'../router';\n\nimport {RouterLink, RouterLinkWithHref} from './router_link';\n\n\n/**\n *\n * @description\n *\n *
Tracks whether the linked route of an element is currently active, and allows you\n * to specify one or more CSS
classes to add to the element when the linked route\n * is active.\n *\n * Use this directive to create a visual
distinction for elements associated with an active route.\n * For example, the following code highlights the word
"Bob" when the the router\n * activates the associated route:\n *\n * ```\n * <a routerLink="/user/bob"\n
routerLinkActive="active-link">Bob</a>\n * ```\n *\n * Whenever the URL is either '/user' or '/user/bob', the
"active-link" class is\n * added to the anchor tag. If the URL changes, the class is removed.\n *\n * You can set
more than one class using a space-separated string or an array.\n * For example:\n *\n * ```\n * <a routerLink="/user/bob" routerLinkActive="class1 class2">Bob</a>\n * <a routerLink="/user/bob"\n
[routerLinkActive]="['class1', 'class2']">Bob</a>\n * ```\n *\n * To add the classes only when the URL matches
the link exactly, add the option `exact: true`:\n *\n * ```\n * <a routerLink="/user/bob" routerLinkActive="active-
link" [routerLinkActiveOptions]="{exact: true}">Bob</a>\n * ```\n *\n * To directly check the `isActive`
status of the link, assign the `RouterLinkActive`\n * instance to a template variable.\n * For example, the following
checks the status without assigning any CSS classes:\n *\n * ```\n * <a routerLink="/user/bob" routerLinkActive
#rla="routerLinkActive">\n *   Bob {{ rla.isActive ? '(already open)' : '' }}\n * </a>\n * ```\n *\n * You can apply
the `RouterLinkActive` directive to an ancestor of linked elements.\n * For example, the following sets the active-
link class on the `<div>` parent tag\n * when the URL is either '/user/jim' or

```

```

'/user/bob'.\n * \n * ```\n * <div routerLinkActive=\"active-link\" [routerLinkActiveOptions]=\"{exact: true}\">\n *
<a routerLink=\"/user/jim\">Jim</a>\n * <a routerLink=\"/user/bob\">Bob</a>\n * </div>\n * ```\n * \n *

current router state.\n * \n * Each outlet can have a unique name, determined by the optional `name` attribute.\n *
The name cannot be set or changed dynamically. If not set, default value is `primary`.\n * \n * ```\n * <router-
outlet></router-outlet>\n * <router-outlet name='left'></router-outlet>\n * <router-outlet name='right'></router-
outlet>\n * ```\n * \n * Named outlets can be the targets of secondary routes.\n * The `Route` object for a secondary

```

route has an

```
`outlet` property to identify the target outlet:\n *\n * `{path: <base-path>, component: <component>, outlet:\n <target_outlet_name>}`\n *\n * Using named outlets and secondary routes, you can target multiple outlets in\n *\n * the same `RouterLink` directive.\n *\n * The router keeps track of separate branches in a navigation tree for each named\n * outlet and\n * generates a representation of that tree in the URL.\n * The URL for a secondary route uses the\n * following syntax to specify both the primary and secondary\n * routes at the same time:\n *\n * `http://base-path/primary-route-path(outlet-name:route-path)`\n *\n * A router outlet emits an activate event when a new\n * component is instantiated,\n * and a deactivate event when a component is destroyed.\n *\n * ``\n *\n * <router-outlet\n * (activate)='onActivate($event)'\n * (deactivate)='onDeactivate($event)'\n * ></router-outlet>\n * ``\n *\n * @see [Routing tutorial](guide/router-tutorial-toh#named-outlets)\n * \"Example of a named\n * outlet and\n * secondary route configuration\".\n *\n * @see `RouterLink`\n *\n * @see `Route`\n *\n * @NgModule ```

is rejected with the exception.

