Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster. This is a convenience that creates an instance of the `ElasticsearchClusterConfig.Builder` avoiding the need to create one manually via `ElasticsearchClusterConfig#builder()`. When the `Consumer` completes, `ElasticsearchClusterConfig.Builder#build()` is called immediately and its result is passed to a consumer that will call methods on `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`. A consumer that will call methods on `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`.

When the `Consumer` completes, `ElasticsearchClusterConfig.Builder#build()` is called immediately and its result is passed to a consumer that will call methods on `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`.

```
@link ElasticsearchClusterConfig.Builder#build()
```

**Parameters:**

- `elasticsearchClusterConfig`:
  - Type: `Consumer` (a consumer that will call methods on `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`)
  - Description: A consumer that will call methods on `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`.

**Return Value:**

- `null`:
  - Type: `null`
  - Description: A reference to this object so that method calls can be chained together.

**See Also:**

- `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`

```java
@link ElasticsearchClusterConfig.Builder#build()
```

**Documentation:**

- `null`:
  - Type: `null`
  - Description: A reference to this object so that method calls can be chained together.

**See Also:**

- `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`

```java
@link ElasticsearchClusterConfig.Builder#build()
```

**HttpContext:**

- `null`:
  - Type: `null`
  - Description: A reference to this object so that method calls can be chained together.

**See Also:**

- `ElasticsearchClusterConfig.ElasticsearchClusterConfig(Consumer consumer)`

```java
@link ElasticsearchClusterConfig.Builder#build()
```

### Fluent Methods

- **fluentSetterMethodName**: "domainConfig"
  
- **fluentGetterMethodName**: "domainConfig"
  
### Marshalling

- **marshallingType**: "SDK_POJO"

### HTTP

- **isStreaming**: false
- **marshallLocation**: "PAYLOAD"
- **marshallLocationName**: "DomainConfig"
- **isPayload**: true
- **uri**: false
- **queryString**: false
- **http**: null
  
- **isBinary**: false
- **additionalMarshallingPath**: null
- **additionalUnmarshallingPath**: null
- **flattened**: false
- **greedy**: false
- **header**: false
- **payload**: false
- **statusCode**: false
- **uri**: false

### Model

- **returnType**: "ElasticsearchDomainConfig"
- **documentation**: null

```java
public ElasticsearchDomainConfig fromJson(String json) {
    return ElasticsearchDomainConfig.fromJson(json);
}
```

The configuration information of the domain requested in the <code>DescribeElasticsearchDomainConfig</code> request.

```java
@link ElasticsearchDomainConfig.Builder
```

 Returns a reference to this object so that method calls can be chained together.

```java
@see #domainConfig(ElasticsearchDomainConfig)
```

```java
@Deprecated
```

```java
public ElasticsearchDomainConfig withDomainConfig(ElasticsearchDomainConfig domainConfig) {
    this.domainConfig = domainConfig;
    return this;
}
```

### Fluent Settings

- **deprecated**: false
- **documentation**: "The configuration information of the domain requested in the <code>DescribeElasticsearchDomainConfig</code> request."

```java
ElasticsearchDomainConfig domainConfig = ElasticsearchDomainConfig.builder()
    .withDomainConfig(domainConfig)
    .build();
```

Returns a reference to this object so that method calls can be chained together.

This is a convenience that creates an instance of the `Integer.Builder` avoiding the need to create one manually via `Integer.Builder#build()`. When the `Consumer` completes, `Integer.Builder#build()` is called immediately and its result is passed to `#iops(Integer)`. A consumer that will call methods on `Integer.Builder` returns a reference to this object so that method calls can be chained together.

```
@<param iops> Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
@param iops Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
@return Returns a reference to this object so that method calls can be chained together.
```

```

create one manually via {@link Integer#builder()}.
When the {@link Consumer} completes, {@link
Integer.Builder#build()} is called immediately and its result is passed to {@link
#iops(Integer)}. Returns a reference to this object so that
method calls can be chained together.

Getters and Setters:

- **getIops()**
  - Method that returns the IOPD for a Provisioned IOPS EBS volume (SSD).
- **setIops(Integer iops)**
  - Method that sets the IOPD for a Provisioned IOPS EBS volume (SSD). Returns a reference to this object so that
method calls can be chained together.

Returned Types:

- Integer

Additional Metadata:

