Omitting this option returns all images for which you have launch permissions, regardless of ownership.

```java
public ExecutableByStringList withOwners(java.util.Collection<String> owners) {
    list.add(owners);
    setOwners(owners); // optional
    return self();
}
```

By using the `withOwners` method, you can filter images based on ownership.

### Notes:
- Specify an AWS account ID, `self` (owner is the sender of the request), or an AWS owner alias (valid values are `amazon` | `aws-marketplace` | `microsoft`). Omitting this option returns all images for which you have launch permissions, regardless of ownership.
- Use `@link #setOwners(java.util.Collection)` or `@link #withOwners(java.util.Collection)` if you want to override the existing values.

To scope the images by users with explicit launch permissions, specify an AWS account ID, `self` (the sender of the request), or `all` (public AMIs).

```java
public ExecutableByStringList withExecutableUsers(String... executableUsers) {
    list.addAll(Arrays.asList(executableUsers));
    return self();
}
```

By using the `withExecutableUsers` method, you can filter images based on users with explicit launch permissions.

### Notes:
- Specify an AWS account ID, `self` (the sender of the request), or `all` (public AMIs).
- Omitting this option returns all images for which you have launch permissions, regardless of ownership.

## XML Representation

```xml
<variable>
  <variableDeclarationType>com.amazonaws.internal.SdkInternalList<String></variableDeclarationType>
  <variableName>owners</variableName>
  <variableType>java.util.List<String></variableType>
  <documentation>
    Filters the images by the owner. Specify an AWS account ID, `self` (owner is the sender of the request), or an AWS owner alias (valid values are `amazon` | `aws-marketplace` | `microsoft`). Omitting this option returns all images for which you have launch permissions, regardless of ownership.
  </documentation>
</variable>

<variable>
  <c2jName>ExecutableUsers</c2jName>
  <c2jShape>ExecutableByStringList</c2jShape>
  <deprecated>false</deprecated>
  <documentation>
    Scopes the images by users with explicit launch permissions. Specify an AWS account ID, `self` (the sender of the request), or `all` (public AMIs).
  </documentation>
</variable>
```

## HTTP Representation

```java
public ExecutableByStringList withOwners(String... owners) {
    list.addAll(Arrays.asList(owners));
    setOwners(owners); // optional
    return self();
}
```

By using the `withOwners` method, you can filter images based on ownership.

### Notes:
- Specify an AWS account ID, `self` (owner is the sender of the request), or an AWS owner alias (valid values are `amazon` | `aws-marketplace` | `microsoft`). Omitting this option returns all images for which you have launch permissions, regardless of ownership.
- Use `@link #setOwners(java.util.Collection)` or `@link #withOwners(java.util.Collection)` if you want to override the existing values.

To scope the images by users with explicit launch permissions, specify an AWS account ID, `self` (the sender of the request), or `all` (public AMIs).

```java
public ExecutableByStringList withExecutableUsers(String... executableUsers) {
    list.addAll(Arrays.asList(executableUsers));
    return self();
}
```

By using the `withExecutableUsers` method, you can filter images based on users with explicit launch permissions.

### Notes:
- Specify an AWS account ID, `self` (the sender of the request), or `all` (public AMIs).
- Omitting this option returns all images for which you have launch permissions, regardless of ownership.

- <code>architecture</code> - The image architecture (for example, <code>i386</code> or <code>x86_64</code>). - A Boolean value that indicates whether the Amazon EBS volume is deleted on instance termination.

- <code>block-device-mapping.delete-on-termination</code> - A Boolean value that indicates whether the Amazon EBS volume is deleted on instance termination.

- <code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code>). - The ID of the snapshot used for the EBS volume.

- <code>block-device-mapping.snapshot-id</code> - The ID of the snapshot used for the EBS volume. - The ID of the EBS volume, in GiB.

- <code>block-device-mapping.volume-size</code> - The volume size of the EBS volume, in GiB.

- <code>block-device-mapping.volume-type</code> - The volume type of the EBS volume (for example, <code>gp2</code> or <code>io1</code>). - The hypervisor type (<code>ovm</code> or <code>xen</code>).

- <code>description</code> - The description of the image (provided during image creation).

- <code>ena-support</code> - A Boolean that indicates whether enhanced networking with ENA is enabled.

- <code>hypervisor</code> - The hypervisor type (<code>ovm</code> or <code>xen</code>).

- <code>image-id</code> - The ID of the image.

- <code>image-type</code> - The image type (<code>machine</code> or <code>kernel</code>). - The name of the AMI (provided during image creation).

- <code>is-public</code> - A Boolean that indicates whether the image is public.

- <code>kernel-id</code> - The kernel ID.

- <code>manifest-location</code> - The location of the manifest.

- <code>name</code> - The name of the AMI (provided during image creation).

- <code>owner-alias</code> - String value from an Amazon-maintained list (for example, <code>amazon</code> or <code>microsoft</code>) of snapshot owners. Not to be confused with the user-configured AWS account alias, which is set from the IAM console.
The AWS account ID of the image owner. 

- The platform. To only list Windows-based AMIs, use `code:windows`.

- The product code. To only list the product code of `devpay`, use `code:devpay`.

- The state of the image. The state of the image is available for images that are not yet available.

- The state of the image. The state of the image is pending for images that are pending.

- The state of the image. The state of the image is failed for images that are failed.

- The reason code for the state change.

- The message for the state change.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `code:tag:Purpose` for the filter name and `code:X` for the filter value.

- The key assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter `\"tag-key\"=\"Purpose\"` and the filter `\"tag-value=\"X\"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the filter `\"tag\":\"X\"`.

- The type of the root device volume.

- The name of the root device volume (for example, `code:/dev/sda1`).

- The description of the image (provided during image creation).

- The kernel that indicates whether enhanced networking with ENA is enabled.

- The hypervisor type (`code:ovm` | `code:xen`).

- The image type (`code:multiboot` | `code:machine` | `code:kernel` | `code:ramdisk`).

- The AWS account ID of the image owner.

- The name of the AMI (provided during image creation).

- String value from an Amazon-maintained list of snapshot owners. Not to be confused with the user-configured AWS account alias, which is set from the IAM console.

- The AWS account ID of the image owner. To only list Windows-based AMIs, use `code:windows`.

- The product code. To only list the product code of `devpay`, use `code:devpay`.

- The type of the product code (`code:devpay`).

- The type of the product code (`code:marketplace`).

- The name of the root device volume (for example, `code:/dev/sda1`).

- The type of the root device volume.

- The type of the root device volume.
The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. 

The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

The state of the image (<code>available</code> | <code>pending</code> | <code>failed</code>). 

The reason code for the state change. 

The type of the root device volume (<code>ebs</code> | <code>instance-store</code>). 

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. 

The state of the image (<code>available</code> | <code>pending</code> | <code>failed</code>). 

The reason code for the state change. 

The message for the state change. 

The virtualization type (<code>paravirtual</code> | <code>hvm</code>). 

The architecture (<code>i386</code> | <code>x86_64</code>). 

The image architecture (<code>i386</code> | <code>x86_64</code>). 

A Boolean that indicates whether the Amazon EBS volume is deleted on instance termination. 

The ID of the snapshot used for the EBS volume. 

The volume size of the EBS volume, in GiB. 

The type of the product code (<code>devpay</code> | <code>marketplace</code>). 

The name of the AMI (provided during image creation). 

The AWS account ID of the image owner. 

String value from an Amazon-maintained list (<code>amazon</code> | <code>aws-marketplace</code> | <code>microsoft</code>) of snapshot owners. Not to be confused with the user-configured AWS account alias, which is set from the IAM console. 

The platform. To only list Windows-based AMIs, use <code>windows</code>. 

The type of the product code (<code>devpay</code> | <code>marketplace</code>). 

The AWS account ID of the image owner. 

The type of the root device volume (<code>ebs</code> | <code>instance-store</code>). 

The state of the image (<code>available</code> | <code>pending</code> | <code>failed</code>). 

The reason code for the state change. 

The message for the state change. 

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. 

The key of a tag assigned to the resource. This filter is independent of the tag-value filter.
For example, if you use both the filter \"tag:Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the

```java
<code>tag</code>:<i>key</i>=<i>value</i> filter. 
```

- The value of a tag assigned to the resource. This filter is independent of the \"tag-key\" filter. 

```java
<code>tag-value</code> 
```

- The virtualization type (\"paravirtual\" | \"hvm\")

```java
virtualization-type
```

 returns a reference to this object so that method calls can be chained together.

```java

"setterDocumentation": "One or more filters.
<code>architecture</code> - The image architecture (\"i386\" | \"x86_64\`).
<code>block-device-mapping.delete-on-termination</code> - A Boolean value that indicates whether the Amazon EBS volume is deleted on instance termination.
<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the \"tag-key\" filter.
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the tag-value filter.
<code>tag:Purpose</code> - The tag key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify \"tag:Purpose\" for the filter name and \"tag-value=X\" for the filter value.

  "variableSetterType": "java.util.Collection<String>"
A list of import image task IDs.

**NOTE:** This method appends the values to the existing list (if any). Use `{ @link #setImportTaskIds(java.util.Collection) }` or `{ @link #withImportTaskIds(java.util.Collection) }` if you want to override the existing values.

```java
importTaskIds
```

A list of import image task IDs.

Returns a reference to this object so that method calls can be chained together.

```java
@param importTaskIds
```

A list of import image task IDs.

Returns a reference to this object so that method calls can be chained together.

```java
@returns
```

A token that indicates the next page of results.

A token that indicates the next page of results.

Returns a reference to this object so that method calls can be chained together.

```java
nextToken
```

A token that indicates the next page of results.

A token that indicates the next page of results.

Returns a reference to this object so that method calls can be chained together.

```java
@returns
```

A token that indicates the next page of results.

A token that indicates the next page of results.

Returns a reference to this object so that method calls can be chained together.

```java
@returns
```

</table>

### Method Signature

```java
public com.amazonaws.services.ec2.model.Filter[] withFilters(java.util.Collection<Filter> filters)
```

### Parameters

- `filters`: One or more filters.

### Return Value

The method returns a reference to this object so that method calls can be chained together.

```java
@override
```

### URI in Resource

```
@override
```

### Installed Filters

```
<code>availability-zone</code> | <code>instance-stop</code>).</p> <li> <p> <code>event.description</code> - A description of the event.</p> <li> <p> <code>event.not-after</code> - The latest end time for the scheduled event (for example, <code>2014-09-15T17:15:20.000Z</code>). <li> <p> <code>event.not-before</code> - The earliest start time for the scheduled event (for example, <code>2014-09-15T17:15:20.000Z</code>). <li> <p> <code>instance-state-code</code> - The code for the instance state, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. "c2jName" : "Filters",

"c2jShape" : "FilterList",
"deprecated" : false,
"documentation" : "<p>One or more filters.</p> 
<li> <code>affinity</code> - The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>). </li>  
<li> <code>architecture</code> - The instance architecture (<code>i386</code> | <code>x86_64</code>). </li>  
<li> <code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface. </li>  
<li> <code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface. </li>  
<li> <code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface. </li>  
<li> <code>association.association-id</code> - The association ID returned when the network interface was associated with an IPv4 address. </li>  
<li> <code>availability-zone</code> - The Availability Zone of the instance. </li>  
<li> <code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>. </li>  
<li> <code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination. </li>  
<li> <code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code> or <code>/xvdh</code>). </li>  
<li> <code>block-device-mapping.status</code> - The status for the EBS volume (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>). </li>  
<li> <code>block-device-mapping.volume-id</code> - The volume ID of the EBS volume. </li>  
<li> <code>client-token</code> - The idempotency token you provided when you launched the instance. </li>  
<li> <code>dns-name</code> - The public DNS name of the instance. </li>  
<li> <code>group-id</code> - The ID of the security group for the instance. EC2-Classic only. </li>  
<li> <code>group-name</code> - The name of the security group for the instance. EC2-Classic only. </li>  
<li> <code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable. </li>  
<li> <code>hypervisor</code> - The hypervisor type of the instance (<code>ovm</code> | <code>xen</code>). </li>  
<li> <code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN. </li>  
<li> <code>instance-id</code> - The ID of the image used to launch the instance. </li>  
<li> <code>instance.lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance (<code>scheduled</code>). </li>  
<li> <code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped). </li>  
<li> <code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>). </li>  
<li> <code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>). </li>  
<li> <code>instance.group-id</code> - The ID of the security group for the instance. </li>  
<li> <code>instance.group-name</code> - The name of the security group for the instance. </li>  
<li> <code>ip-address</code> - The public IPv4 address of the instance. </li>  
<li> <code>kernel-id</code> - The kernel ID. </li>  
<li> <code>key-name</code> - The name of the key pair used when the instance was launched. </li>  
<li> <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). </li>  
<li> <code>launch-time</code> - The time when the instance was launched. </li>  
<li> <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (<code>disabled</code> | <code>enabled</code>). </li>  
<li> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface. </li>  
<li> <code>network-interface.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address. </li>  
<li> <code>network-interface.addresses.association.ip-owner-id</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface. </li>
source-dest-check - Indicates whether the instance performs source/destination checking. A value of true means that checking is enabled, and false means checking is disabled. The value must be false for the instance to perform network address translation (NAT) in your VPC.

state-reason-code - The reason code for the state change.

state-reason-message - A message that describes the state change.

subnet-id - The ID of the subnet for the instance.

tag - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify tag:Purpose for the filter name and tag:X for the filter value.

tag-key - The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag:tag-value=X filter.

tag-value - The value of a tag assigned to the resource. This filter is independent of the tag-key filter.

tenancy - The tenancy of an instance.

association.public-ip - The address of the Elastic IP address (IPv4) bound to the network interface.

association.ip-owner-id - The owner of the Elastic IP address (IPv4) associated with the network interface.

association.allocation-id - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

association.association-id - The association ID returned when the network interface was associated with an IPv4 address.

availability-zone - The Availability Zone of the instance.

block-device-mapping.attach-time - The attach time for an EBS volume mapped to the instance, for example, 2010-09-15T17:15:20.000Z.

block-device-mapping.delete-on-termination - A Boolean that indicates whether the EBS volume is deleted on instance termination.

block-device-mapping.device-name - The device name for the EBS volume (for example, /dev/sdh or xvdh).

block-device-mapping.status - The status for the EBS volume (attaching | attached | detaching | detached).

block-device-mapping.volume-id - The volume ID of the EBS volume.

client-token - The idempotency token you provided when you launched the instance.

dns-name - The public DNS name of the instance.

detached - The status for the EBS volume (attaching | attached | detached).

group-id - The ID of the security group for the instance. EC2-Classic only.

group-name - The name of the security group for the instance. EC2-Classic only.

host-id - The ID of the Dedicated Host on which the instance is running, if applicable.

hypervisor - The hypervisor type of the instance (ovm | xen).

iam-instance-profile.arn - The instance profile associated with the instance. Specified as an ARN.

image-id - The ID of the image used to launch the instance.

instance-id - The ID of the instance.

instance-lifecycle - Indicates whether this is a Spot Instance or a Scheduled Instance.

instance-state-code - The state
of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).
interface.</p> 
<li><p><code>owner-id</code> - The AWS account ID of the instance owner.</p> 
<li><p><code>placement-group-name</code> - The name of the placement group for the instance.</p> 
<li><p><code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</p> 
<li><p><code>private-dns-name</code> - The private IPv4 DNS name of the instance.</p> 
<li><p><code>private-ip-address</code> - The private IPv4 address of the instance.</p> 
<li><p><code>product-code</code> - The product code associated with the AMI used to launch the instance.</p> 
<li><p><code>ramdisk-id</code> - The RAM disk ID.</p> 
<li><p><code>reason</code> - The reason for the current state of the instance (for example, shows 'User Initiated [date]' when you stop or terminate the instance). Similar to the state-reason-code filter.</p> 
<li><p><code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</p> 
<li><p><code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</p> 
<li><p><code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).</p> 
<li><p><code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.</p> 
<li><p><code>spot-instance-request-id</code> - The ID of the Spot instance request.</p> 
<li><p><code>state-reason-code</code> - The reason code for the state change.</p> 
<li><p><code>state-reason-message</code> - A message that describes the state change.</p> 
<li><p><code>subnet-id</code> - The ID of the subnet for the instance.</p> 
<li><p><code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>=X</code> for the filter value.</p> 
<li><p><code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=X</code>, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p> 
<li><p><code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=X</code>, you get any resources assigned both the tag key Purpose and the tag value X.</p> 
<li><p><code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>=X</code> for the filter value.</p> 
<li><p><code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=X</code>, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p> 
<li><p><code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=X</code>, you get any resources assigned both the tag key Purpose and the tag value X.
mapped to the instance, for example, `<code>2010-09-15T17:20.000Z</code>`.

