    * Creates a token that can be used in a DI Provider.\n     *\n     * Use an `InjectionToken` whenever the type you are
    injecting is not reified (does not have a\n     * runtime representation) such as when injecting an interface, callable
    type, array or\n     * parameterized type.\n     *\n     * `InjectionToken` is parameterized on `T` which is the type of
    object which will be returned by\n     * the `Injector`. This provides additional level of type safety.\n     *\n     * ``\n
    * interface MyInterface {...}\n     * var myInterface = injector.get(new
    InjectionToken<MyInterface>('SomeToken'));\n     * // myInterface is inferred to be MyInterface.\n     * ``\n     *\n
    * When creating an `InjectionToken`, you can optionally specify a factory function which returns\n     * (possibly
    by creating) a default value of the parameterized type `T`. This sets
    up the\n     * `InjectionToken` using this factory as a provider as if it was defined explicitly in the\n     *
    application's root injector. If the factory function, which takes zero arguments, needs to inject\n     * dependencies, it
    can do so using the `inject` function. See below for an example.\n     *\n     * Additionally, if a `factory` is specified
    you can also specify the `providedIn` option, which\n     * overrides the above behavior and marks the token as
    belonging to a particular `@NgModule`. As\n     * mentioned above, `root` is the default value for `providedIn`.\n
    *\n     * @usageNotes\n     * ### Basic Example\n     *\n     * ### Plain InjectionToken\n     *\n     * { @example
    core/di/ts/injector_spec.ts region='InjectionToken'}\n     *\n     * ### Tree-shakable InjectionToken\n     *\n     *

safe.\n    * This regular expression matches a subset of URLs that will not cause script\n    * execution if
used in URL context within a HTML document. Specifically, this\n    * regular expression matches if (comment
from here on and regex copied from\n    * Soy's EscapingConventions):\n    * (1) Either an allowed protocol (http,
https, mailto or ftp).\n    * (2) or no protocol.

    A protocol must be followed by a colon. The below\n    * allows that by allowing colons only after one of the
characters [/?#].\n    * A colon after a hash (#) must be in the fragment.\n    * Otherwise, a colon after a (?)
must be in a query.\n    * Otherwise, a colon after a single solidus (/) must be in a path.\n    * Otherwise, a
colon after a double solidus (//) must be in the authority\n    * (before port).\n    * The pattern disallows &,
used in HTML entity declarations before\n    * one of the characters in [/?#]. This disallows HTML entities used in
the\n    * protocol name, which should never happen, e.g. \"h&#116;tp\" for \"http\".\n    * It also disallows HTML
entities in the first path part of a relative path,\n    * e.g. \"foo&lt;bar/baz\". Our existing escaping functions should
not produce\n    * that. More importantly, it disallows masking of a colon,\n    * e.g. \"javascript&#58;...\".\n
   *\n   * This regular expression
was taken from the Closure sanitization library.\n   */\n   var SAFE_URL_PATTERN =

/** \n * Each injector is saved in 9 contiguous slots in `LView` and 9 contiguous slots in \n * `TView.data`. This
allows us to store information about the current node's tokens (which \n * can be shared in `TView`) as well as the
tokens of its ancestor nodes (which cannot be \n * shared, so they live in `LView`). \n * \n * Each of these slots
(aside from the last slot) contains a bloom filter. This bloom filter \n * determines whether a directive is available
on the associated node or not. This prevents us \n * from searching the directives array at this level unless it's
probable the directive is in it. \n * \n * See: https://en.wikipedia.org/wiki/Bloom_filter for more about bloom
filters. \n * \n * Because all injectors have been flattened into `LView` and `TViewData`, they cannot typed \n
* using interfaces as they were previously.

