must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a
href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a>
in the <i>Amazon Virtual Private Cloud User Guide</i>.</p>
  "returnType" : "Boolean",
  "documentation" : null
**SourceDestCheck**

Indicates whether source/destination checking is enabled. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the Amazon Virtual Private Cloud User Guide.

### setterDocumentation

Indicates whether source/destination checking is enabled. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the Amazon Virtual Private Cloud User Guide.

### varargSetterDocumentation

Indicates whether source/destination checking is enabled. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the Amazon Virtual Private Cloud User Guide.

### setterMethodName

Indicates whether source/destination checking is enabled. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the Amazon Virtual Private Cloud User Guide.

### setterModel

Indicates whether source/destination checking is enabled. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the Amazon Virtual Private Cloud User Guide.
<code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the <i>Amazon Virtual Private Cloud User Guide</i>.

```java
public class NetworkInterface {
    private boolean sourceDestCheck;

    // Getter and setter for sourceDestCheck
    public boolean isSourceDestCheck() {
        return sourceDestCheck;
    }
    public NetworkInterface withSourceDestCheck(boolean sourceDestCheck) {
        this.sourceDestCheck = sourceDestCheck;
        return this;
    }
}
```

The `sourceDestCheck` variable indicates whether source/destination checking is enabled. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the <i>Amazon Virtual Private Cloud User Guide</i>.

### Groups

Changes the security groups for the network interface. The new set of groups you specify replaces the current set. You must specify at least one group, even if it's just the default security group in the VPC. You must specify the ID of the security group, not the name.

```java
public class NetworkInterface {
    private java.util.List<String> groups;

    // Getter and setter for groups
    public java.util.List<String> getGroups() {
        return groups;
    }
    public NetworkInterface withGroups(java.util.List<String> groups) {
        this.groups = groups;
        return this;
    }
}
```

The `groups` variable specifies the security groups for the network interface. The new set of groups you specify replaces the current set. You must specify at least one group, even if it's just the default security group in the VPC. You must specify the ID of the security group, not the name.

Information about the IP addresses and network interface associated with the NAT gateway.

The state of the NAT gateway:
- **pending**: The NAT gateway is being created and is not ready to process traffic.
- **failed**: The NAT gateway could not be created. Check the `failureCode` and `failureMessage` fields for the reason.
- **available**: The NAT gateway is able to process traffic. This status remains until you delete the NAT gateway, and does not indicate the health of the NAT gateway.
- **deleting**: The NAT gateway is in the process of being terminated and may still be processing traffic.
- **deleted**: The NAT gateway has been terminated and is no longer processing traffic.

The state of the NAT gateway:
- **pending**: The NAT gateway is being created and is not ready to process traffic.

**Open Source Used In Finesse Software 12.5(1)SU2 19655**

VPC to an EC2-Classic instance that's linked to a peer VPC via ClassicLink.

```java
public class AllowEgressFromLocalVpcToRemoteClassicLink {
    public boolean getAllowEgressFromLocalVpcToRemoteClassicLink() {
        // Implementation
    }
}
```

**Setter Method**

```java
public void setAllowEgressFromLocalVpcToRemoteClassicLink(boolean allowEgressFromLocalVpcToRemoteClassicLink) {
    // Implementation
}
```

**Documentation**

If true, enables outbound communication from instances in a local VPC to an EC2-Classic instance that's linked to a peer VPC via ClassicLink.

```java
/**
 * If true, enables outbound communication from instances in a local VPC to an
 * EC2-Classic instance that's linked to a peer VPC via ClassicLink.
 * @return If true, enables outbound communication from instances in a local VPC to an
 * EC2-Classic instance that's linked to a peer VPC via ClassicLink.*/

public boolean getAllowEgressFromLocalVpcToRemoteClassicLink() {
    // Implementation
}
```

**Setter Method**

```java
public void setAllowEgressFromLocalVpcToRemoteClassicLink(boolean allowEgressFromLocalVpcToRemoteClassicLink) {
    // Implementation
}
```

