patterns, like `#,###.00`. For example, the pattern `#,###.00`\n * when used to format the number 12345.678 could
result in `"12'345,678"`. That would happen if the\n * grouping separator for your language is an apostrophe, and the
decimal separator is a comma.\n * \n * Important: The characters `.` `, `0` `#` (and others below) are special
placeholders\n * that stand for the decimal separator, and so on, and are NOT real characters.\n * You must NOT
`translate` the placeholders. For example, don't change `.` to `,` even though in\n * your language
the decimal point is written with a comma. The symbols should be replaced by the\n * local equivalents, using the
appropriate `NumberSymbol` for your language.\n * \n * Here are the special characters used in number patterns:\n
* \n * | Symbol | Meaning |\n * |-----|-----|\n * | . | Replaced automatically by the character used for the decimal
point. |\n * | , | Replaced by the "grouping" (thousands) separator. |\n * | 0 | Replaced by a digit (or zero if there
aren't enough digits). |\n * | # | Replaced by a digit (or nothing if there aren't enough). |\n * | ¤ | Replaced by a
currency symbol, such as $ or USD. |\n * | % | Marks a percent format. The % symbol may change position, but
must be retained. |\n * | E | Marks a scientific format. The E symbol may change position, but must be retained. |\n
* | ' | Special characters used as literal characters are quoted with ASCII single quotes. |\n * \n * @param locale A
locale code for the locale format rules to use.\n * @param type The
type of numeric value to be formatted (such as `Decimal` or `Currency`.)\n * @returns The localized format
string.\n * @see `NumberFormatStyle`\n * @see [CLDR website](http://cldr.unicode.org/translation/number-

/\*\*  
 \* A [structural directive](guide/structural-directives) that renders a template for each item in a collection.  
 \* The directive is placed on an element, which becomes the parent of the cloned templates.  
 \* The `ngForOf` directive is generally used in the [shorthand form](guide/structural-directives#the-asterisk-prefix) `\*ngFor`.  
 \* In this form, the template to be rendered for each iteration is the content of an anchor element containing the directive.  
 \* The following example shows the shorthand syntax with some options, contained in an `- ` element.  
 \* `<li *ngFor="let item of items; index as i; trackBy: trackByFn">...</li>`  
 \* The shorthand form expands into a long form that uses the `ngForOf`

selector\n \* on an `<ng-template>` element.\n \* The content of the `<ng-template>` element is the `<li>` element that held the\n \* short-form directive.\n \* \n \* Here is the expanded version of the short-form example.\n \* \n \* ``\n \* <ng-template ngFor let-item [ngForOf]="items" let-i="index" [ngForTrackBy]="trackByFn">\n \* <li>...</li>\n \* </ng-template>\n \* ``\n \* \n \* Angular automatically expands the shorthand syntax as it compiles the template.\n \* The context for each embedded view is logically merged to the current component\n \* context according to its lexical position.\n \* \n \* When using the shorthand syntax, Angular allows only [one structural directive\n \* on an element](guide/structural-directives#one-structural-directive-per-host-element).\n \* If you want to iterate conditionally, for example,\n \* put the `*ngIf` on a container element that wraps the `*ngFor` element.\n \* For further discussion, see\n \* [Structural Directives](guide/structural-directives#one-per-element).\n \* \n \* @usageNotes\n \* \n \* ### Local variables\n \* \n \* `*NgForOf` provides exported values that can be aliased to local variables.\n \* For example:\n \* \n \* ``\n \* <li \*ngFor="let user of users; index as i; first as isFirst">\n \* {{i}}/{{users.length}}. {{user}} <span \*ngIf="isFirst">default</span>\n \* </li>\n \* ``\n \* \n \* The following exported values can be aliased to local variables:\n \* \n \* - `$implicit: T`: The value of the individual items in the iterable (`*ngForOf`).\n \* - `*ngForOf: NgIterable<T>`: The value of the iterable expression. Useful when the expression is\n \* more complex than a property access, for example when using the async pipe (`*userStreams | async`).\n \* - `*index: number`: The index of the current item in the iterable.\n \* - `*count: number`: The length of the iterable.\n \* - `*first: boolean`: True when the item is the first item in the iterable.\n \* - `*last: boolean`: True when the item is the last item in the iterable.\n \* - `*even: boolean`: True when the item has an even index in the iterable.\n \* - `*odd: boolean`: True when the item has an odd index in the iterable.\n \* \n \* ### Change propagation\n \* \n \* When the contents of the iterator changes, `*NgForOf` makes the corresponding changes to the DOM:\n \* \n \* \* When an item is added, a new instance of the template is added to the DOM.\n \* \* When an item is removed, its template instance is removed from the DOM.\n \* \* When items are reordered, their respective templates are reordered in the DOM.\n \* \n \* Angular uses object identity to track insertions and deletions within the iterator and reproduce\n \* those changes in the DOM. This has important implications for animations and any stateful\n \* controls that are present, such as `<input>` elements that accept user input. Inserted rows can\n \* be animated in, deleted rows can be animated out, and unchanged rows retain any unsaved state\n \* such as user input.\n \* For more on animations, see [Transitions and Triggers](guide/transition-and-triggers).\n \* \n \* The identities of elements in the iterator can change while the data does not.\n \* This can happen, for example, if the iterator is produced from an RPC to the server, and that\n \* RPC is re-run. Even if the data hasn't changed, the second response produces objects with\n \* different identities, and Angular must tear down the entire DOM and rebuild it (as if all old\n \* elements were deleted and all new elements inserted).\n \* \n \* To avoid this expensive operation, you can customize the default tracking algorithm.\n \* by supplying the `*trackBy` option to `*NgForOf`.  
`*trackBy` takes a function that has two arguments: `*index` and `*item`.  
If `*trackBy` is given, Angular tracks changes by the return value of the function.

The default\n \* template for the `else` clause is blank.\n \* A [shorthand form](guide/structural-directives#the-asterisk--prefix) of the directive,\n \* `\*ngIf="condition"`, is generally used, provided\n \* as an attribute of the anchor element for the inserted template.\n \* Angular expands this into a more explicit version, in which the anchor element\n \* is contained in an `` element.\n \* Simple form with shorthand syntax:\n \*\n \* <div \*ngIf="condition">Content to render when condition is true.</div>\n \*\n \* Simple form with expanded syntax:\n \*\n \* <ng-template [ngIf]="condition"><div>Content to render when condition is\n \* true.</div></ng-template>\n \*\n \* Form with an `else` block:\n \*\n \* <div \*ngIf="condition; else elseBlock">Content to render when condition is true.</div>\n \* <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n \*\n \* Shorthand form with `then` and `else` blocks:\n \*\n \* <div \*ngIf="condition; then thenBlock else elseBlock"></div>\n \* <ng-template #thenBlock>Content to render when condition is true.</ng-template>\n \* <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n \*\n \* Form with storing the value locally:\n \*\n \* <div \*ngIf="condition as value; else elseBlock">{{ value }}</div>\n \* <ng-template #elseBlock>Content to render when value is null.</ng-template>\n \*\n \* @usageNotes\n \*\n \* The `\*ngIf` directive is most commonly used to conditionally show an inline template,\n \* as seen in the following example.\n \*\n \* The default `else` template is blank.\n \*\n \* { @example common/ngIf/ts/module.ts region='NgIfSimple' }\n \*\n \* ### Showing an alternative template using `else`\n \*\n \* To display a template when `expression` evaluates to false, use an `else` template\n \* binding as shown in the following example. The `else` binding points to an ``\n \* element labeled `#elseBlock`.\n \* The template can be defined anywhere in the component view, but is typically placed right after\n \* `\*ngIf` for readability.\n \*\n \* { @example common/ngIf/ts/module.ts region='NgIfElse' }\n \*\n \* ### Using an external `then` template\n \*\n \* In the previous example, the then-clause template is specified inline, as the content of the\n \* tag that contains the `\*ngIf` directive. You can also specify a template that is defined\n \* externally, by referencing a labeled `` element. When you do this, you can\n \* change which template to use at runtime, as shown in the following example.\n \*\n \* { @example common/ngIf/ts/module.ts region='NgIfThenElse' }\n \*\n \* ### Storing a conditional result in a variable\n \*\n \* You might want to show a set of properties from the same object. If you are waiting\n \* for asynchronous data, the object can be undefined. In this case, you can use `\*ngIf` and store the result of the condition in a local\n \* variable as shown in the the following example.\n \*\n \* { @example common/ngIf/ts/module.ts region='NgIfAs' }\n \*\n \* This code uses only one `AsyncPipe`, so only one subscription is created. The conditional statement stores the result of `userStream|async` in the local variable `user`. You can then bind the local `user` repeatedly.\n \*\n \* The conditional displays the data only if `userStream` returns a value, so you don't need to use the\n \* [safe-navigation-operator](guide/template-expression-operators#safe-navigation-operator) `?.` to guard against null values when accessing properties. You can display an alternative template while waiting for the data.\n \*\n \* ### Shorthand syntax\n \*\n \* The shorthand syntax `\*ngIf` expands into two separate template specifications\n \* for the `then` and `else` clauses. For example, consider the following shorthand statement,\n \* that is meant to show a loading page while waiting for data to be loaded.\n \*\n \* <div class="hero-list" \*ngIf="heroes else loading">\n \* ...</div>\n \* <ng-template #loading>\n \* <div>Loading...</div>\n \* </ng-template>\n \*\n \* You can see that the `else` clause references the `` with the `#loading` label, and the template for the `then` clause\n \* is provided as the content of the anchor element.\n \*\n \* However, when Angular expands the shorthand syntax, it creates\n \* another `` tag, with `\*ngIf` and `\*ngIfElse` directives. The anchor element containing the template for the `then`

clause becomes

```

<ng-template>` tag.
<ng-template [ngIf]="heroes"
[ngIfElse]="loading">
<div class="hero-list">
...
</div>
</ng-template>
<ng-template #loading>
<div>Loading...</div>
</ng-template>

```

The presence of the implicit template object has implications for the nesting of structural directives. For more on this subject, see [Structural Directives](https://angular.io/guide/structural-directives#one-per-element).

ISO8601 extended format + Z indicator for offset 0 (= XXXXX)	-08:00	\n *		
O, OO & OOO   Short localized GMT format	GMT-8			
\n *	OOOO   Long localized GMT format	GMT-08:00		

\n \* \n \* Note that timezone correction is not applied to an ISO string that has no time component, such as `2016-09-19T00:00:00.000Z`.

