Describes an association between an IAM instance profile and an instance.

The ID of the association.

Returns a reference to this object so that method calls can be chained together.

The ID of the association.

The ID of the association.

Returns the ID of the association.

The ID of the association.

The ID of the association.

Information about the disk containers:

```java
public class DiscImage

public void setDiskContainers(java.util.Collection<ImageDiskContainer> diskContainers)
```

This method appends the values to the existing list (if any). Use `@link #setDiskContainers(java.util.Collection)` or `@link #withDiskContainers(java.util.Collection)` if you want to override the existing values.

Valid values: `AWS` | `BYOL`
Valid values: `<code>AWS</code>` | `<code>BYOL</code>`

Note: You may only use BYOL if you have existing licenses with rights to use these licenses in a third party cloud like AWS. For more information, see <a href="http://docs.aws.amazon.com/vm-import/latest/userguide/vmimport-image-import.html#prerequisites-image">Prerequisites</a> in the VM Import/Export User Guide.

Valid values: `<code>AWS</code>` | `<code>BYOL</code>`

The license type to be used for the Amazon Machine Image (AMI) after importing.

Valid values: `<code>AWS</code>` | `<code>BYOL</code>`

@returns {String} The license type to be used for the Amazon Machine Image (AMI) after importing.

Valid values: `<code>AWS</code>` | `<code>BYOL</code>`
Valid values: <code>AWS</code> | <code>BYOL</code>

```java
public void setLicenseType(String licenseType) {
    this.licenseType = licenseType;
}
```

**Note:** You may only use BYOL if you have existing licenses with rights to use these licenses in a third party cloud like AWS. For more information, see <a href="http://docs.aws.amazon.com/vmimport/latest/userguide/vmimport-image-import.html#prerequisites-image">Prerequisites</a> in the VM Import/Export User Guide.

*/",
"fluentSetterMethodName" : "withPublicIpAddress"
The public IPv4 address assigned to the instance, if applicable.

Setter Documentation:

```java
/**
 * The public IPv4 address assigned to the instance, if applicable.
 * @param publicIpAddress The public IPv4 address assigned to the instance, if applicable.
 * @return Returns a reference to this object so that method calls can be chained together.
 */
```

Setter Method Name:

```
"setterMethodName" : "setPublicIpAddress",
```

Setter Model:

```
"setterModel" : {
    "variableDeclarationType" : "String",
    "variableName" : "publicIpAddress",
    "variableType" : "String",
    "documentation" : "",
    "simpleType" : "String",
    "variableSetterType" : "String"
}
```

Simple:

```
"simple" : true,
```

Vararg Setter Documentation:

```
/**
 * The public IPv4 address assigned to the instance, if applicable.
 * @param publicIpAddress The public IPv4 address assigned to the instance, if applicable.
 * @return Returns a reference to this object so that method calls can be chained together.
 */
```

Indicates whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

@returns Returns a reference to this object so that method calls can be chained together.

```java
public boolean getEbsOptimized() {
    return ebsOptimized;
}

public EbsOptimized withEbsOptimized(boolean ebsOptimized) {
    this.ebsOptimized = ebsOptimized;
    return this;
}
```

Specifies whether enhanced networking with ENA is enabled.

@returns Returns a reference to this object so that method calls can be chained together.

```java
public boolean getEnaSupport() {
    return enaSupport;
}

public EbsOptimized withEnaSupport(boolean enaSupport) {
    this.enaSupport = enaSupport;
    return this;
}

Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of `<code>true</code>` means checking is enabled, and `<code>false</code>` means checking is disabled. The value must be `<code>false</code>` for the instance to perform NAT. For more information, see `<a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a>` in the `<i>Amazon Virtual Private Cloud User Guide</i>`.

@method setSourceDestCheck

```java
public void setSourceDestCheck(boolean value) {
    // Implementation
}
```

Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of `<code>true</code>` means checking is enabled, and `<code>false</code>` means checking is disabled. The value must be `<code>false</code>` for the instance to perform NAT. For more information, see `<a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a>` in the `<i>Amazon Virtual Private Cloud User Guide</i>`. 

```java
public void setSourceDestCheck(boolean value) {
    // Implementation
}
```
NAT Instances in the Amazon Virtual Private Cloud User Guide. Returns a reference to this object so that method calls can be chained together.