```

The instance type for a dedicated master
This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String.Builder()`. When the `Consumer` completes, its result is passed to `#dedicatedMasterTypeAsString(String)`. A consumer that will call methods on `String.Builder` is called immediately and its result is passed to `#dedicatedMasterTypeAsString(String)`. Returns a reference to this object so that method calls can be chained together.

```java
@see #dedicatedMasterType(String)
```

```java
@deprecated
```

```java
@see ESPartitionInstanceType
```

```java
public String getDedicatedMasterTypeAsString()
```

```java
String getDedicatedMasterType()
```

```java
protected void setDedicatedMasterType(String value)
```

```java
protected void setDedicatedMasterTypeAsString(String value)
```

```
The instance type for a dedicated master node.
```

```
The instance type for a dedicated master node. Returns a reference to this object so that method calls can be chained together.
```

```
The instance type for a dedicated master node.
```

```
If the service returns an enum value that is not available in the current SDK version, `#dedicatedMasterType` will return `ESPartitionInstanceType.UNKNOWN_TO_SDK_VERSION`. The raw value returned by the service is available from `#dedicatedMasterTypeAsString`.
```

```java
public ESPartitionInstanceType getDedicatedMasterType()
```

```java
ESPartitionInstanceType getDedicatedMasterType()
```

```java
ESPartitionInstanceType setDedicatedMasterType(ESPartitionInstanceType value)
```

```java
ESPartitionInstanceType setDedicatedMasterTypeAsString(String value)
```

```java
ESPartitionInstanceType setDedicatedMasterType(ESPartitionInstanceType value)
```

```java
ESPartitionInstanceType setDedicatedMasterType(String value)
```

```java
ESPartitionInstanceType setDedicatedMasterType(String value)
```

```
The instance type for a dedicated master node.
```

```
The raw value returned by the service is available from `#dedicatedMasterTypeAsString`.
```

```java
public ESPartitionInstanceType getDedicatedMasterType()
```

```java
ESPartitionInstanceType getDedicatedMasterType()
```

```java
ESPartitionInstanceType setDedicatedMasterType(ESPartitionInstanceType value)
```

```java
ESPartitionInstanceType setDedicatedMasterTypeAsString(String value)
```

```java
ESPartitionInstanceType setDedicatedMasterType(ESPartitionInstanceType value)
```

```
The raw value returned by the service is available from `#dedicatedMasterTypeAsString`.
```

```java
public ESPartitionInstanceType getDedicatedMasterType()
```

```java
ESPartitionInstanceType getDedicatedMasterType()
```

```java
ESPartitionInstanceType setDedicatedMasterType(ESPartitionInstanceType value)
```

```java
ESPartitionInstanceType setDedicatedMasterTypeAsString(String value)
```

```java
ESPartitionInstanceType setDedicatedMasterType(ESPartitionInstanceType value)
```

```
The raw value returned by the service is available from `#dedicatedMasterTypeAsString`.
```

```java
public ESPartitionInstanceType getDedicatedMasterType()
```

```java
ESPartitionInstanceType getDedicatedMasterType()

Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example `<code>key, value</code>`: `<code>'vpc','vpc-endpoint-h2bsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>`.

This is a convenience that creates an instance of the `{@link Map<String,String>.Builder}` avoiding the need to create one manually via `{@link Map<String,String>#builder()}`. When the `{@link Consumer}` completes, `{@link Map<String,String>.Builder#build()}` is called immediately and its result is passed to `{@link #endpoints(Map<String,String>)}`.

@deprecated

Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example `<code>key, value</code>`: `<code>'vpc','vpc-endpoint-h2bsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>`.

Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`. The method requires a `{@link Map<String,String>}` as its sole parameter.

Returns a reference to this object so that method calls can be chained together.

Retrieves the Elasticsearch domain endpoints used to submit index and search requests. Example `<code>key, value</code>`: `<code>'vpc','vpc-endpoint-h2bsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>`.

The method is intended to be used as a fluent setter method for constructing a `Map<String,String>` containing Elasticsearch domain endpoints.

Returns a reference to this object so that method calls can be chained together.

Getter method for retrieving the Elasticsearch domain endpoints used to submit index and search requests. Example `<code>key, value</code>`: `<code>'vpc','vpc-endpoint-h2bsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>`.

The method returns a `Map<String,String>` containing the Elasticsearch domain endpoints.

Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`.

The method requires a `Map<String,String>` as its sole parameter and returns a reference to this object so that method calls can be chained together.

A map of compatible Elasticsearch versions returned as part of the `<code>GetCompatibleElasticsearchVersions</code>` operation. 