- `errorHandler?: ErrorHandler;` Configures a preloading strategy. One of `PreloadAllModules` or `NoPreloading` (the default).
- `preloadingStrategy?: any;` Define what the router should do if it receives a navigation request to the current URL. Default is `'ignore'`, which causes the router ignores the navigation. This can disable features such as a `"refresh"` button. Use this option to configure the behavior when navigating to the current URL. Default is `'ignore'`.
- `onSameUrlNavigation?: 'reload'|'ignore';` Configures if the scroll position needs to be restored when navigating back.
 - `'disabled'` - (Default) Does nothing. Scroll position is maintained on navigation.
 - `'top'` - Sets the scroll position to `x = 0, y = 0` on all navigation.
 - `'enabled'` - Restores the previous scroll position on backward navigation, else sets the position to the anchor if one is provided, or sets the scroll position to `[0, 0]` (forward navigation). This option will be the default in the future.
- You can implement custom scroll restoration behavior by adapting the enabled behavior as in the following example.

```
typescript
class AppModule {
  constructor(router: Router, viewportScroller: ViewportScroller) {
    router.events.pipe(
      filter((e: Event): e is Scroll => e instanceof Scroll)
    ).subscribe(e => {
      if (e.position) {
        // backward navigation
        viewportScroller.scrollToPosition(e.position);
      } else if (e.anchor) {
        // anchor navigation
        viewportScroller.scrollToAnchor(e.anchor);
      } else {
        // forward navigation
        viewportScroller.scrollToPosition([0, 0]);
      }
    });
  }
}

scrollPositionRestoration?: 'disabled'|'enabled'|'top';
```
- When set to `'enabled'`, scrolls to the anchor element when the URL has a fragment. Anchor scrolling is disabled by default. Anchor scrolling does not happen on `'popstate'`. Instead, we restore the position that we stored or scroll to the top.
- `anchorScrolling?: 'disabled'|'enabled';` Configures the scroll offset the router will use when scrolling to an element.
 - When given a tuple with `x` and `y` position value, the router uses that offset each time it scrolls.
 - When given a function, the router invokes the function every time it restores scroll position.
- `scrollOffset?: [number, number]|((() => [number, number]));` Defines how the router merges parameters, data, and resolved data from parent to child routes. By default (`'emptyOnly'`), inherits parent parameters only for path-less or component-less routes. Set to `'always'` to enable unconditional inheritance of parent parameters.
- `paramsInheritanceStrategy?: 'emptyOnly'|'always';` A custom handler for malformed URI errors. The handler is invoked when `encodedURI` contains invalid character sequences. The default implementation is to redirect to the root URL, dropping any path or parameter information. The function takes three parameters:
 - `URIError` - Error thrown when parsing a bad URL.
 - `UrlSerializer` - `UrlSerializer` that's configured with the router.
 - `url` - The malformed URL that caused the `URIError`.
- `malformedUriErrorHandler?: (error: URIError, urlSerializer: UrlSerializer, url: string) => UrlTree;` Defines when the router updates the browser URL. By default (`'deferred'`), update after successful navigation. Set to `'eager'` if prefer to update the URL at the beginning of navigation. Updating the URL early allows you to handle a failure of navigation by showing an error message with the URL that failed.
- `urlUpdateStrategy?: 'deferred'|'eager';` Enables a bug fix that corrects relative link resolution in components with empty paths. Example:

```
typescript
const routes = [
  { path: '', component: ContainerComponent, children: [
    { path: 'a', component: AComponent },
    { path: 'b', component: BComponent }
  ] },
];
```

 From the `ContainerComponent`, this will not work:

```
<a [routerLink]="['./a']">Link to A</a>
```

 However, this will work:

```
<a [routerLink]="['./a']">Link to A</a>
```

 In other words, you're required to use `../` rather than `./`. The default in v11 is `'corrected'`.
- `relativeLinkResolution?: 'legacy'|'corrected';`