```java
public class SpotInstanceRequest {
  private boolean sourceDestCheck;

  // Constructor...

  public SpotInstanceRequest withSourceDestCheck(boolean sourceDestCheck) {
    this.sourceDestCheck = sourceDestCheck;
    return this;
  }

  public String getSpotInstanceRequestId() {
    return spotInstanceRequestId;
  }

  // Getters and setters...

  public SpotInstanceRequestSpotInstanceRequestId(String spotInstanceRequestId) {
    this.spotInstanceRequestId = spotInstanceRequestId;
    // Other actions...
  }

  // Marshalling...

  // Unmarshalling...

  // Additional methods...
}
```

If the request is a Spot instance request, the ID of the request.

```java
public class SpotInstanceRequest {
  private boolean sourceDestCheck;

  // Constructor...

  public SpotInstanceRequest withSourceDestCheck(boolean sourceDestCheck) {
    this.sourceDestCheck = sourceDestCheck;
    return this;
  }

  public String getSpotInstanceRequestId() {
    return spotInstanceRequestId;
  }

  // Getters and setters...

  public SpotInstanceRequestSpotInstanceRequestId(String spotInstanceRequestId) {
    this.spotInstanceRequestId = spotInstanceRequestId;
    // Other actions...
  }

  // Marshalling...

  // Unmarshalling...

  // Additional methods...
}

```

### EbsInstanceBlockDevice

#### Documentation:

- **Parameters used to automatically set up EBS volumes when the instance is launched.**

#### Members:

- **DeviceName**
  - **c2jName**: `DeviceName`
  - **c2jShape**: `String`
  - **deprecated**: false
  - **documentation**: The device name exposed to the instance (for example, `<code>/dev/sdh</code> or `<code>xvdh</code>`).
  - **enumType**: null
  - **http**: null
  - **getterDocumentation**: The device name exposed to the instance (for example, `<code>/dev/sdh</code>` or `<code>xvdh</code>`).
  - **getterMethodName**: `getDeviceName`
  - **getterModel**: `String`
  - **marshallLocationName**: `DeviceName`
  - **marshallPayloadName**: `DeviceName`
  - **payloadMemberName**: `DeviceName`
  - **queryString**: false

#### Variable:

- **variableDeclarationType**: `EbsInstanceBlockDevice`
- **variableName**: `ebs`
- **variableType**: `EbsInstanceBlockDevice`
- **documentation**: Parameters used to automatically set up EBS volumes when the instance is launched.

```java
public class EbsInstanceBlockDevice {
    private EbsInstanceBlockDevice ebs;

    public EbsInstanceBlockDevice setEbs(EbsInstanceBlockDevice ebs) {
        this.ebs = ebs;
        return this;
    }

    public EbsInstanceBlockDevice getEbs() {
        return ebs;
    }
}
```

---

Open Source Used In Finesse Software 12.5(1)SU2 19039
the security groups. When requesting instances in EC2-Classic, you can specify the names or the IDs of the security
groups.

```java
public class CreateInstancesRequest
{
...
    @Variable
    private List<GroupIdentifier> allSecurityGroups;
    //...
    public List<GroupIdentifier> getAllSecurityGroups()
    {
        return allSecurityGroups;
    }
    //...
    public void setAllSecurityGroups(List<GroupIdentifier> allSecurityGroups)
    {
        this.allSecurityGroups = allSecurityGroups;
    }
    //...
}
```

When requesting instances in a VPC, you must specify
the IDs of the security groups. When requesting instances in EC2-Classic, you can specify the names or the IDs of
the security groups.

### MonitoringEnabled

```java
public class CreateInstancesRequest
{
...
    @Variable
    private boolean monitoringEnabled;
    //...
    public boolean getMonitoringEnabled()
    {
        return monitoringEnabled;
    }
    //...
    public void setMonitoringEnabled(boolean monitoringEnabled)
    {
        this监测ingEnabled = monitoringEnabled;
    }
    //...
}
```

### IdempotencyToken

```java
public class CreateInstancesRequest
{
...
    @Variable
    private String idempotencyToken;
    //...
    public String getIdempotencyToken()
    {
        return idempotencyToken;
    }
    //...
    public void setIdempotencyToken(String idempotencyToken)
    {
        this.idempotencyToken = idempotencyToken;
    }
    //...
}
```

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #setUnsuccessful

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used. NOTE:

This method appends the values to the existing list (if any). Use @link #setUnsuccessful or @link #withUnsuccessful if you want to override the existing values.

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #return

Returns a reference to this object so that method calls can be chained together.

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #setUnsuccessful

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #setUnsuccessful

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #setUnsuccessful

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #setUnsuccessful

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #setUnsuccessful

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

@link #setUnsuccessful

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.