- `<code>block-device-mapping.delete-on-termination</code>` - A Boolean that indicates whether the EBS volume is deleted on instance termination.

- `<code>block-device-mapping.device-name</code>` - The device name for the EBS volume (for example, `<code>/dev/sdh</code>` or `<code>xvdh</code>`).

- `<code>block-device-mapping.status</code>` - The status for the EBS volume (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>). When an instance is running, if applicable.</p>

- `<code>client-token</code>` - The idempotency token provided when you launched the instance.</p>

- `<code>dns-name</code>` - The public DNS name of the instance.</p>

- `<code>group-id</code>` - The ID of the security group for the instance. EC2-Classic only.</p>

- `<code>group-name</code>` - The name of the security group for the instance. EC2-Classic only.</p>

- `<code>host-id</code>` - The ID of the Dedicated Host on which the instance is running, if applicable.</p>

- `<code>hypervisor</code>` - The hypervisor type of the instance (<code>ovm</code> | <code>xen</code>). When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). Then be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped). When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).

- `<code>image-id</code>` - The ID of the image used to launch the instance.</p>

- `<code>instance-id</code>` - The ID of the instance.</p>

- `<code>instance-lifecycle</code>` - Indicates whether this is a Spot Instance or a Scheduled Instance (<code>spot</code> | <code>scheduled</code>).</p>

- `<code>instance.state-code</code>` - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).

- `<code>instance.state-name</code>` - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>). When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). Then be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).

- `<code>instance-type</code>` - The type of instance (for example, `<code>t2.micro</code>`).

- `<code>ipv4-address</code>` - The public IPv4 address of the instance.</p>

- `<code>key-name</code>` - The name of the key pair used when the instance was launched.</p>

- `<code>kernel-id</code>` - The kernel ID.</p>

- `<code>launch-index</code>` - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). Then be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched.</p>

- `<code>launch-time</code>` - The time when the instance was launched. 
Network interface details:

- **network-interface-id**: The ID of the network interface.
- **network-interface.owner-id**: The ID of the owner of the network interface.
- **network-interface.private-dns-name**: The private DNS name of the network interface.
- **network-interface.mac-address**: The MAC address of the network interface.
- **network-interface.ipv6-addresses.ipv6-address**: The IPv6 address associated with the network interface.
- **network-interface.group-id**: The ID of a security group associated with the network interface.
- **network-interface.group-name**: The name of a security group associated with the network interface.
- **network-interface.private-dns-name**: The private DNS name of the network interface.
- **network-interface.requester-id**: The requester ID for the network interface.
- **network-interface.requester-managed**: Indicates whether the network interface is being managed by AWS.
- **network-interface.status**: The status of the network interface (available | in-use).
- **network-interface.in-use**: Whether the network interface is in-use.
- **network-interface.availability-zone**: The availability zone of the network interface.
- **network-interface.association.host**: The host of the network interface.
- **network-interface.association.mapped-port**: The mapped port of the network interface.
- **network-interface.association.private-ip-address**: The private IP address associated with the network interface.
- **network-interface.association.resource-id**: The resource ID associated with the network interface.
- **network-interface.association.resource-type**: The resource type associated with the network interface.
- **network-interface.association.public-dns-name**: The public DNS name associated with the network interface.
- **network-interface.association.public-ip-address**: The public IP address associated with the network interface.
(regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the &lt;code&gt;tag&lt;/code&gt;::i&lt;key&gt;&lt;/i&gt;::i&lt;value&gt;&lt;/i&gt; filter.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;tag-value&lt;/code&gt; - The value of a tag assigned to the resource. This filter is independent of the &lt;code&gt;tag-key&lt;/code&gt; filter.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;tenancy&lt;/code&gt; - The tenancy of an instance &lt;code&gt;dedicated&lt;/code&gt; | &lt;code&gt;default&lt;/code&gt; | &lt;code&gt;host&lt;/code&gt;.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;virtualization-type&lt;/code&gt; - The virtualization type of the instance (&lt;code&gt;paravirtual&lt;/code&gt; | &lt;code&gt;hvm&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;vpc-id&lt;/code&gt; - The ID of the VPC that the instance is running in.&lt;/p&gt; &lt;/li&gt; &lt;\n&gt;@return Returns a reference to this object so that method calls can be chained together."&gt;,
    "getterDocumentation" : "/**
     * One or more filters.&lt;/p&gt; &lt;/ul&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;affinity&lt;/code&gt; - The affinity setting for an instance running on a Dedicated Host (&lt;code&gt;default&lt;/code&gt; | &lt;code&gt;host&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;architecture&lt;/code&gt; - The instance architecture (&lt;code&gt;i386&lt;/code&gt; | &lt;code&gt;x86_64&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association-public-ip&lt;/code&gt; - The address of the Elastic IP Address (IPv4) bound to the network interface.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association.ip-owner-id&lt;/code&gt; - The owner of the Elastic IP Address (IPv4) associated with the network interface.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association-association-id&lt;/code&gt; - The association ID returned when you allocated the Elastic IP Address (IPv4) for your network interface.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;block-device-mapping.delete-on-termination&lt;/code&gt; - A Boolean that indicates whether the EBS volume is deleted on instance termination.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;block-device-mapping.device-name&lt;/code&gt; - The device name for the EBS volume (for example, &lt;code&gt;/dev/sdh&lt;/code&gt; or &lt;code&gt;xvdh&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;block-device-mapping.status&lt;/code&gt; - The status for the EBS volume (&lt;code&gt;attaching&lt;/code&gt; | &lt;code&gt;attached&lt;/code&gt; | &lt;code&gt;detaching&lt;/code&gt; | &lt;code&gt;detached&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;block-device-mapping.volume-id&lt;/code&gt; - The volume ID of the EBS volume.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;client-token&lt;/code&gt; - The idempotency token you provided when you launched the instance.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;dns-name&lt;/code&gt; - The public DNS name of the instance.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;group-id&lt;/code&gt; - The ID of the security group for the instance. EC2-Classic only.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;group-name&lt;/code&gt; - The name of the security group for the instance. EC2-Classic only.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;host-id&lt;/code&gt; - The ID of the Dedicated Host on which the instance is running, if applicable.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;hypervisor&lt;/code&gt; - The hypervisor type of the instance (&lt;code&gt;ovm&lt;/code&gt; | &lt;code&gt;xen&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;iam-instance-profile.arn&lt;/code&gt; - The instance profile associated with the instance. Specified as an ARN.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;image-id&lt;/code&gt; - The ID of the image used to launch the instance.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;instance-id&lt;/code&gt; - The ID of the instance.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;instance-lifecycle&lt;/code&gt; - Indicates whether this is a Spot Instance or a Scheduled Instance (&lt;code&gt;spot&lt;/code&gt; | &lt;code&gt;scheduled&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;instance-state-code&lt;/code&gt; - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;instance-state-name&lt;/code&gt; - The state of the instance (&lt;code&gt;pending&lt;/code&gt; | &lt;code&gt;running&lt;/code&gt; | &lt;code&gt;shutting-down&lt;/code&gt; | &lt;code&gt;terminated&lt;/code&gt; | &lt;code&gt;stopping&lt;/code&gt; | &lt;code&gt;stopped&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;instance-type&lt;/code&gt; - The type of instance (for example, &lt;code&gt;t2.micro&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;instance.group-id&lt;/code&gt; - The ID of the security group for the instance.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;instance.group-name&lt;/code&gt; - The name of the security group for the instance.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;ip-address&lt;/code&gt; - The public IPv4 address of the instance.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;kernel-id&lt;/code&gt; - The kernel ID.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;key-name&lt;/code&gt; - The name of the key pair used when the instance was launched.&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;launch-index&lt;/code&gt; - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).&lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;launch-time&lt;/code&gt; -
The time when the instance was launched.

- `<code>monitoring-state</code>` - Indicates whether detailed monitoring is enabled (`<code>false</code>` | `<code>true</code>`).

- `<code>placement-group-name</code>` - The name of the placement group for the instance.

- `<code>platform</code>` - The platform. Use `<code>windows</code>` if you have Windows instances; otherwise, leave blank.

- `<code>product-code</code>` - The product code associated with the AMI used to launch the instance.

- `<code>ramdisk-id</code>` - The RAM disk ID.

- `<code>reason</code>` - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.

- `<code>requester-id</code>` - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).

- `<code>reservation-id</code>` - The ID of the reservation.
instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.

- `<code>root-device-name</code>` - The name of the root device for the instance (for example, `<code>/dev/sda1</code>` or `<code>/dev/xvda</code>`).
- `<code>root-device-type</code>` - The type of root device that the instance uses (`<code>ebs</code>` | `<code>instance-store</code>`).
- `<code>source-dest-check</code>` - Indicates whether the instance performs source/destination checking. A value of `<code>true</code>` means that checking is enabled, and `<code>false</code>` means checking is disabled. The value must be `<code>true</code>` or `<code>false</code>` for the instance to perform network address translation (NAT) in your VPC.
- `<code>spot-instance-request-id</code>` - The ID of the Spot instance request.
- `<code>state-reason-code</code>` - The reason code for the state change.
- `<code>state-reason-message</code>` - A message that describes the state change.
- `<code>tag</code>:<i>key</i>=<i>value</i>` - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.
- `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the `<code>tag:tag-key/=x</code>` filter.
- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.
- `<code>tenancy</code>` - The tenancy of an instance (`<code>dedicated</code>` | `<code>default</code>` | `<code>host</code>`).
- `<code>virtualization-type</code>` - The virtualization type of the instance (`<code>paravirtual</code>` | `<code>hvm</code>`).
- `<code>vpc-id</code>` - The ID of the VPC that the instance is running in.
- `<code>block-device-mapping.attach-time</code>` - The attach time for an EBS volume mapped to the instance, for example, `<code>2010-09-15T17:15:20.000Z</code>`.
- `<code>block-device-mapping.delete-on-termination</code>` - A Boolean that indicates whether the EBS volume is deleted on instance termination.
- `<code>block-device-mapping.device-name</code>` - The device name for the EBS volume (for example, `<code>/dev/sdh</code>` or `<code>/dev/xvdh</code>`).
- `<code>block-device-mapping.status</code>` - The status for the EBS volume (`<code>attaching</code>` | `<code>attached</code>` | `<code>detaching</code>` | `<code>detached</code>`).
- `<code>volume-id</code>` - The volume ID of the EBS volume.
- `<code>client-token</code>` - The idempotency token you provided when you launched the instance.
- `<code>dns-name</code>` - The public DNS name of the instance.
- `<code>group-id</code>` - The ID of the security group for the instance.
- `<code>group-name</code>` - The name of the security group for the instance.
- `<code>hypervisor</code>` - The hypervisor type of the instance's reservation.
instance (<code>ovm</code>) | <code>xen</code>).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>image-id</code> - The ID of the image used to launch the instance.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>instance-id</code> - The ID of the instance.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance (<code>spot</code>) | (<code>scheduled</code>).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>instance-group-id</code> - The ID of the security group for the instance.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>instance-group-name</code> - The name of the security group for the instance.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>ip-address</code> - The public IPv4 address of the instance.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>kernel-id</code> - The kernel ID.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>key-name</code> - The name of the key pair used when the instance was launched.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>launch-time</code> - The time when the instance was launched.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (<code>disabled</code> | <code>enabled</code>).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-addresses.ipv6-address</code> - The IPv4 address of the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-addresses.association.public-ip</code> - The ID of the association of an Elastic IP Address (IPv4) with a network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-addresses.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-attachment.attachment-id</code> - The ID of the interface attachment.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-attachment.instance-id</code> - The ID of the instance to which the network interface is attached.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-device-index</code> - The device index to which the network interface is attached.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-attachment.status</code> - The status of the attachment (<code>attached</code> | <code>detaching</code> | <code>detached</code>).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-attachment.attach-time</code> - The time that the network interface was attached to an instance.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.availability-zone</code> - The Availability Zone for the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.description</code> - The description of the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-group-id</code> - The ID of a security group associated with the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface-group-name</code> - The name of a security group associated with the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.mac-address</code> - The MAC address of the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.network-interface-id</code> - The ID of the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.owner-id</code> - The ID of the owner of the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.requester-id</code> - The requester ID for the network interface.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.\p &lt;/li&gt; &lt;li&gt; &lt;p&gt; <code>network-interface.status</code> - The status of the network interface (<code>available</code> | <code>in-use</code>).\p &lt;/li&gt; &lt;li&gt; &lt;p&gt;
network-interface.source-dest-check - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.

network-interface.subnet-id - The ID of the subnet for the network interface.

network-interface.vpc-id - The ID of the VPC for the network interface.

name - The name of the placement group for the instance.

devpay - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.

ramdisk-id - The RAM disk ID.

reservation-ids - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.

root-device-name - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>.

root-device-type - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).