```java
public class CompatibleElasticsearchVersions {
    private List<CompatibleVersionsMap> compatibleElasticsearchVersions;

    // Getters and setters
}
```

Here is the documentation for the `compatibleElasticsearchVersions` parameter:

- **Compatibility Method Name**: `setCompatibleElasticsearchVersions`
- **Compatibility Model**: `java.util.List<CompatibleVersionsMap>`
- **Documentation**: A map of compatible Elasticsearch versions returned as part of the `<code>GetCompatibleElasticsearchVersions</code>` operation.

This is a convenience that creates an instance of the `List<CompatibleVersionsMap>.Builder` avoiding the need to create one manually via `List<CompatibleVersionsMap>.Builder#builder()`. When the `Consumer` completes, `List<CompatibleVersionsMap>.Builder#build()` is called immediately and its result is passed to `compatibleElasticsearchVersions(List<CompatibleVersionsMap>)`. Returns a reference to this object so that method calls can be chained together.

```java
public void setCompatibleElasticsearchVersions(List<CompatibleVersionsMap> compatibleElasticsearchVersions) {
    this.compatibleElasticsearchVersions = compatibleElasticsearchVersions;
}
```

**Deprecated**: false

InstanceCountLimits represents the limits on number of instances that be created in Amazon Elasticsearch for given InstanceType.

```java
public class InstanceCountLimits {
    private Integer minimumInstanceCount;

    public InstanceCountLimits() {
        this.minimumInstanceCount = 0;
    }

    public void setMinimumInstanceCount(int value) {
        this.minimumInstanceCount = value;
    }

    public int getMinimumInstanceCount() {
        return this.minimumInstanceCount;
    }
}
```

This is a convenience that creates an instance of the `Integer.Builder` avoiding the need to create one manually via `Integer.builder()`. When the `Consumer` completes, `Integer.Builder.build()` is called immediately and its result is passed to `minimumInstanceCount(Integer)`. Returns a reference to this object so that method calls can be chained together.

```java
public class InstanceCountLimits {
    private Integer minimumInstanceCount;

    public InstanceCountLimits() {
        this.minimumInstanceCount = 0;
    }

    public void setMinimumInstanceCount(int value) {
        this.minimumInstanceCount = value;
    }

    public int getMinimumInstanceCount() {
        return this.minimumInstanceCount;
    }
}
```

The new value for the MinimumInstanceCount property for this object.

```java
public class InstanceCountLimits {
    private Integer minimumInstanceCount;

    public InstanceCountLimits() {
        this.minimumInstanceCount = 0;
    }

    public void setMinimumInstanceCount(int value) {
        this.minimumInstanceCount = value;
    }

    public int getMinimumInstanceCount() {
        return this.minimumInstanceCount;
    }
}
```

The value of the MinimumInstanceCount property for this object.

