* A regular expression for breaking a URI into its component parts.\n    * \n    * { @link
http://www.gbiv.com/protocols/uri/rfc/rfc3986.html#RFC2234 } says\n    * As the \"first-match-wins\" algorithm is
identical to the
\"greedy\" \n    * disambiguation method used by POSIX regular expressions, it is natural and\n    * commonplace
to use a regular expression for parsing the potential five\n    * components of a URI reference.\n    * \n    * The
following line is the regular expression for breaking-down a\n    * well-formed URI reference into its
components.\n    * \n    * <pre>\n    * ^([^\s:/#?+;:)?(?:/[^\s:/#?+;:)]?([^\s:/#?+;:)]?(\.?)?)? \n    * 12      3 4
5   6 7   8 9\n    * </pre>\n    * \n    * The numbers in the second line above are only to assist readability;
they\n    * indicate the reference points for each subexpression (i.e., each paired\n    * parenthesis). We refer to the
value matched for subexpression <n> as $<n>.\n    * For example, matching the above expression to\n    * <pre>\n
* http://www.ics.uci.edu/pub/ietf/uri/#Related\n    * </pre>\n    * results in the following subexpression
matches:\n    * <pre>\n    * $1 = http:\n
* $2 = http\n    * $3 = //www.ics.uci.edu\n    * $4 = www.ics.uci.edu\n    * $5 = /pub/ietf/uri/\n    * $6
= <undefined>\n    * $7 = <undefined>\n    * $8 = #Related\n    * $9 = Related\n    * </pre>\n    * where
<undefined> indicates that the component is not present, as is the\n    * case for the query component in the above
example. Therefore, we can\n    * determine the value of the five components as\n    * <pre>\n    * scheme =
$2\n    * authority = $4\n    * path = $5\n    * query = $7\n    * fragment = $9\n    * </pre>\n    * \n
* The regular expression has been modified slightly to expose the\n    * userInfo, domain, and port separately from
the authority.\n    * The modified version yields\n    * <pre>\n    * $1 = http      scheme\n    * $2 =
<undefined>      userInfo -\n    * $3 = www.ics.uci.edu      domain | authority\n    * $4 = <undefined>      port
-\n
* $5 = /pub/ietf/uri/      path\n    * $6 = <undefined>      query without ?\n    * $7 = Related      fragment
without #\n    * </pre>\n    * @internal\n    */\n    var _splitRe = new RegExp('^ +\n    '(?:' +\n    '([^\s:/#?+;:)]? +\n

code is:\n   * ```\n   * var _c1 = [AttributeMarker.Classes, 'foo', 'bar', 'baz'];\n   *
\n   * ```\n   *\n   * Classes = 1,\n\n   /**\n   * Signals style declaration.\n   *\n   * Each pair of values following `Styles`
designates a style name and value to include on the\n   * element.\n   * ## Example:\n   *\n   * Given:\n   * ```\n   *
<div style="width:100px; height:200px; color:red">...</div>\n   * ```\n   * the generated code is:\n   * ```\n   *
var _c1 = [AttributeMarker.Styles, 'width', '100px', 'height', '200px', 'color', 'red'];\n   *
\n   * ```\n   *\n   * Styles = 2,\n\n   /**\n   * Signals that the following attribute names were extracted from input or output bindings.\n   *\n   * For
example, given the following HTML:\n   *\n   * ```\n   * <div moo="car" [foo]="exp" (bar)="doSth()">\n   *
\n   * ```\n   * the generated code is:\n   * ```\n   * var _c1 = ['moo', 'car', AttributeMarker.Bindings, 'foo',
'bar'];\n   *
\n   * ```\n   *\n   * Bindings = 3,\n\n   /**\n   * Signals that the following attribute names were hoisted from an
inline-template declaration.\n   *\n

```

* For example, given the following HTML:

```
<div *ngFor="let value of values; trackBy:trackBy" dirA [dirB]="value">
```

the generated code for the `template()` instruction would include:

```
['dirA', AttributeMarker.Bindings, 'dirB', AttributeMarker.Template, 'ngFor', 'ngForOf', 'ngForTrackBy', 'let-value']
```

while the generated code for the `element()` instruction inside the template function would include:

```
['dirA', AttributeMarker.Bindings, 'dirB']
```

Template = 4, Signals that the following attribute is `ngProjectAs` and its value is a parsed `CssSelector`.

For example, given the following HTML:

