manual page for details.

Indeed, the current situation is:

```
$ whatis xorg.conf; whatis xorg.conf.d
xorg.conf (5)   - (unknown subject)
xorg.conf.d (5) - (unknown subject)
```

With this patch:

```
xorg.conf (5)   - configuration files for Xorg X server
xorg.conf.d (5) - configuration files for Xorg X server
```

Author: Peter Hutterer <peter.hutterer@who-t.net>
Date: Tue Dec 20 16:32:52 2011 -0800

Process and deliver touch events

Does not include pointer emulation handling.
Does include partial ownership handling but not the actual processing of
ownership events.

Note: this commit is a retroactive commit extracted from a series of ~50
commits and may thus appear a bit more complicated than what you'd write out
from scratch.

Pointer processing tree is roughly:
- ProcessOtherEvents
- ProcessTouchEvents
  - DeliverTouchEvents
    - DeliverTouchBeginEvent|DeliverTouchEndEvent|...
    - DeliverOneTouchEvent

Also hooks up the event history playing to the right function now.

Date:   Wed Dec 14 15:56:05 2011 +1000
dix: add touch event history helper functions
If touch client has not registered for ownership events and a grab above that client is rejected, the client needs to receive the complete event history.

The history currently doesn't really do fancy overflow handling. We assume that the first TOUCH_HISTORY_SIZE events are the important ones and anything after that is dropped. If that is a problem, fix the client that takes > 100 event to decide whether to accept or reject.

Events marked with TOUCH_CLIENT_ID or TOUCH_REPLAYING must not be stored in the history; they are events created by the DIX to comply with the protocol. Any such event should already be in the history anyway.

A fixme in this patch: we don't have a function to actually deliver the event yet.

glxext.h:47:13: warning: redundant redeclaration of 'GlxExtensionInit' [-Wredundant-decls]
glxserver.h:80:6: note: previous declaration of 'GlxExtensionInit' was here

dix: add helper functions to create DDX touch recs

DDX touch points are the ones that keep records of the driver-submitted touchpoints. They're unaffected by the grab state and terminate on a TouchEnd submitted by the driver.

The client ID assigned is server-global.

Since drivers usually submit in the SIGIO handler, we cannot allocate in the these functions.

Co-authored-by: Daniel Stone <daniel@fooishbar.org>
xfree86: bump the input ABI for the touch changes

New additions to the API:
- InitTouchClassDeviceStruct
- xf86PostTouchEvent

Changes to the ABI:
- DeviceIntRec now contains a TouchClassPtr

input: add a TouchClassRec to the devices

These structs will be used to store touch-related data, events and information.

Drivers must call InitTouchClassDeviceStruct to set up a multi-touch capable device.

Touchpoints for the DDX and the DIX are handled separately - touchpoints submitted by the driver/DDX will be stored in the DDXTouchPointInfoRec. Once the touchpoints are processed by the DIX, new TouchPointInfoRecs are created and stored. This process is already used for pointer events with the last.valuators field.

Note that this patch does not actually add the generation of touch events, only the required structs.

TouchListeners are (future) recipients of touch or emulated pointer events. Each listener is in a state, depending which event they have already received. The type of listener defines how the listener got to be one.
Add the touch input API stubs

xf86PostTouchEvent is the driver API to submit touch events to the server. This API doesn't do anything yet though but now we can at least bump the API.

For valuators, drivers should use the existing xf86InitValuatorAxisStruct function.

Hook up TouchBegin/Update/End events

The are the same as device events internally but require the touch ID separately from the detail.button field (the protocol uses the detail field for the touch id).
For simpler integration of pointer emulation we need to set the detail.button field while keeping the touchid around.

Add the three new touch event types to the various places in the server where they need to be handled. The actual handling of the events is somewhat more complicated in most places.

dix: move storing last.valuators into a helper function
Allocate the memory at device creation time and always store the event, even if we're not frozen. This way we know which event triggered the grab. Since the event was never freed anyway except on device shutdown, this doesn't really change things much.

They achieve the same thing, re-use the more generic InputLevel so we can convert to/from easier.

Add GrabIsPointerGrab and GrabIsKeyboardGrab helpers

Previously, this was only called if there was a mask match, so even if we
had a no-propagate flag set or a stopAt window specified, if no mask triggered on the window we would recurse up to the root window and eventually deliver.
Move this, so that the stopAt and do-not-propagate mask is honoured.

dix: move EventDeliveryState into a header file, we'll need it elsewhere
Xi: split updating button count and state into helper functions

Functional change: for a button mapped to 0, the motionHintWindow is not updated to the NullWindow anymore. Before it got updated unconditionally to the button mapping. I have no idea what the practical effect of this is, but I guess it's closer to the correct behaviour: pressing a button that's logically disabled now does not disrupt the motion hint delivery.

