If you set this parameter to `<code>true</code>`, you can't terminate the instance using the Amazon EC2 console, CLI, or API; otherwise, you can. To change this attribute to `<code>false</code>` after launch, use `<a>ModifyInstanceAttribute</a>`. Alternatively, if you set `<code>InstanceInitiatedShutdownBehavior</code>` to `<code>terminate</code>`, you can terminate the instance by running the shutdown command from the instance.

<p>Default: `<code>false</code>`<br>

Amazon EC2 chooses the IPv6 addresses from the range of your subnet. You cannot specify this option and the option to assign specific IPv6 addresses in the same request. You can specify this option if you've specified a minimum number of instances to launch.

For more information, see:

http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html

Ensuring Idempotency

Constraints: Maximum 64 ASCII characters

getClientToken

Unique, case-sensitive identifier you provide to ensure the idempotency of the request.

For more information, see:

http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html

Ensuring Idempotency

Constraints: Maximum 64 ASCII characters

Unique, case-sensitive identifier you provide to ensure the idempotency of the request.

"returns" : "null"
The name of the key pair. You can create a key pair using <a>CreateKeyPair</a> or <a>ImportKeyPair</a>. If you do not specify a key pair, you can't connect to the instance unless you choose an AMI that is configured to allow users another way to log in.

**Examples**

```java
@Param(keyName \"KeyName\")
```

*Description*

The name of the key pair. You can create a key pair using <a>CreateKeyPair</a> or <a>ImportKeyPair</a>. If you do not specify a key pair, you can't connect to the instance unless you choose an AMI that is configured to allow users another way to log in.

**Examples**

```java
@Param(keyName \"KeyName\")
```
The name of the key pair. You can create a key pair using
<a>CreateKeyPair</a> or <a>ImportKeyPair</a>. If you do not specify a key pair, you can't connect to the instance unless you choose an AMI that is configured to allow users another way to log in.

@importance 3

The name of the key pair. You can create a key pair using <a>CreateKeyPair</a> or <a>ImportKeyPair</a>. If you do not specify a key pair, you can't connect to the instance unless you choose an AMI that is configured to allow users another way to log in.

@importance 3

The maximum number of instances to launch. If you specify more instances than Amazon EC2 can launch in the target Availability Zone, Amazon EC2 launches the largest possible number of instances above <code>MinCount</code>.

Constraints: Between 1 and the maximum number you're
allowed for the specified instance type. For more information about the default limits, and how to request an increase, see <a href="http://aws.amazon.com/ec2/faqs/#How_many_instances_can_I_run_in_Amazon_EC2">How many instances can I run in Amazon EC2</a> in the Amazon EC2 FAQ.

### Variations

#### Parameter

- **userData**
  - Type: String
  - Documentation: The user data to make available to the instance. For more information, see [Running Commands on Your Linux Instance at Launch](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/user-data.html) (Linux) and [Adding User Data](https://docs.aws.amazon.com/AWSEC2/latest/WindowsGuide/ec2-instance-metadata.html#instancedata-add-user-data) (Windows). If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

### Method

- **setUserData**
  - Returns: This object
  - Documentation: Returns a reference to this object so that method calls can be chained together.

### XML

```xml
<param
  name="userData"
  type="String"
  documentation="The user data to make available to the instance. For more information, see [Running Commands on Your Linux Instance at Launch](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/user-data.html) (Linux) and [Adding User Data](https://docs.aws.amazon.com/AWSEC2/latest/WindowsGuide/ec2-instance-metadata.html#instancedata-add-user-data) (Windows). If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

@returns Returns a reference to this object so that method calls can be chained together."

Availability Zone

`@return` Returns a reference to this object so that method calls can be chained together.

