 * Takes an array of {@link
 IterableDifferFactory}
 and returns a provider used to extend the
 * inherited {@link IterableDiffers} instance with the provided
 factories and return a new
 * {@link IterableDiffers} instance.
 */
 @usageNotes
 ###
 Example
 * The following example shows how to extend an existing list of factories,
 * which will only be applied to the injector for this component and its children.
 * This step is all that's required to make a new {@link IterableDiffer} available.
 * ``
 * @Component({
 * viewProviders: [
 * IterableDiffers.extend([new ImmutableListDiffer()])
 *])
 * })
 * ``
 *
 * IterableDiffers.extend = function (factories) {
 * return {
 * provide:
 IterableDiffers,
 * useFactory: function (parent) {
 * if (!parent) {
 * // Typically would occur
 * when calling IterableDiffers.extend inside of dependencies passed
 * // to bootstrap(), which would override default pipes instead of extending them.
 * throw new Error('Cannot
 * extend IterableDiffers without a parent injector');
 * }
 * return
 IterableDiffers.create(factories, parent);
 * },
 * // Dependency technically isn't optional, but we
 * can provide a better error message this way.
 * deps: [[IterableDiffers, new SkipSelf(), new Optional()]]
 * };
 * };
 *
 * IterableDiffers.prototype.find = function (iterable) {
 * var factory =
 this.factories.find(function (f) { return f.supports(iterable); });
 * if (factory != null) {
 * return
 * factory;
 * }
 * else {
 * throw new Error("Cannot find a differ supporting object " + iterable
 * + " of type " +
 * getTypeNameForDebugging(iterable) + "`");
 * }
 * return IterableDiffers;
 * }();
 /**
 @nocollapse
 *
 * IterableDiffers.prov = defineInjectable({
 * token: IterableDiffers,
 * providedIn: 'root',
 * factory: function () { return new IterableDiffers([new DefaultIterableDifferFactory()]); },
 * function
 * getTypeNameForDebugging(type) { return type['name'] || typeof type; }

detection functionality.\n * A change-detection tree collects all views that are to be checked for changes.\n *
Use the methods to add and remove views from the tree, initiate change-detection,\n * and explicitly mark views
as _dirty_, meaning that they have changed and need to be re-rendered.\n * \n * @see [Using change detection
hooks](guide/lifecycle-hooks#using-change-detection-hooks)\n * @see [Defining custom change
detection](guide/lifecycle-hooks#defining-custom-change-detection)\n * \n * @usageNotes\n * \n * The
following examples demonstrate how to modify default change-detection behavior\n * to perform explicit

```

detection when needed.

```

 * ## Use `markForCheck()` with `CheckOnce` strategy
 * The following example sets the `OnPush` change-detection strategy for a component
 * (`CheckOnce`, rather than the default `CheckAlways`), then forces a second check
 * after an interval. See [live demo](http://plnkr.co/edit/GC512b?p=preview).
 * <code-example path="core/ts/change_detect/change-detection.ts"
 * region="mark-for-check">
 * ## Detach change detector to limit how often check occurs
 * The following example defines a component with a large list of read-only
 * data that is expected to change constantly, many times per second.
 * To improve performance, we want to check and update the list
 * less often than the changes actually occur. To do that, we detach
 * the component's change detector and perform an explicit local check every five seconds.
 * <code-example path="core/ts/change_detect/change-detection.ts"
 * region="detach">
 * ## Reattaching a detached component
 * The following example creates a component displaying live data.
 * The component detaches its change detector from the main change detector tree
 * when the `live` property is set to false, and reattaches it when the property
 * becomes true.
 * <code-example path="core/ts/change_detect/change-detection.ts"
 * region="reattach">

ngAfterContentCheck, ngAfterContentInit,\n // ngAfterViewCheck, and ngAfterViewInit lifecycle hooks
(depending on the node\n // flags in lifecycle). Unlike ngDoCheck, ngOnChanges and ngOnInit, which are\n //
called during a pre-order traversal of the view tree (that is calling the\n // parent hooks before the child hooks)

```

these events are sent in using a\n // post-order traversal of the tree (children before parents). This changes the\n // meaning of initIndex in the view state. For ngOnInit, initIndex tracks the\n // expected nodeIndex which a ngOnInit should be called. When sending\n // ngAfterContentInit and ngAfterViewInit it is the expected count of\n // ngAfterContentInit or ngAfterViewInit methods that have been called. This\n // ensure that despite being called recursively or after picking up after an\n // exception, the ngAfterContentInit or ngAfterViewInit will be called on the\n // correct nodes. Consider for example, the following (where E is an element\n // and D is a directive)\n // Tree: pre-order index post-order index\n // E1 0 6\n // E2 1 1\n // D3 2 0\n // E4 3 5\n // E5 4 4\n // E6 5 2\n // E7 6 3\n // As can be seen, the post-order index has an unclear relationship to the\n // pre-order index (postOrderIndex === preOrderIndex - parentCount +\n // childCount). Since number of calls to ngAfterContentInit and ngAfterViewInit\n // are stable (will be the same for the same view regardless of exceptions or\n // recursion) we just need to count them which will roughly correspond to the\n // post-order index (it skips elements and directives that do not have\n // lifecycle hooks).\n //\n // For example, if an exception is raised in the E6.onAfterViewInit() the\n // initIndex is left at 3 (by shouldCallLifecycleInitHook() which set it to\n // initIndex + 1). When checkAndUpdateView() is called again D3, E2 and E6 will\n // not have their ngAfterViewInit() called but, starting with E7, the rest of\n // the view will begin getting ngAfterViewInit() called until a check and\n // pass is complete.\n //\n // This algorithm also handles recursion. Consider if E4's ngAfterViewInit()\n // indirectly calls E1's ChangeDetectorRef.detectChanges(). The expected\n // initIndex is set to 6, the recursive checkAndUpdateView() starts walk again.\n // D3, E2, E6, E7, E5 and E4 are skipped, ngAfterViewInit() is called on E1.\n // When the recursion returns the initIndex will be 7 so E1 is skipped as it\n // has already been called in the recursively called checkAnUpdateView().\n // function callLifecycleHooksChildrenFirst(view, lifecycles) {\n // if (!(view.def.nodeFlags & lifecycles)) {\n // return;\n // }\n // var nodes = view.def.nodes;\n // var initIndex = 0;\n // for (var i = 0; i < nodes.length; i++) {\n // var nodeDef = nodes[i];\n // var parent = nodeDef.parent;\n // if (!parent && nodeDef.flags & lifecycles) {\n // // matching root node (e.g. a pipe)\n // callProviderLifecycles(view, i, nodeDef.flags & lifecycles, initIndex++);\n // }\n // if ((nodeDef.childFlags & lifecycles) === 0) {\n // // no child matches one of the lifecycles\n // i += nodeDef.childCount;\n // }\n // while (parent && (parent.flags & 1 /\* TypeElement \*/) && i === parent.nodeIndex + parent.childCount) {\n // // last child of an element\n // if (parent.directChildFlags & lifecycles) {\n // initIndex = callElementProvidersLifecycles(view, parent, lifecycles, initIndex);\n // }\n // parent = parent.parent;\n // }\n // }\n // function callElementProvidersLifecycles(view, elDef, lifecycles, initIndex) {\n // for (var i = elDef.nodeIndex + 1; i <= elDef.nodeIndex + elDef.childCount; i++) {\n // var nodeDef = view.def.nodes[i];\n // if (nodeDef.flags & lifecycles) {\n // callProviderLifecycles(view, i, nodeDef.flags & lifecycles, initIndex++);\n // }\n // // only visit direct children\n // i += nodeDef.childCount;\n // }\n // return initIndex;\n // }\n // function callProviderLifecycles(view, index, lifecycles, initIndex) {\n // var providerData = asProviderData(view, index);\n // if (!providerData) {\n // return;\n // }\n // var provider = providerData.instance;\n // if (!provider) {\n // return;\n // }\n // Services.setCurrentNode(view, index);\n // if (lifecycles & 1048576 /\* AfterContentInit \*/ && !shouldCallLifecycleInitHook(view, 512 /\* InitState\_CallingAfterContentInit \*/, initIndex)) {\n // provider.ngAfterContentInit();\n // }\n // if (lifecycles & 2097152 /\* AfterContentChecked \*/) {\n // provider.ngAfterContentChecked();\n // }\n // if (lifecycles & 4194304 /\* AfterViewInit \*/ && !shouldCallLifecycleInitHook(view, 768 /\* InitState\_CallingAfterViewInit \*/, initIndex)) {\n // provider.ngAfterViewInit();\n // }\n // if (lifecycles & 8388608 /\* AfterViewChecked \*/) {\n // provider.ngAfterViewChecked();\n // }\n // if (lifecycles & 131072 /\* OnDestroy \*/) {\n // provider.ngOnDestroy();\n // }\n // }\n // var ComponentFactoryResolver\$1 = /\*\* @class \*/ (function (\_super) {\n // \_\_extends(ComponentFactoryResolver, \_super);\n // /\*\*\n // \* @param ngModule

not actually created (via `create` below).\n // - Since an .ngfactory file in View Engine references the
.ngfactory files of the NgModule's\n // imports,\n //\n // In Ivy, things are a bit
different. .ngfactory files still exist for compatibility, but are\n // not a required API to use - there are other
ways to obtain an NgModuleFactory for a given\n // NgModule. Thus, relying on a side effect in the
.ngfactory file is not sufficient. Instead,\n // the side effect of registration is added here, in the constructor
of NgModuleFactory,\n // ensuring no matter how a factory is created, the module is registered correctly.\n
 //\n // An alternative would be to include the registration side effect inline following the actual\n
 // NgModule definition. This also has the correct timing, but breaks tree-shaking - modules\n // will
be registered and retained even if they're otherwise never referenced.\n
 registerNgModuleType(moduleType);\n }\n return _this;\n }\n