Format examples

These examples transform a date into various formats, assuming that `dateObj` is a JavaScript `Date` object for year: 2015, month: 6, day: 15, hour: 21, minute: 43, second: 11, given in the local time for the `en-US` locale.

```

 * \n * ``\n * {{ dateObj | date }} // output is 'Jun 15, 2015'
 * \n * {{ dateObj | date:'medium' }} // output is 'Jun 15, 2015, 9:43:11 PM'
 * \n * {{ dateObj | date:'shortTime' }} // output is '9:43 PM'
 * \n * {{ dateObj | date:'mm:ss' }} // output is '43:11'

```

Usage example

The following component uses a date pipe to display the current date in different formats.

```

 @Component({
 selector: 'date-pipe',
 template: `
 <div>
 <p>Today is {{ today | date }}</p>
 <p>Or if you prefer, {{ today | date:'fullDate' }}</p>
 <p>The time is {{ today | date:'h:mm a z' }}</p>
 </div>
 `,
 })
 export class DatePipeComponent {
 today: number = Date.now();
 }

```

Get the current date and time as a date-time value.

```

 export class DatePipeComponent {
 today: number = Date.now();
 }

```

Usage example

```

 @Pipe({name: 'date', pure: true})
 export class DatePipe implements PipeTransform {
 constructor(@Inject(LOCALE_ID) private locale: string) {}

 transform(
 value: Date|string|number,
 format?: string,
 timezone?: string,
 locale?: string
): string|null {
 if (value == null || value === '' || value !== value) return null;

 try {
 return formatDate(value, format, locale || this.locale, timezone);
 } catch (error) {
 throw invalidPipeArgumentError(DatePipe, error.message);
 }
 }
 }

```

{assertLessThan} from '../util/assert';\nimport {defineInjectable} from '../interface/defs';\n\n/**\n * Creates a token
that can be used in a DI Provider.\n *\n * Use an `InjectionToken` whenever the type you are injecting is not reified
(does not have a\n * runtime representation) such as when injecting an interface, callable type, array or\n *
parameterized type.\n *\n * `InjectionToken` is parameterized on `T` which is the type of object which will be
returned by\n *
the `Injector`. This provides additional level of type safety.\n *\n * ``\n * interface MyInterface { ... }\n * var
myInterface = injector.get(new InjectionToken<MyInterface>('SomeToken'));\n * // myInterface is inferred to be
MyInterface.\n *\n * ``\n *\n * When creating an `InjectionToken`, you can optionally specify a factory function which
returns\n * (possibly by creating) a default value of the parameterized type `T`. This sets up the\n * `InjectionToken`
using this factory as a provider as if it was defined explicitly in the\n * application's root injector. If the factory
function, which takes zero arguments, needs to inject\n * dependencies, it can do so using the `inject` function. See
below for an example.\n *\n * Additionally, if a `factory` is specified you can also specify the `providedIn` option,
which\n * overrides the above behavior and marks the token as belonging to a particular `@NgModule`. As\n *
mentioned above, `root` is the default value for `providedIn`.\n *\n *
@usageNotes\n * ### Basic Example\n *\n * ### Plain InjectionToken\n *\n * { @example

extends InjectionToken<T> {\n prov: never;\n}\n\n", "*/\n\n * @license\n * Copyright Google LLC All Rights
Reserved.\n *\n * Use of this source code is governed by an MIT-style license that can be\n * found in the
LICENSE file at https://angular.io/license\n *\n\nimport {InjectionToken} from '../di/injection_token';\nimport
{Type} from '../interface/type';\nimport {makePropDecorator} from '../util/decorators';\n\n/**\n * A DI token that
you can use to create a virtual [provider](guide/glossary#provider)\n * that will populate the `entryComponents`
field of components and NgModules\n * based on its `useValue` property value.\n * All components that are

```

referenced in the `useValue` value (either directly or in a nested array or map) are added to the `entryComponents` property.

The following example shows how the router can populate the `entryComponents` field of an NgModule based on a router configuration that refers to components.

```

typescript // helper function inside the router
function provideRoutes(routes) {
 return [{ provide: ROUTES, useValue: routes }, { provide: ANALYZE_FOR_ENTRY_COMPONENTS, useValue: routes, multi: true }];
}
// user code
let routes = [{ path: '/root', component: RootComp }, { path: '/teams', component: TeamsComp }];
@NgModule({ providers: [provideRoutes(routes)] })
class ModuleWithRoutes {}
export const ANALYZE_FOR_ENTRY_COMPONENTS = new InjectionToken<any>('AnalyzeForEntryComponents');
// Type of the `Attribute` decorator / constructor function.
export interface AttributeDecorator {
 // Specifies that a constant attribute value should be injected.
 // The directive can inject constant string literals of host element attributes.
 @usageNotes
 // Suppose we have an <input> element and want to know its `type`.
 // <input type="text">
 // A decorator can inject string literal `text` as in the following example.
 // @example core/ts/metadata/metadata.ts region='attributeMetadata'
 @publicApi
 (name: string): any;
 new(name: string): Attribute;
}
// Type of the Attribute metadata.
export interface Attribute {
 // The name of the attribute to be injected into the constructor.
 attributeName?: string;
 // Type of the Query metadata.
 @publicApi
 export interface Query {
 descendants: boolean;

/**
 * This function checks to see if the `ngDevMode` has been set. If yes, then we honor
 * it, otherwise we default to dev mode with additional checks.
 *
 * The idea is that unless we are doing production
 * build where we explicitly set `ngDevMode === false` we should be helping the developer by providing
 * as much early warning and errors as possible.
 *
 * `defineComponent` is guaranteed to have been called before any
 * component template functions (and thus Ivy instructions), so a single initialization there is sufficient to ensure
 * ngDevMode is defined for the entire instruction set.
 *
 * When checking `ngDevMode` on toplevel, always
 * init it before referencing it (e.g. `((typeof ngDevMode === 'undefined' || ngDevMode) && initNgDevMode())`),
 * otherwise you can get a `ReferenceError` like in https://github.com/angular/angular/issues/31595.
 *
 * Details on possible values for `ngDevMode` can be found on its docstring.
 *
 * NOTE:
 * - changes to the `ngDevMode` name must be synced with `compiler-cli/src/tooling.ts`.
 *
 * @export function
 * initNgDevMode(): boolean {
 * // The below checks are to ensure that calling `initNgDevMode` multiple times does
 * // not reset the counters.
 * // If the `ngDevMode` is not an object, then it means we have not created the perf
 * // counters yet.
 * if (typeof ngDevMode === 'undefined' || ngDevMode) {
 * if (typeof ngDevMode !== 'object') {
 * ngDevModeResetPerfCounters();
 * }
 * return typeof ngDevMode !== 'undefined' && !!ngDevMode;
 * }
 * return false;
 * }

We need a reference to this so we can easily walk up the\n \* node tree in DI and get the TView.data array associated with a node (where the\n \* directive defs are stored).\n \* \n [readonly][TVIEW]: TView;\n \n /\*\* Flags for this view. See LViewFlags for more info. \n [FLAGS]: LViewFlags;\n \n /\*\*\n \* This may store an { @link LView } or { @link LContainer }.\n \n \*\n \* `LView` - The parent view. This is needed when we exit the view and must restore the previous\n \* LView. Without this, the render method would have to keep a stack of\n \* views as it is recursively rendering templates.\n \*\n \* `LContainer` - The current view is part of a container, and is an embedded view.\n \*\n [PARENT]: LView|LContainer|null;\n \n /\*\*\n \*\n \* The next sibling LView or LContainer.\n \*\n \* Allows us to propagate between sibling view states that aren't in the same\n \* container. Embedded views already have a node.next, but it is only set for\n \* views in the same container. We need a way to link component views and views\n \* across containers as well.\n \*\n [NEXT]: LView|LContainer|null;\n \n /\*\* Queries active for this view - nodes from a view are reported to those queries. \n [QUERIES]: LQueries|null;\n \n /\*\*\n \*\n \* Store the `TNode` of the location where the current `LView` is inserted into.\n \*\n \* Given:\n \*\n \* ```\n \* <div>\n \* <ng-template><span></span></ng-template>\n \* </div>\n \* ```\n \*\n \* We end up with two `TView`s.\n \* - `parent` `TView` which contains `<div><!-- anchor --></div>`\n \* - `child` `TView` which contains `<span></span>`\n \*\n \* Typically the `child` is inserted into the declaration location of the `parent`, but

it can be inserted anywhere. Because it can be inserted anywhere it is not possible to store the insertion information in the `TVView` and instead we must store it in the `LView[T\_HOST]`. So to determine where is our insertion parent we would execute:

```

const parentLView = IView[PARENT];
const parentTNode = IView[T_HOST];
const insertionParent = parentLView[parentTNode.index];

```

If `null`, this is the root view of an application (root component is in this view) and it has no parents.

[T\_HOST]: TNode|null;

When a view is destroyed, listeners need to be released and outputs need to be unsubscribed. This context array stores both listener functions wrapped with their context and output subscription instances for a particular view.

These change per LView instance, so they cannot be stored on TVView. Instead, TVView.cleanup saves an index to the necessary context in this array.

// TODO: flatten into LView[]

[CLEANUP]: any[]|null;

- For dynamic views, this is the context with which to render the template (e.g. `NgForContext`), or `{}` if not defined explicitly.

- For root view of the root component the context contains change detection data.

- For non-root components, the context is the component instance.

- For inline views, the context is null.

[CONTEXT]: {}|RootContext|null;

An optional Module Injector to be used as fall back after Element Injectors are consulted.

readonly[INJECTOR]: Injector|null;

Factory to be used for creating Renderer.

[RENDERER\_FACTORY]: RendererFactory3;

Renderer to be used for this view.

[RENDERER]: Renderer3;

An optional custom sanitizer.

[SANITIZER]: Sanitizer|null;

Reference to the first LView or LContainer beneath this LView in the hierarchy.

Necessary to store this so views can traverse through their nested views to remove listeners and call onDestroy callbacks.

[CHILD\_HEAD]: LView|LContainer|null;

The last LView or LContainer beneath this LView in the hierarchy.

The tail allows us to quickly add a new state to the end of the view list without having to propagate starting from the first child.

[CHILD\_TAIL]: LView|LContainer|null;

View where this view's template was declared.

The template for a dynamically created view may be declared in a different view than it is inserted. We already track the "insertion view" (view where the template was inserted) in LView[PARENT], but we also need access to the "declaration view" (view where the template was declared). Otherwise, we wouldn't be able to call the view's template function with the proper contexts. Context should be inherited from the declaration view tree, not the insertion view tree.

Example (AppComponent template):

```

<ng-template #foo></ng-template>
<some-comp [tpl]="foo"></some-comp>

```

declared here --> inserted inside this component -->

The <ng-template> above is declared in the AppComponent template, but it will be passed into SomeComp and inserted there. In this case, the declaration view would be the AppComponent, but the insertion view would be SomeComp. When we are removing views, we would want to traverse through the insertion view to clean up listeners. When we are calling the template function during change detection, we need the declaration view to get inherited context.

[DECLARATION\_VIEW]: LView|null;

Points to the declaration component view, used to track transplanted LView's.

See: `DECLARATION\_VIEW` which points to the actual LView where it was declared, whereas `DECLARATION\_COMPONENT\_VIEW` points to the component which may not be same as `DECLARATION\_VIEW`.