Xi: deduplicate button motion mask setting

No functional changes

dix: deduplicate callers of DeliverDeviceEvents in DeliverGrabbedEvents

No functional change.

dix: split grab event conversion and delivery into a helper function

Effective functional change: XI2 events are checked with XACE now.
DeliverOneGrabbedEvent is exported for future use by touch events.

Remove duplicate declaration of xf86ValidateModesFlags in xf86Modes.h

Clears gcc warning in every file that includes xf86Modes.h:
xf86Modes.h:102:1: warning: redundant redeclaration of 'xf86ValidateModesFlags'
The main body of this function is an if { } else if { } pair of blocks. Previously there was int button at the top level scope which is used only in the first block, and a redeclaration of int button inside the second block. Since there’s no overlap in the code paths for the two uses of button, move the one from the outer block into the first block to help the programmer more quickly determine they are unrelated usages, and to silence the gcc warning of:

_xkbFilterDeviceBtn: move variable declarations to match usage scope

For consistency, move DeviceIntPtr dev declarations as well that are used in the same way.

XkbFindSrvLedInfo: remove extraneous name-clashing sli variable

Variable is already defined outside the outer if statement, and there’s no need to redefine inside the if statement.

No point in setting sli before if (dev->kbdfeed->xkb_sli==NULL) check - if check is true, we immediately set it, if check is false, we immediately return without further reference or use of it.

The one thing we do with it inside the inner if statement is store an allocation in it for a brief moment before writing to the final destination, which is immediately returned to the caller.
In short, there's no benefit to the variable at all in this block, it just gives the optimizer more code to figure out how to omit.

Fixes gcc warning:

xkbLEDs.c: In function 'XkbFindSrvLedInfo':
xkbLEDs.c:683:19: warning: declaration of 'sli' shadows a previous local
xkbLEDs.c:679:18: warning: shadowed declaration is here

OsInit: store "/dev/null" in a const char *

It's only passed as the input side of a strcpy and as the filename to fopen, so doesn't need to be non-const. Fixes gcc warning:

constify the reason string throughout the authorization check framework

Almost all of the places the string is assigned point to a literal string constant, so use const char * for those, and const char ** for function calls that return it via an argument. Fortunately the top level function, ClientAuthorized, which returns the string as its return value is called from only one place, ProcEstablishConnection. ProcEstablishConnection stores either that return value or a string literal in char *reason. It only uses reason as an argument to SendConnSetup. SendConnSetup passes the reason argument to strlen & WriteToClient, both of which already have const qualifiers on their args. Thus added const to the reason variable in ProcEstablishConnection and the reason argument to SendConnSetup.

Fixes gcc warnings:

Constify string for authorization protocol names

gcc was warning from storing string constants in a char *name field:
auth.c:64:1: warning: initialization discards qualifiers from pointer target type
auth.c:72:1: warning: initialization discards qualifiers from pointer target type
auth.c:81:1: warning: initialization discards qualifiers from pointer target type

Making the field const requires changing AuthorizationFromID to take
a const char ** pointer for the name argument which it sets to point
to the matching name entry.

Changing that argument requires changing its sole caller in the security
extension to pass the address of a const char * variable to it, which it
can do, since the only thing it does with the returned name is to pass
it back to the RemoveAuthorization function that already expects a const
char *name.

os/access.c: replace acmp & acopy macros with memcmp & memcpy calls

No need to cast to char * now that all supported platforms use C89-standard
void * argument types, so just drop the casts from acmp & acopy macros,
which clears the gcc warnings for places const pointers were cast non-const:

access.c: In function 'DefineSelf':
access.c:786:3: warning: cast discards qualifiers from pointer target type
access.c:795:6: warning: cast discards qualifiers from pointer target type
access.c: In function 'NewHost':
access.c:1293:9: warning: cast discards qualifiers from pointer target type
access.c:1298:6: warning: cast discards qualifiers from pointer target type
access.c:1309:5: warning: cast discards qualifiers from pointer target type

Without the casts, acmp & acopy are just a funny way to write memcmp & memmove, so drop the macros and inline the calls, taking care to swap the first two arguments to memmove since it had swapped them.

