The <code>PresignedUrl</code> must be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic that is described in <a href="http://docs.aws.amazon.com/AmazonS3/latest/API/sigv4-query-string-auth.html">Authenticating Requests by Using Query Parameters (AWS Signature Version 4)</a>. An invalid or improperly signed <code>PresignedUrl</code> will cause the copy operation to fail asynchronously, and the snapshot will move to an <code>error</code> state."/"
The pre-signed URL that facilitates copying an encrypted snapshot. This parameter is only required when copying an encrypted snapshot with the Amazon EC2 Query API; it is available as an optional parameter in all other cases. The <code>PresignedUrl</code> should use the snapshot source endpoint, the <code>CopySnapshot</code> action, and include the <code>SourceRegion</code>, <code>SourceSnapshotId</code>, and <code>DestinationRegion</code> parameters. The <code>PresignedUrl</code> must be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic that is described in the Amazon Simple Storage Service API Reference. An invalid or improperly signed <code>PresignedUrl</code> will cause the copy operation to fail asynchronously, and the snapshot will move to an <code>error</code> state. 

```java
@param presignedUrl The pre-signed URL that facilitates copying an encrypted snapshot. This parameter is only required when copying an encrypted snapshot with the Amazon EC2 Query API; it is available as an optional parameter in all other cases. The <code>PresignedUrl</code> should use the snapshot source endpoint, the <code>CopySnapshot</code> action, and include the <code>SourceRegion</code>, <code>SourceSnapshotId</code>, and <code>DestinationRegion</code> parameters. The <code>PresignedUrl</code> must be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic that is described in the Amazon Simple Storage Service API Reference. An invalid or improperly signed <code>PresignedUrl</code> will cause the copy operation to fail asynchronously, and the snapshot will move to an <code>error</code> state.

```
Amazon S3, the signing algorithm for this parameter uses the same logic that is described in `<a href="http://docs.aws.amazon.com/AmazonS3/latest/API/sigv4-query-string-auth.html">Authenticating Requests by Using Query Parameters (AWS Signature Version 4)</a>` in the `<i>Amazon Simple Storage Service API Reference</i>`. An invalid or improperly signed `<code>PresignedUrl</code>` will cause the copy operation to fail asynchronously, and the snapshot will move to an `<code>error</code>` state.

```java
@param presignedUrl The pre-signed URL that facilitates copying an encrypted snapshot. This parameter is only required when copying an encrypted snapshot with the Amazon EC2 Query API; it is available as an optional parameter in all other cases. The `<code>PresignedUrl</code>` should use the snapshot source endpoint, the `<code>CopySnapshot</code>` action, and include the `<code>SourceRegion</code>`, `<code>SourceSnapshotId</code>`, and `<code>DestinationRegion</code>` parameters. The `<code>PresignedUrl</code>` must be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic that is described in `<a href="http://docs.aws.amazon.com/AmazonS3/latest/API/sigv4-query-string-auth.html">Authenticating Requests by Using Query Parameters (AWS Signature Version 4)</a>` in the `<i>Amazon Simple Storage Service API Reference</i>`. An invalid or improperly signed `<code>PresignedUrl</code>` will cause the copy operation to fail asynchronously, and the snapshot will move to an `<code>error</code>` state.

```java
@return Returns a reference to this object so that method calls can be chained together.
```
```java

**The protocol. A value of `<code>-1</code>` or `<code>all</code>` means all protocols. If you specify `<code>all</code>`, `<code>-1</code>`, or a protocol number other than `<code>tcp</code>`, `<code>udp</code>`, or `<code>icmp</code>`, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol `<code>58</code>` (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol `<code>58</code>` (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

## setterDocumentation

```java
/**
 * The protocol. A value of `<code>-1</code>` or `<code>all</code>` means all protocols. If you specify `<code>all</code>`, `<code>-1</code>`, or a protocol number other than `<code>tcp</code>`, `<code>udp</code>`, or `<code>icmp</code>`, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol `<code>58</code>` (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol `<code>58</code>` (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.
 */
```

## setterMethodName

```java
setProtocol
```
CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol
<code>58</code> (ICMPv6) and specify an IPv4 CIDR block, traffic on all ports is allowed, regardless of any ports or ICMP types or
codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, traffic on all ports is allowed, regardless of any ports or ICMP types or
codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4 CIDR block, traffic for
all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

@returns Returns a reference to this object so that method calls can be chained together.