```
<h1 attr="value" ngProjectAs="[title]">
```

the generated code for the `element()` instruction would include:

```
['attr', 'value', AttributeMarker.ProjectAs, ['title', '']]
```

ProjectAs = 5, Signals that the following attribute will be translated by runtime

For example, given the following HTML:

```
<div moo="car" foo="value" i18n-foo [bar]="binding" i18n-bar>
```

the generated code is:

```
var _c1 = ['moo', 'car', AttributeMarker.I18n, 'foo', 'bar'];
```

https://github.com/webcomponents/webcomponentsjs/blob/4efecd7e0e/src/ShadowCSS/ShadowCSS.js\n *\n * The
original file level comment is reproduced below\n */\n\n\n * This is a limited shim for ShadowDOM css styling.\n
https://dvcs.w3.org/hg/webcomponents/raw-file/tip/spec/shadow/index.html#styles\n\n The intention here is to
support only the styling features which can be\n relatively simply implemented. The goal is to allow users to avoid
the\n most obvious pitfalls and do so without compromising performance significantly.\n For ShadowDOM styling
that's not covered here, a set of best practices\n can be provided that should allow users to accomplish more
complex styling.\n\n The following is a list of specific ShadowDOM styling features and a brief\n discussion of the
approach used to shim.\n\n Shimmed features:\n\n * :host, :host-context: ShadowDOM allows styling of the

```

shadowRoot's

host element using the :host rule. To shim this feature, the :host styles are reformatted and prefixed with a given scope name and promoted to a document level stylesheet. For example, given a scope name of .foo, a rule like this: :host { background: red; } becomes: .foo { background: red; } \* encapsulation: Styles defined within ShadowDOM, apply only to dom inside the ShadowDOM. Polymer uses one of two techniques to implement this feature. By default, rules are prefixed with the host element tag name as a descendant selector. This ensures styling does not leak out of the 'top' of the element's ShadowDOM. For example, div { font-weight: bold; } becomes: x-foo div { font-weight: bold; } Alternatively, if WebComponents.ShadowCSS.strictStyling is set to true then selectors are scoped by adding an attribute selector suffix to each simple

selector that contains the host element tag name. Each element in the element's ShadowDOM template is also given the scope attribute. Thus, these rules match only elements that have the scope attribute. For example, given a scope name of x-foo, a rule like this: div { font-weight: bold; } becomes: div[x-foo] { font-weight: bold; } Note that elements that are dynamically added to a scope must have the scope selector added to them manually. \* upper/lower bound encapsulation: Styles which are defined outside a shadowRoot should not cross the ShadowDOM boundary and should not apply inside a shadowRoot. This styling behavior is not emulated. Some possible ways to do this that were rejected due to complexity and/or performance concerns include: (1) reset every possible property for every possible selector for a given scope name; (2) re-implement css in javascript. As an alternative, users should make

sure to use selectors specific to the scope in which they are working. \* ::distributed: This behavior is not emulated. It's often not necessary to style the contents of a specific insertion point and instead, descendants of the host element can be styled selectively. Users can also create an extra node around an insertion point and style that node's contents via descendent selectors. For example, with a shadowRoot like this: <style>::content(div) { background: red; } </style> <content></content> could become: <style> /\*@polyfill .content-container div \* ^::content(div) { background: red; } </style> <div class="content-container"> <content></content> </div> Note the use of @polyfill in the comment above a ShadowDOM specific style declaration. This is a directive to the styling shim to use the selector in comments in lieu of the next selector when

```
running under polyfill.
export class ShadowCss {
 strictStyling: boolean = true;
 constructor() {}
 /* Shim some cssText with the given selector. Returns cssText that can be included in the document via
 WebComponents.ShadowCSS.addCssToDocument(css).
 * When strictStyling is true:
 * - selector is the attribute added to all elements inside the host,
 * - hostSelector is the attribute added to the host itself.
 */

the runtime
for style/class bindings.\n *\n * Styling in Angular uses up two slots in the runtime LView/TData data structures
to\n * record binding data, property information and metadata.\n *\n * When a binding is registered it will place the