The start index of each `LInjector` and `TInjector` \n * will differ based on where it is flattened into the main
array, so it's not possible to know \n * the indices ahead of time and save their types here. The interfaces are still
included here \n * for documentation purposes. \n * \n * export interface LInjector extends Array<any> { \n

*\n * \n function noProviderError(injector, key) {\n return injectionError(injector, key, function (keys) {\n
var first = stringify(keys[0].token);\n return `No provider for ` + first + `!` +
constructResolvingPath(keys);\n });\n }\n /**\n * Thrown when dependencies form a cycle.\n * \n *
@usageNotes\n * ### Example\n * \n * ```typescript\n * var injector = Injector.resolveAndCreate([\n *
{provide: `one`, useFactory: (two) => `two`, deps: [[new Inject(`two`)]],\n * {provide: `two`,
useFactory: (one) => `one`, deps: [[new Inject(`one`)]],\n *]);\n * \n * expect(() =>
injector.get(`one`)).toThrowError();\n * ```\n * \n * Retrieving `A`
or `B` throws a `CyclicDependencyError` as the graph above cannot be constructed.\n * \n function
cyclicDependencyError(injector, key) {\n return injectionError(injector, key, function (keys) {\n return
`Cannot instantiate cyclic dependency!` + constructResolvingPath(keys);\n });\n }\n /**\n * Thrown
when a constructing type returns with an Error.\n * \n * The `InstantiationError` class contains the original error
plus the dependency graph which caused\n * this object to be instantiated.\n * \n * @usageNotes\n * ###
Example\n * \n * ```typescript\n * class A {\n * constructor() {\n * throw new Error('message');\n *
}\n * }\n * \n * var injector = Injector.resolveAndCreate([A]);\n * \n * try {\n * injector.get(A);\n *
}\n * catch (e) {\n * expect(e instanceof InstantiationError).toBe(true);\n *
expect(e.originalException.message).toEqual(`message`);\n *
expect(e.originalStack).toBeDefined();\n * }\n * ```\n * \n function instantiationError(injector,
originalException, originalStack, key) {\n return injectionError(injector, key, function (keys) {\n var first
= stringify(keys[0].token);\n return originalException.message + `: Error during instantiation of ` + first +
`!` + constructResolvingPath(keys) + `.`;\n }, originalException);\n }\n /**\n * Thrown when an

```

```

object other than { @link Provider } (or `Type`) is passed to { @link Injector}
 * creation.
 *
 * @usageNotes
 * ### Example
 * ```typescript
 * expect(() => Injector.resolveAndCreate(["not a
type"]))toThrowError();
 * ```
 * /
 * function invalidProviderError(provider) {
 * return Error("Invalid
provider - only instances of Provider and Type are allowed, got: " + provider);
 * }
 * /**
 * Thrown when the
class has no annotation information.
 *
 * Lack of annotation information prevents the { @link Injector} from determining which dependencies
 * need to be injected into the constructor.
 *
 * @usageNotes
 * ### Example
 * ```typescript
 * class A {
 * constructor(b) {}
 * }
 * expect(() =>
Injector.resolveAndCreate([A])).toThrowError();
 * ```
 * This error is also thrown when the class not
marked with { @link Injectable} has parameter types.
 * ```typescript
 * class B {}
 * class A
{
 * constructor(b:B) {} // no information about the parameter types of A is available at runtime.
 * }
 * expect(() => Injector.resolveAndCreate([A,B])).toThrowError();
 * ```
 * /
 * function
noAnnotationError(typeOrFunc, params) {
 * var signature = [];
 * for (var i = 0, ii = params.length; i < ii;
i++) {
 * var parameter = params[i];
 * if (!parameter
|| parameter.length == 0) {
 * signature.push('?');
 * } else {
 * signature.push(parameter.map(stringify).join(' '));
 * }
 * }
 * return Error('Cannot resolve all
parameters for \'' + stringify(typeOrFunc) + '\'' +
signature.join(', ') + ').' +
'Make sure that all the
parameters are decorated with Inject or have valid type annotations and that \'' +
stringify(typeOrFunc) +
'\'' is decorated with Injectable.');
```

```

 * }
 * /**
 * Thrown when getting an object by index.
 *
 * @usageNotes
 * ### Example
 * ```typescript
 * class A {}
 * var injector =
Injector.resolveAndCreate([A]);
 * expect(() => injector.getAt(100)).toThrowError();
 * ```
 * /
 * function outOfBoundsError(index) {
 * return Error("Index " + index + " is out-of-bounds.");
 * }
 * // TODO: add a working example
 *
 * after alpha38 is released
 * /**
 * Thrown when a multi provider and a regular provider are bound to the same
token.
 *
 * @usageNotes
 * ### Example
 * ```typescript
 * expect(() =>
Injector.resolveAndCreate([
 * { provide: "Strings", useValue: "string1", multi: true },
 * { provide:
"Strings", useValue: "string2", multi: false }
 *])).toThrowError();
 * ```
 * /
 * function
mixingMultiProvidersWithRegularProvidersError(provider1, provider2) {
 * return Error("Cannot mix multi
providers and regular providers, got: " + provider1 + " " + provider2);
 * }