**Documentation**

If true, enables outbound communication from instances in a local VPC to an EC2-Classic instance that's linked to a peer VPC via ClassicLink.

```java
/**
 * If true, enables outbound communication from instances in a local VPC to an
 * EC2-Classic instance that's linked to a peer VPC via ClassicLink.*/

public void setAllowEgressFromLocalVpcToRemoteClassicLink(boolean allowEgressFromLocalVpcToRemoteClassicLink) {
    // Implementation
}
```
to an EC2-Classic instance that's linked to a peer VPC via ClassicLink.<p>

@param allowEgressFromLocalVpcToRemoteClassicLink If true, enables outbound communication from instances in a local VPC to an EC2-Classic instance that's linked to a peer VPC via ClassicLink.

@return Returns a reference to this object so that method calls can be chained together.*"/",

**Active**

The current price schedule, as determined by the term remaining for the Reserved Instance in the listing. When you specify price schedules for five months and two months, this means that schedule 1, covering the first three months of the remaining term, will be active during months 5, 4, and 3. Then schedule 2, covering the last two months of the term, will be active for months 2 and 1. When you specify price schedules for five months and two months, this means that schedule 1, covering the first three months of the remaining term, will be active during months 5, 4, and 3. Then schedule 2, covering the last two months of the term, will be active for months 2 and 1.

A specific price schedule is always in effect, but only one price schedule can be active at any time. Take, for example, a Reserved Instance listing that has five months remaining in its term. When you specify price schedules for five months and two months, this means that schedule 1, covering the first three months of the remaining term, will be active during months 5, 4, and 3. Then schedule 2, covering the last two months of the term, will be active for months 2 and 1. When you specify price schedules for five months and two months, this means that schedule 1, covering the first three months of the remaining term, will be active during months 5, 4, and 3. Then schedule 2, covering the last two months of the term, will be active for months 2 and 1.

@returns Returns a reference to this object so that method calls can be chained together.

```
// The current price schedule, as determined by the term remaining for
// the Reserved Instance in the listing. A specific price schedule is
// always in effect, but only one price schedule can be active at any
time. Take, for example, a Reserved Instance listing that has five
months remaining in its term. When you specify price schedules for
five months and two months, this means that schedule 1, covering the
first three months of the remaining term, will be active during months
5, 4, and 3. Then schedule 2, covering the last two months of the term,
will be active for months 2 and 1. When you specify price schedules for
five months and two months, this means that schedule 1, covering the
first three months of the remaining term, will be active during months
5, 4, and 3. Then schedule 2, covering the last two months of the term,
will be active for months 2 and 1.

**Active**

The current price schedule, as determined by the term remaining for the
Reserved Instance in the listing. A specific price schedule is always in
effect, but only one price schedule can be active at any time. Take, for
example, a Reserved Instance listing that has five months remaining in
its term. When you specify price schedules for five months and two
months, this means that schedule 1, covering the first three months of the
remaining term, will be active during months 5, 4, and 3. Then schedule
2, covering the last two months of the term, will be active for months 2
and 1. When you specify price schedules for five months and two
months, this means that schedule 1, covering the first three months of the
remaining term, will be active during months 5, 4, and 3. Then schedule
2, covering the last two months of the term, will be active for months 2
and 1.

The total hourly price of the reservation calculated per hour.

- **totalHourlyPrice**: The total hourly price of the reservation calculated per hour.
- **currencyCode**: The currency in which the `totalUpfrontPrice` and `totalHourlyPrice` amounts are specified. At this time, the only supported currency is USD.

### Fluent Setters

- **withCurrencyCode**: The currency in which the `totalUpfrontPrice` and `totalHourlyPrice` amounts are specified. At this time, the only supported currency is USD.
- **getCurrencyCode**: The currency in which the `totalUpfrontPrice` and `totalHourlyPrice` amounts are specified. At this time, the only supported currency is USD.

**ClientToken**

Unique, case-sensitive identifier that ensures the idempotency of the request. For more information, see [Ensuring Idempotency](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html).

```java
@Param clientToken
```

**PurchaseRequests**

One or more purchase requests. For more information, see [Ensuring Idempotency](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html).

```java
@Param purchaseRequests
```