```

reentrancy issues during JIT compilation. This matters in the following scenario:

- Consider a component 'A' that extends component 'B', both declared in module 'M'. During the compilation of 'A' the definition of 'B' is requested to capture the inheritance chain, potentially triggering compilation of 'B'. If this nested compilation were to trigger ``flushModuleScopingQueueAsMuchAsPossible`` it may happen that module 'M' is still pending in the queue, resulting in 'A' and 'B' to be patched with the NgModule scope. As the compilation of 'A' is still in progress, this would introduce a circular dependency on its compilation. To avoid this issue, the module scope queue is only flushed for compilations at the depth 0, to ensure all compilations have finished.

```

var compilationDepth = 0;
/**
 * Compile an Angular component according to its decorator metadata, and patch the resulting component def
 * (cmp) onto the component type.
 * Compilation may be asynchronous (due to the need to resolve URLs
 * for the component template or other resources, for example). In the event that compilation is not immediate,
 * `compileComponent` will enqueue resource resolution into a global queue and will fail to return the `cmp`
 * until the global queue has been resolved with a call to `resolveComponentResources`.
 */

An injectable service for executing work inside or outside of the Angular zone.\n    * \n    * The most common use
of this service is to optimize performance when starting a work consisting of\n    * one or more asynchronous tasks
that don't require UI updates or error handling to be handled by\n    * Angular. Such tasks can be kicked off via
{ @link
#runOutsideAngular} and if needed, these tasks\n    * can reenter the Angular zone via { @link #run}.\n    * \n    *
<!-- TODO: add/fix links to:\n    * - docs explaining zones and the use of zones in Angular and change-detection\n    *
- link to runOutsideAngular/run (throughout this file!)\n    * -->\n    * \n    * @usageNotes\n    * ###
Example\n    * \n    * ```\n    * import {Component, NgZone} from '@angular/core';\n    * import {NgIf} from
'@angular/common';\n    * \n    * @Component({\n    *   selector: 'ng-zone-demo',\n    *   template: `\n    *
<h2>Demo: NgZone</h2>\n    * \n    * <p>Progress: {{progress}}%</p>\n    * <p *ngIf="progress >=
100">Done processing {{label}} of Angular zone!</p>\n    * \n    * <button
(click)="processWithinAngularZone()">Process within Angular zone</button>\n    * <button
(click)="processOutsideOfAngularZone()">Process outside of Angular zone</button>\n    * \n    * `,\n    * })\n    *
export class NgZoneDemo
{\n    *   progress: number = 0;\n    *   label: string;\n    * \n    *   constructor(private _ngZone: NgZone) {\n    *
\n    *   // Loop inside the Angular zone\n    *   // so the UI DOES refresh after each setTimeout cycle\n    *

preventing Cross Site Scripting Security bugs (XSS) by sanitizing\n * values to be safe to use in the different DOM
contexts.\n * For example, when binding a URL in an `<a [href]="someValue">` hyperlink, `someValue` will
be\n * sanitized so that an attacker cannot inject e.g. a `javascript:` URL that would execute code
on\n * the website.\n * In specific situations, it might be necessary to disable sanitization, for example if the\n *
application genuinely needs to produce a `javascript:` style link with a dynamic value in it.\n * Users can bypass
security by constructing a value with one of the `bypassSecurityTrust...` methods, and then binding to that value
from the template.\n * These situations should be very rare, and extraordinary care must be taken to avoid
creating a\n * Cross Site Scripting (XSS) security bug!\n * When using `bypassSecurityTrust...`, make sure to
call the method as early as possible and as\n * close as possible to the source of the value, to make it easy to verify
no security bug is\n * created by its use.\n * It is not required (and not recommended) to bypass security if the
value is safe, e.g. a URL that\n * does not start with a suspicious protocol, or an HTML snippet that does not contain
dangerous\n * code. The sanitizer leaves safe values intact.\n

```

\*\n \* @security Calling any of the `bypassSecurityTrust...` APIs disables Angular's built-in\n \* sanitization for the value passed in. Carefully check and audit all values and code paths going\n \* into this call. Make sure any user data is appropriately escaped for this security context.\n \* For more detail, see the [Security Guide](http://g.co/ng/security).\n \*\n \* @publicApi\n \*\n @Injectable({providedIn: 'root', useExisting: forwardRef(() => DomSanitizerImpl)})\n\nexport abstract class DomSanitizer implements Sanitizer {\n /\*\n \* Sanitizes a value for use in the given SecurityContext.\n \*\n \* If value is trusted for the context, this method will unwrap the contained safe value and use\n \* it directly. Otherwise, value will be sanitized to be safe in the given context, for example\n \* by replacing URLs that have an unsafe protocol part (such as `javascript:`). The implementation\n \* is responsible to make sure that the value can definitely be safely used in the given context.\n \*\n abstract sanitize(context: SecurityContext, value: SafeValue|string|null): string|null;\n\n /\*\n \* Bypass security and trust the given value to be safe HTML. Only use this when the bound HTML\n \* is unsafe (e.g. contains `

```

default encoding. This function will only ever be called from `encodeURIComponent` or `encodeURIComponent` as it's the base set of

encodings to be used. We need a custom encoding because `encodeURIComponent` is too aggressive and encodes stuff that doesn't have to be encoded per <https://url.spec.whatwg.org>.