<p><code>architecture</code> - The instance architecture (<code>i386</code> | <code>x86_64</code>). </p> <li><p><code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface. </p> <li><p><code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface. </p> <li><p><code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface. </p> <li><p><code>association.association-id</code> - The association ID returned when the network interface was associated with an IPv4 address. </p> <li><p><code>availability-zone</code> - The Availability Zone of the instance. </p> <li><p><code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>. </p> <li><p><code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination. </p> <li><p><code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code> or <code>xvdh</code>). </p> <li><p><code>block-device-mapping.status</code> - The status for the EBS volume (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>). </p> <li><p><code>block-device-mapping.volume-id</code> - The volume ID of the EBS volume. </p> <li><p><code>client-token</code> - The idempotency token you provided when you launched the instance. </p> <li><p><code>dns-name</code> - The public DNS name of the instance. </p> <li><p><code>group-id</code> - The ID of the security group for the instance. EC2-Classic only. </p> <li><p><code>group-name</code> - The name of the security group for the instance. EC2-Classic only. </p> <li><p><code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable. </p> <li><p><code>hypervisor</code> - The hypervisor type of the instance (<code>ovm</code> | <code>xen</code>). </p> <li><p><code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN. </p> <li><p><code>image-id</code> - The ID of the image used to launch the instance. </p> <li><p><code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance. </p> <li><p><code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), and 80 (stopped). </p> <li><p><code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>). </p> <li><p><code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>). </p> <li><p><code>ip-address</code> - The public IPv4 address of the instance. </p> <li><p><code>kernel-id</code> - The kernel ID. </p> <li><p><code>key-name</code> - The name of the key pair used when the instance was launched. </p> <li><p><code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, and so on). </p> <li><p><code>launch-time</code> - The time when the instance was launched. </p> <li><p><code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (<code>disabled</code> | <code>enabled</code>). </p> <li><p><code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface. </p> <li><p><code>network-interface.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address. </p> <li><p><code>network-interface.addresses.association.public-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface. </p> <li><p><code>network-interface.addresses.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface. </p> <li><p><code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment. </p> <li><p><code>network-interface.attachment.instance-id</code> - The ID of the instance to which the network interface is attached. </p> <li><p><code>network-interface.attachment.instance-owner-id</code> - The owner ID of the
instance to which the network interface is attached.</p>  
<li><code>network-interface.association.device-index</code> - The device index to which the network interface is attached.</li> <li><code>network-interface.association.status</code> - The status of the association.</li>  
<li><code>network-interface.ATTACHMENT</code> - The time that the network interface was attached to an instance.</li>  
<li><code>network-interface.attachment.device-index</code> - The device index to which the network interface is attached.</li> <li><code>network-interface.attachment.status</code> - The status of the attachment.</li> <li><code>network-interface.attachment.attach-time</code> - The time that the network interface was attached to an instance.</li> <li><code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated.</li> <li><code>network-interface.availability-zone</code> - The Availability Zone for the network interface.</li> <li><code>network-interface.description</code> - The description of the network interface.</li> <li><code>network-interface.group-id</code> - The ID of a security group associated with the network interface.</li> <li><code>network-interface.group-name</code> - The name of a security group associated with the network interface.</li> <li><code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.</li> <li><code>network-interface.mac-address</code> - The MAC address of the network interface.</li> <li><code>network-interface.network-interface-id</code> - The ID of the network interface.</li> <li><code>network-interface.owner-id</code> - The ID of the owner of the network interface.</li> <li><code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</li> <li><code>network-interface.requester-id</code> - The requester ID for the network interface.</li> <li><code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</li> <li><code>network-interface.requester-attached</code> - The status of the network interface.</li> <li><code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</li> <li><code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.</li> <li><code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</li> <li><code>placement-group-name</code> - The name of the placement group for the instance.</li> <li><code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</li> <li><code>product-code</code> - The product code associated with the AMI used to launch the instance.</li> <li><code>product-code.type</code> - The type of product code.</li> <li><code>ramdisk-id</code> - The RAM disk ID.</li> <li><code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</li> <li><code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</li> <li><code>root-device-name</code> - The name of the root device for the instance.</li> <li><code>root-device-type</code> - The type of root device that the instance uses.</li> <li><code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.
<code>state-reason-code</code> - The reason code for the state change.  

<code>state-reason-message</code> - A message that describes the state change.  

<code>subnet-id</code> - The ID of the subnet for the instance.  

<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.  

<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.  

<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.  

<code>tenancy</code> - The tenancy of an instance  

<code>affinity</code> - The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>).  

<code>architecture</code> - The instance architecture (<code>i386</code> | <code>x86_64</code>).  

<code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface.  

<code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface.  

<code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.  

<code>image-id</code> - The ID of the image used to launch the instance.  

<code>instance-id</code> - The ID of the instance.  

<code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).  

<code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>).  

<code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>).  

<code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN.  

<code>hypervisor</code> - The hypervisor type of the instance (<code>ovm</code> | <code>xen</code>).  

<code>image-id</code> - The ID of the image used to launch the instance.  

<code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).  

<code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>).
**Open Source Used In Finesse Software 12.5(1)SU2**

16236

- The ID of the security group for the instance. 
- The name of the security group for the instance. 
- The public IPv4 address of the instance. 
- The kernel ID. 
- The name of the key pair used when the instance was launched. 
- When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). 
- The time when the instance was launched. 
- Indicates whether detailed monitoring is enabled. 
- The private IPv4 address associated with the network interface. 
- Specifies whether the IPv4 address of the network interface is the primary IPv4 address. 
- The ID of the association of an Elastic IP Address (IPv4) with a network interface. 
- The owner ID of the private IPv4 address associated with the network interface. 
- The ID of the interface attachment. 
- The device index to which the network interface is attached. 
- The time that the network interface was attached to an instance. 
- Specifies whether the attachment is deleted when an instance is terminated. 
- The Availability Zone for the network interface. 
- The description of the network interface. 
- The ID of a security group associated with the network interface. 
- The IPv6 address associated with the network interface. 
- The MAC address of the network interface. 
- The ID of the network interface. 
- The ID of the owner of the network interface. 
- The private DNS name of the network interface. 
- The status of the network interface. 
- Whether the network interface performs source/destination checking. 
- The value must be `true` if checking is enabled, and `false` if checking is disabled. 
- The value must be `true` if checking is enabled, and `false` if checking is disabled. 
- The platform. Use `windows` if you have Windows instances; otherwise, leave blank. 
- The platform. Use `windows` if you have Windows instances; otherwise, leave blank. 
- The product code associated with the AMI used to launch the instance.
<code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.  

<code>association.association-id</code> - The association ID returned when the network interface was associated with an IPv4 address.  

<code>availability-zone</code> - The Availability Zone of the instance.  

<code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>.  

<code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code> or <code>xvdh</code>).  

<code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination.  

<code>block-device-mapping.volume-id</code> - The volume ID of the EBS volume.  

<code>client-token</code> - The idempotency token you provided when you launched the instance.  

<code>dns-name</code> - The public DNS name of the instance.  

<code>group-id</code> - The ID of the security group for the instance. EC2-Classic only.  

<code>group-name</code> - The name of the security group for the instance. EC2-Classic only.  

<code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable.  

<code>hypervisor</code> - The hypervisor type of the instance (<code>ovm</code> | <code>xen</code>).  

<code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specificed as an ARN.  

<code>image-id</code> - The ID of the image used to launch the instance.  

<code>instance-id</code> - The ID of the instance.  

<code>instance.lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance.  

<code>ip-address</code> - The public IPv4 address of the instance.  

<code>key-name</code> - The name of the key pair used when the instance was launched.  

<code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).  

<code>launch-time</code> - The time when the instance was launched.  

<code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (<code>disabled</code> | <code>enabled</code>).  

<code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.  

<code>network-interface.addresses.association.private-ip-address</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.  

<code>network-interface.addresses.association.public-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface.  

<code>network-interface.addresses.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface.  

<code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.  

<code>network-interface.attachment.instance-id</code> - The ID of the instance to which the network interface is attached.  

<code>network-interface.attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.  

<code>network-interface.attachment.device-index</code> - The device index to which the network interface is attached.  

<code>network-interface.attachment.status</code> - The status of the attachment.
<code>attached</code> | <code>detaching</code> | <code>detached</code>). \(</li> \li> \p> \<code>network-interface.attachment.attach-time</code> - The time that the network interface was attached to an instance. \(</li> \li> \p> \<code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated. \(</li> \li> \p> \<code>network-interface.availability-zone</code> - The Availability Zone for the network interface. \(</li> \li> \p> \<code>network-interface.description</code> - The description of the network interface. \(</li> \li> \p> \<code>network-interface.group-id</code> - The ID of a security group associated with the network interface. \(</li> \li> \p> \<code>network-interface.mac-address</code> - The MAC address of the network interface. \(</li> \li> \p> \<code>network-interface.network-interface-id</code> - The ID of the network interface. \(</li> \li> \p> \<code>network-interface.owner-id</code> - The ID of the owner of the network interface. \(</li> \li> \p> \<code>network-interface.private-dns-name</code> - The private DNS name of the network interface. \(</li> \li> \p> \<code>network-interface.requester-id</code> - The requester ID for the network interface. \(</li> \li> \p> \<code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS. \(</li> \li> \p> \<code>network-interface.status</code> - The status of the network interface (available | in-use). \(</li> \li> \p> \<code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. Similar to the state-reason-code filter. \(</li> \li> \p> \<code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on). \(</li> \li> \p> \<code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID. \(</li> \li> \p> \<code>root-device-name</code> - The name of the root device for the instance (for example, /dev/sda1 | /dev/xvda). \(</li> \li> \p> \<code>root-device-type</code> - The type of root device that the instance uses (ebs | instance-store). \(</li> \li> \p> \<code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of true means that checking is enabled, and false means checking is disabled. The value must be false for the instance to perform network address translation (NAT) in your VPC. \(</li> \li> \p> \<code>spot-instance-request-id</code> - The ID of the Spot instance request. \(</li> \li> \p> \<code>state-reason-code</code> - The reason code for the state change. \(</li> \li> \p> \<code>state-reason-message</code> - A message that describes the state change. \(</li> \li> \p> \<code>tag</code>:<i>key</i>=<i>value</i> - The key/value
combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.</p> </li> <li> `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key Purpose (regardless of what the tag’s key is), and the tag value X (regardless of what the tag’s value is). If you want to list only resources where Purpose is X, see the `<code>tag</code>` filter. `<p>` </li> <li> `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. `<p>` </li> <li> `<code>tenancy</code>` - The tenancy of an instance (`<code>dedicated</code>` | `<code>default</code>` | `<code>host</code>`). This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key Purpose and the tag value X. `<p>` </li> <li> `<code>virtualization-type</code>` - The virtualization type of the instance (`<code>paravirtual</code>` | `<code>hvm</code>`). This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key Purpose and the tag value X. `<p>` </li> <li> `<code>vpc-id</code>` - The ID of the VPC that the instance is running in. `<p>` </li> </ul> <p>Note: This method appends the values to the existing list (if any). Use `{@link com.amazonaws.services/ec2.model.FilterType.setFilters(java.util.Collection)}` or `{@link com.amazonaws.services/ec2.model.FilterType.withFilters(java.util.Collection)}` if you want to override the existing values.</p>
<code>instance.group-name</code> - The name of the security group for the instance. 

<code>ip-address</code> - The public IPv4 address of the instance.

<code>kernel-id</code> - The kernel ID.

<code>key-name</code> - The name of the key pair used when the instance was launched.

<code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).

<code>launch-time</code> - The time when the instance was launched.

<code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (disabled | enabled).

<code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.

<code>network-interface.addresses.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.

<code>ip-address</code> - The public IPv4 address of the instance.

<code>kernel-id</code> - The kernel ID.

<code>key-name</code> - The name of the key pair used when the instance was launched.

<code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).

<code>launch-time</code> - The time when the instance was launched.

<code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (disabled | enabled).

<code>network-interface.addresses.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.

<code>network-interface.addresses.association.public-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface.

<code>network-interface.addresses.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface.

<code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.

<code>network-interface.attachment.attachment-instance-id</code> - The ID of the instance to which the network interface is attached.

<code>network-interface.attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.

<code>network-interface.attachment.device-index</code> - The device index to which the network interface is attached.

<code>network-interface.attachment.status</code> - The status of the attachment (attached | detached).

<code>network-interface.association.public-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface.

<code>network-interface.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface.

<code>network-interface.description</code> - The description of the network interface.

<code>network-interface.group-id</code> - The ID of the security group associated with the network interface.

<code>network-interface.group-name</code> - The name of a security group associated with the network interface.

<code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.

<code>network-interface.mac-address</code> - The MAC address of the network interface.

<code>network-interface.network-interface-id</code> - The ID of the network interface.

<code>network-interface.owner-id</code> - The ID of the owner of the network interface.

<code>network-interface.private-dns-name</code> - The private DNS name of the network interface.

<code>network-interface.requester-id</code> - The requester ID for the network interface.

<code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.

<code>network-interface.status</code> - The status of the network interface (available | in-use).

<code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.

<code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.

<code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.

<code>owner-id</code> - The AWS account ID of the instance owner.

<code>placement-group-name</code> - The name of the placement group for the instance.

<code>platform</code> - The platform. Use windows if you have Windows instances; otherwise, leave blank.

<code>private-dns-name</code> - The private IPv4 DNS name of the instance.

<code>private-ip-address</code> - The private IPv4 address of the instance.

<code>product-code</code> - The product code associated with the AMI used to launch the instance.

<code>product-code.type</code> - The type of product code (devpay | |
<li><code>affinity</code> - The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>). </li>

<code>architecture</code> - The instance architecture (<code>i386</code> | <code>x86_64</code>). </li>

<code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface. </li>

<code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface. </li>

<code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface. </li>

<code>association.association-id</code> - The association ID returned when the network interface was associated with an IPv4 address. </li>

<code>availability-zone</code> - The Availability Zone of the instance. </li>

<code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>. </li>

<code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on
name</code> - The name of a security group associated with the network interface.</p>  

- <code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.</p>  

- <code>network-interface.mac-address</code> - The MAC address of the network interface.</p>  

- <code>network-interface.network-interface-id</code> - The ID of the network interface.</p>  

- <code>network-interface.owner-id</code> - The ID of the owner of the network interface.</p>  

- <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</p>  

- <code>network-interface.requester-id</code> - The requester ID for the network interface.</p>  

- <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</p>  

- <code>network-interface.status</code> - The status of the network interface.</p>  

- <code>network-interface.available</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</p>  

- <code>network-interface.unavailable</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</p>  

- <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</p>  

- <code>network-interface.owner-id</code> - The AWS account ID of the instance owner.</p>  

- <code>placement-group-name</code> - The name of the placement group for the instance.</p>  

- <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</p>  

- <code>private-dns-name</code> - The private DNS name of the instance.</p>  

- <code>private-ip-address</code> - The private IPv4 address of the instance.</p>  

- <code>product-code</code> - The product code associated with the AMI used to launch the instance.</p>  

- <code>product-code.type</code> - The type of product code.</p>  

- <code>product-code.devpay</code> - The type of product code (devpay).</p>  

- <code>product-code.marketplace</code> - The type of product code (marketplace).</p>  

- <code>ramdisk-id</code> - The RAM disk ID of the instance.</p>  

- <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</p>  

- <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</p>  

- <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</p>  

- <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</p>  

- <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> or <code>instance-store</code>).</p>  

- <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.</p>  

- <code>spot-instance-request-id</code> - The ID of the Spot instance request.</p>  

- <code>state-reason-code</code> - The reason code for the state change.</p>  

- <code>state-reason-message</code> - A message that describes the state change.</p>  

- <code>tag</code>:<code>key</code>=<code>value</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>value=X</code> for the filter value. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter <code>\"tag-key=Purpose\"</code> and the filter <code>\"tag-value=X\"</code>, you get any resources assigned both the tag key Purpose and the tag value X (regardless of what the tag's value is). If you want to list only resources where Purpose is X, see the <code>tag:tag-value</code>:<code>key</code>=<code>value</code> filter.
<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

<code>tenancy</code> - The tenancy of an instance (<code>dedicated</code> | <code>default</code> | <code>host</code>). The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>). The ID of the VPC that the instance is running in.