The purpose of this code is to create a linked list so that the\n * instructions can be traversed in priority order when computing the styles.\n *\n * Assume we are dealing with the following code:\n * ```\n * @Component({\n * template: `\n * <my-cmp [style]=" {color: '#001'}" \n * [style.color]=" #002" \n * dir-style-color-1\n * dir-style-color-2>\n * `})\n * class ExampleComponent {\n * static ngComp = ... {\n * ...\n * }\n * }\n * })\n * ```\n * Compiler ensures that\n * `styleProp` is after `styleMap`\n * styleMap({color: '#001'});\n * styleProp('color', '#002');\n * ...\n * }\n * }\n * @Directive({\n * selector: `[dir-style-color-1]`,\n * })\n * class Style1Directive {\n * @HostBinding('style') style = {color: '#005'};\n * @HostBinding('style.color') color = '#006';\n * }\n * static ngDir = ... {\n * ...\n * }\n * // Compiler ensures that `styleProp` is after `styleMap`\n * styleMap({color: '#005'});\n * styleProp('color', '#006');\n * ...\n * }\n * }\n * @Directive({\n * selector: `[dir-style-color-2]`,\n * })\n * class Style2Directive {\n * @HostBinding('style') style = {color: '#007'};\n * @HostBinding('style.color') color = '#008';\n * }\n * static ngDir = ... {\n * ...\n * }\n * // Compiler ensures that `styleProp` is after `styleMap`\n * styleMap({color: '#007'});\n * styleProp('color', '#008');\n * ...\n * }\n * }\n * @Directive({\n * selector: `[my-cmp]`,\n * })\n * class MyComponent {\n * @HostBinding('style') style = {color: '#003'};\n * @HostBinding('style.color') color = '#004';\n * }\n * static ngComp = ... {\n * ...\n * }\n * // Compiler ensures that `styleProp` is after `styleMap`\n * styleMap({color: '#003'});\n * styleProp('color', '#004');\n * ...\n * }\n * }\n * ```\n * The Order of instruction execution is:\n * \n * NOTE: the comment binding location is for illustrative purposes only.\n * \n * ```\n * // Template:\n * (ExampleComponent)\n * styleMap({color: '#001'}); // Binding index: 10\n * styleProp('color', '#002'); // Binding index: 12\n * // MyComponent\n * styleMap({color: '#003'}); // Binding index: 20\n * styleProp('color', '#004'); // Binding index: 22\n * // Style1Directive\n * styleMap({color: '#005'}); // Binding index: 24\n * styleProp('color', '#006'); // Binding index: 26\n * // Style2Directive\n * styleMap({color: '#007'}); // Binding index: 28\n * styleProp('color', '#008'); // Binding index: 30\n * ```\n * \n * The correct priority order of concatenation is:\n * \n * ```\n * // MyComponent\n * styleMap({color: '#003'}); // Binding index: 20\n * styleProp('color', '#004'); // Binding index: 22\n * // Style1Directive\n * styleMap({color: '#005'}); // Binding index: 24\n * styleProp('color', '#006'); // Binding index: 26\n * // Style2Directive\n * styleMap({color: '#007'}); // Binding index: 28\n * styleProp('color', '#008'); // Binding index: 30\n * // Template: (ExampleComponent)\n * styleMap({color: '#001'});\n * styleProp('color', '#002'); // Binding index: 12\n * ```\n * \n * What color should be rendered?\n * \n * Once the items are correctly sorted in the list, the answer is simply the last item in the\n * concatenation list which is `#002`.\n * \n * To do so we keep a linked list of all of the bindings which pertain to this element.\n * \n * Notice that the bindings are inserted in the order of execution, but the `TVView.data` allows\n * us to traverse them in the order of priority.\n * \n * |Idx|`TVView.data`|`LView`| Notes\n * \n

```

|---|-----|-----|-----\n * |...| | \n * |10 |`null` |`{color: '#001'}\`
`styleMap('color', {color: '#001'})`\n * |11 |30 |12` |... \n * |12 |`color` |`'#002` |
`styleProp('color', '#002')`\n * |13 |10 |0` |... \n * |...| |
\n * |20 |`null` |`{color: '#003'}\`|`styleMap('color', {color: '#003'})`\n * |21 |0 |22` |...
\n * |22 |`color` |`'#004` |`styleProp('color', '#004')`\n * |23 |20 |24` |... \n * |24 |`null`
|`{color: '#005'}\`|`styleMap('color', {color: '#005'})`\n * |25 |22 |26` |... \n * |26 |`color` |`'#006`
|`styleProp('color', '#006')`\n * |27 |24 |28` |... \n * |28 |`null` |`{color: '#007'}\`|
`styleMap('color', {color: '#007'})`\n * |29 |26 |30` |... \n * |30 |`color` |`'#008` |
`styleProp('color', '#008')`\n * |31 |28 |10` |... \n * \n * The above data structure allows us to re-
concatenate the styling no matter which data binding\n * changes.\n * \n * NOTE: in addition to keeping
track of next/previous index the `TVView.data` also stores prev/next\n
* duplicate bit. The duplicate bit if true says there either is a binding with the same name or\n * there is a map
(which may contain the name). This information is useful in knowing if other\n * styles with higher priority need
to be searched for overwrites.\n * \n * NOTE: See `should support example in 'tNode_linked_list.ts'
documentation` in\n * `tNode_linked_list_spec.ts` for working example.\n * \n var
__unused_const_as_closure_does_not_like_standalone_comment_blocks__;\n /**\n * Insert new `tStyleValue`
at `TData` and link existing style bindings such that we maintain linked\n * list of styles and compute the