```
function encodeURIComponent(s: string): string {
 return encodeURIComponent(s)
 .replace(/%40/g, '@')
 .replace(/%3A/g, ':')
 .replace(/%24/g, '$')
 .replace(/%2C/g, ',');
}

// This function should be used to encode both keys and
// values in a query string key/value. In the following URL, you need to call encodeURIComponent on "k" and "v":
// http://www.site.org/html;mk=mv?k=v#f

// This function should be used to encode a URL fragment. In
// the following URL, you need to call encodeURIComponent on "f":
// http://www.site.org/html;mk=mv?k=v#f

// This function should be run on any URI segment as well as the key and value in a key/value pair for matrix
// params. In the following URL, you need to call encodeURIComponent on "html", "mk", and "mv":
// http://www.site.org/html;mk=mv?k=v#f

// This function should be used to encode a URL fragment. In
// the following URL, you need to call encodeURIComponent on "f":
// http://www.site.org/html;mk=mv?k=v#f
```

`encodeURIComponent` should be run on any URI segment as well as the key and value in a key/value pair for matrix params. In the following URL, you need to call `encodeURIComponent` on `"html"`, `"mk"`, and `"mv"`:

```
function encodeURIComponent(s: string): string {
 return encodeURIComponent(s)
 .replace(/%40/g, '@')
 .replace(/%3A/g, ':')
 .replace(/%24/g, '$')
 .replace(/%2C/g, ',');
}

// This function should be used to encode a URL fragment. In
// the following URL, you need to call encodeURIComponent on "f":
// http://www.site.org/html;mk=mv?k=v#f
```

```
function decodeURIComponent(s: string): string {
 return decodeURIComponent(s)
 .replace(/%40/g, '@')
 .replace(/%3A/g, ':')
 .replace(/%24/g, '$')
 .replace(/%2C/g, ',');
}

// This function should be used to decode a URL fragment. In
// the following URL, you need to call decodeURIComponent on "f":
// http://www.site.org/html;mk=mv?k=v#f
```

`decodeURIComponent` should be run on any URI segment as well as the key and value in a key/value pair for matrix params. In the following URL, you need to call `decodeURIComponent` on `"html"`, `"mk"`, and `"mv"`:

```
function decodeURIComponent(s: string): string {
 return decodeURIComponent(s)
 .replace(/%40/g, '@')
 .replace(/%3A/g, ':')
 .replace(/%24/g, '$')
 .replace(/%2C/g, ',');
}

// This function should be used to decode a URL fragment. In
// the following URL, you need to call decodeURIComponent on "f":
// http://www.site.org/html;mk=mv?k=v#f
```

```

in this object.\n \* Supports static, parameterized, redirect, and wildcard routes, as well as\n \* custom route data  
and resolve methods.\n \* For detailed usage information, see the [Routing Guide](guide/router).\n \*/\n \*  
@usageNotes\n \* ### Simple Configuration\n \* The following route specifies that when navigating to, for  
example,\n \* `/team/11/user/bob`, the router creates the 'Team' component\n \* with the 'User' child component in  
it.\n \* ```\n \* {\n \* path: 'team/:id',\n \* component: Team,\n \* children: [\n \* {\n \* path: 'user/:name',\n \* component: User\n \* }\n \* ]\n \* }\n \* ```\n \* ### Multiple Outlets\n \* The following route creates sibling  
components with multiple outlets.\n \* When navigating to `/team/11(aux:chat/jim)`, the router creates the 'Team'  
component next to\n \* the 'Chat' component. The 'Chat' component is placed into the 'aux' outlet.\n \* ```\n \* {\n \* path: 'team/:id',\n \* component: Team\n \* }, {\n \* path: 'chat:user',\n \* component: Chat\n \* outlet: 'aux'\n \* }\n \* ```\n \* ### Wild Cards\n \* The following route uses wild-  
card notation to specify a component\n \* that is always instantiated regardless of where you navigate to.\n \* ```\n \* {\n \* path: '\*\*',\n \* component: WildcardComponent\n \* }\n \* ```\n \* ### Redirects\n \* The following  
route uses the `redirectTo` property to ignore a segment of\n \* a given URL when looking for a child path.\n \* When navigating to `/team/11/legacy/user/jim`, the router changes the URL segment\n \* `/team/11/legacy/user/jim` to  
`/team/11/user/jim`, and then instantiates\n \* the Team component with the User child component in it.\n \* ```\n \* {\n \* path: 'team/:id',\n \* component: Team,\n \* children: [\n \* {\n \* path: 'legacy/user/:name',\n \* redirectTo:  
'user/:name'\n \* }, {\n \* path: 'user:name',\n \* component: User\n \* }\n \* ]\n \* }\n \* ```\n \* The redirect path  
can be relative, as shown in this example,  
or absolute.\n \* If we change the `redirectTo` value in the example to the absolute URL segment `/user/:name`,\n \* the result URL is also absolute, `/user/jim`.\n \* ### Empty Path\n \* Empty-path route configurations can be  
used to instantiate components that do not 'consume'\n \* any URL segments.\n \* In the following configuration,  
when navigating to\n \* `/team/11`, the router instantiates the 'AllUsers' component.\n \* ```\n \* {\n \* path:  
'team/:id',\n \* component: Team,\n \* children: [\n \* {\n \* path: '',\n \* component: AllUsers\n \* }, {\n \* path:  
'user/:name',\n \* component: User\n \* }\n \* ]\n \* }\n \* ```\n \* Empty-path routes can have children. In the  
following example, when navigating\n \* to `/team/11/user/jim`, the router instantiates the wrapper component  
with\n \* the user component in it.\n \* Note that an empty path route inherits its parent's parameters and data.\n \* ```\n \* {\n \* path: 'team/:id',\n \* component: Team,\n \* children: [\n \* {\n \* path: '',\n \* component: WrapperCmp,\n \* children: [\n \* {\n \* path: 'user/:name',\n \* component: User\n \* }\n \* ]\n \* }\n \* ]\n \* }\n \* ```\n \* ### Matching Strategy\n \* The default path-match  
strategy is 'prefix', which means that the router\n \* checks URL elements from the left to see if the URL matches a  
specified path.\n \* For example, `/team/11/user` matches `team/:id`.\n \* ```\n \* {\n \* path: '',\n \* pathMatch:  
'prefix', //default\n \* redirectTo: 'main'\n \* }, {\n \* path: 'main',\n \* component: Main\n \* }\n \* ```\n \* You  
can specify the path-match strategy 'full' to make sure that the path\n \* covers the whole unconsumed URL. It is

important to do this when redirecting empty-path routes. Otherwise, because an empty path is a prefix of any URL, the router would apply the redirect even when navigating to the redirect destination, creating an endless loop.

In the following example, supplying the 'full' 'pathMatch' strategy ensures that the router applies the redirect if and only if navigating to '/'.  

```
{
 path: '',
 pathMatch: 'full',
 redirectTo: 'main'
}, {
 path: 'main',
 component: Main
}]
```

### Componentless Routes  
You can share parameters between sibling components. For example, suppose that two sibling components should go next to each other, and both of them require an ID parameter. You can accomplish this using a route that does not specify a component at the top level.

In the following example, 'MainChild' and 'AuxChild' are siblings. When navigating to 'parent/10/(a/aux:b)', the route instantiates the main child and aux child components next to each other. For this to work, the application component must have the primary and aux outlets defined.  

```
{
 path: 'parent/:id',
 children: [
 {
 path: 'a',
 component: MainChild
 },
 {
 path: 'b',
 component: AuxChild,
 outlet: 'aux'
 }
]
}
```

The router merges the parameters, data, and resolve of the componentless parent into the parameters, data, and resolve of the children. This is especially useful when child components are defined with an empty path string, as in the following example.

With this configuration, navigating to '/parent/10' creates the main child and aux components.  

```
{
 path: 'parent/:id',
 children: [
 {
 path: '',
 component: MainChild
 },
 {
 path: '',
 component: AuxChild,
 outlet: 'aux'
 }
]
}
```

### Lazy Loading  
Lazy loading speeds up application load time by splitting the application into multiple bundles and loading them on demand. To use lazy loading, provide the 'loadChildren' property in the 'Route' object, instead of the 'children' property.