\texttt{<li> <p> <code>subnet-id</code> - The ID of the subnet for the instance.
\texttt{<li> <p> <code>tag</code>:\texttt{<i>key</i>=\texttt{<i>value</i>}} - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify \texttt{<code>tag:Purpose</code>} for the filter name and \texttt{<code>X</code>} for the filter value.
\texttt{<li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the \texttt{<code>tag-value</code>} filter. For example, if you use both the filter \texttt{\"tag-key\"=\texttt{Purpose\"}} and the filter \texttt{\"tag-value=X\"}, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the \texttt{<code>tag</code>:\texttt{<i>key</i>=\texttt{X}} \texttt{<i>value</i>}} filter.
\texttt{<li> <p> <code>tenancy</code> - The tenancy of an instance (\texttt{<code>dedicated</code>} | \texttt{<code>default</code>} | \texttt{<code>host</code>}).
\texttt{<li> <p> <code>virtualization-type</code> - The virtualization type of the instance (\texttt{<code>paravirtual</code>} | \texttt{<code>hvm</code>}).
\texttt{<li> <p> <code>vpc-id</code> - The ID of the VPC that the instance is running in.
\texttt{<li> <p>\texttt{@return} Returns a reference to this object so that method calls can be chained together.*/

"fluentSetterMethodName" : "withFilters",

"getterDocumentation" : "/**\p{One or more filters.}\ul\li \p{<code>affinity</code>} - The affinity setting for an instance running on a Dedicated Host (\texttt{<code>default</code>} | \texttt{<code>host</code>}).\p{</li> <p> <code>architecture</code>\p{}</li> <p> <code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface.
\texttt{<li> <p> <code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface.
\texttt{<li> <p> <code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
\texttt{<li> <p> <code>availability-zone</code> - The Availability Zone of the instance.
\texttt{<li> <p> <code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, \texttt{<code>2010-09-15T17:15:20.000Z</code>}.
\texttt{<li> <p> <code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination.
\texttt{<li> <p> <code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, \texttt{<code>/dev/sdh</code>} or \texttt{<code>/dev/xvdh</code>}).
\texttt{<li> <p> <code>block-device-mapping.status</code> - The status for the EBS volume (\texttt{<code>attaching</code>} | \texttt{<code>attached</code>} | \texttt{<code>detaching</code>} | \texttt{<code>detached</code>}).
\texttt{<li> <p> <code>client-token</code> - The idempotency token you provided when you launched the instance.
\texttt{<li> <p> <code>dns-name</code> - The public DNS name of the instance.
\texttt{<li> <p> <code>group-id</code> - The ID of the security group for the instance. EC2-Classic only.
\texttt{<li> <p> <code>group-name</code> - The name of the security group for the instance. EC2-Classic only.
\texttt{<li> <p> <code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable.
\texttt{<li> <p> <code>hypervisor</code> - The hypervisor type of the instance (\texttt{<code>ovm</code>} | \texttt{<code> xen</code>}).
\texttt{<li> <p> <code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN.
\texttt{<li> <p> <code>image-id</code> - The ID of the image used to launch the instance.
\texttt{<li> <p> <code>instance-id</code> - The ID of the instance.
\texttt{<li> <p> <code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a
### Filters

Each of the following filters can be used with the AWS CLI `describe-instances` command to filter the list of instances returned by the command. These filters can be combined to filter the results further.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>affinity</code></td>
<td>The affinity setting for an instance running on a Dedicated Host (default</td>
</tr>
<tr>
<td><code>architecture</code></td>
<td>The instance architecture (i386</td>
</tr>
<tr>
<td><code>association.public-ip</code></td>
<td>The Elastic IP address (IPv4) bound to the network interface.</td>
</tr>
<tr>
<td><code>association.ip-owner-id</code></td>
<td>The owner of the Elastic IP address (IPv4) associated with the network interface.</td>
</tr>
<tr>
<td><code>association.association-id</code></td>
<td>The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.</td>
</tr>
<tr>
<td><code>availability-zone</code></td>
<td>The Availability Zone of the instance.</td>
</tr>
<tr>
<td><code>association.allocation-id</code></td>
<td>The allocation ID returned when you associated with an IPv4 address.</td>
</tr>
<tr>
<td><code>association.association-attribute</code></td>
<td>The association attribute.</td>
</tr>
<tr>
<td><code>association.association-attribute-value</code></td>
<td>The association attribute value.</td>
</tr>
<tr>
<td><code>association.ip-owner-id</code></td>
<td>The owner of the Elastic IP address (IPv4) associated with the network interface.</td>
</tr>
<tr>
<td><code>association.allocation-id</code></td>

The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).</p> <li> <p> <code>key-name</code> - The name of the key pair used when the instance was launched.</p> <li> <p> <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).</p> <li> <p> <code>launch-time</code> - The time when the instance was launched.</p> <li> <p> <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.
Availability Zone for the network interface.\p
<li> <p> <code>network-interface.description</code> - The description of the network interface.\p
</li> 
<li> <p> <code>network-interface.group-id</code> - The ID of a security group associated with the network interface.\p
</li> 
<li> <p> <code>network-interface.group-name</code> - The name of a security group associated with the network interface.\p
</li> 
<li> <p> <code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.\p
</li> 
<li> <p> <code>network-interface.mac-address</code> - The MAC address of the network interface.\p
</li> 
<li> <p> <code>network-interface.network-interface-id</code> - The ID of the network interface.\p
</li> 
<li> <p> <code>network-interface.owner-id</code> - The ID of the owner of the network interface.\p
</li> 
<li> <p> <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.\p
</li> 
<li> <p> <code>network-interface.requester-id</code> - The requester ID for the network interface.\p
</li> 
<li> <p> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.\p
</li> 
<li> <p> <code>network-interface.status</code> - The status of the network interface (available|in-use).\p
</li> 
<li> <p> <code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.\p
</li> 
<li> <p> <code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.\p
</li> 
<li> <p> <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.\p
</li> 
<li> <p> <code>owner-id</code> - The AWS account ID of the instance owner.\p
</li> 
<li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.\p
</li> 
<li> <p> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.\p
</li> 
<li> <p> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.\p
</li> 
<li> <p> <code>private-ip-address</code> - The private IPv4 address of the instance.\p
</li> 
<li> <p> <code>product-code</code> - The product code associated with the AMI used to launch the instance.\p
</li> 
<li> <p> <code>product-code.type</code> - The type of product code (devpay|marketplace).\p
</li> 
<li> <p> <code>ramdisk-id</code> - The RAM disk ID.\p
</li> 
<li> <p> <code>reason</code> - The reason for the state change.\p
</li> 
<li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.\p
</li> 
<li> <p> <code>root-device-name</code> - The name of the root device for the instance.\p
</li> 
<li> <p> <code>root-device-type</code> - The type of root device that the instance uses (ebs|instance-store).\p
</li> 
<li> <p> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.\p
</li> 
<li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.\p
</li> 
<li> <p> <code>state-reason-code</code> - The reason code for the state change.\p
</li> 
<li> <p> <code>state-reason-message</code> - A message that describes the state change.\p
</li> 
<li> <p> <code>subnet-id</code> - The ID of the subnet for the instance.\p
</li> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.\p
</li> 
<li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter...
"tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. <p>
<li> <p>
<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. <p>
<li> <p>
<code>tenancy</code> - The tenancy of an instance (<code>dedicated</code> | <code>default</code> | <code>host</code>). <p>
<li> <p>
<code>virtualization-type</code> - The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>). <p>
<li> <p>
<code>vpc-id</code> - The ID of the VPC that the instance is running in.</p> */

<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag "Purpose=production", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value production (regardless of what the tag's key is). If you want to list only resources where Purpose is production, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. For example, if you use both the filter "tag:<i>key</i>="Production" and the filter "tag-value=XYZ", you get any resources assigned both the tag key Production and the tag value XYZ. </p> 
<li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag</code>:<i>key</i>=<i>value</i> filter. For example, if you only want resources assigned the tag key Production, see the <code>tag-key</code> filter. </p> 
<li> <p> <code>subnet-id</code> - The ID of the subnet for the instance. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of the Spot instance request. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your VPC. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. </p> 
<li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The ID of your security group. }</code>

network interface is being managed by AWS. </li> <li> <p> <code>network-interface.status</code> - The status of the network interface (<code>available</code>) | <code>in-use</code>).</p> </li> <li> <p> <code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>true</code> for the network interface to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.</p> </li> <li> <p> <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</p> </li> <li> <p> <code>owner-id</code> - The AWS account ID of the instance owner.</p> </li> <li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.</p> </li> <li> <p> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</p> </li> <li> <p> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.</p> </li> <li> <p> <code>private-ip-address</code> - The private IPv4 address of the instance.</p> </li> <li> <p> <code>product-code</code> - The product code associated with the AMI used to launch the instance.</p> </li> <li> <p> <code>product-code.type</code> - The type of product code (<code>devpay</code> | <code>marketplace</code>).</p> </li> <li> <p> <code>ramdisk-id</code> - The RAM disk ID.</p> </li> <li> <p> <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</p> </li> <li> <p> <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</p> </li> <li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</p> </li> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</p> </li> <li> <p> <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).</p> </li> <li> <p> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>true</code> for the instance to perform network address translation (NAT) in your VPC. </p> </li> <li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.</p> </li> <li> <p> <code>state-reason-code</code> - The reason code for the state change.</p> </li> <li> <p> <code>state-reason-message</code> - A message that describes the state change.</p> </li> <li> <p> <code>subnet-id</code> - The ID of the subnet for the instance.</p> </li> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tagKey</code>:<i>key</i>=<i>value</i> filter. </p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. </p> </li> <li> <p> <code>tenancy</code> - The tenancy of an instance ( <code>dedicated</code> | <code>default</code> | <code>host</code> ).</p> </li> <li> <p> <code>virtualization-type</code> - The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>).</p> </li> <li> <p> <code>vpc-id</code> - The ID of the VPC that the instance is running in.</p> </li>

detailed monitoring is enabled (disabled | enabled). </li> 
<li> <p> The private IPv4 address associated with the network interface. </p> </li> 
<li> <p> The primary private IPv4 address. </p> </li> 
<li> <p> Specifies whether the IPv4 address of the network interface is private. </p> </li> 
<li> <p> - The ID of the association of an Elastic IP address (IPv4) with a network interface. </p> </li> 
<li> <p> - The owner ID of the private IPv4 address associated with the network interface. </p> </li> 
<li> <p> - The ID of the interface attachment. </p> </li> 
<li> <p> - The ID of the instance to which the network interface is attached. </p> </li> 
<li> <p> - The description of the network interface. </p> </li> 
<li> <p> - The ID of a security group associated with the network interface. </p> </li> 
<li> <p> - The name of a security group associated with the network interface. </p> </li> 
<li> <p> - The IPv6 address associated with the network interface. </p> </li> 
<li> <p> - The MAC address of the network interface. </p> </li> 
<li> <p> - The ID of the network interface. </p> </li> 
<li> <p> - The ID of the owner of the network interface. </p> </li> 
<li> <p> - The private DNS name of the network interface. </p> </li> 
<li> <p> - The requester ID for the network interface. </p> </li> 
<li> <p> - Indicates whether the network interface is being managed by AWS. </p> </li> 
<li> <p> - The status of the network interface. </p> </li> 
<li> <p> - Whether the network interface performs source/destination checking. </p> </li> 
<li> <p> - Use Windows if you have Windows instances; otherwise, leave blank. </p> </li> 
<li> <p> - The private IPv4 DNS name of the instance. </p> </li> 
<li> <p> - The type of product code. </p> </li> 
<li> <p> - The RAM disk ID. </p> </li> 
<li> <p> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on). </p> </li> 
<li> <p> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-
one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.