Example:

```

<#VIEW #myComp>
<div *ngIf="true">
<ng-template #myTpl>...</ng-template>
</div>
</#VIEW>

```

In the above case `DECLARATION\_VIEW` for `myTpl` points to the LView of `ngIf` whereas `DECLARATION\_COMPONENT\_VIEW` points to LView of the `myComp` which owns the template.

The reason for this is that all embedded views are always check-always whereas the component view can be check-always or on-push. When we have a transplanted view it is important to determine if we have transplanted a view from check-always declaration to on-push insertion point. In such a case the transplanted view needs to be added to the LContainer in the declared LView and CD during the declared view CD (in addition to the CD at the insertion point.) (Any transplanted views which are intra Component are of no interest because the CD strategy of declaration and insertion will always be the same, because it is the same component.)

\*\n \* Queries already track moved views in `LView[DECLARATION\_LCONTAINER]` and\n \* `LContainer[MOVED\_VIEWS]`. However the queries also track `LView`s which moved within the same\n \* component `LView`. Transplanted views are a subset of moved views, and we use\n \* `DECLARATION\_COMPONENT\_VIEW` to differentiate them. As in this example.\n \* \n \* Example showing intra component `LView` movement.\n \* ```\n \* <#VIEW #myComp>\n \* <div \*ngIf="condition; then thenBlock else elseBlock">\n \* <ng-template #thenBlock>Content to render when condition is true.</ng-template>\n \* <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n \* </#VIEW>\n \* ```\n \* The `thenBlock` and `elseBlock` is moved but not transplanted.\n \* \n \* Example showing inter component `LView` movement (transplanted view).\n \* ```\n \* <#VIEW #myComp>\n \* <ng-template #myTpl>...</ng-template>\n \* <insertion-component [template]="myTpl"></insertion-component>\n \* </#VIEW>\n \* ```\n \* In the above example `myTpl` is passed into a different component. If `insertion-component` instantiates `myTpl` and `insertion-component` is on-push then the `LContainer` needs to be\n \* marked as containing transplanted views and those views need to be CD as part of the\n \* declaration CD.\n \* \n \* \n \* When change detection runs, it iterates over `[MOVED\_VIEWS]` and CDs any child `LView`s where\n \* the `DECLARATION\_COMPONENT\_VIEW` of the current component and the child `LView` does not match\n \* (it has been transplanted across components.)\n \* \n \* Note: `[DECLARATION\_COMPONENT\_VIEW]` points to itself if the LView is a component view (the\n \* simplest / most common case).\n \* \n \* see also:\n \* - <https://hackmd.io/@mhevery/rJUsvv9H> write up of the problem\n \* - `LContainer[HAS\_TRANSPLANTED\_VIEWS]` which marks which `LContainer` has transplanted views.\n \* - `LContainer[TRANSPLANT\_HEAD]` and `LContainer[TRANSPLANT\_TAIL]` storage for transplanted\n \* - `LView[DECLARATION\_LCONTAINER]` similar problem for queries\n \* - `LContainer[MOVED\_VIEWS]` similar problem for queries\n \* \n \* [DECLARATION\_COMPONENT\_VIEW]: LView;\n \* \n \* /\*\*\n \* A declaration point of embedded views (ones instantiated based on the content of a\n \* <ng-template>), null for other types of views.\n \* \n \* We need to track all embedded views created from a given declaration point so we can prepare\n \* query matches in a proper order (query matches are ordered based on their declaration point and\n \* \_not\_ the insertion point).\n \* \n \* [DECLARATION\_LCONTAINER]: LContainer|null;\n \* \n \* /\*\*\n \* More flags for this view. See PreOrderHookFlags for more info.\n \* \n \* [PREORDER\_HOOK\_FLAGS]: PreOrderHookFlags;\n \* \n \* /\*\*\n \* The number of direct transplanted views which need a refresh or have descendants themselves\n \* that need a refresh but have not marked their ancestors as Dirty. This tells us that during\n \* change detection we should still descend to find those children to refresh, even if the parents\n \* are not `Dirty` ^ `CheckAlways`.\n \* \n \* [TRANSPLANTED\_VIEWS\_TO\_REFRESH]: number;\n \* \n \* /\*\*\n \* Flags associated with an LView (saved in LView[FLAGS])\n \* \n \* export const enum LViewFlags {\n \* /\*\* The state of the init phase on the first 2 bits\n \* \n \* InitPhaseStateIncrementer = 0b000000000001,\n \* InitPhaseStateMask = 0b000000000011,\n \* \n \* /\*\* Whether or not the view is in creationMode.\n \* \n \* This must be stored in the view rather than using `data` as a marker so that\n \* we can properly support embedded views. Otherwise, when exiting a child view\n \* back into the parent view, `data` will be defined and `creationMode` will be\n \* improperly reported as false.\n \* \n \* CreationMode = 0b00000000100,\n \* \n \* /\*\* Whether or not this LView instance is on its first processing pass.\n \* \n \* An LView instance is considered to be on its "first pass" until it\n \* has completed one creation mode run and one update mode run. At this\n \* time, the flag is turned off.\n \* \n \* FirstLViewPass = 0b00000001000,\n \* \n \* /\*\* Whether this view has default change detection strategy (checks always) or onPush\n \* \n \* CheckAlways = 0b00000010000,\n \* \n \* /\*\* Whether or not manual change detection is turned on for onPush components.\n \* \n \* This is a special mode that only marks components dirty in two cases:\n \* \n \* 1) There has been a change to an @Input property\n \* \n \* 2) `markDirty()` has been called manually by the user\n \* \n \* Note that in this mode, the firing of events does NOT mark components\n \* dirty automatically.\n \* \n \* Manual mode is turned off by default for backwards compatibility, as events\n \* automatically mark OnPush components dirty in View Engine.\n \* \n \* TODO: Add a public API to

ChangeDetectionStrategy to turn this mode on

 /** Stores a set of OpCodes to process `HostBindingsFunction` associated with a current view.
 * In order to invoke `HostBindingsFunction` we need:
 * 1. 'elementIdx': Index to the element associated with the `HostBindingsFunction`.
 * 2. 'directiveIdx': Index to the directive associated with the `HostBindingsFunction`. (This will become the context for the `HostBindingsFunction` invocation.)
 * 3. 'bindingRootIdx': Location where the bindings for the `HostBindingsFunction` start. Internally `HostBindingsFunction` binding indexes start from `0` so we need to add `bindingRootIdx` to it.
 * 4. `HostBindingsFunction`: A host binding function to execute.
 * The above information needs to be encoded into the `HostBindingOpCodes` in an efficient manner.
 * 1. `elementIdx` is encoded into the `HostBindingOpCodes` as `~elementIdx` (so a negative number);
 * 2. `directiveIdx`
 * 3. `bindingRootIdx`
 * 4. `HostBindingsFunction` is passed in as is.
 * The `HostBindingOpCodes` array contains:
 * - negative number to select the element index.
 * - followed by 1 or more of:
 * - a number to select the directive index
 * - a number to select the bindingRoot index
 * - and a function to invoke.
 * ## Example
 * ```
 * const hostBindingOpCodes = [
 * ~30, // Select element 30
 * 40, 45, MyDir.dir.hostBindings // directiveIdx = 40; bindingRootIdx = 45;
 * 50, 55, OtherDir.dir.hostBindings // Invoke host bindings on OtherDire on element 30
 *];
 * // directiveIdx = 50; bindingRootIdx = 55;
 *]
 * ```
 * ## Pseudocode
 * ```
 * const hostBindingOpCodes = tView.hostBindingOpCodes;
 * if (hostBindingOpCodes === null) return;
 * for (let i = 0; i < hostBindingOpCodes.length; i++) {
 * const opCode = hostBindingOpCodes[i] as number;
 * if (opCode < 0) {
 * // Negative numbers are element indexes.
 * setSelectedIndex(~opCode);
 * } else {
 * // Positive numbers are NumberTuple which store bindingRootIndex and directiveIndex.
 * const directiveIdx = opCode;
 * const bindingRootIdx = hostBindingOpCodes[++i] as number;
 * const hostBindingFn = hostBindingOpCodes[++i] as HostBindingsFunction<any>;
 * setBindingRootForHostBindings(bindingRootIdx, directiveIdx);
 * const context = IView[directiveIdx];
 * hostBindingFn(RenderFlags.Update, context);
 * }
 * }
 * ```
 * ##
 * export interface HostBindingOpCodes extends Array<number|HostBindingsFunction<any>> {
 * __brand__: 'HostBindingOpCodes';
 * }
 * debug?: string[];
 }
 /** Explicitly marks `TView` as a specific type in `ngDevMode`
 * It is useful to know conceptually what time of `TView` we are dealing with when debugging an application (even if the runtime does not need it.) For this reason we store this information in the `ngDevMode` `TView` and than use it for better debugging experience.
 export const enum TViewType {
 /** Root `TView` is the used to

```

bootstrap components into. It is used in conjunction with `* `LView`` which takes an existing DOM node not owned by Angular and wraps it in ``TVView`/`LView`` so that other components can be loaded into it.

`* `Root`` = 0, `* `Component`` = 1, `* `Embedded`` = 2, `* `Converts`` ``TVViewType`` into human readable text.

`* Make sure this matches with `TVViewType``

```

export const TVViewTypeAsString = [
 'Root', // 0
 'Component', // 1
 'Embedded', // 2
] as const;

```

The static data for an `LView` (shared between all templates of a given type).

Stored on the ``ComponentDef.tView``.