Given the following example route, the router will lazy load the associated module on demand using the browser native import system.  

```
{
 path: 'lazy',
 loadChildren: () => import('./lazy-route/lazy.module').then(mod => mod.LazyModule)
}
```

@publicApi  
export interface Route {  
 /\*\*  
 \* The path to match against. Cannot be used together with a custom 'matcher' function.  
 \* A URL string that uses router matching notation.  
 \* Can be a wild card ('\*\*') that matches any URL (see Usage Notes below).  
 \* Default is '/' (the root path).  
 \* path?: string;  
 \* The path-matching strategy, one of 'prefix' or 'full'.  
 \* Default is 'prefix'.  
 \* By default, the router checks URL elements from the left to see if the URL matches a given path, and stops when there is a match.  
 \* For example, '/team/11/user' matches 'team/:id'.  
 \* The path-match strategy 'full' matches against the entire URL.  
 \* It is important to do this when redirecting empty-path routes.  
 \* Otherwise, because an empty path is a prefix of any URL, the router would apply the redirect even when navigating to the redirect destination, creating an endless loop.  
 \* pathMatch?: string;  
 \* A custom URL-matching function. Cannot be used together with 'path'.  
 \* matcher?: UrlMatcher;  
 \* The component to instantiate when the path matches.  
 \* Can be empty if child routes specify components.  
 \* component?: Type<any>;  
 \* A URL to redirect to when the path matches.  
 \* Absolute if the URL begins with a slash (/), otherwise relative to the path URL.  
 \* When not present, router does not redirect.  
 \* redirectTo?: string;  
 \* Name of a 'RouterOutlet' object where the component can be placed when the path matches.  
 \* outlet?: string;  
 \* An array of dependency-injection tokens used to look up 'CanActivate()' handlers, in order to determine if the current user is allowed to activate the component. By default, any user can activate.  
 \* canActivate?: any[];  
 \* An array of DI tokens used to look up 'CanActivateChild()' handlers, in order to determine if the current user is allowed to activate a child of the component. By default, any user can activate a child.  
 \* canActivateChild?: any[];  
 \* An array of DI tokens used to look up 'CanDeactivate()' handlers, in order to determine if the current user is allowed to deactivate the component. By default, any user can deactivate.  
 \* canDeactivate?: any[];  
 \* An array of DI tokens used to look up 'CanLoad()' handlers, in order to determine if the current user is allowed to load the component. By default, any user can load.  
 \* canLoad?: any[];  
 \* Additional developer-defined data provided to the component via 'ActivatedRoute'. By default, no additional data is passed.  
 \* data: any;

```

import { Component } from '@angular/core';
This component is used internally within the router to be a placeholder when an empty router-outlet is needed. For example, with a config such as:
{path: 'parent', outlet: 'nav', children: [...]}
In order to render, there needs to be a component on this config, which will default to this EmptyOutletComponent.
@Component({template: <router-outlet></router-outlet>})
export class EmptyOutletComponent {
 export {EmptyOutletComponent as EmptyOutletComponent};
}

`@see [Router.navigateByUrl() method](api/router/Router#navigatebyurl)`

`@see [Router.createUrlTree() method](api/router/Router#createurltree)`

`@see [Routing and Navigation guide](guide/router)`

`@see UrlCreationOptions`

`@see NavigationBehaviorOptions`

`@publicApi`

`^`next export interface NavigationExtras extends UrlCreationOptions, NavigationBehaviorOptions

`{`

`error?: any` Error handler that is invoked when a navigation error occurs.

`if the handler returns a value, the navigation Promise is resolved with this value.`

`if the handler throws an exception, the navigation Promise is rejected with the exception.`

`@publicApi`

`^`next export type ErrorHandler = (error: any) => any;

`function defaultErrorHandler(error: any): any {`

`throw error;`

`}`

`function defaultMalformedUriErrorHandler(`

`error: URIError, urlSerializer: UrlSerializer, url: string): UrlTree {`

`return urlSerializer.parse('/');`

`}`

`^`next export type RestoredState = {

`[k: string]: any;`

`navigationId: number;`

`}`

`^`next Information about a navigation operation.

`Retrieve the most recent navigation object with the`

`[Router.getCurrentNavigation() method](api/router/Router#getcurrentnavigation)`

`id: number` The unique identifier of the current navigation.

`initialUrl: string` The target URL passed into the `Router#navigateByUrl` call before navigation. This is the value before the router has parsed or applied redirects to it.

`extractedUrl: string` The initial target URL after being parsed with `UrlSerializer.extract`.

`finalUrl: string` The extracted URL after redirects have been applied. This URL may not be available immediately, therefore this property can be `undefined`.

`It is guaranteed to be set after the `RoutesRecognized` event fires.`

`trigger: string` Identifies how this navigation was triggered.

`--imperative--` Triggered by `router.navigateByUrl` or `router.navigate`.

`--popstate--` Triggered by a popstate event.

`--hashchange--` Triggered by a hashchange event.

`extras: NavigationExtras` A `NavigationExtras` options object that controlled the strategy used for this navigation.

`previousNavigation: Navigation` The previously successful `Navigation` object. Only one previous navigation is available, therefore this previous `Navigation` object has a `null` value for its own `previousNavigation`.

`@publicApi`

`^`next export type Navigation = {

`id: number` The unique identifier of the current navigation.

`initialUrl: string | UrlTree` The target URL passed into the `Router#navigateByUrl` call before navigation. This is the value before the router has parsed or applied redirects to it.

`extractedUrl: string | UrlTree` The initial target URL after being parsed with `UrlSerializer.extract`.

`finalUrl: string | UrlTree` The extracted URL after redirects have been applied. This URL may not be available immediately, therefore this property can be `undefined`.

`It is guaranteed to be set after the `RoutesRecognized` event fires.`

`trigger: string` Identifies how this navigation was triggered.

`--imperative--` Triggered by `router.navigateByUrl` or `router.navigate`.

`--popstate--` Triggered by a popstate event.

`--hashchange--` Triggered by a hashchange event.

`trigger: string` Identifies how this navigation was triggered.

`--imperative--` Triggered by `router.navigateByUrl` or `router.navigate`.

`--popstate--` Triggered by a popstate event.

`--hashchange--` Triggered by a hashchange event.

`extras: NavigationExtras` Options that controlled the strategy used for this navigation.

`previousNavigation: Navigation` The previously successful `Navigation` object. Only one previous navigation is available, therefore this previous `Navigation` object has a `null` value for its own `previousNavigation`.

{Router} from './router';\nimport {ActivatedRoute} from './router_state';\nimport {Params}
from './shared';\nimport {UrlTree} from './url_tree';\n\n/n/**\n * @description\n * \n * When applied to an element
in a template, makes that element a link\n * that initiates navigation to a route. Navigation opens one or more routed
components\n * in one or more <router-outlet> locations on the page.\n * \n * Given a route configuration `[{ path:
'user/:name', component: UserCmp }]`,\n * the following creates a static link to the route:\n * link to user component\n * \n * You can use dynamic values to generate the link.\n *
For a dynamic link, pass an array of path segments,\n * followed by the params for each segment.\n * For example,
`['/team', teamId, 'user', userName, {details: true}]`\n * generates a link to `/team/11/user/bob;details=true`.\n * \n *
Multiple static segments can be merged into one term and combined with dynamic segments.\n * For example,
`['/team/11/user', userName, {details: true}]`\n * \n * The input that you provide to
the link is treated as a delta to the current URL.\n * For instance, suppose the current URL is
`/user/(box//aux:team)`.\n * The link <a [routerLink]=\"['/user/jim']\">Jim creates the URL\n *
`/user/(jim//aux:team)`.\n * See { @link Router#createUrlTree createUrlTree } for more information.\n * \n *
@usageNotes\n * \n * You can use absolute or relative paths in a link, set query parameters,\n * control how
parameters are handled, and keep a history of navigation states.\n * \n * ### Relative link paths\n * \n * The first
segment name can be prepended with `^`, `./`, or `../`.\n * \n * If the first segment begins with `^`, the router looks up
the route from the root of the\n * app.\n * \n * If the first segment begins with `./`, or doesn't begin with a slash, the
router\n * looks in the children of the current activated route.\n * \n * If the first segment begins with `../`, the router
goes up one level in the route tree.\n * \n * ### Setting and handling query params and fragments\n * \n *
The following link adds a query parameter and a fragment to the generated URL:\n * \n * <a
[routerLink]=\"['/user/bob']\" [queryParams]=\"{debug: true}\" fragment=\"education\">\n * link to user
component\n * \n * \n * By default, the directive constructs the new URL using the given query parameters.\n *
* The example generates the link: `/user/bob?debug=true#education`.\n * \n * You can instruct the directive to
handle query parameters differently\n * by specifying the `queryParamsHandling` option in the link.\n * Allowed
values are:\n * \n * - `merge`: Merge the given `queryParams` into the current query params.\n * \n * - `preserve`:
Preserve the current query params.\n * \n * For example:\n * \n * <a [routerLink]=\"['/user/bob']\"
[queryParams]=\"{debug: true}\" queryParamsHandling=\"merge\">\n * link to user component\n * \n * \n *
* See { @link UrlCreationOptions.queryParamsHandling UrlCreationOptions#queryParamsHandling }.\n * \n *
Preserving navigation
history\n * \n * You can provide a `state` value to be persisted to the browser's\n * [History.state`
property](https://developer.mozilla.org/en-US/docs/Web/API/History#Properties).\n * For example:\n * \n * <a
[routerLink]=\"['/user/bob']\" [state]=\"{tracingId: 123}\">\n * link to user component\n * \n * \n *
Use { @link Router.getCurrentNavigation() Router#getCurrentNavigation } to retrieve a saved\n * navigation-state
value. For example, to capture the `tracingId` during the `NavigationStart`\n * event:\n * \n * // Get
NavigationStart events\n * router.events.pipe(filter(e => e instanceof NavigationStart)).subscribe(e => {\n * const
navigation = router.getCurrentNavigation();\n * tracingService.trace({id: navigation.extras.state.tracingId});\n *
});\n * \n * @ngModule RouterModule\n * \n * @publicApi\n * \n * @Directive({ selector:
'not(a):not(area)[routerLink]'})\n * \n * export class RouterLink implements OnChanges {\n * /**\n * Passed to { @link
Router#createUrlTree
Router#createUrlTree } as part of the\n * `UrlCreationOptions`.\n * \n * @see { @link

'@angular/core';\nimport { from, of, Subscription } from 'rxjs';\nimport { mergeAll } from 'rxjs/operators';\n\nimport
{ Event, NavigationEnd } from '../events';\nimport { Router } from '../router';\nimport { RouterLink,\n RouterLinkWithHref } from '../router_link';\n\n\n/**\n * @description\n * Tracks whether the linked route of
an element is currently active, and allows you\n * to specify one or more CSS classes to add to the element when the
linked route\n * is active.\n * Use this directive to create a visual distinction for elements associated with an
active route.\n * For example, the following code highlights the word "Bob" when the the router\n * activates the