/**
 * The protocol. A value of <code>-1</code> or <code>all</code> means all protocols.
 * If you specify <code>all</code>, <code>-1</code>, or a protocol number other than <code>tcp</code>, <code>udp</code>, or <code>icmp</code>, traffic on all ports is allowed, regardless of any ports or ICMP types or
codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4 CIDR block, traffic for
all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

@returns Returns a reference to this object so that method calls can be chained together.

```java
RuleAction ruleAction = new RuleAction();
ruleAction.setRuleAction(RuleAction.ALLOW); // Indicates whether to allow or deny the traffic that matches the rule.

RuleRuleAction policy = new RuleRuleAction();
policy.setRuleAction(ALLOW); // Indicates whether to allow or deny the traffic that matches the rule.

"xmlNameSpaceUri": null,
{
"c2jName": "SecondaryPrivateIpAddressCount",
"c2jShape": "Integer",
"deprecated": false,
The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using `privateIpAddresses`.

The number of IP addresses you can assign to a network interface varies by instance type. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-eni.html#AvailableIpPerENI">IP Addresses Per ENI Per Instance Type</a> in the <i>Amazon Virtual Private Cloud User Guide</i>.

```java
public int getSecondaryPrivateIpAddressCount() {
    return getSecondaryPrivateIpAddressCount();
}
```

```java
public void withSecondaryPrivateIpAddressCount(int secondaryPrivateIpAddressCount) {
    withSecondaryPrivateIpAddressCount(secondaryPrivateIpAddressCount);
}
```
**SecondaryPrivateIpAddressCount**

The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using `privateIpAddresses`.

The number of IP addresses you can assign to a network interface varies by instance type. For more information, see the Amazon Virtual Private Cloud User Guide.

```java
import com.amazonaws.services.ec2.model.DescribeNetworkInterfacesResult;
import com.amazonaws.services.ec2.model.NetworkInterface;
import com.amazonaws.services.ec2.model.SecondaryPrivateIpAddressCount;
import java.util.List;

public class SecondaryPrivateIpAddressCount {
    private int secondaryPrivateIpAddressCount;

    public int getSecondaryPrivateIpAddressCount() {
        return secondaryPrivateIpAddressCount;
    }

    public void setSecondaryPrivateIpAddressCount(int secondaryPrivateIpAddressCount) {
        this.secondaryPrivateIpAddressCount = secondaryPrivateIpAddressCount;
    }
}
```

For more information, see the Amazon Virtual Private Cloud User Guide.
subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using
<code>privateIpAddresses</code>. The number of IP addresses you can assign to a network interface

  "simpleType" : "String",
  "variableSetterType" : "String"
The primary private IPv4 address of the network interface. If you don't specify an IPv4 address, Amazon EC2 selects one for you from the subnet's IPv4 CIDR range. If you specify an IP address, you cannot indicate any IP addresses specified in as primary (only one IP address can be designated as primary).

@param privateIpAddress

@returns

Returns a reference to this object so that method calls can be chained together.

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

@returns

One or more private IPv4 addresses.

**One or more private IPv4 addresses.**

**NOTE:** This method appends the values to the existing list (if any). Use [@link #setPrivateIpAddresses(java.util.Collection)] or [@link #withPrivateIpAddresses(java.util.Collection)] if you want to override the existing values.

@returns a reference to this object so that method calls can be chained together.

**The number of secondary private IPv4 addresses to assign to a network interface.**

When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using <code>privateIpAddresses</code>

@returns a reference to this object so that method calls can be chained together.

**The number of secondary private IPv4 addresses to assign to a network interface.**

When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using <code>privateIpAddresses</code>

@returns a reference to this object so that method calls can be chained together.
The number of IP addresses you can assign to a network interface varies by instance type. For more information, see "IP Addresses Per ENI Per Instance Type" in the Amazon Virtual Private Cloud User Guide.

```java

/**
 * Unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html">Ensuring Idempotency</a>.
 * @return Unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html">Ensuring Idempotency</a>.
 */

public String getClientToken() {
  return clientToken;
}

```

The documentation for `ClientToken` field is as follows:

```java

/**
 * Unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html">Ensuring Idempotency</a>.
 */

```

This helps avoid duplicate listings. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html">Ensuring Idempotency</a>.

/**
 * The full ARN of the AWS Key Management Service (AWS KMS) customer master key (CMK) to use when creating the encrypted volume. This parameter is only required if you want to use a non-default CMK; if this parameter is not specified, the default CMK for EBS is used. The ARN contains the <code>arn:aws:kms</code> namespace, followed by the region of the CMK, the AWS account ID of the CMK owner, the <code>key</code> namespace, and then the CMK ID. For example, arn:aws:kms:<i>us-east-1</i>:<i>012345678910</i>:key/<i>abcd1234-a123-456a-a12b-a123b4cd56ef</i>. If a <code>KmsKeyId</code> is specified, the <code>Encrypted</code> flag must also be set.

@input
<var>KmsKeyId</var>

*/
If a `<code>KmsKeyId</code>` is specified, the `<code>Encrypted</code>` flag must also be set.

```java
public void withKmsKeyId(String kmsKeyId) {
    setKmsKeyId(kmsKeyId);
    setEncrypted(true);
}
```

The full ARN of the AWS Key Management Service (AWS KMS) customer master key (CMK) to use when creating the encrypted volume. This parameter is only required if you want to use a non-default CMK; if this parameter is not specified, the default CMK for EBS is used. The ARN contains the `<code>arn:aws:kms</code>` namespace, followed by the region of the CMK, the AWS account ID of the CMK owner, the `<code>key</code>` namespace, and then the CMK ID. For example, `arn:aws:kms:<i>us-east-1</i>:<i>012345678910</i>:key/<i>abcd1234-a123-456a-a12b-a123b4cd56ef</i>`. If a `<code>KmsKeyId</code>` is specified, the `<code>Encrypted</code>` flag must also be set.