Since all the calls to memmove end up being to non-overlapping memory (mostly copying from an existing pointer to a newly allocated one), replace those with memcpy.

And finally, don't actually call memcpy to copy 0 bytes from one place to another, since that's just a waste of a perfectly good function call.

commit 2ddae8f0bd2a99ce0cd15bf3848393af29e615acf
Author: Alan Coopersmith <alan.coopersmith@oracle.com>
Date:   Mon Dec 12 16:49:33 2011 -0800

constify strings in resource name registry

LookupResourceName already returned a const char *, so just needed to change the variable we're storing the list in to be a const char ** and then add const to the name argument to RegisterResourceName (which just stores name in the array) and CreateNewResourceType (which just passes name to RegisterResourceName).
Cleans a bunch of gcc warnings of the form:
registry.c:319:5: warning: passing argument 2 of 'RegisterResourceName' discards qualifiers from pointer target type
registry.c:200:1: note: expected 'char *' but argument is of type 'const char *'

and from all the extensions:
damageext.c: In function 'DamageExtensionInit':
damageext.c:490:5: warning: passing argument 2 of 'CreateNewResourceType' discards qualifiers from pointer target type
../include/resource.h:159:26: note: expected 'char *' but argument is of type 'const char *'

Date: Sat Dec 10 10:01:18 2011 -0800

Even more correctly free config file names

If we didn't go into the if (!autoconfig) { } block, the filename, dirname, and sysdirname pointers were never initialized, but we freed them outside the block, leading to potential memory corruption.

Move the frees inside the block where they're initialized to avoid this.

To avoid similar problems, move the declarations of the variables that are only used in this block inside the block.
Regression introduced by commit 3d635fe84d6de53e2f74203b10e89f7851fe3fc1

Found by gcc warning:

xf86RegisterRootWindowProperty is confused about xnfcalloc

It will never return NULL, so don't try to handle a NULL condition, since that just confuses programmers and static analyzers.

It uses calloc, so all the allocated memory is cleared, so there's no point looping over the memory to manually initialize it NULL.

And just because it's annoying, it doesn't need to be the only place in this file to do if (NULL==...) instead of if (... == NULL).

fbdevhw: iterate over all modes that match a mode. (v3)

So on RHEL5 anaconda sets an xorg.conf with a fixed 800x600 mode in it, we run radeonfb and fbdev since ati won't work in userspace due to domain issues in the older codebase.

On certain pseries blades the built-in KVM can't accept an 800x600-43 mode, it requires the 800x600-60 mode, so we have to have the kernel radeonfb driver reject the 800x600-43 mode when it sees it. However then fbdev doesn't try any of the other 800x600 modes in the modelist, and we end up getting a default 640x480 mode we don't want.

This patch changes the mode validation loop to continue on with the other modes that match to find one that works.

v2: move code around to avoid extra loop, after comment from Jamey.
v3: move loop setup back into loop as per Jeremy's review.

Author: Alan Coopersmith <alan.coopersmith@oracle.com>
Date:   Fri Dec 2 00:09:07 2011 -0800

Fix builds of Xnest & Xephyr with Solaris Studio compilers

Required in order to build with Studio cc now that xorg-macros is setting -erwarn=E_FUNC_HAS_NO_RETURN_STMT since a bug in the Solaris system headers causes the noreturn attribute to not be correctly applied to the exit() prototype in <stdlib.h> when building with Studio instead of gcc.

Otherwise compiler exits with errors:
"Display.c", line 65: Function has no return statement : x_io_error_handler
"hostx.c", line 341: Function has no return statement : x_io_error_handler

Uses Studio-specific pragma instead of adding another exit() prototype with a noreturn attribute to avoid causing gcc to warn about having a redundant prototype for the exit() function.

commit e4dcf580f007d6adcf5b0c639865d7aaab1a319d
Author: Alan Coopersmith <alan.coopersmith@oracle.com>
LoaderOpen returns either a valid pointer or NULL, so don't check for < 0

Fixes Sun cc warning that was recently elevated to error by the stricter default CFLAGS changes to xorg-macros:

"loadmod.c", line 914: improper pointer/integer combination: op "<"

Should have been changed when commit ab7f057ce9df4e905b12 changed the LoaderOpen return type from int to void *.