```

interface TVView {
 /** Type of `TVView` ('Root'|'Component'|'Embedded'). */
 type: TVViewType;
 /** This is a blueprint used to generate LView instances for this TVView. Copying this blueprint is faster than creating a new LView from scratch. */

 directiveRegistry: DirectiveDefList|null;
 /** Full registry of pipes that may be found in this view. The property is either an array of `PipeDefs` or a function which returns the array of `PipeDefs`. The function is necessary to be able to support forward declarations. It's necessary to keep a copy of the full def list on the TVView so it's possible to render template functions without a host component. */
 pipeRegistry: PipeDefList|null;
 /** Array of ngOnInit, ngOnChanges and

```

ngDoCheck hooks that should be executed for this view in

- \* creation mode.
- \* This array has a flat structure and contains TNode indices, directive indices (where an instance can be found in `LView`) and hook functions. TNode index is followed by the directive index and a hook function. If there are multiple hooks for a given TNode, the TNode index is not repeated and the next lifecycle hook information is stored right after the previous hook function. This is done so that at runtime the system can efficiently iterate over all of the functions to invoke without having to make any decisions/lookups.

preOrderHooks: HookData|null;

- \* Array of ngOnChanges and ngDoCheck hooks that should be executed for this view in update mode.
- \* This array has the same structure as the `preOrderHooks` one.

preOrderCheckHooks: HookData|null;

- \* Array of ngAfterContentInit and ngAfterContentChecked hooks that should be executed for this view in creation mode.
- \* Even indices: Directive index
- \* Odd indices: Hook function

contentHooks: HookData|null;

- \* Array of ngAfterContentChecked hooks that should be executed for this view in update mode.
- \* Even indices: Directive index
- \* Odd indices: Hook function

contentCheckHooks: HookData|null;

- \* Array of ngAfterViewInit and ngAfterViewChecked hooks that should be executed for this view in creation mode.
- \* Even indices: Directive index
- \* Odd indices: Hook function

viewHooks: HookData|null;

- \* Array of ngAfterViewChecked hooks that should be executed for this view in update mode.
- \* Even indices: Directive index
- \* Odd indices: Hook function

viewCheckHooks: HookData|null;

- \* Array of ngOnDestroy hooks that should be executed when this view is destroyed.
- \* Even indices: Directive index
- \* Odd indices: Hook function

destroyHooks: DestroyHookData|null;

- \* When a view is destroyed, listeners need to be released and outputs need to be unsubscribed. This cleanup array stores both listener data (in chunks of 4) and output data (in chunks of 2) for a particular view. Combining the arrays saves on memory (70 bytes per array) and on a few bytes of code size (for two separate for loops).
- \* If it's a native DOM listener or output subscription being stored:
- \* 1st index is: event name `name = tView.cleanup[i+0]`
- \* 2nd index is: index of native element or a function that retrieves global target (window, document or body) reference based on the native element:
- \* `typeof idxOrTargetGetter === 'function': global target getter function
- \* `typeof idxOrTargetGetter === 'number': index of native element
- \* 3rd index is: index of listener function `listener = LView[CLEANUP][tView.cleanup[i+2]]`
- \* 4th index is: `useCaptureOrIdx = tView.cleanup[i+3]`
- \* `typeof useCaptureOrIdx === 'boolean': useCapture boolean
- \* `typeof useCaptureOrIdx === 'number':
- \* `useCaptureOrIdx >= 0` `removeListener = LView[CLEANUP][useCaptureOrIdx]`
- \* `useCaptureOrIdx < 0` `subscription = LView[CLEANUP][-useCaptureOrIdx]`
- \* If it's an output subscription or query list destroy hook:
- \* 1st index is: output unsubscribe function / query list destroy function
- \* 2nd index is: index of function context in LView.cleanupInstances[]

tView.cleanup[i+0].call(LView[CLEANUP][tView.cleanup[i+1]])

- \* cleanup: any[]|null;
- \* A list of element indices for child components that will need to be refreshed when the current view has finished its check. These indices have already been adjusted for the HEADER\_OFFSET.
- \* components: number[]|null;
- \* A collection of queries tracked in a given view.
- \* queries: TQueries|null;
- \* An array of indices pointing to directives with content queries alongside with the corresponding query index. Each entry in this array is a tuple of:
- \* - index of the first content query index declared by a given directive;
- \* - index of a directive.
- \* We are storing those indexes so we can refresh content queries as part of a view refresh process.
- \* contentQueries: number[]|null;
- \* Set of schemas that declare elements to be allowed inside the view.
- \* schemas: SchemaMetadata[]|null;
- \* Array of constants for the view. Includes attribute arrays, local definition arrays etc.
- \* Used for directive matching, attribute bindings, local definitions and more.
- \* consts: TConstants|null;
- \* Indicates that there was an error before we managed to complete the first create pass of the view. This means that the view is likely corrupted and we should try to recover it.
- \* incompleteFirstPass: boolean;

export const enum RootContextFlags {

- \* Empty = 0b00,
- \* DetectChanges = 0b01,
- \* FlushPlayers = 0b10

RootContext contains information which is shared for all components which were bootstrapped with { @link renderComponent}.

`RootContext` {  
 \* A function used for scheduling change detection in the future. Usually this is `requestAnimationFrame`.  
 \* scheduler: (workFn: () => void) => void;  
 \* A promise which is resolved when all components are considered clean (not dirty).  
 \* This promise is overwritten every time a first call to { @link markDirty} is invoked.  
 \* clean: Promise<null>;  
 \* RootComponents - The components that were instantiated by the call to { @link renderComponent}.  
 \* components: {}[];  
 \* The player flushing handler to kick off all animations.  
 \* playerHandler: PlayerHandler|null;  
 \* What render-related operations to run once a scheduler has been set.  
 \* flags: RootContextFlags;  
 \* Single hook callback function. `HookFn = () => void`;  
 \* Information necessary to call a hook. E.g. the callback that needs to be invoked and the index at which to find its context.  
 \* HookEntry = number|HookFn;  
 \* Array of hooks that should be executed for a view and their directive indices.  
 \* For each node of the view, the following data is stored:  
 \* 1) Node index (optional)  
 \* 2) A series of number/function pairs where:  
 \* - even indices are directive indices  
 \* - odd indices are hook functions  
 \* Special cases:  
 \* - a negative directive index flags an init hook (`ngOnInit`, `ngAfterContentInit`, `ngAfterViewInit`)  
 \* HookData = HookEntry[];  
 \* Array of destroy hooks that should be executed for a view and their directive indices.  
 \* The array is set up as a series of number/function or number/(number|function)[]:  
 \* - Even indices represent the context with which hooks should be called.  
 \* - Odd indices are the hook functions themselves. If a value at an odd index is an array, it represents the destroy hooks of a 'multi' provider where:  
 \* - Even indices represent the index of the provider for which we've registered a destroy hook,  
 \* inside of the 'multi' provider array.  
 \* - Odd indices are the destroy hook functions.  
 \* For example:  
 \* LView: [0, 1, 2, AService, 4, [BService, CService, DService]]  
 \* destroyHooks: [3, AService.ngOnDestroy, 5, [0, BService.ngOnDestroy, 2, DService.ngOnDestroy]]  
 \* In the example above 'AService' is a type provider with an 'ngOnDestroy', whereas 'BService', 'CService' and 'DService' are part of a 'multi' provider where only 'BService' and 'DService' have an 'ngOnDestroy' hook.  
 \* DestroyHookData = (HookEntry|HookData)[];  
 \* Static data that corresponds to the instance-specific data array on an LView.  
 \* Each node's static data is stored in `tData` at the same index that it's stored in the data array. Any nodes that do not have static data store a null value in `tData` to avoid a sparse array.  
 \* Each pipe's definition is stored here at the same index as its pipe instance in the data array.  
 \* Each host property's name is stored here at the same index as its value in the data array.  
 \* Each property binding name is stored here at the same index as its value in the data array. If the binding is an interpolation, the static string values are stored parallel to the dynamic values. Example:  
 \* id="prefix {{ v0 }}" a {{ v1 }} b {{ v2 }} suffix  
 \* LView | TView.data  
 \* -----  
 \* v0 value | 'a' v1 value | 'b' v2 value | id prefix suffix  
 \* Injector bloom filters are also stored here.  
 \* TData = (TNode|PipeDef<any>|DirectiveDef<any>|ComponentDef<any>|number|TStylingRange|TStylingKey|Type<any>|InjectionToken<any>|TI18n|I18nUpdateOpCodes|Ticu|null|string)[];  
 \* Note: This hack is necessary so we don't erroneously get a circular dependency failure based on types.  
 \* unusedValueExportToPlacateAjd = 1;  
 \* Human readable version of the 'LView'.  
 \* LView is a data structure used internally to keep track of views. The 'LView' is designed for efficiency and so at times it is difficult to read or write tests which assert on its values. For this reason when 'ngDevMode' is true we patch a 'LView.debug' property which points to 'LViewDebug' for easier debugging and test writing. It is the intent of 'LViewDebug' to be used in tests.  
 \* LViewDebug {  
 \* Flags associated with the 'LView' unpacked into a more readable state.  
 \* See 'LViewFlags' for the flag meanings.  
 \* readonly flags: {  
 \* initPhaseState: number,  
 \* creationMode: boolean,

 const tView = IView[1];
 assertBetween(HEADER_OFFSET, tView.bindingStartIndex, index);
}
```

```

function assertIndexInVarsRange(IView: LView, index: number) {
 const tView = IView[1];
 assertBetween(tView.bindingStartIndex, tView.expandoStartIndex, index);
}
```

```

function assertIndexInExpandoRange(IView: LView, index: number) {
 const tView = IView[1];
 assertBetween(tView.expandoStartIndex, IView.length, index);
}
```

```

function assertBetween(lower: number, upper: number, index: number) {
 if (!(lower <= index && index < upper)) {
 throwError(`Index out of range (expecting ${lower} <= ${index} < ${upper})`);
 }
}
```

This is a basic sanity check that the `injectorIndex` seems to point to what looks like a NodeInjector data structure.

```

@param IView `LView` which should be checked.
@param injectorIndex index into the `LView` where the `NodeInjector` is expected.
```

```

function assertNodeInjector(IView: LView, injectorIndex: number) {
 assertIndexInExpandoRange(IView, injectorIndex);
 assertIndexInExpandoRange(IView, injectorIndex + NodeInjectorOffset.PARENT);
 assertNumber(IView[injectorIndex + 0], 'injectorIndex should point to a bloom filter');
 assertNumber(IView[injectorIndex + 1], 'injectorIndex should point to a bloom filter');
 assertNumber(IView[injectorIndex + 2], 'injectorIndex should point to a bloom filter');

This property will be monkey-patched on elements, components and directives

```

export const MONKEY_PATCH_KEY_NAME = '__ngContext__';
```

The internal view context which is specific to a given DOM element, directive or component instance. Each value in here (besides the LView and element node details) can be present, null or undefined. If undefined then it implies the value has not been looked up yet, otherwise, if null, then a lookup was executed and nothing was found.

Each value will get filled when the respective value is examined within the getContext function. The component, element and each directive instance will share the same instance of the context.