duplicate flag.\n * \n * Note: this function is executed during `firstUpdatePass` only to populate the

if another style binding in the list has the same\n                * `TStyleValue`.\n                *\n                * NOTE: this function is intended to
be called twice once with `isPrevDir` set to `true` and once\n                * with it set to `false` to search both the previous as
well as next items in the list.\n                *\n                * No duplicate case\n                * ```\n                * [style.color]\n                * [style.width.px]\n
<<- index\n                * [style.height.px]\n
                * ```\n                * In the above case adding `[style.width.px]` to the existing `[style.color]` produces no\n                *
duplicates because `width` is not found in any other part of the linked list.\n                *\n                * Duplicate case\n                * ```\n
                * [style.color]\n                * [style.width.em]\n                * [style.width.px] <<- index\n                * ```\n                * In the above case adding
`[style.width.px]` will produce a duplicate with `[style.width.em]`\n                * because `width` is found in the chain.\n
                *\n                * Map case 1\n                * ```\n                * [style.width.px]\n                * [style.color]\n                * [style] <<- index\n                * ```\n                *
In the above case adding `[style]` will produce a duplicate with any other bindings because\n                * `[style]` is a Map
and as such is fully dynamic and could produce `color` or `width`.\n                *\n                * Map case 2\n                * ```\n                * [style]\n
                * [style.width.px]\n                * [style.color] <<- index\n                * ```\n                * In the above case adding `[style.color]` will
produce
a duplicate because there is already a\n                * `[style]` binding which is a Map and as such is fully dynamic and could
produce `color` or\n                * `width`.\n                *\n                * NOTE: Once `[style]` (Map) is added into the system all things are
mapped as duplicates.\n                * NOTE: We use `style` as example, but same logic is applied to `class`es as well.\n

            does not seem to be a styling instruction in the `template`.
            return undefined;
        }
        return
        tData[getTStylingRangePrev(bindings)];
    }
    /**
    * Update the `TStylingKey` of the first template
    instruction in `TNode`.
    * Logically `hostBindings` styling instructions are of lower priority than that of
    the template.
    * However, they execute after the template styling
    instructions. This means that they get inserted
    * in front of the template styling instructions.
    * If we
    have a template styling instruction and a new `hostBindings` styling instruction is
    * executed it means that it
    may need to steal static fields from the template instruction. This
    * method allows us to update the first template
    instruction `TStylingKey` with a new value.
    * Assume:
    * ```
    * <div my-dir style="color: red"
    [style.color]="tmplExp"></div>
    * @Directive({
    *   host: {
    *     'style': 'width: 100px',
    *     '[style.color]': 'dirExp',
    *   }
    * })
    * class MyDir {}
    * ```
    * when
    `[style.color]="tmplExp"` executes it creates this data structure.
    * ```
    * [, 'color', 'color', 'red', 'width',
    '100px'],
    * ```
    * The reason for this is that the template instruction does not know if there are
    styling
    * instructions
    and must assume that there are none and must collect all of the static styling.
    * (both
    * `color` and
    `width`)
    * When `[style.color]': 'dirExp'` executes we need to insert a new data into the linked list.
    * ```
    * [, 'color', 'width', '100px'], // newly inserted
    * [, 'color', 'color', 'red', 'width', '100px'], // this is
    wrong
    * ```
    * Notice that the template statics is now wrong as it incorrectly contains `width` so we
    need to
    * update it like so:
    * ```
    * [, 'color', 'width', '100px'],
    * [, 'color', 'color', 'red'], //
    UPDATE
    * ```

`previousTNodes` list and update relevant `TNode`s in `previousTNodes` list\n * `tNode.insertBeforeIndex`.\n
*\n * Things to keep in mind:\n * 1. All i18n text nodes are encoded as `TNodeType.Element` and are created
eagerly by the\n * `i18nStart` instruction.\n * 2. All `TNodeType.Placeholder` `TNodes` are elements which
will be created later by\n * `elementStart`
instruction.\n * 3. `elementStart` instruction will create `TNode`s in the ascending `TNode.index` order. (So a\n
* smaller index `TNode` is guaranteed to be created before a larger one)\n *\n * We use the above three