```

followed information in the `LView` slot 1) binding value slot 2) cached value (all other values collected before it in string form) When a binding is registered it will place the following information in the `TData` slot 1) prop name slot 2) binding index that points to the previous style/class binding (and some extra config values) Let's imagine we have a binding that looks like so:
 

```
<div [style.width]=`x` [style.height]=`y`>
 Our `LView` and `TData` data-structures look like so:
 typescript
 LView = {
 // ...
 x, // value of x
 "width: x",
 y, // value of y
 "width: x; height: y",
 // ...
 };
 TData = {
 // ...
 "width", // binding slot 20
 0,
 "height",
 20,
 // ...
 };

```

 A styling expression summary that is to be processed by the compiler
 

```

 export interface StylingInstruction {
 reference: o.ExternalReference;
 // Calls to individual styling instructions. Used when chaining calls to the same instruction.
 }
 export interface StylingInstructionCall {
 sourceSpan: ParseSourceSpan;
 supportsInterpolation: boolean;
 allocateBindingSlots: number;
 params: ((convertFn: (value: any) => o.Expression | o.Expression[]) => o.Expression[]);
 }

```

 An internal record of the input data for a styling binding
 

```

 interface BoundStylingEntry {
 hasOverrideFlag: boolean;
 name: string;
 suffix: string;
 sourceSpan: ParseSourceSpan;
 value: AST;
 }

```

 Produces creation/update instructions for all styling bindings (class and style) It also produces the creation instruction to register all initial styling values (which are all the static class="..." and style="..." attribute values that exist on an element within a template). The builder class below handles producing instructions for the following cases:
 

- Static style/class attributes (style="..." and class="...")
- Dynamic style/class map bindings ([style]="map" and [class]="map|string")
- Dynamic style/class property bindings ([style.prop]="exp" and [class.name]="exp")

 Due to the complex relationship of all of these cases, the instructions generated for these attributes/properties/bindings must be done so in the correct order. The order which these must be generated is as follows:
 

```

 if (createMode) {
 styling(...)
 }
 if (updateMode) {
 styleMap(...)
 classMap(...)
 styleProp(...)
 classProp(...)
 }

```

 The creation/update methods within the builder class produce these instructions.
 

```

properties, and events.\\n *\\n * ## Overview\\n *\\n * Each line represents one kind of element. The
`element_inheritance` and properties are joined\\n * using `element_inheritance|properties` syntax.\\n *\\n * ##
Element Inheritance\\n *\\n * The `element_inheritance` can be further subdivided as
`element1,element2,...^parentElement`.\\n * Here the individual elements are separated by

```

`,` (commas). Every element in the list\n * has identical properties.\n * An `element` may inherit additional properties from `parentElement` If no `parentElement` is\n * specified then `""` (blank) element is assumed.\n * NOTE: The blank element inherits from root `[Element]` element, the super element of all\n * elements.\n * NOTE an element prefix such as `:svg:` has no special meaning to the schema.\n * ## Properties\n * Each element has a set of properties separated by`,` (commas). Each property can be prefixed\n * by a special character designating its type:\n * - (no prefix): property is a string.\n * - `*`: property represents an event.\n * - `!`: property is a boolean.\n * - `#`: property is a number.\n * - `%`: property is an object.\n * ## Query\n * The class creates an internal squas representation which allows to easily answer the query of\n * if a given property exist on a given element.\n * NOTE: We don't yet support querying for types or events.\n * NOTE: This schema is auto extracted from `schema_extractor.ts` located in the test folder,\n * see dom_element_schema_registry_spec.ts\n */