```

export interface LContext {
 /** The component's parent view data.
 * @param IView: LView;
 * @param The index instance of the node.
 * @param nodeIndex: number;
 * @param The instance of the DOM node that is attached to the INode.
 * @param native: RNode;
 * @param The instance of the Component node.
 * @param component: {}|null|undefined;
 * @param The list of active directives that exist on this element.
 * @param directives: any[]|null|undefined;
 * @param The map of local references (local reference name => element or directive instance) that exist
 * on this element.
 * @param localRefs: {[key: string]: any}|null|undefined;
}

Set a new binding root index so that host template functions can execute.\n *\n * Bindings inside the host template

```

are 0 index. But because we don't know ahead of time how many host bindings we have we can't pre-compute them. For this reason they are all 0 index and we just shift the root so that they match next available location in the LView. @param bindingRootIndex Root index for `hostBindings` @param currentDirectiveIndex `TData[currentDirectiveIndex]` will point to the current directive whose `hostBindings` are being processed. @nexport function setBindingRootForHostBindings(bindingRootIndex: number, currentDirectiveIndex: number) { const lFrame = instructionState.lFrame; lFrame.bindingIndex = lFrame.bindingRootIndex = bindingRootIndex; setCurrentDirectiveIndex(currentDirectiveIndex); }  
When host binding is

executing this points to the directive index. `TView.data[getCurrentDirectiveIndex()]` is `DirectiveDef`  
`LView[getCurrentDirectiveIndex()]` is directive instance. @nexport function getCurrentDirectiveIndex(): number { return instructionState.lFrame.currentDirectiveIndex; }  
Sets an index of a directive whose `hostBindings` are being processed. @param currentDirectiveIndex `TData` index where current directive instance can be found. @nexport function setCurrentDirectiveIndex(currentDirectiveIndex: number): void { instructionState.lFrame.currentDirectiveIndex = currentDirectiveIndex; }  
Retrieve the current `DirectiveDef` which is active when `hostBindings` instruction is being executed. @param tData Current `TData` where the `DirectiveDef` will be looked up at. @nexport function getCurrentDirectiveDef(tData: TData): DirectiveDef<any> | null { const currentDirectiveIndex = instructionState.lFrame.currentDirectiveIndex; return currentDirectiveIndex === -1 ? null : tData[currentDirectiveIndex] as DirectiveDef<any>; }  
@nexport function getCurrentQueryIndex(): number { return instructionState.lFrame.currentQueryIndex; }  
@nexport function setCurrentQueryIndex(value: number): void { instructionState.lFrame.currentQueryIndex = value; }  
Returns a `TNode` of the location where the current `LView` is declared at. @param lView an `LView` that we want to find parent `TNode` for. @nfunction getDeclarationTNode(lView: LView): TNode | null { const tView = lView[TVIEW]; // Return the declaration parent for embedded views if (tView.type === TViewType.Embedded) { ngDevMode && assertDefined(tView.declTNode, 'Embedded TNodes should have declaration parents. '); return tView.declTNode; } // Components don't have `TView.declTNode` because each instance of component could be inserted in different location, hence `TView.declTNode` is meaningless. }

Falling back to `T\_HOST` in case we cross component boundary. if (tView.type === TViewType.Component) { return lView[T\_HOST]; }  
Remaining TNode type is `TViewType.Root` which doesn't have a parent TNode. return null;  
This is a light weight version of the `enterView` which is needed by the DI system. @param lView `LView` location of the DI context. @param tNode `TNode` for DI context @param flags DI context flags. if `SkipSelf` flag is set then we walk up the declaration tree from `tNode` until we find parent declared `TElementNode`. @returns `true` if we have successfully entered DI associated with `tNode` (or with declared `TNode` if `flags` has `SkipSelf`). Failing to enter DI implies that no associated `NodeInjector` can be found and we should instead use `ModuleInjector`. - If `true` then this call must be followed by `leaveDI` - If `false` then this call failed and we should NOT call

`leaveDI` @nexport function enterDI(lView: LView, tNode: TNode, flags: InjectFlags) { ngDevMode && assertLViewOrUndefined(lView); if (flags & InjectFlags.SkipSelf) { ngDevMode && assertTNodeForTView(tNode, lView[TVIEW]); let parentTNode = tNode as TNode | null; let parentLView = lView; while (true) { ngDevMode && assertDefined(parentTNode, 'Parent TNode should be defined. @fileoverview\n * A module to facilitate use of a Trusted Types policy internally within\n * Angular. It lazily
constructs the Trusted Types policy, providing helper\n * utilities for promoting strings to Trusted Types. When
Trusted Types are not\n * available, strings are used as a fallback.\n * \n * @security All use of this module is security-
sensitive and should go through\n * security review.\n * \n\nimport { global } from './global';\nimport
{ TrustedHTML, TrustedScript, TrustedScriptURL, TrustedTypePolicy, TrustedTypePolicyFactory } from
'./trusted_type_defs';\n\n**\n * The Trusted Types policy, or null if Trusted Types are not\n * enabled/supported, or
undefined if the policy has not been created yet.\n * \n\nlet policy: TrustedTypePolicy|null|undefined;\n\n**\n *
Returns the Trusted Types policy, or null if Trusted Types are not\n * enabled/supported. The first call to this
function will create the policy.\n * \n\nfunction getPolicy(): TrustedTypePolicy|null {\n if (policy === undefined) {\n
policy = null;\n if (global.trustedTypes) {\n try {\n policy = (global.trustedTypes as
TrustedTypePolicyFactory).createPolicy('angular', {\n createHTML: (s: string) => s,\n createScript: (s:
string) => s,\n createScriptURL: (s: string) => s,\n });\n } catch {\n // trustedTypes.createPolicy
throws if called with a name that is\n // already registered, even in report-only mode. Until the API changes,\n
 // catch the error not to break the applications functionally. In such\n // cases, the code will fall back to using
strings.\n }\n }\n return policy;\n}\n\n\n**\n * Unsafely promote a string to a TrustedHTML, falling back
to strings

```

when Trusted Types are not available. This is a security-sensitive function; any use of this function must go through security review. In particular, it must be assured that the provided string will never cause an XSS vulnerability if used in a context that will be interpreted as HTML by a browser, e.g. when assigning to element.innerHTML. The following exports function trustedHTMLFromString(html: string):

```
TrustedHTML|string {\n return getPolicy()?.createHTML(html) || html;\n}\n\n/**\n * Unsafely promote a string to a TrustedScript, falling back to strings when Trusted Types are not available.\n * @security In particular, it must be assured that the provided string will never cause an XSS vulnerability if used in a context that will be interpreted and executed as a script by a browser, e.g. when calling eval.\n */\nexport function trustedScriptFromString(script: string): TrustedScript|string {\n return getPolicy()?.createScript(script) || script;\n}\n\n/**\n
```

```
 * Unsafely promote a string to a TrustedScriptURL, falling back to strings when Trusted Types are not available.\n * @security This is a security-sensitive function; any use of this function must go through security review. In particular, it must be assured that the provided string will never cause an XSS vulnerability if used in a context that will cause a browser to load and execute a resource, e.g. when assigning to script.src.\n */\nexport function trustedScriptURLFromString(url: string): TrustedScriptURL|string {\n return getPolicy()?.createScriptURL(url) || url;\n}\n\n/**\n * Unsafely call the Function constructor with the given string arguments. It is only available in development mode, and should be stripped out of production code.\n * @security This is a security-sensitive function; any use of this function must go through security review. In particular, it must be assured that it is only called from development code, as use
```

```
in production code can lead to XSS vulnerabilities.\n */\nexport function newTrustedFunctionForDev(...args: string[]): Function {\n if (typeof ngDevMode === 'undefined') {\n throw new Error('newTrustedFunctionForDev should never be called in production');\n }\n if (!global.trustedTypes) {\n // In environments that don't support Trusted Types, fall back to the most straightforward implementation:\n return new Function(...args);\n }\n // Chrome currently does not support passing TrustedScript to the Function constructor. The following implements the workaround proposed on the page below, where the Chromium bug is also referenced:\n // https://github.com/w3c/webappsec-trusted-types/wiki/Trusted-Types-for-function-constructor\n const fnArgs = args.slice(0, -1).join(',');\n const fnBody = args.pop()!.toString();\n const body = `(function anonymous(${fnArgs}) { ${fnBody} })`;\n // Using eval directly confuses the compiler and prevents this module from being stripped out of JS binaries even if not used. The global['eval'] indirection fixes that.\n const fn = global['eval'](trustedScriptFromString(body) as string) as Function;\n // To completely mimic the behavior of calling "new Function", two more things need to happen:\n // 1. Stringifying the resulting function should return its source code\n fn.toString = () => body;\n // 2. When calling the resulting function, `this` should refer to `global`\n return fn.bind(global);\n}\n\n// When Trusted Types support in Function constructors is widely available, the implementation of this function can be simplified to:\n// return new Function(...args.map(a => trustedScriptFrom(a)));

that can be found in the LICENSE file at <https://angular.io/license> This file is used to control if the default rendering pipeline should be `ViewEngine` or `Ivy`. For more information on how to run and debug tests with either Ivy or View Engine (legacy), please see [BAZEL.md](./docs/BAZEL.md).

```

let _devMode: boolean = true;
let _runModeLocked: boolean = false;

Returns whether Angular is in development mode. After called once, the value is locked and won't change any more. By default, this is true, unless a user calls `enableProdMode` before calling this.

@publicApi
export function isDevMode(): boolean {
 if (_runModeLocked) return _devMode;
}

* Disable Angular's development mode, which turns off assertions and other checks within the framework.

* One important assertion this disables verifies that a change detection pass does not result in additional changes to any bindings (also known as unidirectional data flow).

@publicApi
export function enableProdMode(): void {
 if (_runModeLocked) throw new Error('Cannot enable prod mode after platform setup.');
```

import {trustedHTMLFromString} from '../util/security/trusted_types';

This helper is used to get hold of an inert tree of DOM elements containing dirty HTML that needs sanitizing.

* Depending upon browser support we use one of two strategies for doing this.

Default: DOMParser strategy
Fallback: InertDocument strategy
export function getInertBodyHelper(defaultDoc: Document): InertBodyHelper {
 return isDOMParserAvailable() ? new DOMParserHelper() : new InertDocumentHelper(defaultDoc);
}

export interface InertBodyHelper {
 /**
 * Get an inert DOM element containing DOM created from the dirty HTML string provided.
 */
 getInertBodyElement(html: string): HTMLElement | null;
}

* Uses DOMParser to create and fill an inert body element. This is the default strategy used in browsers that support it.

class DOMParserHelper implements InertBodyHelper {
 getInertBodyElement(html: string): HTMLElement | null {
 // We add these extra elements to ensure that the rest of the content is parsed as expected // e.g. leading whitespace is maintained and tags like <meta> do not get hoisted to the <head> tag. Note that the <body> tag is closed implicitly to prevent unclosed tags
 const html = '<body><remove></remove>' + html;
 try {
 const body = new window.DOMParser().parseFromString(trustedHTMLFromString(html) as string, 'text/html').body as HTMLBodyElement;
 body.removeChild(body.firstChild);
 return body;
 } catch {
 return null;
 }
 }

 * Use an HTML5 `template` element, if supported, or an inert body element created via `createHTMLDocument` to create and fill an inert DOM element. This is the fallback strategy if the browser does not support DOMParser.

 class InertDocumentHelper implements InertBodyHelper {
 private inertDocument: Document;

 constructor(private defaultDoc: Document) {
 this.inertDocument = this.defaultDoc.implementation.createHTMLDocument('sanitization-inert');
 if (this.inertDocument.body == null) {
 // usually there should be only one body element in the document, but IE doesn't have any, so we need to create one.
 const inertHtml = this.inertDocument.createElement('html');
 this.inertDocument.appendChild(inertHtml);
 const inertBodyElement = this.inertDocument.createElement('body');
 inertHtml.appendChild(inertBodyElement);
 }

 getInertBodyElement(html: string): HTMLElement | null {
 // Prefer using <template> element if supported.
 const templateEl = this.inertDocument.createElement('template');
 if ('content' in templateEl) {
 templateEl.innerHTML = trustedHTMLFromString(html) as string;
 return templateEl;
 }

 // Note that previously we used to do something like this.inertDocument.body.innerHTML = html and we returned the inert `body` node. This was changed, because IE seems to treat setting `innerHTML` on an inserted element differently, compared to one that hasn't been inserted yet. In particular, IE appears to split some of the text into multiple text nodes rather than keeping them in a single one which ends up messing with Ivy's parsing further down the line. This has been worked around by creating a new inert `body` and using it as the root node in which we insert the HTML.
 const inertBody =

\*/\n\n/\*\*\n \* Factory for creating instances of injectors in the NodeInjector.\n \*\n \* This factory is complicated by  
the fact that it can resolve `multi` factories as well.\n \*\n \* NOTE: Some of the fields are optional which means that  
this class has two hidden classes.\n \* - One without `multi` support (most  
common)\n \* - One with `multi` values, (rare).\n \*\n \* Since VMs can cache up to 4 inline hidden classes this is  
OK.\n \*\n \* - Single factory: Only `resolving` and `factory` is defined.\n \* - `providers` factory:  
`componentProviders` is a number and `index = -1`.\n \* - `viewProviders` factory: `componentProviders` is a  
number and `index` points to `providers`.\n \*/\nexport class NodeInjectorFactory {\n /\*\*\n \* The inject  
implementation to be activated when using the factory.\n \*  
injectImpl: null|(<T> (token:  
Type<T>|InjectionToken<T>, flags?: InjectFlags) => T);\n \*/\n /\*\*\n \* Marker set to true during factory invocation  
to see if we get into recursive loop.\n \* Recursive loop causes an error to be displayed.\n \*  
resolving =  
false;\n \*/\n /\*\*\n \* Marks that the token can see other Tokens declared in `viewProviders` on the same node.\n \*/\n