- `<code>root-device-name</code>` - The name of the root device for the instance (for example, `<code>/dev/sda1</code>` or `<code>/dev/xvda</code>`).
- `<code>root-device-type</code>` - The type of root device that the instance uses. For example, `<code>ebs</code>` or `<code>instance-store</code>`.
- `<code>source-dest-check</code>` - Indicates whether the instance performs source/destination checking. A value of `<true>` means that checking is enabled, and `<false>` means checking is disabled. The value must be `<false>` for the instance to perform network address translation (NAT) in your VPC.
- `<code>spot-instance-request-id</code>` - The ID of the Spot instance request.
- `<code>state-reason-code</code>` - The reason code for the state change.
- `<code>state-reason-message</code>` - A message that describes the state change.
- `<code>subnet-id</code>` - The ID of the subnet for the instance.
- `<code>tag</code>` - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value. If you want to list only resources where `Purpose` is `X`, see the `<code>tag</code>` filter.
- `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `<code>tag-key="Purpose"</code>` and the filter `<code>tag-value="X"</code>`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the `<code>tag</code>` filter.
- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.
- `<code>tenancy</code>` - The tenancy of an instance.
- `<code>architecture</code>` - The instance architecture.
- `<code>association.public-ip</code>` - The address of the Elastic IP address (IPv4) bound to the network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.allocation-id</code>` - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>availability-zone</code>` - The Availability Zone of the instance.
- `<code>block-device-mapping.attach-time</code>` - The attach time for an EBS volume mapped to the instance, for example, `<code>2010-09-15T17:15:20.000Z</code>`.
- `<code>block-device-mapping.delete-on-termination</code>` - A Boolean that indicates whether the EBS volume is deleted on instance termination.
- `<code>block-device-mapping.device-name</code>` - The device name for the EBS volume (for example, `<code>/dev/sdh</code>` or `<code>xvdh</code>`).
- `<code>block-device-mapping.status</code>` - The status for the EBS volume.
- `<code>detaching</code>` - The status of the EBS volume and the attach time for an EBS volume mapped to the instance, for example, `<code>2010-09-15T17:15:20.000Z</code>`.
- `<code>device-name</code>` - The name of the root device for the instance.
- `<code>device-type</code>` - The type of root device that the instance uses.
- `<code>dns-name</code>` - The public DNS name of the instance.
- `<code>group-id</code>` - The ID of the security group for the instance.
- `<code>group-name</code>` - The name of the security group for the instance.
instance is running, if applicable.</p> <li> <p> <code>hypervisor</code> - The hypervisor type of the instance. (hypervisor: <code>ovm</code> | <code>xen</code>). </p> </li> <li> <p> <code>iam-instance-profile.arn</code> - The ID of the image used to launch the instance. </p> </li> <li> <p> <code>instance-id</code> - The ID of the instance. </p> </li> <li> <p> <code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance. </p> </li> <li> <p> <code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped). </p> </li> <li> <p> <code>instance-state-name</code> - The state of the instance. </p> </li> <li> <p> <code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>). </p> </li> <li> <p> <code>instance.group-id</code> - The ID of the security group for the instance. </p> </li> <li> <p> <code>instance.group-name</code> - The name of the security group for the instance. </p> </li> <li> <p> <code>instance.ip-address</code> - The public IPv4 address of the instance. </p> </li> <li> <p> <code>instance.kid</code> - The Kernel ID. </p> </li> <li> <p> <code>key-name</code> - The name of the key pair used when the instance was launched. </p> </li> <li> <p> <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). </p> </li> <li> <p> <code>launch-time</code> - The time when the instance was launched. </p> </li> <li> <p> <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (true | false). </p> </li> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface. </p> </li> <li> <p> <code>network-interface.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address. </p> </li> <li> <p> <code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment. </p> </li> <li> <p> <code>network-interface.attachment.instance-id</code> - The ID of the instance to which the network interface is attached. </p> </li> <li> <p> <code>network-interface.attachment.status</code> - The status of the attachment. </p> </li> <li> <p> <code>network-interface.associated-addresses.ipv6-address</code> - The IPv6 address associated with the network interface. </p> </li> <li> <p> <code>network-interface.description</code> - The description of the network interface. </p> </li> <li> <p> <code>network-interface.owner-id</code> - The ID of the owner of the network interface. </p> </li> <li> <p> <code>network-interface.requester-id</code> - The requester ID for the network interface. </p> </li> <li> <p> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS. </p> </li> <li> <p> <code>network-interface.status</code> - The
status of the network interface \(<\text{code}>\text{available}</\text{code}>\) | \(<\text{code}>\text{in-use}</\text{code}>\). \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{network-interface.source-dest-check}</\text{code}>\) - Whether the network interface performs source/destination checking. A value of \(<\text{code}>\text{true}</\text{code}>\) means checking is enabled, and \(<\text{code}>\text{false}</\text{code}>\) means checking is disabled. The value must be \(<\text{code}>\text{false}</\text{code}>\) for the network interface to perform network address translation (NAT) in your VPC. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{network-interface.subnet-id}</\text{code}>\) - The ID of the subnet for the network interface. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{network-interface.vpc-id}</\text{code}>\) - The ID of the VPC for the network interface. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{owner-id}</\text{code}>\) - The AWS account ID of the instance owner. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{placement-group-name}</\text{code}>\) - The name of the placement group for the instance. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{platform}</\text{code}>\) - The platform. Use \(<\text{code}>\text{windows}</\text{code}>\) if you have Windows instances; otherwise, leave blank. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{private-dns-name}</\text{code}>\) - The private IPv4 DNS name of the instance. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{private-ip-address}</\text{code}>\) - The private IPv4 address of the instance. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{product-code}</\text{code}>\) - The product code associated with the AMI used to launch the instance. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{product-code.type}</\text{code}>\) - The type of product code (\(<\text{code}>\text{devpay}</\text{code}>\) | \(<\text{code}>\text{marketplace}</\text{code}>\)). \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{ramdisk-id}</\text{code}>\) - The RAM disk ID. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{reason}</\text{code}>\) - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{requester-id}</\text{code}>\) - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on). \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{reservation-id}</\text{code}>\) - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{root-device-name}</\text{code}>\) - The name of the root device for the instance (for example, \(<\text{code}>\text{/dev/sda1}</\text{code}>\) or \(<\text{code}>\text{/dev/xvda}</\text{code}>\)). \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{root-device-type}</\text{code}>\) - The type of root device that the instance uses (\(<\text{code}>\text{ebs}</\text{code}>\) | \(<\text{code}>\text{instance-store}</\text{code}>\)). \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{source-dest-check}</\text{code}>\) - Indicates whether the instance performs source/destination checking. A value of \(<\text{code}>\text{true}</\text{code}>\) means that checking is enabled, and \(<\text{code}>\text{false}</\text{code}>\) means checking is disabled. The value must be \(<\text{code}>\text{false}</\text{code}>\) for the instance to perform network address translation (NAT) in your VPC. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{spot-instance-request-id}</\text{code}>\) - The ID of the Spot instance request. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{state-reason-code}</\text{code}>\) - The reason code for the state change. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{state-reason-message}</\text{code}>\) - A message that describes the state change. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{subnet-id}</\text{code}>\) - The ID of the subnet for the instance. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{tag}</\text{code}>\)\(<i>\text{key}</i>=\text{value}</i>)\(</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify \(<code>tag:Purpose</code>\) for the filter name and \(<code>tag:X</code>\) for the filter value. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{tag-key}</\text{code}>\) - The key of a tag assigned to the resource. This filter is independent of the \(<code>tag-value</code>\) filter. For example, if you use both the filter \(<code>tag-key=Purpose</code>\) and the filter \(<code>tag-value=X</code>\), you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the \(<code>tag</code>\)\(<i>\text{key}</i>=\text{X}</i>)\(</code> filter. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{tag-value}</\text{code}>\) - The value of a tag assigned to the resource. This filter is independent of the \(<code>tag-key</code>\) filter. \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{tenancy}</\text{code}>\) - The tenancy of an instance \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{virtualization-type}</\text{code}>\) - The virtualization type of the instance \(</p>\)
\(</li>\) \(</p>\)
\(<\text{code}>\text{vpc-id}</\text{code}>\) - The ID of the VPC that the instance is running in. \(</p>\)
\(</li>\) \(</p>\)

"variableDeclarationType" : "com.amazonaws.internal.SdkInternalList<Filter>",
"variableName" : "filters",
```
"variableType": "java.util.List<Filter>",
"documentation": "One or more filters.

- **affinity**: The affinity setting for an instance running on a Dedicated Host (default | host).
- **architecture**: The instance architecture (i386 | x86_64).
- **association.public-ip**: The address of the Elastic IP address (IPv4) bound to the network interface.
- **association.ip-owner-id**: The owner of the Elastic IP address (IPv4) associated with the network interface.
- **association.allocation-id**: The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- **association.association-id**: The association ID returned when the network interface was associated with an IPv4 address.
- **availability-zone**: The Availability Zone of the instance.
- **block-device-mapping.attach-time**: The attach time for an EBS volume mapped to the instance, for example, 2010-09-15T17:15:20.000Z.
- **block-device-mapping.delete-on-termination**: A Boolean that indicates whether the EBS volume is deleted on instance termination.
- **block-device-mapping.device-name**: The device name for the EBS volume (for example, /dev/sdh or /dev/xvdh).
- **block-device-mapping.volume-id**: The volume ID of the EBS volume.
- **client-token**: The idempotency token you provided when you launched the instance.
- **dns-name**: The public DNS name of the instance.
- **group-id**: The ID of the security group for the instance. EC2-Classic only.
- **group-name**: The name of the security group for the instance. EC2-Classic only.
- **host-id**: The ID of the Dedicated Host on which the instance is running, if applicable.
- **hypervisor**: The hypervisor type of the instance (ovm | xen).
- **iam-instance-profile.arn**: The instance profile associated with the instance. Specified as an ARN.
- **image-id**: The ID of the image used to launch the instance.
- **instance-id**: The ID of the instance.
- **instance-lifecycle**: Indicates whether this is a Spot Instance or a Scheduled Instance (spot | scheduled).
- **instance.state-code**: The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).
- **instance.state-name**: The state of the instance (pending | running | shutting-down | terminated | stopping | stopped).
- **instance-type**: The type of instance (for example, t2.micro).
- **instance.group-id**: The ID of the security group for the instance.
- **instance.group-name**: The name of the security group for the instance.
- **ip-address**: The public IPv4 address of the instance.
- **kernel-id**: The kernel ID.
- **key-name**: The name of the key pair used when the instance was launched.
- **launch-index**: When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).
- **launch-time**: The time when the instance was launched.
- **launch-state**: Indicates whether detailed monitoring is enabled (disabled | enabled).
- **network-interface.addresses.private-ip-address**: The private IPv4 address associated with the network interface.
- **network-interface.addresses.primary**: Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.
- **network-interface.addresses.association.public-ip**: The ID of the association of an Elastic IP address (IPv4) with a network interface.
- **network-interface.addresses.association.ip-owner-id**: The owner ID of the private IPv4 address associated with the network interface.
interface.attachment.attachment-id</code> - The ID of the interface attachment.</p> <li> <code>network-interface.attachment.instance-id</code> - The ID of the instance to which the network interface is attached.</li> <li> <code>network-interface.attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.</li> <li> <code>network-interface.attachment.device-index</code> - The device index to which the network interface is attached.</li> <li> <code>network-interface.attachment.status</code> - The status of the attachment (<code>attaching</code> | <code>attached</code> | <code>detached</code> | <code>detaching</code> | <code>detached</code>).</li> <li> <code>network-interface.attachment.attach-time</code> - The time that the network interface was attached to an instance.</li> <li> <code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated.</li> <li> <code>network-interface.availability-zone</code> - The Availability Zone for the network interface.</li> <li> <code>network-interface.description</code> - The description of the network interface.</li> <li> <code>network-interface.group-id</code> - The ID of a security group associated with the network interface.</li> <li> <code>network-interface.group-name</code> - The name of a security group associated with the network interface.</li> <li> <code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.</li> <li> <code>network-interface.mac-address</code> - The MAC address of the network interface.</li> <li> <code>network-interface.network-interface-id</code> - The ID of the network interface.</li> <li> <code>network-interface.owner-id</code> - The ID of the owner of the network interface.</li> <li> <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</li> <li> <code>network-interface.private-ip-address</code> - The private IPv4 address of the instance.</li> <li> <code>network-interface.public-dns-name</code> - The public DNS name of the instance.</li> <li> <code>network-interface.public-ip-address</code> - The public IPv4 address of the instance.</li> <li> <code>network-interface.requester-id</code> - The requester ID for the network interface.</li> <li> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</li> <li> <code>network-interface.source-dest-check</code> - Indicates whether the instance performs source/destination checking. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get ten reservation IDs.</li> <li> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</li> <li> <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).</li> <li> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of
true means that checking is enabled, and false means checking is disabled. The value must be false for the instance to perform network address translation (NAT) in your VPC. The ID of the Spot instance request. The reason code for the state change. A message that describes the state change. The ID of the subnet for the instance. The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify tag:Purpose for the filter name and X for the filter value. The ID of the VPC that the instance is running in.

```
List<Filter>
```

This filter is independent of the tag-value filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag:Purpose filter. This filter is independent of the tag-value filter. The tenancy of an instance (dedicated | default | host). The virtualization type of the instance (paravirtual | hvm). The ID of the instance request.

```
java.util.Collection<Filter>
```

This filter is independent of the tag-key filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag:Purpose filter. The ID of the subnet for the instance.

```
java.util.List<String>
```

This filter is independent of the tag-key filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag:Purpose filter.

**Simple**: false,