```

associated route:

```

Bob

```

Whenever the URL is either '/user' or '/user/bob', the 'active-link' class is added to the anchor tag. If the URL changes, the class is removed.

You can set more than one class using a space-separated string or an array.

For example:

```

Bob
Bob

```

To add the classes only when the URL matches the link exactly, add the option 'exact: true':

```

Bob

```

To directly check the 'isActive' status of the link, assign the 'RouterLinkActive' instance to a template variable.

For example, the following checks the status without assigning any CSS classes:

```

Bob {{
 rla.isActive ? '(already open)' : ''
}}

```

You can apply the 'RouterLinkActive' directive to an ancestor of linked elements.

For example, the following sets the active-link class on the 'div' parent tag when the URL is either '/user/jim' or '/user/bob'.

```

<div routerLinkActive="active-link" [routerLinkActiveOptions]="{exact: true}">
 Jim
 Bob
</div>

```

```

 /**
 * @description
 * Acts as a placeholder that Angular dynamically fills based on the current router state.
 * Each outlet can have a unique name, determined by the optional `name` attribute.
 * The name cannot be set or changed dynamically. If not set, default value is "primary".
 * <router-outlet>
 * <router-outlet name='left'>
 * <router-outlet name='right'>
 *
 * Named outlets can be the targets of secondary routes.
 * The `Route` object for a secondary route has an `outlet` property to identify the target outlet:
 * {path: <base-path>, component: <component>, outlet: <target_outlet_name>}
 * Using named outlets and secondary routes, you can target multiple outlets in the same `RouterLink` directive.
 * The router keeps track of separate branches in a navigation tree for each named outlet and generates a representation of that tree in the URL.
 * The URL for a secondary route uses the following syntax to specify both the primary and secondary routes at the same time:
 * http://base-path/primary-route-path(outlet-name:route-path)
 * A router outlet emits an activate event when a new component is instantiated and a deactivate event when a component is destroyed.
 * <router-outlet (activate)='onActivate($event)' (deactivate)='onDeactivate($event)'>
 *
 * @see [Routing tutorial](guide/router-tutorial-toh#named-outlets)
 * Example of a named outlet and secondary route configuration:
 * @see `RouterLink`
 * @see `Route`
 * @ngModule RouterModule
 * @publicApi

URL fragment\n * instead

```

of the history API.