```

canSeeViewProviders: boolean;\n\n /**\n * An array of factories to use in case of `multi` provider.\n */\n multi?:
Array<()
=> any>;\n\n /**\n * Number of `multi`-providers which belong to the component.\n *\n * This is needed
because when multiple components and directives declare the `multi` provider\n * they have to be concatenated in
the correct order.\n *\n * Example:\n *\n * If we have a component and directive active on a single element as
declared here\n * ```\n * component:\n * provides: [{provide: String, useValue: 'component', multi: true}],\n
* viewProvides: [{provide: String, useValue: 'componentView', multi: true}],\n *\n * directive:\n * provides:
[{provide: String, useValue: 'directive', multi: true}],\n * ```\n *\n * Then the expected results are:\n *\n *
```\n * providers: ['component', 'directive']\n * viewProviders: ['component', 'componentView', 'directive']\n *
```\n *\n * The way to think about it is that the `viewProviders` have been inserted after the component\n * but
before the directives, which is why we need to
know how many `multi`s have been declared by\n * the component.\n */\n componentProviders?: number;\n\n
/**\n * Current index of the Factory in the `data`. Needed for `viewProviders` and `providers` merging.\n * See

attributeValue\n \* in that order.\n \*/\n NamespaceURI = 0,\n /\*\*\n \* Signals class declaration.\n \*\n \* Each value following `Classes` designates a class name to include on the element.\n \* ## Example:\n \*\n \* Given:\n \* ```\n \* <div class="foo bar baz">...</div>\n \* ```\n \* the generated code is:\n \* ```\n \* var \_c1 = [AttributeMarker.Classes, 'foo', 'bar', 'baz'];\n \* ```\n \*/\n Classes = 1,\n /\*\*\n \* Signals style declaration.\n \*\n \* Each pair of values following `Styles` designates a style name and value to include on the\n \* element.\n \* ## Example:\n \*\n \* Given:\n \* ```\n \* <div style="width:100px; height:200px; color:red">...</div>\n \* ```\n \* the generated code is:\n \* ```\n \* var \_c1 = [AttributeMarker.Styles, 'width', '100px', 'height', '200px', 'color', 'red'];\n \* ```\n \*/\n Styles = 2,\n\n /\*\*\n \* Signals that the following attribute names were extracted from input or output bindings.\n \*\n \* For example, given the following HTML:\n \* ```\n \* <div moo="car" [foo]="exp" (bar)="doSth()">\n \* ```\n \* the generated code is:\n \* ```\n \* var \_c1 = ['moo', 'car', AttributeMarker.Bindings, 'foo', 'bar'];\n \* ```\n \*/\n Bindings = 3,\n\n /\*\*\n \* Signals that the following attribute names were hoisted from an inline-template declaration.\n \*\n \* For example, given the following HTML:\n \* ```\n \* <div \*ngFor="let value of values; trackBy:trackBy" dirA [dirB]="value">\n \* ```\n \* the generated code for the `template()` instruction would include:\n \* ```\n \* ['dirA', AttributeMarker.Bindings, 'dirB', AttributeMarker.Template, 'ngFor', 'ngForOf', 'ngForTrackBy', 'let-value']\n \* ```\n \* while the generated code for the `element()` instruction inside the template function would\n \* include:\n \* ```\n \* ['dirA', AttributeMarker.Bindings, 'dirB']\n \* ```\n \*/\n Template = 4,\n\n /\*\*\n \* Signals that the following attribute is `ngProjectAs` and its value is a\n \* parsed\n \* `CssSelector`.\n \*\n \* For example, given the following HTML:\n \* ```\n \* <h1 attr="value" ngProjectAs="[title]">\n \* ```\n \* the generated code for the `element()` instruction would include:\n \* ```\n \* ['attr', 'value', AttributeMarker.ProjectAs, ['title']]\n \* ```\n \*/\n ProjectAs = 5,\n\n /\*\*\n \* Signals that the following attribute will be translated by runtime i18n\n \*\n \* For example, given the following HTML:\n \* ```\n \* <div moo="car" foo="value" i18n-foo [bar]="binding" i18n-bar>\n \* ```\n \* the generated code is:\n \* ```\n \* var \_c1 = ['moo', 'car', AttributeMarker.I18n, 'foo', 'bar'];\n \* ```\n \*/\n I18n = 6,\n\n\n /\*\*\n \* A combination of:\n \* - Attribute names and values.\n \* - Special markers acting as flags to alter attributes processing.\n \* - Parsed ngProjectAs selectors.\n \*/\nexport type TAttributes = (string|AttributeMarker|CssSelector)[];\n\n\n /\*\*\n \* Constants that are associated with a view. Includes:\n \* - Attribute arrays.\n \* - Local definition arrays.\n \* - Translated messages (i18n).\n \*/\nexport type TConstants = (TAttributes|string)[];\n\n\n /\*\*\n \* Factory function that returns an array of consts. Consts can be represented as a function in\n \* case any additional statements are required to define consts in the list. An example is i18n\n \* where additional i18n calls are generated, which should be executed when consts are requested\n \* for the first time.\n \*/\nexport type TConstantsFactory = () => TConstants;\n\n\n /\*\*\n \* TConstants type that describes how the `consts` field is generated on ComponentDef: it can be\n \* either an array or a factory function that returns that array.\n \*/\nexport type TConstantsOrFactory = TConstants|TConstantsFactory;\n\n\n\n /\*\*\n \* Binding data (flyweight) for a particular node that is shared between all templates\n \* of a specific type.\n \*\n \* If a property is:\n \* - PropertyAliases: that property's data was generated and this is it\n \* - Null: that property's data was already generated and nothing was found.\n \* - Undefined: that property's data has not yet been generated\n \* see: [https://en.wikipedia.org/wiki/Flyweight\\_pattern](https://en.wikipedia.org/wiki/Flyweight_pattern) for more on the Flyweight pattern\n \*/\nexport interface TNode {\n\n /\*\*\n \* The type of the TNode. See TNodeType.\n \*/\n type: TNodeType;\n\n /\*\*\n \* Index of the TNode in TView.data and corresponding native element in LView.\n \*\n \* This is necessary to get from any TNode to its corresponding native element when\n \* traversing the node tree.\n \*\n \* If index is -1, this is a dynamically created container node or embedded view node.\n \*/\n index: number;\n\n /\*\*\n \* Insert before existing DOM node index.\n \*\n \* When DOM nodes are being inserted, normally they are being appended as they are created.\n \*\n \* Under i18n case, the translated text nodes are created ahead of time as part of the\n \* `i18nStart` instruction which means that this `TNode` can't just be appended and instead\n \* needs to be inserted using `insertBeforeIndex` semantics.\n \*/\n

Additionally sometimes it is necessary to insert new text nodes as a child of this `TNode`. In such a case the value stores an array of text nodes to insert.

Example:

```
<div>HelloWorld!
```

In the above example the `i18nStart` instruction can create `Hello`, `World` and `!` text nodes. It can also insert `Hello` and `!` text node as a child of `

`, but it can't insert `World` because the `` node has not yet been created. In such a case the `` `TNode` will have an array which will direct the `` to not only insert itself in front of `!` but also to insert the `World` (created by `i18nStart`) into `` itself.

```
* Pseudo code:
if (insertBeforeIndex === null) {
 // append as normal
} else if (Array.isArray(insertBeforeIndex)) {
 // First insert current `TNode` at correct location
 const currentNode = lView[this.index];
 parentNode.insertBefore(currentNode, lView[this.insertBeforeIndex[0]]);
 // Now append all of the children
 for(let i=1; i<this.insertBeforeIndex.length; i++) {
 currentNode.appendChild(lView[this.insertBeforeIndex[i]]);
 }
} else {
 parentNode.insertBefore(lView[this.index], lView[this.insertBeforeIndex]);
}
// Append as normal using `parentNode.appendChild`
// Append using `parentNode.insertBefore(lView[this.index], lView[this.insertBeforeIndex])`
// Initialization
Because `i18nStart` executes before nodes are created, on `TView.firstCreatePass` it is not possible for `i18nStart`
```

to set the `insertBeforeIndex` value as the corresponding `TNode` has not yet been created. For this reason the `i18nStart` creates a `TNodeType.Placeholder` `TNode` at that location. See `TNodeType.Placeholder` for more information.

`insertBeforeIndex`: InsertBeforeIndex;

The index of the closest injector in this node's LView.

If the index === -1, there is no injector on this node or any ancestor node in this view.

If the index !== -1, it is the index of this node's injector OR the index of a parent injector in the same view. We pass the parent injector index down the node tree of a view so it's possible to find the parent injector without walking a potentially deep node tree.

Injector indices are not set across view boundaries because there could be multiple component hosts.

If tNode.injectorIndex === tNode.parent.injectorIndex, then the index belongs to a parent injector.

`injectorIndex`: number;

Stores starting index of the directives.

NOTE: The first directive is always component (if present).

`directiveStart`: number;

Stores final exclusive index of the directives.

The area right behind the `directiveStart-directiveEnd` range is used to allocate the `HostBindingFunction` `vars` (or null if no bindings.) Therefore `directiveEnd` is used to set `LFrame.bindingRootIndex` before `HostBindingFunction` is executed.

`directiveEnd`: number;

Stores the last directive which had a styling instruction.

Initial value of this is -1 which means that no `hostBindings` styling instruction has executed. As `hostBindings` instructions execute they set the value to the index of the `DirectiveDef` which contained the last `hostBindings` styling instruction.