The goal is to\nallow users to avoid the\n  most obvious pitfalls and do so without compromising performance significantly.\n  For ShadowDOM styling that's not covered here, a set of best practices\n  can be provided that should allow users\nto accomplish more complex styling.\n  The following is a list of specific ShadowDOM styling features and a\nbrief\ndiscussion of the approach used to shim.\n  Shimmed features:\n  * :host, :host-context:\nShadowDOM allows styling of the shadowRoot's host\nelement using the :host rule. To shim this feature, the\n:host styles are\n  reformatted and prefixed with a given scope name\nand promoted to a\ndocument level stylesheet.\n  For example, given a scope name of .foo, a rule like\nthis:\n  :host {\n    background: red;\n  }\n  becomes:\n  .foo {\n    background:\nred;\n  }\n  * encapsulation: Styles defined within ShadowDOM, apply only to\ndom inside the\nShadowDOM. Polymer uses one of two techniques to implement\n  this feature.\n  By default, rules are\nprefixed with the host element tag name\n  as a descendant selector. This ensures styling does not leak out of the\n'top'\nof the element's ShadowDOM. For example,\n  div {\n    font-weight: bold;\n  }\n  becomes:\n  x-foo div {\n    font-weight: bold;\n  }\n  becomes:\n  Alternatively, if\nWebComponents.ShadowCSS.strictStyling is set to true then\n  selectors are scoped by adding an attribute\nselector suffix to each\n  simple selector that contains the\n  host element tag name. Each element\n  in the element's ShadowDOM template is also given the scope\nattribute.\n  Thus, these rules match only elements that have the scope attribute.\n  For example, given a scope\nname of x-foo, a rule like this:\n  div {\n    font-weight: bold;\n  }\n  becomes:\n  div[x-foo]

```

{\n font-weight: bold;\n }\n\n Note that elements that are dynamically added to a scope must have the scope\n selector added to them manually.\n\n * upper/lower bound encapsulation: Styles which are defined outside a\n shadowRoot should not cross the ShadowDOM boundary and should not apply\n inside a shadowRoot.\n\n This styling behavior is not emulated. Some possible ways to do this that\n were rejected due to complexity and/or performance concerns include: (1) reset\n every possible property for every possible selector for a given scope name;\n (2) re-implement css in javascript.\n\n

As an alternative, users should make sure to use selectors\n specific to the scope in which they are working.\n\n * ::distributed: This behavior is not emulated. It's often not necessary\n to style the contents of a specific insertion point and instead, descendants\n of the host element can be styled selectively. Users can also create an\n extra node around an insertion point and style that node's contents\n via descendent selectors. For example, with a shadowRoot like this:\n\n <style>\n ::content(div) {\n background: red;\n }\n </style>\n <content></content>\n\n could become:\n\n <style>\n /*@polyfill .content-container div * \n ::content(div) {\n background: red;\n }\n </style>\n <div class=\"content-container\">\n <content></content>\n </div>\n\n Note the use of @polyfill in the comment above a ShadowDOM

specific style\n declaration. This is a directive to the styling shim to use the selector\n in comments in lieu of the next selector when running under polyfill.\n\n *\n\n var ShadowCss = /** @class */ (function () {\n function ShadowCss() {\n this.strictStyling = true;\n }\n\n /*\n * Shim some cssText with the given selector. Returns cssText that can\n * be included in the document via WebComponents.ShadowCSS.addCssToDocument(css).\n\n * When strictStyling is true:\n * - selector is the attribute added to all elements inside the host,\n * - hostSelector is the attribute added to the host itself.\n\n *\n\n ShadowCss.prototype.shimCssText = function (cssText, selector, hostSelector) {\n if (hostSelector === void 0) { hostSelector = "; }\n\n var commentsWithHash = extractCommentsWithHash(cssText);\n\n cssText = stripComments(cssText);\n\n cssText = this._insertDirectives(cssText);\n\n var scopedCssText = this._scopeCssText(cssText, selector, hostSelector);\n\n return __spread([scopedCssText], commentsWithHash).join("\\n");\n }\n\n ShadowCss.prototype._insertDirectives = function (cssText) {\n cssText = this._insertPolyfillDirectivesInCssText(cssText);\n\n return this._insertPolyfillRulesInCssText(cssText);\n }\n\n /*\n * Process styles to convert native ShadowDOM rules that will trip\n * up the css parser; we rely on decorating the stylesheet with inert rules.