Changes log message when file is found but dlopen() fails from:
(EE) LoadModule: Module dbe does not have a dbeModuleData data object.
(EE) Failed to load module "dbe" (invalid module, 0) to:
(EE) Failed to load module "dbe" (loader failed, 7)

Fix gcc warnings about redundant declarations of fallback functions

Ensure ffs, strndup, strlcat, etc. aren't defined by our headers if they're already defined in the system headers.

This does export the HAVE_FFS, HAVE_STRNDUP, etc. definitions to drivers, but if you built the Xserver with a libc that had those, and then build the drivers with a less capable libc, you're going to have problems anyway, and this should solve some reported problems with conflicts between our strndup definition and gcc magic for it.

Date: Wed Nov 30 19:39:51 2011 -0800

Remove unused function checks from configure.ac & include/*.h.in

The code that used getisax to check for MMX support was moved to pixman and removed from the X server by commit eb2d7fe02f9cbc.

The code that used HAVE_MKSTEMP was deleted by the Xprint removal in commit 1c8bd318fbaf.

All alloca calls were removed by the patch series end in commit 5e363500c8, and used custom X checks instead of the autoconf HAVE_ALLOCA anyway.

I can find no record of HAVE_GETUID, HAVE_GETEUID, HAVE_LINK, HAVE_MEMMOVE, HAVE_MEMSET, HAVE_STRCHR, HAVE_STRRCHR, HAVE_GETOPT, HAVE_GETOPT_LONG, HAVE_DOPRNT, or HAVE_VPRINTF ever being used, and the calls to those functions are not wrapped in #ifdefs.
(Most of those are in our baseline requirements of C89 & Unix98 anyway.)

Save major/minor opcodes in ClientRec for RecordAReply

The record extension needs the major and minor opcodes in the reply hook, but the request buffer may have been freed by the time the hook is invoked. Saving the request major and minor codes as the request is executed avoids fetching from the defunct request buffer.

This patch also eliminates the public MinorOpcodeOfRequest function, inlining it into Dispatch. Usages of that function have been replaced with direct access to the new ClientRec field.

include: add BUG_WARN macro for internal bug cases.

There are plenty of cases that can only be triggered by a real bug in the
server and doing the ErrorF dance manually everywhere is a tad painful and
the error message is usually used only to find the spot in the file anyway.

Plus, reading BUG_WARN somewhere is a good indicator to the casual reader
that this isn't intended behaviour.

Note that this is intentionally different to the BUG_ON behaviour on the
kernel, we do not FatalError the server. It's just a warning + stacktrace.
If the bug is really fatal, call FatalError.

commit cccafabd56d0f8e5784ea03ad9fd03224f952bfe
Author: Alan Coopersmith <alan.coopersmith@oracle.com>
Date: Thu Nov 3 21:10:51 2011 -0700

Mark arguments to fopen/popen/system wrappers as const char *
Silencing more gcc -Wwrite-strings warnings
Reduce unnecessary string copying in xkbtext routines

Instead of using sprintf to copy a static string to a local buffer, just to pass it to TryCopyStr, pass the static string to TryCopyStr directly, as is already done in other parts of this code.

Convert a bunch of sprintf to snprintf calls

This batch is the straightforward set - others are more complex and need more analysis to determine right size to pass.

Remove xf86FormatPciBusNumber from API, inline the one place its used

Found no calls from current driver modules

Move DoShowOptions to xf86Configure.c, delete xf86ShowOpts.c

Gets rid of duplicate static copy of optionTypeToString by putting both callers of that helper function in the same source file.

Date: Mon Oct 31 22:17:35 2011 -0700

Remove bad code from DoShowOptions (Xorg -showopts handler)

When we want to print a string, it's okay to just print it. We don't need to first allocate a buffer 2 bytes bigger than the string, copy the entire string unmodified to the buffer, print the buffer, and then leak the buffer (though we AbortDDX 8 lines later, and then just in case we survived that, call exit as well, so the leak is short lived, just oh so pointless).

Fix vesa's VBE PanelID interpretation

xserver's VESA driver's VBE (Vesa BIOS Extensions) code
includes a PanelID probe, which can get a monitor's native
resolution. From this, using CVT formulas, it derives
horizontal sync rate and a vertical refresh rate ranges.