```

invariants to determine `TNode.insertBeforeIndex`. In an ideal world `TNode.insertBeforeIndex` would always be `TNode.next.index`. However, this will not work because `TNode.next.index` may be larger than `TNode.index` which means that the next node is not yet created and therefore we can't insert in front of it.

Rule1: `TNode.insertBeforeIndex = null` if `TNode.next === null` (Initial condition, as we don't know if there will be further `TNode`s inserted after.)

Rule2: If `previousTNode` is created after the `tNode` being inserted, then `previousTNode.insertBeforeNode = tNode.index` (So when a new `tNode` is added we check previous to see if we can update its `insertBeforeTNode`)

See `TNode.insertBeforeIndex` for more context.

@param previousTNodes A list of previous TNodes so that we can easily traverse `TNode`s in reverse order. (If `TNode` would have `previous` this would not be necessary.)

@param newTNode A TNode to add to the `previousTNodes` list.

```
function addTNodeAndUpdateInsertBeforeIndex(previousTNodes,
newTNode) {
 // Start with Rule1
 ngDevMode && assertEqual(newTNode.insertBeforeIndex,

Resolves the providers which are defined in the DirectiveDef. \n * \n * When inserting the tokens and the
factories in their respective arrays, we can assume that \n * this method is called first for the component (if any),
and then for other directives on the same \n * node. \n * As a consequence, the providers are always processed in
that order: \n * 1) The view providers of the component \n
 * 2) The providers of the component \n * 3) The providers of the other directives \n * This matches the
structure of the injectables arrays of a view (for each node). \n * So the tokens and the factories can be pushed at
the end of the arrays, except \n * in one case for multi providers. \n * \n * @param def the directive
definition \n * @param providers: Array of `providers`. \n * @param viewProviders: Array of
`viewProviders`. \n * \n * function providersResolver(def, providers, viewProviders) { \n var tView =

(Short
circuit of nothing dirty)\n *\n * Use case: `[a, a] => [b, a, a]`\n *\n * If we did not have this
check then the insertion of `b` would:\n * 1) evict first `a`\n * 2) insert `b` at `0` index.\n * 3)
leave `a` at index `1` as is. <-- this is wrong!\n * 3) reinsert `a` at index 2. <-- this is wrong!\n *\n *
The correct behavior is:\n * 1) evict first `a`\n * 2) insert `b` at `0`
index.\n * 3) reinsert `a` at index 1.\n * 3) move `a` at from `1` to `2`.\n *\n *\n *
Double check that we have not evicted a duplicate item. We need to check if the item type may\n * have
already been removed:\n * The insertion of b will evict the first 'a'. If we don't reinsert it now it will be
reinserted\n * at the end. Which will show up as the two 'a's switching position. This is incorrect, since a\n
* better way to think of it is as insert of 'b' rather than switch 'a' with 'b' and then add 'a'\n * at the end.\n