```java
public String getKmsKeyId() {
    return kmsKeyId;
}
```

The snapshot from which to create the volume.

```
@override
public void setSnapshotId(String snapshotId) {
    this.snapshotId = snapshotId;
}
```

- **Variable**: `snapshotId`<br>**Type**: `String`<br>**Default**: `null`
- **Fluent Setter**: `withSnapshotId(String snapshotId)`
- **Getters**:
  - `getSnapshotId()`: Returns the snapshot ID.

**Validation**:
- The snapshot ID must exist in the repository.

**Usage**:
To create a new volume from a snapshot:
```
Volume volume = new Volume()
    .withSnapshotId(snapshotId)
    .build();
```

**Deprecation**: The `SnapshotId` field is marked as deprecated in Finesse version 12.5.1.

**XML Representation**:
```
<volumeType>
  <snapshotId>123456789</snapshotId>
</volumeType>
```
<code>standard</code> return The volume type. **PeerVpcId**

- **Documentation:** The ID of the VPC with which you are creating the VPC peering connection. 

```java
@Param peerVpcId The ID of the VPC with which you are creating the VPC peering connection.
```

```java
public interface VpcPeeringConnection
{
    public VpcPeeringConnection withPeerVpcId(String peerVpcId);
}
```

**Getter Documentation:**

```java
public String getPeerVpcId();
```

**Setter Documentation:**

```java
public void setPeerVpcId(String peerVpcId);
```

**PeerOwnerId**

- **Documentation:** The AWS account ID of the owner of the peer VPC.

```java
@Param peerOwnerId The AWS account ID of the owner of the peer VPC.
```

```java
public interface VpcPeeringConnection
{
    public VpcPeeringConnection withPeerOwnerId(String peerOwnerId);
}
```

**Getter Documentation:**

```java
public String getPeerOwnerId();
```

**Setter Documentation:**

```java
public void setPeerOwnerId(String peerOwnerId);
```

- **Default:** Default: Your AWS account ID

```java
@NonNull String peerOwnerId = System.getenv("AWS_DEFAULT_REGION") == null ? null : System.getenv("AWS_DEFAULT_REGION").split("-")[1];
```

**Documentation:**

```java
The AWS account ID of the owner of the peer VPC.
```

</ul>"
This method appends the values to the existing list (if any). Use { @link #setFilters(java.util.Collection) } or { @link #withFilters(java.util.Collection) } if you want to override the existing values.

The ID of a VPC security group that’s associated with the instance. 

The ID of the instance.

The key/value combination of a tag assigned to the resource.

The key or tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

The ID of the VPC that the instance is linked to.

Returns a reference to this object so that method calls can be chained together.

The token to retrieve the next page of results.

The token to retrieve the next page of results.

Returns a reference to this object so that method calls can be chained together.

The token to retrieve the next page of results.

The token to retrieve the next page of results.

The token to retrieve the next page of results.

The token to retrieve the next page of results.

### Filters for Customer Gateway

- <code>customer-gateway-id</code> - The ID of the customer gateway.
- <code>ip-address</code> - The IP address of the customer gateway's Internet-routable external interface.
- <code>state</code> - The state of the customer gateway (pending | available | deleting | deleted).
- <code>type</code> - The type of customer gateway. Currently, the only supported type is <code>ipsec.1</code>.

**NOTE:** This method appends the values to the existing list (if any). Use [@link #setFilters(java.util.Collection)] or [@link #withFilters(java.util.Collection)] if you want to override the existing values.
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). NoUpfront | PartialUpfront | AllUpfront

- The state of the reservation (payment-pending | payment-failed | active | retired).

- The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned <code>nextToken</code> value. This value can be between 5 and 500; if <code>maxResults</code> is given a larger value than 500, you will receive an error.

- Returns a reference to this object so that method calls can be chained together.

- The Availability Zone of the host.

### Filters

- **<code>instance-type</code>**
  - The instance type size that the Dedicated Host is configured to support.

- **<code>auto-placement</code>**
  - Whether auto-placement is enabled or disabled (<code>on</code> | <code>off</code>).

- **<code>host-reservation-id</code>**
  - The ID of the reservation assigned to this host.

- **<code>client-token</code>**
  - The idempotency token you provided when you launched the instance.

- **<code>state</code>**

### Documentation

This method appends the values to the existing list (if any). Use `@link #setFilter(java.util.Collection)` or `@link #withFilter(java.util.Collection)` if you want to override the existing values.

- **Availability Zone**
  - The Availability Zone of the host.

- **Availability Zone**
  - The Availability Zone of the host.

- **Availability Zone**
  - The Availability Zone of the host.

### Method

```java
public @return

```