- `useHash?: boolean`
  - One of `'enabled'`, `'enabledBlocking'`, `'enabledNonBlocking'` or `'disabled'`.
  - When set to `'enabled'` or `'enabledBlocking'`, the initial navigation starts before the root component is created. The bootstrap is blocked until the initial navigation is complete. This value is required for [server-side rendering](guide/universal) to work. When set to `'enabledNonBlocking'`, the initial navigation starts after the root component has been created.
  - The bootstrap is not blocked on the completion of the initial navigation. When set to `'disabled'`, the initial navigation is not performed. The location listener is set up before the root component gets created. Use if there is a reason to have more control over when the router starts its initial navigation due to some complex initialization logic.
- `initialNavigation?: InitialNavigation`
  - A custom error handler for failed navigations.
  - If the handler returns a value, the navigation Promise is resolved with this value.
  - If the handler throws an exception, the navigation Promise is rejected with the exception.
- `errorHandler?: ErrorHandler`
  - Configures a preloading strategy.
  - One of `'PreloadAllModules'` or `'NoPreloading'` (the default).
- `preloadingStrategy?: any`
  - Define what the router should do if it receives a navigation request to the current URL.
  - Default is `'ignore'`, which causes the router ignores the navigation. This can disable features such as a "refresh" button.
  - Use this option to configure the behavior when navigating to the current URL. Default is `'ignore'`.
- `onSameUrlNavigation?: 'reload'|'ignore'`
  - Configures if the scroll position needs to be restored when navigating back.
  - `'disabled'` - (Default) Does nothing. Scroll position is maintained on navigation.
  - `'top'` - Sets the scroll position to `x = 0, y = 0` on all navigation.
  - `'enabled'` - Restores the previous scroll position on backward navigation, else sets the position to the anchor if one is provided, or sets the scroll position to `[0, 0]` (forward navigation). This option will be the default in the future.
  - You can implement custom scroll restoration behavior by adapting the enabled behavior as in the following example.

```

typescript
class AppModule {
 constructor(router: Router, viewportScroller: ViewportScroller) {
 router.events.pipe(
 filter((e: Event): e is Scroll => e instanceof Scroll)
).subscribe(e => {
 if (e.position) {
 // backward navigation
 viewportScroller.scrollToPosition(e.position);
 }
 else if (e.anchor) {
 // anchor navigation
 viewportScroller.scrollToAnchor(e.anchor);
 }
 else {
 // forward
 viewportScroller.scrollToPosition([0, 0]);
 }
 });
 }
}

scrollPositionRestoration?: 'disabled'|'enabled'|'top'
When set to 'enabled', scrolls to the anchor element when the URL has a fragment. Anchor scrolling is disabled by default. Anchor scrolling does not happen on 'popstate'. Instead, we restore the position that we stored or scroll to the top.

anchorScrolling?: 'disabled'|'enabled'
Configures the scroll offset the router will use when scrolling to an element. When given a tuple with x and y position value, the router uses that offset each time it scrolls. When given a function, the router invokes the function every time it restores scroll position.

scrollOffset?: [number, number] | ((() => [number, number]))
Defines how the router merges parameters, data, and resolved data from parent to child routes. By default ('emptyOnly'), inherits parent parameters only for path-less or component-less routes. Set to 'always' to enable unconditional inheritance of parent parameters.

paramsInheritanceStrategy?: 'emptyOnly'|'always'
A custom handler for malformed URI errors. The handler is invoked when `encodedURI` contains invalid character sequences. The default implementation is to redirect to the root URL, dropping any path or parameter information. The function takes three parameters:
- `URIError` - Error thrown when parsing a bad URL.
- `UrlSerializer` - UrlSerializer that's configured with the router.
- `url` - The malformed URL that caused the URIError.

malformedUriErrorHandler?: (error: URIError, urlSerializer: UrlSerializer, url: string) => UrlTree
Defines when the router updates the browser URL. By default ('deferred'), update after successful navigation. Set to 'eager' if prefer to update the URL at the beginning of navigation. Updating the URL early allows you to handle a failure of navigation by showing an error message with the URL that failed.

urlUpdateStrategy?: 'deferred'|'eager'
Enables a bug fix that corrects relative link resolution in

```

```

 */\n /**\n * @description\n *\n * When applied to an element in a template, makes that element a link\n
 * that initiates navigation to a route. Navigation opens one or more routed components\n * in one or more
`<router-outlet>` locations on the page.\n *\n * Given a route configuration `[{ path: 'user/:name', component:
UserCmp }]`,\n * the following creates a static link to the route:\n * `link to user
component`\n *\n * You can use dynamic values to generate the link.\n * For a dynamic link, pass an
array of path segments,\n * followed by the params for each segment.\n * For example, `['/team', teamId, 'user',
userName, { details: true }]`\n * generates a link
to `/team/11/user/bob;details=true`.\n *\n * Multiple static segments can be merged into one term and
combined with dynamic segments.\n * For example, `['/team/11/user', userName, { details: true }]`\n *\n
 * The input that you provide to the link is treated as a delta to the current URL.\n * For instance, suppose the
current URL is `/user/(box//aux:team)`.\n * The link `<a [routerLink]=\"[/user/jim]\">Jim` creates the

```

URL\n \* `/user/(jim//aux:team)`.\n \* See { @link Router#createUrlTree createUrlTree } for more information.\n

\*\n \* @usageNotes\n \*\n \* You can use absolute or relative paths in a link, set query parameters,\n \* control how parameters are handled, and keep a history of navigation states.\n \*\n \* ### Relative link paths\n \*\n \* The first segment name can be prepended with `^`, `./`, or `../`.\n \* \* If the first segment begins with `^`, the router looks up the route from the root of the\n \* app.\n \* \* If the first segment begins with `./`, or doesn't begin with a slash, the router\n \* looks in the children of the current activated route.\n \* \* If the first segment begins with `../`, the router goes up one level in the route tree.\n \* \* ### Setting and handling query params and fragments\n \*\n \* The following link adds a query parameter and a fragment to the generated URL:\n \*\n \* ```\n \* <a [routerLink]="['/user/bob']" [queryParams]="{debug: true}" fragment="education">\n \* link to user component\n \* </a>\n \* ```\n \* By default, the directive constructs the new URL using the given query parameters.\n \* The example generates the link: `/user/bob?debug=true#education`.\n \*\n \* You can instruct the directive to handle query parameters differently\n \* by specifying the `queryParamsHandling` option in the link.\n \* Allowed values are:\n \*\n \* - `merge`: Merge the given `queryParams` into the current query params.\n \* - `preserve`: Preserve the current query params.\n \*\n \* For example:\n \*\n \* ```\n \* <a [routerLink]="['/user/bob']" [queryParams]="{debug: true}" queryParamsHandling="merge">\n \* link to user component\n \* </a>\n \* ```\n \*\n \* See { @link UrlCreationOptions.queryParamsHandling UrlCreationOptions#queryParamsHandling }.\n \*\n \* ### Preserving navigation history\n \*\n \* You can provide a `state` value to be persisted to the browser's\n \* [History.state` property](https://developer.mozilla.org/en-US/docs/Web/API/History#Properties).\n \* For example:\n \*\n \* ```\n \* <a [routerLink]="['/user/bob']" [state]="{tracingId: 123}">\n \* link to user component\n \* </a>\n \* ```\n \*\n \* Use { @link Router.getCurrentNavigation() Router#getCurrentNavigation } to retrieve a saved\n \* navigation-state value. For example, to capture the `tracingId` during the `NavigationStart`\n \* event:\n \*\n \* ```\n \* // Get NavigationStart events\n \* router.events.pipe(filter(e => e instanceof NavigationStart)).subscribe(e => {\n \* const navigation = router.getCurrentNavigation();\n \* tracingService.trace({id: navigation.extras.state.tracingId});\n \* });\n \* ```\n \*\n \* @ngModule RouterModule\n \*\n \* @publicApi\n \*\n \* var RouterLink = /\*\* @class \*/ (function () {\n \* function RouterLink(router, route, tabIndex, renderer, el) {\n \* this.router = router;\n \* this.route = route;\n \* this.commands = [];\n \* /\*\* @internal \*/\n \* this.onChanges = new rxjs.Subject();\n \* if (tabIndex == null) {\n \* renderer.setAttribute(el.nativeElement, 'tabindex', '0');\n \* }\n \* }\n \* /\*\* @nodoc \*/\n \* RouterLink.prototype.ngOnChanges = function (changes) {\n \* // This is subscribed to by `RouterLinkActive` so that it knows to update when there are changes\n \* // to the RouterLinks it's tracking.\n \* this.onChanges.next(this);\n \* }; \n \* Object.defineProperty(RouterLink.prototype, 'routerLink', {\n \* /\*\*\n \* \* Commands to pass to { @link Router#createUrlTree Router#createUrlTree }.\n \* \* - \*\*array\*\*: commands to pass to { @link Router#createUrlTree Router#createUrlTree }.\n \* \* - \*\*string\*\*: shorthand for array of commands with just the string, i.e. `['/route']`\n \* \* - \*\*null|undefined\*\*: shorthand for an empty array of commands, i.e. `[]`\n \* \* @see { @link Router#createUrlTree Router#createUrlTree }\n \* \*/\n \* set: function (commands) {\n \* if (commands != null) {\n \* this.commands = Array.isArray(commands) ? commands : [commands];\n \* }\n \* else {\n \* this.commands = [];\n \* }\n \* },\n \* enumerable: false,\n \* configurable: true\n \* });\n \* /\*\* @nodoc \*/\n \* RouterLink.prototype.onClick = function () {\n \* var extras = {\n \* skipLocationChange: attrBoolValue(this.skipLocationChange),\n \* replaceUrl: attrBoolValue(this.replaceUrl),\n \* state: this.state,\n \* }; \n \* this.router.navigateByUrl(this.urlTree, extras);\n \* return true;\n \* }; \n \* Object.defineProperty(RouterLink.prototype, 'urlTree', {\n \* get: function () {\n \* return this.router.createUrlTree(this.commands, {\n \* relativeTo: this.route,\n \* queryParams:

/**\n * \n * @description\n * \n * Tracks whether the linked route of an element is currently active, and
allows you\n * to specify one or more CSS classes to add to the element when the linked route\n * is active.\n
*\n * Use this directive to create a visual distinction for elements associated with an active route.\n * For
example, the following code highlights the word 'Bob' when the the router\n * activates the associated route:\n
*\n * ```\n * Bob\n * ```\n * \n *
Whenever the URL is either '/user' or '/user/bob', the "active-link" class is\n * added to the anchor tag. If the
URL changes, the class is removed.\n * \n * You can set more than one class using a space-separated string or
an array.\n * For example:\n * \n * ```\n * <a routerLink="/user/bob" routerLinkActive="class1
class2">Bob\n * Bob\n * ```\n
*\n * To add the classes only when the URL matches the link exactly, add the option `exact: true`:\n * \n *
``` \n * <a routerLink="/user/bob" routerLinkActive="active-link"
[routerLinkActiveOptions]="{exact:\n * true}">Bob</a>\n * ```\n * \n * To directly check the `isActive`
status of the link, assign the `RouterLinkActive`\n * instance to a template variable.\n * For example, the
following checks the status without assigning any CSS classes:\n * \n * ```\n * <a routerLink="/user/bob"
routerLinkActive #rla="routerLinkActive">\n *   Bob {{ rla.isActive ? '(already open)' : '' }}\n * </a>\n *
``` \n * \n * You can apply the `RouterLinkActive` directive to an ancestor of linked elements.\n * For
example, the following sets the active-link class on the `<div>` parent tag\n * when the URL is either '/user/jim'
or '/user/bob'.\n * \n * ```\n * <div routerLinkActive="active-link" [routerLinkActiveOptions]="{exact:
true}">\n * Jim\n * Bob\n * </div>\n
* ```\n * \n * @ngModule
RouterModule\n * \n * @publicApi\n * \n * var RouterLinkActive = /** @class */ (function () {\n

'pathParamsChange'|'pathParamsOrQueryParamsChange'|'paramsChange'|'paramsOrQueryParamsChange';\n\n'always'|(((from: ActivatedRouteSnapshot, to: ActivatedRouteSnapshot) => boolean);\n\n/**\n *\n * A configuration object that defines a single route.\n *\n * A set of routes are collected in a `Routes` array to define a `Router` configuration.\n *\n * The router attempts to match segments of a given URL against each route,\n * using the configuration options defined in this object.\n *\n * Supports static, parameterized, redirect, and wildcard routes, as well as\n * custom route data and resolve methods.\n *\n * For detailed usage information, see the [Routing Guide](guide/router).\n *\n * @usageNotes\n *\n * ### Simple Configuration\n *\n * The following route specifies that when navigating to, for example, `/team/11/user/bob`, the router creates the 'Team' component\n * with the 'User' child component in it.\n *\n * ```\n * [{\n *   path: 'team/:id',\n *   component: Team,\n *   children: [{\n *     path: 'user/:name',\n *     component: User\n *   }]\n * }]\n * ```\n *\n * ### Multiple Outlets\n *\n * The following route creates sibling components with multiple outlets.\n * When navigating to `/team/11(aux:chat/jim)`, the router creates the 'Team' component next to\n * the 'Chat' component. The 'Chat' component is placed into the 'aux' outlet.\n *\n * ```\n * [{\n *   path: 'team/:id',\n *   component: Team\n * }, {\n *   path: 'chat:user',\n *   component: Chat\n *   outlet: 'aux'\n * }]\n * ```\n *\n * ### Wild Cards\n *\n * The following route uses wild-card notation to specify a component\n * that is always instantiated regardless of where you navigate to.\n *\n * ```\n * [{\n *   path: '**',\n *   component: WildcardComponent\n * }]\n * ```\n *\n * ### Redirects\n *\n * The following route uses the `redirectTo` property to ignore a segment of\n * a given URL when looking for a child path.\n *\n * When navigating to '/team/11/legacy/user/jim', the router changes the URL segment\n * '/team/11/legacy/user/jim' to '/team/11/user/jim', and then instantiates\n * the Team component with the User child component in it.\n *\n * ```\n * [{\n *   path: 'team/:id',\n *   component: Team,\n *   children: [{\n *     path: 'legacy/user/:name',\n *     redirectTo: 'user/:name'\n *   }, {\n *     path: 'user/:name',\n *     component: User\n *   }]\n * }]\n * ```\n *\n * The redirect path can be relative, as shown in this example, or absolute.\n * If we change the `redirectTo` value in the example to the absolute URL segment '/user/:name',\n * the result URL is also absolute, '/user/jim'.\n\n
```

```
*\n * ### Empty Path\n *\n * Empty-path route configurations can be used to instantiate components that do not 'consume'\n * any URL segments.\n *\n * In the following configuration, when navigating to `/team/11`, the router instantiates the 'AllUsers' component.\n *\n * ```\n * [{\n *   path: 'team/:id',\n *   component: Team,\n *   children: [{\n *     path: '',\n *     component: AllUsers\n *   }, {\n *     path: 'user/:name',\n *     component: User\n *   }]\n * }]\n * ```\n *\n * Empty-path routes can have children. In the following example, when navigating\n * to `/team/11/user/jim`, the router instantiates the wrapper component with\n * the user component in it.\n *\n * Note that an empty path route inherits its parent's parameters and data.\n *\n * ```\n * [{\n *   path: 'team/:id',\n *   component: Team,\n *   children: [{\n *     path: '',\n *     component: WrapperCmp,\n *     children: [{\n *       path: 'user/:name',\n *       component: User\n *     }]\n *   }]\n * }]\n * ```\n *\n * ### Matching Strategy\n *\n * The default path-match strategy is 'prefix', which means that the router\n * checks URL elements from the left to see if the URL matches a specified path.\n * For example, '/team/11/user' matches 'team/:id'.\n *\n * ```\n * [{\n *   path: '',\n *   pathMatch: 'prefix', //default\n *   redirectTo: 'main'\n * }, {\n *   path: 'main',\n *   component: Main\n * }]\n * ```\n *\n * You can specify the path-match strategy 'full' to make sure that the path\n * covers the whole unconsumed URL. It is important to do this when redirecting\n * empty-path routes. Otherwise, because an empty path is a prefix of any URL,\n * the router would apply the redirect even when navigating to the redirect destination,\n * creating an endless loop.\n *\n * In the following example, supplying the 'full' `pathMatch` strategy ensures\n * that the router applies the redirect if and only if navigating to '/'.\n *\n * ```\n * [{\n *   path: '',\n *   pathMatch: 'full',\n
```

Componentless Routes

You can share parameters between sibling components. For example, suppose that two sibling components should go next to each other, and both of them require an ID parameter. You can accomplish this using a route that does not specify a component at the top level. In the following example, 'MainChild' and 'AuxChild' are siblings. When navigating to 'parent/10/(a//aux:b)', the route instantiates the main child and aux child components next to each other. For this to work, the application component must have the primary and aux outlets defined.

```
{ path: 'parent/:id', children: [{ path: 'a', component: MainChild }, { path: 'b', component: AuxChild, outlet: 'aux' } ] }
```

The router merges the parameters, data, and resolve of the componentless parent into the parameters, data, and resolve of the children. This is especially useful when child components are defined with an empty path string, as in the following example. With this configuration, navigating to '/parent/10' creates the main child and aux components.

```
{ path: 'parent/:id', children: [{ path: '', component: MainChild }, { path: '', component: AuxChild, outlet: 'aux' } ] }
```

Lazy Loading

Lazy loading speeds up application load time by splitting the application into multiple bundles and loading them on demand. To use lazy loading, provide the 'loadChildren' property in the 'Route' object, instead of the 'children' property. Given the following example route, the router will lazy load the associated module on demand using the browser native import system.

```
{ path: 'lazy', loadChildren: () => import('./lazy-route/lazy.module').then(mod => mod.LazyModule), }
```

```
@publicApi\nexport interface Route {\n  /**\n   * The path to match against. ```

router configs are identical. This prevents components from being destroyed and recreated when just the fragment or query parameters change (that is, the existing component is `_reused`).

This strategy does not store any routes for later reuse. Angular uses this strategy by default.

It can be used as a base class for custom route reuse strategies, i.e. you can create your own class that extends the `BaseRouteReuseStrategy` one.