Any component may be omitted as either null or\n \* undefined.\n \*\n \* @param opt\_scheme The scheme such as 'http'.\n \* @param opt\_userInfo The user name before the '@'.  
 \* @param opt\_domain The domain such as 'www.google.com', already\n \* URI-encoded.  
 \* @param opt\_port The port number.  
 \* @param opt\_path The path, already URI-encoded. If it is not\n \* empty, it must begin with a slash.  
 \* @param opt\_queryData The URI-encoded query data.  
 \* @param opt\_fragment The URI-encoded fragment identifier.  
 \* @return The fully combined URI.\n \*\nfunction \_buildFromEncodedParts(\n opt\_scheme?: string, opt\_userInfo?: string, opt\_domain?: string, opt\_port?: string,\n opt\_path?: string, opt\_queryData?: string, opt\_fragment?: string): string {\n const out: string[] = [];\n if (opt\_scheme != null) {\n out.push(opt\_scheme + ':');\n }\n if (opt\_domain != null) {\n out.push('/');\n if (opt\_userInfo != null) {\n out.push(opt\_userInfo + '@');\n }\n out.push(opt\_domain);\n if (opt\_port != null) {\n out.push(': ' + opt\_port);\n }\n }\n if (opt\_path != null) {\n out.push(opt\_path);\n }\n if (opt\_queryData != null) {\n out.push('? ' + opt\_queryData);\n }\n if (opt\_fragment != null) {\n out.push('# ' + opt\_fragment);\n }\n return out.join('');\n}\n\n\*\*\n \* A regular expression for breaking a URI into its component parts.\n \*\n \* { @link http://www.gbiv.com/protocols/uri/rfc/rfc3986.html#RFC2234 } says\n \* As the "first-match-wins" algorithm is identical to the "greedy"\n \* disambiguation method used by POSIX regular expressions, it is natural and\n \* commonplace to use a regular expression for parsing the potential five\n \* components of a URI reference.\n \*\n \* The following line is the regular expression for breaking-down a\n \* well-formed URI reference into its components.\n \*\n

```
\n^(?:[^\?#]+):(?:/[^\?#]*)?(?:[^\?#]*(?:[^\?#]*)?(\#(?:.)*))?\n 1 2 3 4 5 6 7 8 9
```

\n\n \* The numbers in the second line above are only to assist readability; they\n \* indicate the reference points for each subexpression (i.e., each paired\n \* parenthesis). We refer to the value matched for subexpression <n> as \$<n>.\n \*\n \* For example, matching the above expression to\n \* 

```
http://www.ics.uci.edu/pub/ietf/uri/#Related
```

\n \* results in the following subexpression matches:\n \* 

```
$1 = http $2 = http $3 = //www.ics.uci.edu $4 = /pub/ietf/uri/ $5 = <undefined> $6 = <undefined> $7 = <undefined> $8 = #Related $9 = Related
```

\n \* where <undefined> indicates that the component is not present, as is the\n \* case for the query component in the above example. Therefore, we can\n \* determine the value of the five components as\n \* 

```
scheme = $2 authority = $4 path = $5 query = $7 fragment = $9
```

\n \* The regular expression has been modified slightly to expose the\n \* userInfo, domain, and port separately from the authority.\n \* The modified version yields\n \* 

```
$1 = http scheme $2 = <undefined> userInfo = $3 = www.ics.uci.edu domain | authority $4 = <undefined> port = $5 = /pub/ietf/uri/ path $6 = <undefined> query without $7 = Related fragment without # $8 = <pre>\n * @internal\n *const _splitRe = new RegExp(\n '^ +\n '(?: +\n '([^\?#]+)' + // scheme\n - ignore special characters\n // used by other URL parts such as :, // ?, /, #, and .\n ')?' +\n '?(?:/ +\n '?(?:[^\?#]*)@'? +\n // userInfo\n '([\\\\\\\\w\\\\\\\\d\\\\\\\\-\\\\\\\\u0100-\\\\\\\\uffff.%]*)' + // domain - restrict to letters,\n // digits, dashes, dots, percent\n // escapes, and unicode characters.\n '?(?:([0-9]+))?' +\n // port\n ')?' +\n '([^\?#]+)?' +\n // path\n '?(?:[^\?#]*(?:[^\?#]*)?)?' +\n // query\n '?(#(?:.)*)' +\n // fragment\n '$');\n
```

\n\n \* The index of each URI component in the return value of goog.uri.utils.split.\n \* @enum {number}\n \*/\nenum \_ComponentIndex {\n Scheme = 1,\n UserInfo,\n Domain,\n Port,\n Path,\n QueryData,\n Fragment\n}\n\n\*\*\n \* Splits a URI into its component parts.\n \*\n \* Each component can be accessed via the component indices; for example:\n \* 

```
goog.uri.utils.split(someStr)[goog.uri.utils.ComponentIndex.QUERY_DATA];
```

\n \* @param uri The URI string to examine.\n \* @return Each component still URI-encoded. Each component that is present will

contain the encoded value, whereas components that are not present will be undefined or empty, depending on the browser's regular expression implementation. Never null, since arbitrary strings may still look like path names.