```
public void setInstanceIds(String... instanceIds)
```

This method appends the values to the existing list (if any). Use `getInstanceIds()` if you want to override the existing values.

**Notes:**
- Describes all your instances.
- Default: Describes all your instances.

Returns a reference to this object so that method calls can be chained together.

**Variable:**
```
public String[] getInstanceIds()
```

**Documentation:**
- One or more instance IDs.
- Default: Describes all your instances.
- `NOTE:` This method appends the values to the existing list (if any). Use `getInstanceIds()` if you want to override the existing values.
- `return`: Returns a reference to this object so that method calls can be chained together.

**MaxResults:**
```
public Integer getMaxResults()
```

**Documentation:**
- The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned `NextToken` value. This value can be between 5 and 1000. You cannot specify this parameter and the instance IDs parameter or tag filters in the same call.
- `return`: Returns a reference to this object so that method calls can be chained together.

**Additional Documentation:**
- The maximum number of results to return in a single call. To retrieve the remaining results, make another call with the returned `NextToken` value. This value can be between 5 and 1000. You cannot specify this parameter and the instance IDs parameter or tag filters in the same call.
- Returns a reference to this object so that method calls can be chained together.

  "documentation" : "<p>One or more filters.</p> <ul>
    
    
    </ul>
    
    
  <p> <code>attachment.state</code> - The current state of the attachment between the gateway and the VPC (<code>available</code>). Present only if a VPC is attached.</p> <li> <code>attachment.vpc-id</code> - The ID of an attached VPC.</li> <li> <code>internet-gateway-id</code> - The ID of the Internet gateway.</li> <li> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</li> <li> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. This filter is independent of the <code>tag-key</code> filter. Further, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. This filter is independent of the <code>tag-key</code> filter. Further, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.
</ul>

@returns a reference to this object so that method calls can be chained together."*/

the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- **<code>tag-value</code>** - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>:<i>key</i>=<i>value</i> filter.

- **<code>tag-value</code>** - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.

"c2jShape" : "FilterList",
"deprecated" : false,
range.from  - The start of the port range specified in the entry. 
range.to  - The end of the port range specified in the entry.
entry.protocol  - The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
entry.egress  - Indicates whether the entry applies to egress traffic.
entry.icmp.code  - The ICMP code specified in the entry, if any.
entry.icmp.type  - The ICMP type specified in the entry, if any.
entry.ipv6-cidr  - The IPv6 CIDR range specified in the entry.
entry.port-range.from  - The start of the port range specified in the entry. 
entry.port-range.to  - The end of the port range specified in the entry.
entry.rule-action  - Allows or denies the matching traffic (ALLOW | DENY).
entry.rule-number  - The number of an entry (in other words, rule) in the ACL's set of entries.

One or more filters.

- The ID of an association ID for the ACL.
- The ID of the network ACL involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the ACL is the default network ACL for the VPC.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Allows or denies the matching traffic (ALLOW | DENY).
- The number of an entry (in other words, rule) in the ACL's set of entries.
- The ID of the network ACL.
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.
- The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- Indicates whether the ACL is the default network ACL for the VPC.
- The ID of the network ACL.
- The ID of the VPC for the network ACL.
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- Indicates whether the ACL is the default network ACL for the VPC.

The number of an entry (in other words, rule) in the ACL's set of entries.

- The ID of the network ACL.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- Indicates whether the ACL is the default network ACL for the VPC.

The ID of the VPC for the network ACL.

- The ID of the association.
- The ID of the subnet involved in the association.

The number of an entry (in other words, rule) in the ACL's set of entries.

- The ID of the network ACL.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- Indicates whether the ACL is the default network ACL for the VPC.

The number of an entry (in other words, rule) in the ACL's set of entries.

- The ID of the network ACL.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- Indicates whether the ACL is the default network ACL for the VPC.

The number of an entry (in other words, rule) in the ACL's set of entries.

- The ID of the network ACL.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- Indicates whether the ACL is the default network ACL for the VPC.
the VPC.

- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP code specified in the entry, if any.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).
- Indicates whether the entry applies to egress traffic.
tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.<p> /li> &lt;i&gt; &lt;p&gt; &lt;code&gt;vpc-id</code&gt; - The ID of the VPC for the network ACL.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;Association.association-id</code&gt; - The ID of an association ID for the ACL.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;Association.network-acl-id</code&gt; - The ID of the network ACL involved in the association.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;Association.subnet-id</code&gt; - The ID of the subnet involved in the association.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;default</code&gt; - Indicates whether the ACL is the default network ACL for the VPC.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.cidr</code&gt; - The IPv4 CIDR range specified in the entry.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.egress</code&gt; - Indicates whether the entry applies to egress traffic.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.icmp.code</code&gt; - The ICMP code specified in the entry, if any.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.icmp.type</code&gt; - The ICMP type specified in the entry, if any.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.ipv6-cidr</code&gt; - The IPv6 CIDR range specified in the entry.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.port-range.from</code&gt; - The start of the port range specified in the entry.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.port-range.to</code&gt; - The end of the port range specified in the entry.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.protocol</code&gt; - The protocol specified in the entry (<code>tcp</code> | <code>udp</code> | <code>icmp</code> or a protocol number).<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.rule-action</code&gt; - Allows or denies the matching traffic (<code>allow</code> | <code>deny</code>).<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;entry.rule-number</code&gt; - The number of an entry (in other words, rule) in the ACL's set of entries.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;network-acl-id</code&gt; - The ID of the network ACL.<p> /li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;tag.key</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. <li>\n<code>association.association-id</code> - The ID of an association ID for the ACL.\n</li>
<li>\n<code>association.network-acl-id</code> - The ID of the network ACL involved in the association.\n</li>
<li>\n<code>association.subnet-id</code> - The ID of the subnet involved in the association.\n</li>
<li>\n<code>default</code> - Indicates whether the ACL is the default network ACL for the VPC.\n</li>
<li>\n<code>entry.cidr</code> - The IPv4 CIDR range specified in the entry.\n</li>
<li>\n<code>entry.egress</code> - Indicates whether the entry applies to egress traffic.\n</li>
<li>\n<code>entry.icmp.code</code> - The ICMP code specified in the entry, if any.\n</li>
<li>\n<code>entry.icmp.type</code> - The ICMP type specified in the entry, if any.\n</li>
<li>\n<code>entry.ipv6-cidr</code> - The IPv6 CIDR range specified in the entry.\n</li>
<li>\n<code>entry.port-range.from</code> - The start of the port range specified in the entry.\n</li>
<li>\n<code>entry.port-range.to</code> - The end of the port range specified in the entry.\n</li>
<li>\n<code>entry.protocol</code> - The protocol specified in the entry (\n<code>tcp</code> | \n<code>udp</code> | \n<code>icmp</code> or a protocol number).\n</li>
<li>\n<code>entry.rule-action</code> - Allows or denies the matching traffic (\n<code>allow</code> | \n<code>deny</code>).\n</li>
<li>\n<code>entry.rule-number</code> - The number of an entry (in other words, rule) in the ACL's set of entries.\n</li>
<li>\n<code>network-acl-id</code> - The ID of the network ACL.\n</li>
<li>\n<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify
the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\"tag-key\":Purpose\"` and the filter `\"tag-value\":X\"`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>` filter.

- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `\"tag-value\":X\"` and the filter `\"tag-key\":Purpose\"`, you get any resources assigned both the tag value X (regardless of what the tag's key is), and the tag key Purpose (regardless of what the tag's value is). If you want to list only resources where Purpose is X, see the `<code>tag</code>` filter.

- `<code>vpc-id</code>` - The ID of the VPC for the network ACL.

- `<code>association.association-id</code>` - The ID of an association ID for the ACL.

- `<code>association.network-acl-id</code>` - The ID of the network ACL involved in the association.

- `<code>association.subnet-id</code>` - The ID of the subnet involved in the association.

- `<code>default</code>` - Indicates whether the ACL is the default network ACL for the VPC.

- `<code>entry.cidr</code>` - The IPv4 CIDR range specified in the entry.

- `<code>entry.egress</code>` - Indicates whether the entry applies to egress traffic.

- `<code>entry.icmp.code</code>` - The ICMP code specified in the entry, if any.

- `<code>entry.icmp.type</code>` - The ICMP type specified in the entry, if any.

- `<code>entry.ipv6-cidr</code>` - The IPv6 CIDR range specified in the entry.

- `<code>entry.port-range.from</code>` - The start of the port range specified in the entry.

- `<code>entry.port-range.to</code>` - The end of the port range specified in the entry.

- `<code>entry.protocol</code>` - The protocol specified in the entry ( `<code>tcp</code>` | `<code>udp</code>` )

- `<code>icmp</code>` - or a protocol number.

- `<code>entry.rule-action</code>` - Allows or denies the matching traffic ( `<code>allow</code>` | `<code>deny</code>` ).

- `<code>entry.rule-number</code>` - The number of an entry (in other words, rule) in the ACL's set of entries.

- `<code>network-acl-id</code>` - The ID of the network ACL.

- `<code>tag</code>` - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\"tag-key\":Purpose\"` and the filter `\"tag-value\":X\"`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>` filter.

- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `\"tag-value\":X\"` and the filter `\"tag-key\":Purpose\"`, you get any resources assigned both the tag value X (regardless of what the tag's key is), and the tag key Purpose (regardless of what the tag's value is). If you want to list only resources where Purpose is X, see the `<code>tag</code>` filter.

- `<code>vpc-id</code>` - The ID of the VPC for the network ACL.
The ID of the subnet involved in the association.</p> <li> <p> <code>association.association-id</code> - Indicates whether the ACL is the default network ACL for the VPC.</p> <li> <p> <code>association.network-acl-id</code> - The ID of the network ACL involved in the association.</p> <li> <p> <code>association.subnet-id</code> - The ID of the subnet involved in the association.</p> <li> <p> <code>default</code> - Indicates whether the ACL is the default network ACL for the VPC.</p> <li> <p> <code>entry.cidr</code> - The IPv4 CIDR range specified in the entry.</p> <li> <p> <code>entry.egress</code> - Indicates whether the entry applies to egress traffic.</p> <li> <p> <code>entry.icmp.code</code> - The ICMP code specified in the entry, if any.</p> <li> <p> <code>entry.icmp.type</code> - The ICMP type specified in the entry, if any.</p> <li> <p> <code>entry.ipv6-cidr</code> - The IPv6 CIDR range specified in the entry.</p> <li> <p> <code>entry.port-range.from</code> - The start of the port range specified in the entry.</p> <li> <p> <code>entry.port-range.to</code> - The end of the port range specified in the entry.</p> <li> <p> <code>entry.protocol</code> - The protocol specified in the entry (TCP | UDP | ICMP or a protocol number).</p> <li> <p> <code>entry.rule-action</code> - Allows or denies the matching traffic (<code>allow</code> | <code>deny</code>).</p> <li> <p> <code>entry.rule-number</code> - The number of an entry (in other words, rule) in the ACL's set of entries.</p> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. default network ACL for the VPC. 

- The IPv4 CIDR range specified in the entry. 
- The ICMP code specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The ICMP type specified in the entry, if any.
- The IPv6 CIDR range specified in the entry.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry. 

- The IPv4 CIDR range specified in the entry.
- The protocol specified in the entry (\texttt{tcp} | \texttt{udp} | \texttt{icmp} or a protocol number). 
- Allows or denies the matching traffic (\texttt{allow} | \texttt{deny}).
- The number of an entry (in other words, rule) in the ACL's set of entries.
- The ID of the network ACL.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify \texttt{tag:Purpose} for the filter name and \texttt{X} for the filter value.

- The key of a tag assigned to the resource. This filter is independent of the \texttt{tag-value} filter. For example, if you use both the filter \texttt{\textbackslash tag-key=Purpose\textbackslash} and the filter \texttt{\textbackslash tag-value=X\textbackslash}, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the \texttt{\textbackslash tag-value=X\textbackslash} filter.

- The value of a tag assigned to the resource. This filter is independent of the \texttt{tag-key} filter. 

- The ID of the VPC for the network ACL.

- The ID of an association ID for the ACL.
- The ID of the network ACL involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the ACL is the default network ACL for the VPC.
- The IPv4 CIDR range specified in the entry.
- Indicates whether the entry applies to egress traffic.
- The IPv6 CIDR range specified in the entry.
- The ICMP type specified in the entry, if any.
- The start of the port range specified in the entry.
- The end of the port range specified in the entry.
- The protocol specified in the entry (\texttt{tcp} | \texttt{udp} | \texttt{icmp} or a protocol number).
- Allows or denies the matching traffic (\texttt{allow} | \texttt{deny}).
- The number of an entry (in other words, rule) in the ACL's set of entries.
- The ID of the network ACL.
Open Source Used In Finesse Software 12.5(1)SU2 16404