```
@publicApi
export abstract class BaseRouteReuseStrategy
implements RouteReuseStrategy {
  /** Whether the given route should detach for later reuse. Always
  returns false for `BaseRouteReuseStrategy`. */
  shouldDetach(route: ActivatedRouteSnapshot): boolean {
    return false;
  }

  /** A no-op; the route is never stored since this strategy never detaches routes for later
  reuse. */
  store(route: ActivatedRouteSnapshot, detachedTree: DetachedRouteHandle): void {}

  /** Returns `false`, meaning the route (and its subtree) is never reattached. */
  shouldAttach(route:
  ActivatedRouteSnapshot): boolean {
    return false;
  }

  /** Returns `null` because this strategy does not store
  routes for later re-use. */
  retrieve(route: ActivatedRouteSnapshot): DetachedRouteHandle|null {
    return null;
  }

  /** Determines if a route should be reused. This strategy returns `true` when the future route
  config and current route config are identical. */
  shouldReuseRoute(future: ActivatedRouteSnapshot, curr:
  ActivatedRouteSnapshot): boolean {
    return future.routeConfig === curr.routeConfig;
  }
}

export class
DefaultRouteReuseStrategy extends BaseRouteReuseStrategy {}

```

extends UrlCreationOptions, NavigationBehaviorOptions { }
 Error handler that is invoked when a navigation error occurs.
 If the handler returns a value, the navigation Promise is resolved with this value.
 If the handler throws an exception, the navigation Promise is rejected with the exception.
 @publicApi
 export type ErrorHandler = (error: any) => any;
 function defaultErrorHandler(error: any): any {
 throw error;
 }
 function defaultMalformedUriErrorHandler(
 error: URIError, urlSerializer: UrlSerializer, url: string): UrlTree {
 return urlSerializer.parse('/');
 }
 export type RestoredState = {
 [k: string]: any;
 navigationId: number;
 };
 Information about a navigation operation.
 Retrieve the most recent navigation object with the [Router.getCurrentNavigation() method](api/router/Router#getCurrentNavigation).
 id: The unique identifier of the current navigation.
 initialUrl: The target URL passed into the Router#navigateByUrl() call before navigation.
 This is the value before the router has parsed or applied redirects to it.
 extractedUrl: The initial target URL after being parsed with UrlSerializer.extract().
 finalUrl: The extracted URL after redirects have been applied.
 This URL may not be available immediately, therefore this property can be undefined.
 It is guaranteed to be set after the RoutesRecognized event fires.
 trigger: Identifies how this navigation was triggered.
 --imperative-- Triggered by router.navigateByUrl or router.navigate.
 --popstate-- Triggered by a popstate event.
 --hashchange-- Triggered by a hashchange event.
 extras: A NavigationExtras options object that controlled the strategy used for this navigation.
 previousNavigation: The previously successful Navigation object. Only one previous navigation is available, therefore this previous Navigation object has a null value for its own previousNavigation.
 @publicApi

template, makes that element a link\n
* that initiates navigation to a route. Navigation opens one or more routed components\n * in one or more `<router-
outlet>` locations on the page.\n *\n * Given a route configuration `[{ path: 'user/:name', component: UserCmp
}]`,\n * the following creates a static link to the route:\n *\n * <a routerLink="/user/bob">link to user
component</a>\n *\n * You can use dynamic values to generate the link.\n * For a dynamic link, pass an array of
path segments,\n * followed by the params for each segment.\n * For example, `['/team', teamId, 'user', userName,
{details: true}]`\n * generates a link to `/team/11/user/bob;details=true`.\n *\n * Multiple static segments can be
merged into one term and combined with dynamic segments.\n * For example, `['/team/11/user', userName,
{details: true}]`\n *\n * The input that you provide to the link is treated as a delta to the current URL.\n * For
instance, suppose the current URL is `/user/(box//aux:team)`.\n * The link `<a

```

```
[routerLink]="['/user/jim']">Jim</a>`
creates the URL\n * `/user/(jim//aux:team)`.\n * See { @link Router#createUrlTree createUrlTree } for more
information.\n * \n * @usageNotes\n * \n * You can use absolute or relative paths in a link, set query parameters,\n * control how parameters are handled, and keep a history of navigation states.\n * \n * ### Relative link paths\n * \n *
The first segment name can be prepended with `^`, `./`, or `../`.\n * \n * If the first segment begins with `^`, the router
looks up the route from the root of the\n * app.\n * \n * If the first segment begins with `./`, or doesn't begin with a
slash, the router\n * looks in the children of the current activated route.\n * \n * If the first segment begins with `../`,
the router goes up one level in the route tree.\n * \n * ### Setting and handling query params and fragments\n * \n *
The following link adds a query parameter and a fragment to the generated URL:\n * \n * ```\n * <a
[routerLink]="['/user/bob']" [queryParams]="{debug: true}" fragment="education">\n
* link to user component\n * </a>\n * ```\n * By default, the directive constructs the new URL using the given
query parameters.\n * The example generates the link: `/user/bob?debug=true#education`.\n * \n * You can instruct
the directive to handle query parameters differently\n * by specifying the `queryParamsHandling` option in the
link.\n * Allowed values are:\n * \n * - `merge`: Merge the given `queryParams` into the current query params.\n *
- `preserve`: Preserve the current query params.\n * \n * For example:\n * \n * ```\n * <a
[routerLink]="['/user/bob']" [queryParams]="{debug: true}" queryParamsHandling="merge">\n * link to user
component\n * </a>\n * ```\n * \n * See { @link UrlCreationOptions.queryParamsHandling
UrlCreationOptions#queryParamsHandling }.\n * \n * ### Preserving navigation history\n * \n * You can provide a
`state` value to be persisted to the browser's\n * [History.state` property](https://developer.mozilla.org/en-
US/docs/Web/API/History#Properties).\n
* For example:\n * \n * ```\n * <a [routerLink]="['/user/bob']" [state]="{tracingId: 123}">\n * link to user
component\n * </a>\n * ```\n * \n * Use { @link Router.getCurrentNavigation() Router#getCurrentNavigation } to
retrieve a saved\n * navigation-state value. For example, to capture the `tracingId` during the `NavigationStart`\n *
event:\n * \n * ```\n * // Get NavigationStart events\n * router.events.pipe(filter(e => e instanceof
NavigationStart)).subscribe(e => {\n *   const navigation = router.getCurrentNavigation();\n *
tracingService.trace({id: navigation.extras.state.tracingId});\n * });\n * ```\n * \n * @ngModule RouterModule\n * \n
* @publicApi\n * \n * @Directive({selector: 'not(a):not(area)[routerLink]'})\n * \n * export class RouterLink implements
OnChanges {\n *   /**\n *    * Passed to { @link Router#createUrlTree Router#createUrlTree } as part of the\n *