\n\n *\n * For example, we convert this rule:\n\n *\n * polyfill-next-selector { content: 'host menu-item'; }\n\n * ::content menu-item {\n *\n * to this:\n\n *\n * scopeName menu-item {\n *\n **\n\n ShadowCss.prototype._insertPolyfillDirectivesInCssText = function (cssText) {\n // Difference with webcomponents.js: does not handle comments\n\n return cssText.replace(_cssContentNextSelectorRe, function () {\n var m = [];\n\n for (var _i = 0; _i < arguments.length; _i++) {\n m[_i] = arguments[_i];\n }\n\n return m[2] + '{';\n\n });\n\n /*\n * Process styles to add rules which will only apply under the polyfill\n\n *\n * For example, we convert this rule:\n\n *\n * polyfill-rule {\n * content: 'host menu-item';\n * ...\n * }\n\n * to this:\n\n *\n * scopeName menu-item { ... }\n\n *\n **\n\n ShadowCss.prototype._insertPolyfillRulesInCssText = function (cssText) {\n // Difference with webcomponents.js: does not handle comments\n\n return cssText.replace(_cssContentRuleRe, function () {\n var m = [];\n\n for (var _i = 0; _i < arguments.length; _i++) {\n m[_i] = arguments[_i];\n }\n\n var rule = m[0].replace(m[1], "").replace(m[2], "");\n\n return m[4] + rule;\n\n });\n\n /* Ensure styles are scoped. also treats ')',\n      * '}' and ']' as conditional recovery points if one of calling productions is expecting\n      * one
of these symbols. This allows skip() to recover from errors such as '(a.) + 1' allowing\n      * more of the AST to be
retained (it doesn't skip any tokens as the ') is retained because\n      * of the '(' begins an '(' <expr> ')' production).
The recovery points of grouping symbols\n      * must be conditional as they must be skipped if none of the calling
productions are not\n      * expecting the closing token else we will never make progress in the case of an\n      *
extraneous group closing symbol (such as a stray ')'). This is not the case for ';' because\n      * parseChain() is
always the root
production and it expects a ';'.\n      */\n    * Furthermore, the presence of a stateful context can add more
recovery points.\n      * - in a `Writable` context, we are able to recover after seeing the `=` operator, which\n
* signals the presence of an independent rvalue expression following the `=` operator.\n      */\n    * If a
production expects one of these token it increments the corresponding nesting count,\n      * and then decrements it
just prior to checking if the token is in the input.\n      */\n    _ParseAST.prototype.skip = function () {\n      var n = this.next;\n      while (this.index < this.tokens.length && !n.isCharacter($SEMICOLON) &&\n        (this.rparensExpected <= 0 || !n.isCharacter($RPAREN)) &&\n          (this.rbracesExpected <= 0 ||\n            !n.isCharacter($RBRACE)) &&\n            (this.rbracketsExpected <= 0 || !n.isCharacter($RBRACKET)) &&\n              (!(this.context & ParseContextFlags.Writable)\n                || !n.isOperator('='))) {\n        if (this.next.isError()) {\n          this.errors.push(new\nParserError(this.next.toString(), this.input, this.locationText(), this.location));\n        }\n        this.advance();\n        n = this.next;\n      }\n    };\n    return _ParseAST;\n  }();\n  var

It encodes inheritance,\n properties, and events.\n *\n * ## Overview\n *\n * Each line represents one kind of element. The `element_inheritance`\n and properties are joined using `element_inheritance|properties` syntax.\n *\n * ## Element Inheritance\n *\n * The `element_inheritance` can be further subdivided as `element1,element2,...^parentElement`. Here the individual elements are separated by `,` (commas).\n Every element in the list has identical properties.\n *\n * An `element` may inherit additional properties from `parentElement`. If no `^parentElement` is specified then `""` (blank)\n element is assumed.\n *\n * NOTE: The blank element inherits from root `[Element]` element, the super element of all elements.\n *\n * NOTE an element prefix such as `svg:` has no special meaning to the schema.\n *\n * ## Properties\n *\n * Each element has a set of properties separated by `,` (commas). Each property can be prefixed by a special character designating its type:\n *\n * - (no prefix): property is a string.\n * - `*`: property represents an event.\n * - `!`: property is a boolean.\n * - `#`: property is a number.\n * - `%`: property is an object.\n *\n * ## Query\n *\n * The class creates an internal squas representation which allows to easily answer the query of\n if\n a given property exist on a given element.\n *\n * NOTE: We don't yet support querying for types or events.\n *\n * NOTE: This schema is auto extracted from `schema_extractor.ts` located in the test folder,\n see dom_element_schema_registry_spec.ts\n //\n\n=====\n//\n\n=====\n\n===== STOP - STOP - STOP - STOP - STOP - STOP =====\n\n//\n\n=====\n\n===== DO NOT EDIT THIS DOM SCHEMA WITHOUT A SECURITY REVIEW!\n\n// Newly added properties must be security reviewed and assigned an appropriate SecurityContext\nin\n// dom_security_schema.ts.