```<code>vpc-id</code>` - The ID of the VPC for the network ACL.</p> <li><code>association.association-id</code>` - The ID of an association ID for the ACL.</li> <li><code>association.network-acl-id</code>` - The ID of the network ACL involved in the association.</li> <li><code>association.subnet-id</code>` - The ID of the subnet involved in the association.</li> <li><code>default</code>` - Indicates whether the ACL is the default network ACL for the VPC.</li> <li><code>entry.cidr</code>` - The IPv4 CIDR range specified in the entry.</li> <li><code>entry.icmp.code</code>` - The ICMP code specified in the entry, if any.</li> <li><code>entry.icmp.type</code>` - The ICMP type specified in the entry, if any.</li> <li><code>entry.ipv6-cidr</code>` - The IPv6 CIDR range specified in the entry.</li> <li><code>entry.port-range.from</code>` - The start of the port range specified in the entry.</li> <li><code>entry.port-range.to</code>` - The end of the port range specified in the entry.</li> <li><code>tag</code>`: <i>key</i> = <i>value</i>` - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.</li> <li><code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the `<code>tag:tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose=X"` and the filter `"tag-value=String"`, you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the `<code>tag:tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose=X"` and the filter `"tag-value=String"`, you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the `<code>tag:tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose=X"` and the filter `"tag-value=String"`, you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the `<code>tag:tag-value</code>` filter.
```
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=XY", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p>

<li><p><code>attachment.attachment-id</code> - The ID of the attachment.</p></li>
<li><p><code>attachment.attachment-time</code> - The time that the network interface was attached to an instance.</p></li>
<li><p><code>attachment.delete-on-termination</code> - Indicates whether the attachment is deleted when an instance is terminated.</p></li>
<li><p><code>attachment.device-index</code> - The device index to which the network interface is attached.</p></li>
<li><p><code>attachment.instance-id</code> - The ID of the instance to which the network interface is attached.</p></li>
<li><p><code>attachment.attachment-id</code> - The ID of the attachment.</p></li>
<li><p><code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached.</p></li>
<li><p><code>attachment.status</code> - The status of the attachment.</p></li>
<li><p><code>description</code> - The description of the network interface.</p></li>
The ID of a security group associated with the network interface.

- The name of a security group associated with the network interface.
- An IPv6 address associated with the network interface.
- The ID of the network interface.
- The AWS account ID of the network interface owner.
- The owner ID of the security group associated with the network interface.
- The private IPv4 address or addresses of the network interface.
- The private DNS name of the network interface (IPv4).
- The ID of the entity that launched the instance on your behalf.
- The status of the network interface.
- The ID of the subnet for the network interface.
- The key/value combination of a tag assigned to the resource.
- The ID of the VPC for the network interface.
- The owner ID of the addresses associated with the network interface.
- The association ID returned when the network interface was associated with the Elastic IP address (IPv4).
- The ID of the association returned when the network interface was associated with an Elastic IP address (IPv4).
- The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- The owner of the Elastic IP address (IPv4) associated with the network interface.
- The address of the Elastic IP address (IPv4) bound to the network interface.
- The public DNS name for the network interface (IPv4).
- The ID of the instance to which the network interface is attached.
- The device index to which the network interface is attached.
- The ID of the instance to which the network interface is attached.
the network interface is attached.</p>

- The ID of the NAT gateway to which the network interface is attached.</p>

- The status of the attachment.</p>

- The availability zone of the network interface.</p>

- The MAC address of the network interface.</p>

- The ID of a security group associated with the network interface.</p>

- The name of a security group associated with the network interface.</p>

- An IPv6 address associated with the network interface.</p>

- The private IPv4 address or addresses of the network interface.</p>

- The private DNS name of the network interface (IPv4).</p>

- The owner ID of the network interface owner.</p>

- The description of the network interface.</p>

- Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).</p>

- Indicates whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.</p>

- The status of the network interface. If the network interface is not attached to an instance, the status is available; if a network interface is attached to an instance the status is in-use.</p>

- The ID of the subnet for the network interface.</p>

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify tag:Purpose for the filter name and X for the filter value.</p>

- The key assigned to the resource. This filter is independent of the tag value filter. For example, if you use both the filter tag:Purpose and the filter tag-value=X, you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the filter.</p>

- The value of a tag assigned to the resource. This filter is independent of the tag key filter. For example, if you use both the filter tag:Purpose and the filter tag-key=Key, you get any resources assigned both the tag key Purpose and the tag key Key (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the filter.</p>

- The ID of the VPC for the network interface.</p>

- The association ID returned when the network interface was associated with an IPv4 address.</p>

- The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.</p>

- The owner of the Elastic IP address (IPv4) associated with the network interface.</p>

- The address of the Elastic IP address (IPv4) bound to the network interface.</p>

- The public DNS name for the network interface (IPv4).</p>

- The time that the network interface was attached to an instance.</p>

- Indicates whether the network interface was attached to an instance.
attachment is deleted when an instance is terminated.</p> </li> <li> <p> <code>attachment.device-index</code> - The device index to which the network interface is attached.</p> </li> <li> <p> <code>attachment.instance-id</code> - The ID of the instance to which the network interface is attached.</p> </li> <li> <p> <code>attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.</p> </li> <li> <p> <code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached.</p> </li> <li> <p> <code>attachment.status</code> - The status of the attachment (attaching | attached | detaching | detached).</p> </li> <li> <p> <code>availability-zone</code> - The Availability Zone of the network interface.</p> </li> <li> <p> <code>description</code> - The description of the network interface.</p> </li> <li> <p> <code>device-index</code> - The device index to which the network interface is attached.</p> </li> <li> <p> <code>device-owner-id</code> - The owner ID of the network interface owner.</p> </li> <li> <p> <code>device-private-ip-address</code> - The private IPv4 address or addresses of the network interface.</p> </li> <li> <p> <code>device-private-dns-name</code> - The private DNS name of the network interface (IPv4).</p> </li> <li> <p> <code>description</code> - The description of the network interface.</p> </li> <li> <p> <code>groupId</code> - The ID of a security group associated with the network interface.</p> </li> <li> <p> <code>group-name</code> - The name of a security group associated with the network interface.</p> </li> <li> <p> <code>ipv6-addresses.ipv6-address</code> - An IPv6 address associated with the network interface.</p> </li> <li> <p> <code>mac-address</code> - The MAC address of the network interface.</p> </li> <li> <p> <code>network-interface-id</code> - The ID of the network interface.</p> </li> <li> <p> <code>owner-id</code> - The AWS account ID of the network interface owner.</p> </li> <li> <p> <code>private-ip-address</code> - The private IPv4 addresses of the network interface.</p> </li> <li> <p> <code>private-dns-name</code> - The private DNS name of the network interface (IPv4).</p> </li> <li> <p> <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</p> </li> <li> <p> <code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).</p> </li> <li> <p> <code>source-dhcp-check</code> - Indicates whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled.</p> </li> <li> <p> <code>tag:Key</code> - The key of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-key=Name", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:tag</code>:<i>key</i>=<i>value</i> filter.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:tag</code>:<i>key</i>=<i>value</i> filter.</p> </li> <li> <p> <code>vpc-id</code> - The ID of the VPC for the network interface.</p> </li>

If you want to list only resources where Purpose is X, see the <code>tag:carbon</code> filter.
The owner ID of the addresses associated with the network interface.

- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-ip</code>` - The address of the Elastic IP address (IPv4) bound to the network interface.
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>association.association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>association.association-id</code>` - The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).

A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>status</code> - The status of the network interface. If the network interface is not attached to an instance, the status is
Open Source Used In Finesse Software 12.5(1)SU2 16458

available; if a network interface is attached to an instance the status is in-use.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

- The tag-key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the

- The association ID returned when the network interface was associated with the Elastic IP address (IPv4).

- The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

- The ID of the VPC for the network interface.

NOTE: This method appends the values to the existing list (if any). Use [setFilters(java.util.Collection)] or [withFilters(java.util.Collection)] if you want to override the existing values.

- The private IPv4 addresses associated with the network interface.

- Whether the private IPv4 address is the primary IP address associated with the network interface.

- The association ID returned when the network interface was associated with the Elastic IP address (IPv4). The ID of the addresses associated with the network interface.

- The association ID returned when the network interface was associated with an IPv4 address.

- The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

- The ID of the owner of the Elastic IP address (IPv4) associated with the network interface.

- The address of the Elastic IP address (IPv4) bound to the network interface.

- The public DNS name for the network interface (IPv4).

- The device index to which the network interface is attached.

- The ID of the instance to which the network interface is attached.

- The owner ID of the instance to which the network interface is attached.

- The ID of the NAT gateway to which the network interface is attached.

- The status of the attachment.

- The Availability Zone of the network interface.

- The ID of a security group associated with the network interface.

- The name of a security group associated with the network interface.

- An IPv6 address associated with the network interface.

- The MAC address of the network interface.

- The ID of the network interface.

- The AWS account ID of the network interface owner.

- The private IPv4 address or addresses of the network interface.

- The private DNS name of the network interface (IPv4).

- The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).
(for example, AWS Management Console, Auto Scaling, and so on).

- **<code>true</code>** - Indicates whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.

- **<code>in-use</code>** - The status of the network interface. If the network interface is not attached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the status is <code>in-use</code>.

- **<code>subnet-id</code>** - The ID of the subnet for the network interface.

- **<code>tag-key=value</code>** - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

- **<code>tag-key requestCode</code>** - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=RequestId" and the filter "tag-value=X", you get any resources assigned both the tag key RequestId (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where RequestId is X, see the <code>tag:RequestId</code> filter.

- **<code>tag-value</code>** - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

- **<code>vpc-id</code>** - The ID of the VPC for the network interface.

@return Returns a reference to this object so that method calls can be chained together.*/

performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC. </p> 

- <code>status</code> - The status of the network interface. If the network interface is not attached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the status is <code>in-use</code>. </p> 

- <code>tag-key</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. </p> 

- <code>tag-value</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "<code>tag-key=Purpose</code>" and the filter "<code>tag-value=X</code>", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X. If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p> 

- <code>attachment.attachment-id</code> - The ID of the interface attachment. </p> 

- <code>attachment.attach.time</code> - The time that the network interface was attached to an instance. </p> 

- <code>attachment.delete-on-termination</code> - Indicates whether the attachment is deleted when an instance is terminated. </p> 

- <code>attachment.device-index</code> - The device index to which the network interface is attached. </p> 

- <code>attachment.instance-id</code> - The ID of the instance to which the network interface is attached. </p> 

- <code>attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached. </p> 

- <code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached. </p> 

- <code>attachment.status</code> - The status of the attachment (attaching | attached | detaching | detached). </p> 

- <code>attachment.association-id</code> - The association ID returned when the network interface was associated with the Elastic IP address (IPv4). </p> 

- <code>attachment.association-public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface. </p> 

- <code>attachment.association-primary</code> - Whether the private IPv4 address is the primary IP address associated with the network interface. </p> 

- <code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached. </p> 

- <code>attachment.owner-id</code> - The AWS account ID of the network interface owner. </p> 

- <code>attachment.private-ip-address</code> - The private IPv4 address or addresses of the network interface. </p> 

- <code>attachment.private-dns-name</code> - The private DNS name of the network interface (IPv4). </p> 

- <code>attachment.requester-id</code> - The ID of the entity that launched the...
instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</li> <li> <p></p> <code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).</li> <li> <p></p> <code>source-desk-check</code> - Indicates whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC. </li> <li> <p></p> <code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).</li> <li> <p></p> <code>status</code> - The status of the network interface. If the network interface is not attached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the status is <code>in-use</code>. </li> <li> <p></p> <code>subnet-id</code> - The ID of the subnet for the network interface. </li> <li> <p></p> <code>tag</code>: <code>key</code> = <code>value</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. </li> <li> <p></p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of the tag's key is). If you want to list only resources where Purpose is X, see the filter <code>tag:Purpose</code>: <code>key</code> = <code>value</code> filter. </li> <li> <p></p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. </li> <li> <p></p> <code>vpc-id</code> - The ID of the VPC for the network interface. </li>
the network interface is attached.</p></li><li><p><code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached.</p></li><li><p><code>attachment.status</code> - The status of the attachment. 
<code>detaching</code> | 
<code>detached</code>.</p></li><li><p><code>availability-zone</code> - The Availability Zone of the network interface.</p></li><li><p><code>description</code> - The description of the network interface.</p></li><li><p><code>group-id</code> - The ID of a security group associated with the network interface.</p></li><li><p><code>group-name</code> - The name of a security group associated with the network interface.</p></li><li><p><code>ipv6-addresses.ipv6-address</code> - An IPv6 address associated with the network interface.</p></li><li><p><code>mac-address</code> - The MAC address of the network interface.</p></li><li><p><code>network-interface-id</code> - The ID of the network interface.</p></li><li><p><code>owner-id</code> - The AWS account ID of the network interface owner.</p></li><li><p><code>private-ip-address</code> - The private IPv4 address or addresses of the network interface.</p></li><li><p><code>private-dns-name</code> - The private DNS name of the network interface (IPv4).</p></li><li><p><code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</p></li><li><p><code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).</p></li><li><p><code>source-desk-check</code> - Indicates whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</p></li><li><p><code>status</code> - The status of the network interface. If the network interface is not attached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the status is <code>in-use</code>.</p></li><li><p><code>subnet-id</code> - The ID of the subnet for the network interface.</p></li><li><p><code>tag.key</code>=<code>value</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p></li><li><p><code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=X</code>, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code> filter. This method appends the values to the existing list (if any). Use <code>[@link #setFilters(java.util.Collection)]</code> or <code>[@link #withFilters(java.util.Collection)]</code> if you want to override the existing values.</p></li><li><p><code>addresses.private-ip-address</code> - The private IPv4 addresses associated with the network interface.</p></li><li><p><code>addresses.private-ip-address.primary</code> - The private IPv4 address associated with the network interface.</p></li><li><p><code>addresses.association.public-ip</code> - The association ID returned when the network interface was associated with the Elastic IP address (IPv4).</p></li><li><p><code>addresses.association.owner-id</code> - The owner ID of the addresses associated with the network interface.</p></li><li><p><code>addresses.association-id</code> - The association ID returned when the network interface was associated with an IPv4 address.</p></li><li><p><code>association.ip-address</code> - The IP address for the Elastic IP address (IPv4) that you allocated for your network interface.</p></li><li><p><code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) that you allocated for your network interface.</p></li><li><p><code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface.</p></li><li><p><code>association.public-dns-name</code> - The public DNS name for the network interface (IPv4).</p></li><li><p><code>attachment.attachment-id</code> - The ID of the interface
attachment. The time that the network interface was attached to an instance. - Indicates whether the attachment is deleted when an instance is terminated. - The device index to which the network interface is attached. - The ID of the instance to which the network interface is attached. - The ID of the NAT gateway to which the network interface is attached. - The ID of a security group associated with the network interface. - An IPv6 address associated with the network interface. - The MAC address of the network interface. - The AWS account ID of the network interface owner. - The private IPv4 address or addresses of the network interface. - The private DNS name of the network interface (IPv4). - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on). - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on.). - The private IPv4 addresses associated with the network interface. - Whether the private IPv4 address is the primary IP address associated with the network interface. - The association ID returned when the network interface was associated with the Elastic IP address (IPv4).
addresses.association.owner-id - The owner ID of the addresses associated with the network interface.

addresses.association.association-id - The association ID returned when the network interface was associated with an IPv4 address.

addresses.associationallocation-id - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

addresses.association.public-ip - The address of the Elastic IP address (IPv4) bound to the network interface.

addresses.association.public-dns-name - The public DNS name for the network interface (IPv4).

association.association-id - The association ID returned when the network interface was associated with an IPv4 address.

association.allocation-id - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

association.ip-owner-id - The owner of the Elastic IP address (IPv4) associated with the network interface.

association.public-ip - The address of the Elastic IP address (IPv4) bound to the network interface.

association.public-dns-name - The public DNS name for the network interface (IPv4).

association.attachment.attachment-id - The ID of the interface attachment.

association.attachment.attachment-time - The time that the network interface was attached to an instance.

association.attachment.delete-on-termination - Indicates whether the attachment is deleted when an instance is terminated.

association.attachment.device-index - The device index to which the network interface is attached.

association.attachment.instance-id - The ID of the instance to which the network interface is attached.

association.attachment.instance-owner-id - The owner ID of the instance to which the network interface is attached.

association.attachment.nat-gateway-id - The ID of the NAT gateway to which the network interface is attached.

association.attachment.status - The status of the attachment (attaching | attached | detaching | detached).

availability-zone - The Availability Zone of the network interface.

description - The description of the network interface.

detached - Detaches the network interface from an instance.

detaching - Detaching the network interface from an instance.

device-index - The device index to which the network interface is attached.

instance-id - The ID of the instance to which the network interface is attached.

instance-owner-id - The owner ID of the instance to which the network interface is attached.

nat-gateway-id - The ID of the NAT gateway to which the network interface is attached.

private-dns-name - The private DNS name of the network interface (IPv4).

private-ip-address - The private IPv4 address or addresses of the network interface.

private-dns-name - The private DNS name of the network interface (IPv4).

requester-id - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).

requester-managed - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).

source-desk-check - Indicates whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.

status - The status of the network interface. If the network interface is not attached to an instance, the status is available.

subnet-id - The ID of the subnet for the network interface.

tag: key = value - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

tag-key - The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "\"tag-key=Purpose\"" and the filter "\"tag-value=X\"", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag: X</code> filter.

tag-value - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "\"tag-key=Purpose\"" and the filter "\"tag-value=X\"", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag: X</code> filter.

vpc-id - The ID of the VPC for the network interface.

NOTE: This method appends the values to the existing list (if any). Use [setFilters(java.util.Collection)] or [withFilters(java.util.Collection)] if you want to override the existing values.

```java
public void setFilters(JavaList<Filter> filters)
```

- `filters` - The name of the placement group.
- `state` - The state of the placement group.
- `strategy` - The strategy of the placement group.

```
@override
protected void generateRequestContents(FrameworkConfiguration configuration)
```

### GroupNames

- `groupNames` - One or more placement group names.

```
@override
protected void generateRequestContents(FrameworkConfiguration configuration)
```

```java
public List<String> getGroupNames()
```

### Filters

- `filters` - One or more filters.

```java
public Filters withFilters(JavaList<Filter> filters)
```

```
@override
protected void generateRequestContents(FrameworkConfiguration configuration)
```

### Strategy

- `strategy` - The strategy of the placement group.