Valid values are: -1 No `hostBindings` instruction has executed.

`directiveStart <= directiveStylingLast < directiveEnd`: Points to the `DirectiveDef` of the last styling instruction which executed in the `hostBindings`.

This data is needed so that styling instructions know which static styling data needs to be collected from the `DirectiveDef.hostAttrs`. A styling instruction needs to collect all data since last styling instruction.

`directiveStylingLast`: number;

Stores indexes of property bindings. This field is only set in the ngDevMode and holds indexes of property bindings so TestBed can get bound property metadata for a given node.

`propertyBindings`: number[]|null;

Stores if Node isComponent, isProjected, hasContentQuery, hasClassInput and hasStyleInput etc.

`TNodeFlags`:

This number stores two values using its bits:

- the index of the first provider on that node (first 16 bits)
- the count of view providers from the component on this node (last 16 bits)

`providerIndexes`: TNodeProviderIndexes;

The value name associated with this node.

if type: `TNodeType.Text`: text value

`TNodeType.Element`: tag name

`TNodeType.ICUContainer`: `Ticu` value: any;

Attributes associated with an element. We need to store attributes to support various

\* use-cases (attribute injection, content projection with selectors, directives matching).\n \* Attributes are stored statically because reading them from the DOM would be way too slow for\n \* content projection and queries.\n \* Since attrs will always be calculated first, they will never need to be marked undefined by\n \* other instructions.\n \* For regular attributes a name of an attribute and its value alternate in the array.\n \* e.g. ['role', 'checkbox']\n \* This array can contain flags that will indicate \"special attributes\" (attributes with\n \* namespaces, attributes extracted from bindings and outputs).\n \* attrs: TAttributes|null;\n \* Same as `TNode.attrs` but contains merged data across all directive host bindings.\n \* We need to keep `attrs` as unmerged so that it can be used for attribute selectors.\n \* We merge attrs here so that it can be used in a performant way for initial rendering.\n \* The `attrs` are merged in first pass in following order:\n \* - Component's `hostAttrs`\n \* - Directives' `hostAttrs`\n \* - Template `TNode.attrs` associated with the current `TNode`.\n \* mergedAttrs: TAttributes|null;\n \* A set of local names under which a given element is exported in a template and\n \* visible to queries. An entry in this array can be created for different reasons:\n \* - an element itself is referenced, ex.: `

`\n \* - a component is referenced, ex.: ``\n \* - a directive is referenced, ex.: `` => `["foo", -1]`\n \* - `` => `["foo", myCmptIdx]`\n \* - `

---

Open Source Used In NBAR SD-AVC 4.4.0 4316

assume this example:\n \* ``<parent>``'s view definition:\n \* ```\n \* `<child id="c1">content1</child>`\n \* `<child id="c2"><span>content2</span></child>`\n \* ```\n \* ``<child>``'s view definition:\n \* ```\n \* `<ng-content id="cont1"></ng-content>`\n \* ```\n \* \n \* If `Array.isArray(projection)` then `TNode` is a host element:\n \* - `projection` stores the content nodes which are to be projected.\n \* - The nodes represent categories defined by the selector: For example:\n \* `<ng-content/><ng-content select="abc"/>` would represent the heads for `<ng-content/>`\n \* and `<ng-content select="abc"/>` respectively.\n \* - The nodes we store in `projection` are heads only, we used `.next` to get their\n \* siblings.\n \* - The nodes `.next` is sorted/rewritten as part of the projection setup.\n \* - `projection` size is equal to the number of projections `<ng-content>`. The size of\n \* `c1` will be `1` because `<child>` has only one `<ng-content>`.\n \* - we store `projection` with the host (`c1`, `c2`) rather than the `<ng-content>` (`cont1`)\n \* because the same component (`<child>`) can be used in multiple locations (`c1`, `c2`) and\n \* as a result have different set of nodes to project.\n \* - without `projection` it would be difficult to efficiently traverse nodes to be projected.\n \* \n \* If `typeof projection === 'number'` then `TNode` is a `<ng-content>` element:\n \* - `projection` is an index of the host's `projection` Nodes.\n \* - This would return the first head node to project:\n \* `getHost(currentTNode).projection[currentTNode.projection]`.\n \* \n \* - When projecting nodes the parent node retrieved may be a `<ng-content>` node, in which case\n \* the process is recursive in nature.\n \* \n \* If `projection` is of type `RNode[]` then we have a collection of native nodes passed as\n \* projectable nodes during dynamic component creation.\n \* \n \* projection:\n \* (TNode|RNode[])[number|null];\n \* \n \* /\*\*\n \* A collection of all `style` static values for an element (including from host).\n \* \n \* This field will be populated if and when:\n \* \n \* - There are one or more initial `style`s on an element (e.g. `<div style="width:200px;">`)\n \* - There are one or more initial `style`s on a directive/component host\n \* (e.g. `@Directive({host: {style: "width:200px;" } })`)\n \* \n \* styles: string|null;\n \* \n \* /\*\*\n \* A collection of all `style` static values for an element excluding host sources.\n \* \n \* Populated when there are one or more initial `style`s on an element\n \* (e.g. `<div style="width:200px;">`)\n \* Must be stored separately from `tNode.styles` to facilitate setting directive\n \* inputs that shadow the `style` property. If we used `tNode.styles` as is for shadowed inputs,\n \* we would feed host styles back into directives as `"inputs"`. If we used `tNode.attrs`, we\n \* would have to concatenate the attributes on every template pass. Instead, we process once on\n \* first create pass and store here.\n \* \n \* stylesWithoutHost: string|null;\n \* \n \* /\*\*\n \* A `KeyValueArray` version of residual `styles`.\n \* \n \* When there are styling instructions then each instruction stores the static styling\n \* which is of lower priority than itself. This means that there may be a higher priority\n \* styling than the instruction.\n \* \n \* Imagine:\n \* ```\n \* <div style="color: highest;" my-dir>\n \* \n \* @Directive({\n \* \n \* host: {\n \* \n \* style: 'color: lowest;',\n \* \n \* [styles.color]: 'exp' // styleProp('color', ctx.exp);\n \* \n \* }})\n \* ```\n \* \n \* In the above case:\n \* - `color: lowest` is stored with `styleProp('color', ctx.exp)`; instruction\n \* - `color: highest` is the residual and is stored here.\n \* \n \* - `undefined`: not initialized.\n \* \n \* - `null`: initialized but `styles` is `null`\n \* \n \* - `KeyValueArray`: parsed version of `styles`.\n \* \n \* residualStyles: KeyValueArray<any>|undefined|null;\n \* \n \* /\*\*\n \* A collection of all class static values for an element (including from host).\n \* \n \* This field will be populated if and when:\n \* \n \* - There are one or more initial classes on an element (e.g. `<div class="one two three">`)\n \* - There are one or more initial classes on a directive/component host\n \* (e.g. `@Directive({host: {class: "SOME_CLASS" } })`)\n \* \n \* classes: string|null;\n \* \n \* /\*\*\n \* A collection of all class static values for an element excluding host sources.\n \* \n \* Populated when there are one or more initial classes on an element\n \* (e.g. `<div class="SOME_CLASS">`)\n \* Must be stored separately from `tNode.classes` to facilitate setting directive\n \* inputs that shadow the `class` property. If we used `tNode.classes` as is for shadowed\n \* inputs, we would feed host classes back into directives as `"inputs"`. If we used\n \* `tNode.attrs`, we would have to concatenate the attributes on every template pass. Instead,\n \* we process once on first create pass and store here.\n \* \n \* classesWithoutHost: string|null;\n \* \n \* /\*\*\n \* A `KeyValueArray`

version of residual `classes`. \n \* Same as `TNode.residualStyles` but for classes. \n \* - `undefined`: not initialized. \n \* - `null`: initialized but `classes` is `null` \n \* - `KeyValueArray`: parsed version of `classes`. \n

\* \n residualClasses: KeyValueArray<any>|undefined|null; \n /\*\* \n \* Stores the head/tail index of the class bindings. \n \* \n \* - If no bindings, the head and tail will both be 0. \n \* - If there are template bindings, stores the head/tail of the class bindings in the template. \n \* - If no template bindings but there are host bindings, the head value will point to the last \n \* host binding for `"class"` (not the head of the linked list), tail will be 0. \n \* \n \* See: `style\_binding\_list.ts` for details. \n \* \n \* This is used by `insertTStylingBinding` to know where the next styling binding should be \n \* inserted so that they can be sorted in priority order. \n \* \n classBindings: TStylingRange; \n /\*\* \n \* Stores the head/tail index of the class bindings. \n \* \n \* - If no bindings, the head and tail will both be 0. \n \* - If there are template bindings, stores the head/tail of the style bindings in the template. \n \* - If no template bindings but there are host bindings, the head value will point to the last \n \* host binding for `"style"` (not the head of the linked list), tail will be 0. \n \* \n \* See: `style\_binding\_list.ts` for details. \n \* \n \* This is used by `insertTStylingBinding` to know where the next styling binding should be \n \* inserted so that they can be sorted in priority order. \n \* \n styleBindings: TStylingRange; \n } \n /\*\* \n \* See `TNode.insertBeforeIndex` \n \*/ \n export type InsertBeforeIndex = null|number|number[]; \n /\*\* \n \* Static data for an element \n \*/ \n export interface TElementNode extends TNode { \n /\*\* \n \* Index in the data[] array \n \*/ \n index: number; \n child: TElementNode|TTextNode|TElementContainerNode|TContainerNode|TProjectionNode|null; \n /\*\* \n \* Element nodes will have parents unless they are the first node of a component or \n \* embedded view (which means their parent is in a different view and must be \n \* retrieved using viewData[HOST\_NODE]). \n \* \n parent: TElementNode|TElementContainerNode|null; \n tViews: null; \n /\*\* \n \* If this is a component TNode with projection, this will be an array of projected \n \* TNodes or native nodes (see TNode.projection for more info). `applyView` performs operation on the view as specified in `action` (insert, detach, destroy)\n */\n * Inserting a view
without projection or containers at top level
is simple. Just iterate over the\n * root nodes of the View, and for each node perform the `action`.\n * Things
get more complicated with containers and projections. That is because coming across:\n * - Container: implies that
we have to insert/remove/destroy the views of that container as well\n * which in turn can have their own
Containers at the View roots.\n * - Projection: implies that we have to insert/remove/destroy the nodes of the
projection. The\n * complication is that the nodes we are projecting can themselves have Containers\n *

```

or other Projections.

As you can see this is a very recursive problem. Yes recursion is not most efficient but the code is complicated enough that trying to implement with recursion becomes unmaintainable.

`@param tView The `TView` which needs to be inserted, detached, destroyed`

`@param IView The LView which needs to be inserted, detached, destroyed.`

`@param renderer Renderer`

to use

`@param action action to perform (insert, detach, destroy)`

`@param parentRElement parent DOM element for insertion (Removal does not need it).`

`@param beforeNode Before which node the insertions should happen.`