```java

public void setAvailabilityZone(String availabilityZone) {
    this.availabilityZone = availabilityZone;
}

public String getAvailabilityZone() {
    return availabilityZone;
}

private String availabilityZone;
```

```java

public class CreateDate {
    private java.util.Date createDate;

    public void setCreateDate(java.util.Date createDate) {
        this.createDate = createDate;
    }

    public java.util.Date getCreateDate() {
        return createDate;
    }
}
```

```java

CreateDate createDate;

For gp2 volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about gp2 baseline performance, I/O credits, and bursting, see: Amazon EBS Volume Types</a> in the Amazon Elastic Compute Cloud User Guide).

Constraint: Range is 100-20000 IOPS for io1 volumes and 100-10000 IOPS for gp2 volumes.

Condition: This parameter is required for requests to create io1 volumes; it is not used in requests to create gp2, st1, sc1, or standard volumes.

This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.</p> Default: <code>false</code>

Parameters:

- **ebsOptimized**: Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

```java
public void withEbsOptimized(Boolean ebsOptimized) {
    // Method body
}
```

- **getEbsOptimized**: Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

```java
public Boolean getEbsOptimized() {
    // Method body
}
```

Value from an Amazon-maintained list (amazon | aws-marketplace | microsoft) of snapshot owners. Not to be confused with the user-configured AWS account alias, which is set from the IAM console.

`return` Returns a reference to this object so that method calls can be chained together.

```java
public String getOwnerId() {
    return ownerId;
}
```

The AWS account ID of the EBS snapshot owner.

```java
public void withOwnerId(String ownerId) {
    this.ownerId = ownerId;
}
```

The AWS account ID of the EBS snapshot owner.

```java
public String getOwnerAlias() {
    return ownerAlias;
}
```

Value from an Amazon-maintained list (amazon | aws-marketplace | microsoft) of snapshot owners. Not to be confused with the user-configured AWS account alias, which is set from the IAM console.

```java
public void withOwnerAlias(String ownerAlias) {
    this.ownerAlias = ownerAlias;
}
```

The AWS account ID of the EBS snapshot owner.

**SnapshotId**

The snapshot ID of the disk being imported.

@returns Returns a reference to this object so that method calls can be chained together.

```java
public String getSnapshotId()
```

```java
public void setSnapshotId(String snapshotId)
```

**Progress**

The percentage of completion for the import snapshot task.

@returns Returns a reference to this object so that method calls can be chained together.

```java
public String getProgress()
```

```java
public Progress withProgress(String progress)
```

---

The snapshot ID of the disk being imported.

@returns Returns a reference to this object so that method calls can be chained together.

```java
public String getSnapshotId()
```

```java
public void setSnapshotId(String snapshotId)
```

---

The percentage of completion for the import snapshot task.

@returns Returns a reference to this object so that method calls can be chained together.

```java
public String getProgress()
```

```java
public Progress withProgress(String progress)
```

Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS Optimized instance. Default: false

The number of units provided by the specified instance type. These are the same units that you chose to set the target capacity in terms (instances or a performance characteristic such as vCPUs, memory, or I/O). If the target capacity divided by this value is not a whole number, we round the number of instances to the next whole number. If this value is not specified, the default is 1.

Returns a reference to this object so that method calls can be chained together.

This method appends the values to the existing list (if any). Use {@code #setBlockDeviceMappings(java.util.Collection)} or {@code #withBlockDeviceMappings(java.util.Collection)} if you want to override the existing values.</p><p><b>NOTE:</b> Returns a reference to this object so that method calls can be chained together.<p/>

The method should be named something like `setBlockDeviceMappings(List<BlockDeviceMapping> blockDeviceMappings)` where `List<BlockDeviceMapping>` is the class of the parameter that is to be set. The method should also be annotated with `@param` to identify the parameter and to provide documentation for the parameter. The method should also be annotated with `@return` to identify the return value of the method.<p/>

The parameter should be a `List<BlockDeviceMapping>` because the method takes a list of `BlockDeviceMapping` objects as the parameter. The parameter can be null, which means that the method should not throw an exception if the parameter is null.<p/>

The return value should be a reference to this object so that method calls can be chained together.</p>