```java
public class InstanceCountLimits {
    private Integer minimumInstanceCount;

    public InstanceCountLimits() {
        this.minimumInstanceCount = 0;
    }

    public void setMinimumInstanceCount(int value) {
        this.minimumInstanceCount = value;
    }

    public int getMinimumInstanceCount() {
        return this.minimumInstanceCount;
    }
}

    "defaultConsumerFluentSetterDocumentation" : "Sets the value of the Member property for this
This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `String.Builder#memberAsString(String)`. Returns a reference to this object so that method calls can be chained together.

```java
public @interface MemberAsString {
    String memberAsString(String value);
}
```

The new value for the Member property for this object will be passed to `memberAsString(String)` method of the `String.Builder` and then passed to `memberAsString` method of this object so that method calls can be chained together.

```java
public @interface Member {
    String member();
}
```

If the service returns an enum value that is not available in the current SDK version, `memberAsString(String)` will return `UNKNOWN_TO_SDK_VERSION`. The raw value returned by the service is available from `memberAsString(String)` method of this object.

```java
public @interface MemberAsString {
    String memberAsString(String value);
}
```

The value of the Member property for this object will be passed to `memberAsString(String)` method of the `String.Builder` and then passed to `memberAsString` method of this object so that method calls can be chained together.

```java
public @interface Member {
    String member();
}
```

If the service returns an enum value that is not available in the current SDK version, `memberAsString(String)` will return `UNKNOWN_TO_SDK_VERSION`. The raw value returned by the service is available from `memberAsString(String)` method of this object.

```java
public @interface MemberAsString {
    String memberAsString(String value);
}
```

Set the `ARN` for the Elasticsearch domain to which the tags are attached that you want to view.

**name**

Set the `ARN` for the Elasticsearch domain to which the tags are attached that you want to view.

**setting**

Set `arn` to the `ARN` for the Elasticsearch domain to which the tags are attached that you want to view.

- **arn**
  
  Set the `ARN` for the Elasticsearch domain to which the tags are attached that you want to view.

**arn**

Set the `ARN` for the Elasticsearch domain to which the tags are attached that you want to view.

**xmlNameSpaceUri**

Set `arn` to the `ARN` for the Elasticsearch domain to which the tags are attached that you want to view.

- **xmlNameSpaceUri**
  
  Set `arn` to the `ARN` for the Elasticsearch domain to which the tags are attached that you want to view.

- **nonStreamingMembers**: [

The result of a `ListTags` operation. Contains tags for all requested Elasticsearch domains.

This is a convenience that creates an instance of the `{@link List<Tag>.Builder}` avoiding the need to create one manually via `{@link List<Tag>#builder()}`. When the `{@link Consumer}` completes, `{@link List<Tag>.Builder#build()}` is called immediately and its result is passed to `{@link #tagList(List<Tag>)}`.

Returns a reference to this object so that method calls can be chained together.

See `{@link #tagList(List<Tag>)}`
@param tagList List of <code>Tag</code> for the requested Elasticsearch domain.

@return Returns a reference to this object so that method calls can be chained together.

The log publishing options configured for the Elasticsearch domain.

The status of the log publishing options for the Elasticsearch domain. See OptionStatus for the status information that's included.

This is a convenience that creates an instance of the OptionStatus.Builder avoiding the need to create one manually via OptionStatus.Builder(). When the Consumer completes, OptionStatus.Builder#build() is called immediately and its result is passed to #status(OptionStatus).

Returns a reference to this object so that method calls can be chained together.

The status of the log publishing options for the Elasticsearch domain. See OptionStatus for the status information that's included.

The log publishing options configured for the Elasticsearch domain.
<code>OptionStatus</code> for the status information that's included.  

```java
@Param

public OptionStatus status() {
    return this.status;
}
```

The status of the log publishing options for the Elasticsearch domain. See <code>OptionStatus</code> for the status information that's included.

```java
public OptionStatus status() {
    return this.status;
}
```

The status of the log publishing options for the Elasticsearch domain. See <code>OptionStatus</code> for the status information that's included.

```java
public OptionStatus status() {
    return this.status;
}
```

The status of the log publishing options for the Elasticsearch domain. See <code>OptionStatus</code> for the status information that's included.

The payment option as defined in the reserved Elasticsearch instance offering.

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `StringBuilder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `#paymentOptionAs(String)`. Returns a reference to this object so that method calls can be chained together.

```
@see ReservedElasticsearchInstancePaymentOption#UNKNOWN_TO_SDK_VERSION}
```

The raw value returned by the service is available from `ReservedElasticsearchInstancePaymentOption#UNKNOWN_TO_SDK_VERSION`. The payment option as defined in the reserved Elasticsearch instance offering.