```java
public Strategy withStrategy(String strategy)
```

```
@override
protected void generateRequestContents(FrameworkConfiguration configuration)
```

### Method Return

- `@return` Returns a reference to this object so that method calls can be chained together.

 * <p>instance-count - The number of new Reserved Instances.</p>
 */
configuration.instance-type</code> - The instance type of the new Reserved Instances.
</li>
</ul>

Example:

```java
// Create a modified ReservedInstance with instance type m5.large
ReservedInstanceModificationRequest request = new ReservedInstanceModificationRequest()
    .withFilters(new Filter[])
    .withClientToken("my-client-token")
    .withTargetConfiguration(new TargetConfiguration()
        .withInstanceType("m5.large")
        .withAvailabilityZone(Region.US_EAST_1.getAvailabilityZone())
    );
```

### Parameters

- **client-token** (String): The idempotency token for the modification request.
- **create-date** (Date): The time when the modification request was created.
- **effective-date** (Date): The time when the modification becomes effective.
- **status** (String): The status of the Reserved Instances modification request.
- **status-message** (String): The reason for the status.
- **update-date** (Date): The time when the modification request was last updated.

### Miscellaneous

- **setterMethodName**: "setFilters"
- **setterModel**: 
  ```java
  public void setFilters(List<Filter> filters) {
      this.filters = (filters == null) ? null : new SdkInternalList<>(filters);
  }
  ```
- **simple**: false
- **varargSetterDocumentation**: 
  ```java
  public void setFilters(List<Filter>... filters) {
      this.filters = new SdkInternalList<>(Arrays.asList(filters));
  }
  ```

@param filters One or more filters. Use {@link #setFilters(java.util.Collection)} or {@link #withFilters(java.util.Collection)} if you want to override the existing values.<p>

### Example

```java
List<Filter> filters = new ArrayList<>();
filters.add(new Filter("name", "value");
SetFiltersRequest request = new SetFiltersRequest(filters);
```

### Method appendValues(flyway.com.FlywayConfiguration)

This method appends the values to the existing list (if any). Use {@link #setFilters(java.util.Collection)} or {@link #withFilters(java.util.Collection)} if you want to override the existing values.
modification request. This ID is only available when the status of the modification is <code>fulfilled</code>.&lt;/p&gt;
&lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;modification-result.target-configuration.availability-zone&lt;/code&gt; - The Availability Zone for the new Reserved Instances.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;modification-result.target-configuration.instance-count &lt;/code&gt; - The number of new Reserved Instances.&lt;/p&gt; &lt;/li&gt; &lt;p&gt; &lt;code&gt;modification-result.target-configuration.instance-type&lt;/code&gt; - The instance type of the new Reserved Instances.&lt;/p&gt; &lt;/li&gt; &lt;p&gt; &lt;code&gt;modification-result.target-configuration.platform&lt;/code&gt; - The network platform of the new Reserved Instances (&lt;code&gt;EC2-Classic&lt;/code&gt; | &lt;code&gt;EC2-VPC&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;reserved-instances-id&lt;/code&gt; - The ID of the Reserved Instances modified.&lt;/p&gt; &lt;/li&gt; &lt;p&gt; &lt;code&gt;reserved-instances-modification-id&lt;/code&gt; - The ID of the modification request.&lt;/p&gt; &lt;/li&gt; &lt;p&gt; &lt;code&gt;status&lt;/code&gt; - The status of the Reserved Instances modification request (&lt;code&gt;processing&lt;/code&gt; | &lt;code&gt;fulfilled&lt;/code&gt; | &lt;code&gt;failed&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;status-message&lt;/code&gt; - The reason for the status.&lt;/p&gt; &lt;/li&gt; &lt;p&gt; &lt;code&gt;update-date&lt;/code&gt; - The time when the modification request was last updated.&lt;/p&gt; &lt;/li&gt; &lt;/ul&gt;

Set to **true** to show only Reserved Instance Marketplace offerings. When this filter is not used, which is the default behavior, all offerings from both AWS and the Reserved Instance Marketplace are listed.

- **product-description** - The Reserved Instance product platform description. Instances that include (Amazon VPC) in the product platform description will only be displayed to EC2-Class account holders and are for use with Amazon VPC.
- **marketplace** - Set to **true** to show only Reserved Instance Marketplace offerings. When this filter is not used, which is the default behavior, all offerings from both AWS and the Reserved Instance Marketplace are listed.
- **product-description** - The Reserved Instance product platform description. Instances that include (Amazon VPC) in the product platform description will only be displayed to EC2-Class account holders and are for use with Amazon VPC.
- **reserved-instances-offering-id** - The Reserved Instances offering ID.
- **scope** - The scope of the Reserved Instance ([Availability Zone](https://aws.amazon.com/awsuginguide/availability-zone/)) or ([Region](https://aws.amazon.com/awsuginguide/region/)).
- **usage-price** - The usage price of the Reserved Instance, per hour (for example, 0.84).
Availability Zone where the Reserved Instance can be used. The duration of the Reserved Instance (for example, one year or three years), in seconds.

- The purchase price of the Reserved Instance (for example, 9800.0).
- The instance type that is covered by the reservation.

Set to true to show only Reserved Instance Marketplace offerings. When this filter is not used, which is the default behavior, all offerings from both AWS and the Reserved Instance Marketplace are listed.

Reserved instances include:

- The Reserved Instance product platform description.
- The availability zone where the Reserved Instance can be used.
- The duration of the Reserved Instance (for example, one year or three years), in seconds.
- The purchase price of the Reserved Instance (for example, 9800.0).
- The instance type that is covered by the reservation.

Set to true to show only Reserved Instance Marketplace offerings. When this filter is not used, which is the default behavior, all offerings from both AWS and the Reserved Instance Marketplace are listed.

2011-11-01 API version, you only have access to the <code>Medium Utilization</code> Reserved Instance offering type. If you are using tools that predate the 2011-11-01 API version, you only have access to the <code>Medium Utilization</code> Reserved Instance offering type.

```java
@java.lang.Override
public java.lang.String getOfferingType() {
    return OfferingTypeValues.MEDIUM_UTILIZATION;
}
```

The Reserved Instance offering type. If you are using tools that predate the 2011-11-01 API version, you only have access to the <code>Medium Utilization</code> Reserved Instance offering type.

```java
public void setOfferingType(java.lang.String offeringType) {
    this.offerType = offeringType;
}
```

The Reserved Instance offering type. If you are using tools that predate the 2011-11-01 API version, you only have access to the <code>Medium Utilization</code> Reserved Instance offering type.
the 2011-11-01 API version, you only have access to the `<code>Medium Utilization</code>` Reserved Instance offering type.

```java
@getterMethod
public String getOfferingType() {
    return offeringType;
}

@setterMethod
public void setOfferingType(String offeringType) {
    this.offeringType = offeringType;
}
```

**Offers an API for Reserved Instance pricing:**

```java
public RIProductDescription getReservedInstanceProductDescription() {
    return productDescription;
}
```

```java
public void setReservedInstanceProductDescription(RIProductDescription productDescription) {
    this.productDescription = productDescription;
}
```

**Reserved Instance offering type:**

```java
public enum RIProductDescription {
    MEDIUM_UTILIZATION,
    ...
}
```

**Reserved Instance product platform description:**

```java
public String getProductDescription() {
    return productDescription;
}
```

```java
public void setProductDescription(String productDescription) {
    this.productDescription = productDescription;
}
```

- **Windows with SQL Server Web**: Windows with SQL Server Web is a standard version of SQL Server that is optimized for web applications. It includes features like in-memory OLTP and Always On failover clusters, making it suitable for high-performance web applications.

- **Windows with SQL Server Web (Amazon VPC)**: This version is designed specifically for use with Amazon VPC, providing enhanced security and scalability for web applications running in the AWS cloud.

- **Windows with SQL Server Standard**: Windows with SQL Server Standard is a robust and versatile version of SQL Server that can be used for a wide range of applications, including web, transaction processing, and reporting.

- **Windows with SQL Server Standard (Amazon VPC)**: This version is tailored for use with Amazon VPC, offering additional features and optimizations for running SQL Server in the AWS environment.

- **Windows with SQL Server Enterprise**: Windows with SQL Server Enterprise is designed for mission-critical applications that require high availability, scalability, and security.

- **Windows with SQL Server Enterprise (Amazon VPC)**: This version is optimized for use with Amazon VPC, providing advanced features and scalability for enterprise-class applications running in the AWS cloud.

- **Windows with SQL Server Web**: Windows with SQL Server Web is a standard version of SQL Server that is optimized for web applications. It includes features like in-memory OLTP and Always On failover clusters, making it suitable for high-performance web applications.

- **Windows with SQL Server Web (Amazon VPC)**: This version is designed specifically for use with Amazon VPC, providing enhanced security and scalability for web applications running in the AWS cloud.

- **Windows with SQL Server Standard**: Windows with SQL Server Standard is a robust and versatile version of SQL Server that can be used for a wide range of applications, including web, transaction processing, and reporting.

- **Windows with SQL Server Standard (Amazon VPC)**: This version is tailored for use with Amazon VPC, offering additional features and optimizations for running SQL Server in the AWS environment.

- **Windows with SQL Server Enterprise**: Windows with SQL Server Enterprise is designed for mission-critical applications that require high availability, scalability, and security.

- **Windows with SQL Server Enterprise (Amazon VPC)**: This version is optimized for use with Amazon VPC, providing advanced features and scalability for enterprise-class applications running in the AWS cloud.
<li>@return Returns a reference to this object so that method calls can be chained together.*</li>

/**<p>One or more filters.</p> - The Availability Zone where the Reserved Instance can be used.</li><li><p>duration</p> - The duration of the Reserved Instance (one year or three years), in seconds.</li>

<!--fluentSetterMethodName": "withFilters",-->
Server Enterprise | Windows with SQL Server Enterprise (Amazon VPC).

- The ID of the Reserved Instance.
- The time at which the Reserved Instance purchase request was placed (for example, 2014-08-07T11:54:42.000Z).
- The state of the Reserved Instance (active | payment-failed | retired).
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify tag:Purpose for the filter name and X for the filter value.
- The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter tag=Purpose and the filter tag-value=X, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the filter tag-value=X.
- The value of a tag assigned to the resource. This filter is independent of the tag-key filter. For example, if you use both the filter tag-key=Price and the filter tag-value=10, you get any resources assigned both the tag key Price (regardless of what the tag's value is), and the tag value 10 (regardless of what the tag's key is). If you want to list only resources where Price is 10, see the filter tag-key=Price and the filter tag-value=10.
- The usage price of the Reserved Instance, per hour (for example, 0.84).

One or more filters.

- **availability-zone**: The Availability Zone where the Reserved Instance can be used.
- **duration**: The duration of the Reserved Instance (one year or three years), in seconds (31536000).
- **end**: The time when the Reserved Instance expires (for example, 2015-08-07T11:54:42.000Z).
- **fixed-price**: The purchase price of the Reserved Instance (for example, 9800.0).
- **instance-type**: The instance type that is covered by the reservation.
- **scope**: The scope of the Reserved Instance (Region or Availability Zone).
- **product-description**: The Reserved Instance product platform description. 
- **reserved-instances-id**: The ID of the Reserved Instance.
- **start**: The time at which the Reserved Instance purchase request was placed (for example, 2014-08-07T11:54:42.000Z).
- **state**: The state of the Reserved Instance (payment-pending, active, payment-failed, retired).
- **tag**: The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- **tag-key**: The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=XY", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>key</i> filter.
- **tag-value**: The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. If you use both the filter "tag-key=Purpose" and the filter "tag-value=XY", you get any resources assigned both the key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>key</i> filter.

Standard

Windows with SQL Server Standard (Amazon VPC)

Windows with SQL Server Web

Windows with SQL Server Web (Amazon VPC)

Windows with SQL Server Enterprise

Windows with SQL Server Enterprise (Amazon VPC).

The ID of the Reserved Instance.

The state of the Reserved Instance (payment-pending | active | payment-failed | retired).

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify tag:Purpose for the filter name and X for the filter value.

The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag:Purpose filter.

The usage price of the Reserved Instance, per hour (for example, 0.84).

The Availability Zone where the Reserved Instance can be used.

- The duration of the Reserved Instance (one year or three years), in seconds. The time when the Reserved Instance expires (for example, 2015-08-07T11:54:42.000Z).
- The purchase price of the Reserved Instance (for example, 9800.0).
- The instance type that is covered by the reservation.
- The scope of the Reserved Instance (Region or Availability Zone).
- The Reserved Instance product platform description. Instances that include (Amazon VPC) in the product platform description will only be displayed to EC2-Classic account holders and are for use with Amazon VPC.

Instances that include (Amazon VPC) in the product platform description will only be displayed to EC2-Classic account holders and are for use with Amazon VPC.

The state of a route in the route table (active | blackhole). The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).

The ID of a route table involved in the association.

The ID of the route table involved in the association.

Indicates whether the route table is the main route table for the VPC (true | false).

The IPv4 CIDR range specified in a route in the table.

The IPv6 CIDR range specified in a route in the table.

The ID (prefix) of the AWS service specified in a route in the table.

The ID of a gateway specified in a route in the table.

The ID of an instance specified in a route in the table.

The ID of an instance specified in a route in the table.

The ID of a NAT gateway.

Describes how the route was created. The route was automatically created when the route table was created.

Indicates that the route was manually added to the route table;

Indicates that the route was propagated by route propagation.

The state of a route in the route table (active | blackhole). The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).

The ID of a VPC peering connection specified in a route in the table.

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

The state of a route in the route table (active | blackhole). The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).

The ID of a route table involved in the association.

The ID of the route table involved in the association.

Indicates whether the route table is the main route table for the VPC (true | false).

The ID of a route table involved in the association.

NOTE: This method appends the values to the existing list (if any). Use { @link setFilters(java.util.Collection) } or { @link withFilters(java.util.Collection) } if you want to override the existing values. 

- The ID of an association ID for the route table. 
- The ID of the route table involved in the association. 
- The ID of the subnet involved in the association. 
- Indicates whether the route table is the main route table for the VPC. 

- The IPv4 CIDR range specified in a route in the route table. 
- The IPv6 CIDR range specified in a route in the route table. 
- The ID of a NAT gateway. 
- Describes how the route was created. 
- Indicates that the route was automatically created when the route table was created. 
- Indicates that the route was manually added to the route table. 
- Indicates that the route was propagated by route propagation. 
- The state of a route in the route table. 
- The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on). 
- The ID of a VPC peering connection specified in a route in the route table. 
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. 
- The value of a tag assigned to the resource. 
- The ID of the VPC for the route table.

  - The ID of a NAT gateway. 
  - Describes how the route was created. 
  - Indicates that the route was automatically created when the route table was created. 
  - Indicates that the route was manually added to the route table. 
  - Indicates that the route was propagated by route propagation. 
  - The state of a route in the route table. 
  - The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on). 
  - The ID of a VPC peering connection specified in a route in the route table. 
  - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. 
  - The value of a tag assigned to the resource. 
  - The ID of the VPC for the route table.

**A list of permissions for creating volumes from the snapshot.**

**NOTE:** This method appends the values to the existing list (if any). Use `@link #setCreateVolumePermissions(java.util.Collection)` or `@link #withCreateVolumePermissions(java.util.Collection)` if you want to override the existing values.

@returns Returns a reference to this object so that method calls can be chained together.

specify this parameter and the snapshot IDs parameter in the same request.

```java
@Return

**getterDocumentation** : 

The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used, <code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.

```java
@Return

The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used, <code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.

```java
@Return

The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used, <code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.
```
another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request. 

```java
@Param maxResults
```

The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used, <code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.

```java
setMaxResults
```

This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.

```java
setMaxResults
```

The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used, <code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.

```java
return
```

Returns a reference to this object so that method calls can be chained together.

Information about the configuration of your Spot fleet.

- **param**
  - `spotFleetRequestConfigs`: Information about the configuration of your Spot fleet.

  ```java
  @param spotFleetRequestConfigs Information about the configuration of your Spot fleet.
  ```

- **setterMethod**: `setSpotFleetRequestConfigs`
- **setterModel**: 
  ```java
  public void setSpotFleetRequestConfigs(
    com.amazonaws.internal.SdkInternalList<SpotFleetRequestConfig> spotFleetRequestConfigs
  ) {
    // Implementation...
  }
  ```

- **simple**: `false`
- **varargSetter**: 
  ```java
  public DescribeSpotFleetRequestsResult withSpotFleetRequestConfigs(
    com.amazonaws.internal.SdkInternalList<SpotFleetRequestConfig> spotFleetRequestConfigs
  ) {
    // Implementation...
  }
  ```

- **return**: Returns a reference to this object so that method calls can be chained together.

```java
public DescribeSpotFleetRequestsResult withSpotFleetRequestConfigs(
    com.amazonaws.internal.SdkInternalList<SpotFleetRequestConfig> spotFleetRequestConfigs
) {
    // Implementation...
  }
```