It however, only derives the upper bounds of the ranges, and
the lower bounds cannot de derived. By default, they are set
to hardcoded constants which represent the lowest supported
resolution: 640x480. The constants in vbe.c however, were
not actually derived from forulas, but carried over from
other code from the bad old days, and are not relevant
to flat panel displays. This caused, for example, EEEPC701's
panel, with a native resolution of 800x480, to end up with
a upper bound of the horizontal sync rate that was lower
than the hardcoded lower bound, which of course broke things.
These numbers have been rederived using both my own CVT tool based on xf86CVTMode(), and using the provided 'cvt' tool that comes with xserver.

randr: Make the RRConstrainCursorHarder logic the same as miPointerSetPosition

The constraining logic in RRConstrainCursorHarder allows the cursor to reach crtc positions of x = width and y = height while the constraining code in miPointerSetPosition only allows it to reach x = width - 1 and y = height - 1 for the analogous screen case.

This patch makes the former's logic equivalent to the latter's which allows applications to benefit from Fitts's law. E.g. a maximized application adjacent to a crtc border wouldn't get pointer events if the user moved the pointer all the way until it's contained.

dix: Reinstate GetImage window size check

Commit 587c3a2d1961834558193e8e14e8e381a077a253 fixed DoGetImage to
check windows against their backing drawables, rather than against the
screen dimensions, to prevent reading outside the bounds of redirected
windows' backing pixmaps (see bug #22804). Unfortunately, while making that change I also removed the check that the rectangle is contained within the bounds of the source window, which is a violation of the specification:

If the drawable is a window, the window must be viewable, and it must be the case that, if there were no inferiors or overlapping windows, the specified rectangle of the window would be fully visible on the screen *and wholly contained within the outside edges of the window* (or a Match error results). Note that the borders of the window can be included and read with this request.

(emphasis mine)

Reinstate the window dimension check, to return BadMatch if the GetImage request falls outside the bounds of the window.

Fixes X Test Suite test XGetImage-15:

dix: block signals when closing all devices

When closing down all devices, we manually unset master for all attached
devices, but the device's sprite info still points to the master's sprite
info. This leaves us a window where the master is freed already but the
device isn't yet. A signal during that window causes dereference of the
already freed spriteInfo in miqeEnqueue's EnqueueScreen macro.

Simply block signals when removing all devices. It's not like we're really
worrying about high-responsive input at this stage.

xfree86: fix potential buffer overflow

The patch below fixes a potential buffer overflow in xf86addComment().
This occurs if  curlen > 0 && eol_seen == 0 && iscomment == 0 , as
follows from the code:

char *xf86addComment(char *cur, char *add)

<...

len = strlen(add);
endnewline = add[len - 1] == 'n';
len += 1 + iscomment + (!hasnewline) + (!endnewline) + eol_seen;

if ((str = realloc(cur, len + curlen)) == NULL)
    return cur;

cur = str;
if (eol_seen || (curlen && !hasnewline))
    cur[curlen++] = 'n';
if (!iscomment)
    cur[curlen++] = '#';
strcpy(cur + curlen, add);
if (!endnewline)
    strcat(cur, "\n");

  dix: move #if statement to stop compiler warning

  ptrveloc.c: In function 'QueryTrackers':
  ptrveloc.c:598:34: warning: variable 'used_offset' set but not used
  [-Wunused-but-set-variable]

  used_offset is used, but only in the debugging code. Move the #if statement
to ignore that warning.

xfree86: use xf86AddNewOption instead of xf86addNewOption

The former strdups for us. If the strdup fails we miss out on the
CorePointer option (default on anyway) and we're likely to fall over soon
anyway, so let's pretend this is the same behaviour.

input: switch InputOption to use XF86OptionRec storage.

Use the same struct for both InputOption and XF86OptionRec so we don't need
to convert to and fro the two in the config backends.

kdrive: switch to new InputOption API.
Bug 38420: Xvfb crashes in miInitVisuals() when started with depth=2

https://bugs.freedesktop.org/show_bug.cgi?id=38420

Exit with fatal error message, not segfault.

xf86Crtc: handle no outputs with no modes harder.

If you started an X server with no connected outputs, we pick a default 1024x768 mode, however if you then ran an xvidmode using app against that server it would segfault the server due to not finding any valid modes.

This was due to the no output mode set code, only adding the modes to the scrn->modes once, when something called randr 1.2 xf86SetScrnInfoModes would get called and remove all the modes and we'd end up with 0.

This change fixes xf86SetScrnInfoModes to always report a scrn mode of at least 1024x768, and pushes the initial configuration to just call it instead of setting up the mode itself.

Fixes: https://bugzilla.redhat.com/show_bug.cgi?id=746926

I've seen other bugs like this on other distros so it might also actually fix them.