```

function applyView(tView: TView, IView: LView, renderer: Renderer3, action: WalkTreeNodeTreeAction.Destroy, parentRElement: null, beforeNode: null): void;
function applyView(tView: TView, IView: LView, renderer: Renderer3, action: WalkTreeNodeTreeAction, parentRElement: RElement|null, beforeNode: RNode|null): void;
function applyView(tView: TView, IView: LView, renderer: Renderer3, action: WalkTreeNodeTreeAction, parentRElement: RElement|null, beforeNode: RNode|null): void {
 applyNodes(renderer, action, tView.firstChild, IView, parentRElement, beforeNode, false);
}

```

``applyProjection` performs operation on the projection.`

Inserting a projection requires us to locate the projected nodes from the parent component.

The complication is that those nodes themselves could be re-projected from their parent component.

`@param tView The `TView` of `LView` which needs to be inserted, detached, destroyed`

`@param IView The `LView` which needs to be inserted, detached, destroyed.`

`@param tProjectionNode node to project`

`function applyProjection(tView: TView, IView: LView, tProjectionNode: TProjectionNode) {`

`const renderer = IView[RENDERER];`

`const parentRNode = getParentRElement(tView, tProjectionNode, IView);`

`const parentTNode = tProjectionNode.parent || IView[T_HOST]!`

`let beforeNode = getInsertInFrontOfRNode(parentTNode, tProjectionNode, IView);`

`applyProjectionRecursive(renderer, WalkTreeNodeTreeAction.Create, IView, tProjectionNode, parentRNode, beforeNode);`

``applyProjectionRecursive` performs operation on the projection specified by `action` (insert, detach, destroy)`

Inserting a projection requires us to locate the projected nodes from the parent component.

The complication is that those nodes themselves could be re-projected from their parent component.

`@param renderer Render to use`

`@param action action to perform (insert, detach, destroy)`

`@param IView The LView which needs to be inserted, detached, destroyed.`

`@param tProjectionNode node to project`

`@param parentRElement parent DOM element for insertion/removal.`

`@param beforeNode Before which node the insertions should happen.`

import { KeyValueArray } from './util/array\_utils';  
import { assertNumber, assertNumberInRange } from './util/assert';

Value stored in the `TData` which is needed to re-concatenate the styling.

See: `TStylingKeyPrimitive` and `TStylingStatic`

export type TStylingKey = TStylingKeyPrimitive | TStylingStatic;

The primitive portion ( `TStylingStatic` removed) of the value stored in the `TData` which is needed to re-concatenate the styling.

\* - `string`: Stores the property name. Used with `styleProp`/`classProp` instruction.  
\* - `null`: Represents map, so there is no name. Used with `styleMap`/`classMap`.  
\* - `false`: Represents an ignore case. This happens when `styleProp`/`classProp` instruction is combined with directive which shadows its input `@Input('class')`. That way the binding should not participate in the styling resolution.

export type TStylingKeyPrimitive = string | null | false;

Store the static values for the styling binding.

The `TStylingStatic` is just `KeyValueArray` where key `""` (stored at location 0) contains the `TStylingKey` (stored at location 1). In other words this wraps the `TStylingKey` such that the `""` contains the wrapped value.

When instructions are resolving styling they may need to look forward or backwards in the linked list to resolve the value. For this reason we have to make sure that the linked list

also contains the static values. However the list only has space for one item per styling instruction. For this reason we store the static values here as part of the `TStylingKey`. This means that the resolution function when looking for a value needs to first look at the binding value, and then at `TStylingKey` (if it exists).  
 Imagine we have:  

```
<div class="TEMPLATE" my-dir> @Directive({ host: { class: 'DIR', [class.dynamic]: 'exp' // classProp('dynamic', ctx.exp); }})
```

 In the above case the linked list will contain one item:  

```
// assume binding location: 10 for `classProp('dynamic', ctx.exp);`
tData[10] = <TStylingStatic>["dynamic", // This is the wrapped value of `TStylingKey`
'DIR': true, // This is the default static value of directive binding.
];
tData[10 + 1] = 0; // We don't have prev/next.
IView[10] = undefined;
```

```
// assume `ctx.exp` is `undefined`
IView[10 + 1] = undefined; // Just normalized `IView[10]`
```

So when the function is resolving styling value, it first needs to look into the linked list (there is none) and then into the static `TStylingStatic` too see if there is a default value for `dynamic` (there is not). Therefore it is safe to remove it.  
 If setting `true` case:  

```
IView[10] = true; // assume `ctx.exp` is `true`
IView[10 + 1] = true; // Just normalized `IView[10]`
```

 So when the function is resolving styling value, it first needs to look into the linked list (there is none) and then into `TNode.residualClass` (TNode.residualStyle) which contains:  

```
tNode.residualClass = [{"TEMPLATE": true, }];
```

 This means that it is safe to add class.  
 export interface TStylingStatic extends KeyValueArray<any> {}  
 This is a branded number which contains previous and

next index.  
 When we come across styling instructions we need to store the `TStylingKey` in the correct order so that we can re-concatenate the styling value in the desired priority.  
 The insertion can happen either at the:  
 - end of template as in the case of coming across additional styling instruction in the template  
 - in front of the template in the case of coming across additional instruction in the `hostBindings`.  
 We use `TStylingRange` to store the previous and next index into the `TData` where the template bindings can be found.  
 - bit 0 is used to mark that the previous index has a duplicate for current value.  
 - bit 1 is used to mark that the next index has a duplicate for the current value.  
 - bits 2-16 are used to encode the next/tail of the template.  
 - bits 17-32 are used to encode the previous/head of template.  
 NODE: \*duplicate\* false implies that it is statically known that this binding will not collide with

other bindings and therefore there is no need to check other bindings. For example the bindings in  

```
[style.color]="exp" [style.width]="exp">
```

 will never collide and will have their bits set accordingly. Previous duplicate means that we may need to check previous if the current binding is `null`. Next duplicate means that we may need to check next bindings if the current binding is not `null`.  
 NOTE: `0` has special significance and represents `null` as in no additional pointer.  
 export interface TStylingRange {  
 \_\_brand\_\_: "TStylingRange";  
 }  
 Shift and masks constants for encoding two numbers into and duplicate info into a single number.  
 export const enum StylingRange {  
 /// Number of bits to shift for the previous pointer  
 PREV\_SHIFT = 17,  
 /// Previous pointer mask.  
 PREV\_MASK = 0xFFFE0000,  
 /// Number of bits to shift for the next pointer  
 NEXT\_SHIFT = 2,  
 /// Next pointer mask.  
 NEXT\_MASK = 0x001FFFC,

```

 // Mask to remove negative bit. (interpret number as positive)
 UNSIGNED_MASK = 0x7FFF,
 }

 * This bit is set if the previous bindings contains a binding which could possibly cause a duplicate. For example:
 <div [style]="map" [style.width]="width">, the `width` binding will have previous duplicate set. The implication is that if `width` binding becomes `null`, it is necessary to defer the value to `map.width`. (Because `width` overwrites `map.width`.)
 PREV_DUPLICATE = 0x02,
 * This bit is set to if the next binding contains a binding which could possibly cause a duplicate. For example:
 <div [style]="map" [style.width]="width">, the `map` binding will have next duplicate set. The implication is that if `map.width` binding becomes not `null`, it is necessary to defer the value to `width`. (Because `width` overwrites `map.width`.)
 NEXT_DUPLICATE = 0x01,
}

 * host?: RElement|string;
 * Module injector for the component. If unspecified, the injector will be
 * NULL_INJECTOR.
 * injector?: Injector;
 * List of features to be applied to the created component.
 * Features are simply
 * functions that decorate a component with a certain behavior.
 * Typically, the
 * features in this list are features that cannot be added to the
 * other features list in the component definition because they rely on other factors.
 * Example: `LifecycleHooksFeature` is a function that adds lifecycle
 * hook capabilities
 * to root components in a tree-shakable way. It cannot be added to the component
 * features
 * list because there's no way of knowing when the component will be used as
 * a root component.
 * hostFeatures?: HostFeature[];
 * A function which is used to schedule change detection work in the
 * future.
 * When marking components as dirty, it is necessary to schedule the work
 * of
 * change detection in the future. This is done to coalesce multiple
 * {@link markDirty} calls into a single
 * changed detection processing.
 * The default value of the scheduler is the `requestAnimationFrame`
 * function.
 * It is also useful to override this function for testing purposes.
 * scheduler?: (work: () => void) => void;
 * See CreateComponentOptions.hostFeatures
 * type HostFeature = (<T>(component: T,
 * componentDef: ComponentDef<T>) => void);
 * TODO: A hack to not pull in the NullInjector from
 * @angular/core.
 * export const NULL_INJECTOR: Injector = {
 * get: (token: any, notFoundValue?: any) => {
 * throwProviderNotFoundError(token, 'NullInjector');
 * }
 * };
 * Bootstraps a Component into an existing
 * host element and returns an instance
 * of the component.
 * Use this function to bootstrap a component into
 * the DOM tree. Each invocation
 * of this function will create a separate tree of components, injectors and
 * change detection cycles and lifetimes. To dynamically insert a new component
 * into an existing tree such that
 * it shares the same injection, change detection
 * and object lifetime, use {@link
 * ViewContainer#createComponent}.
 * @param componentType Component to bootstrap
 * @param options

```

```

```

constructor() {\n *   throw
  new Error('message');\n *   }\n * }\n *\n * var injector = Injector.resolveAndCreate([A]);\n *\n * try {\n *
injector.get(A);\n * } catch (e) {\n *   expect(e instanceof InstantiationException).toBe(true);\n *
expect(e.originalException.message).toEqual('message');\n *   expect(e.originalStack).toBeDefined();\n * }\n *
```\n *\n * export function instantiationError(\n   injector: ReflectiveInjector, originalException: any, originalStack:
any,\n key: ReflectiveKey): InjectionError {\n return injectionError(injector, key, function(keys: ReflectiveKey[])
{\n const first = stringify(keys[0].token);\n return `${originalException.message}: Error during instantiation of
${first}!${\n constructResolvingPath(keys)}.`; \n }, originalException);\n }\n *\n * Thrown when an object
other then { @link Provider } (or `Type`) is passed to { @link Injector}\n * creation.\n *\n * @usageNotes\n * ###
Example\n *\n * ```typescript\n * expect(() => Injector.resolveAndCreate([\"not a type\"]))toThrowError();\n *
```\n *\n * export function invalidProviderError(provider: any) {\n   return Error(\n     `Invalid provider - only
instances of Provider and Type are allowed, got: ${provider}`);\n }\n *\n * Thrown when the class has no
annotation information.\n *\n * Lack of annotation information prevents the { @link Injector} from determining
which dependencies\n * need to be injected into the constructor.\n *\n * @usageNotes\n * ### Example\n *\n *
```\n * class A {\n *   constructor(b) {\n *   }\n * }\n *\n * expect(() =>
Injector.resolveAndCreate([A])).toThrowError();\n *
```\n *\n * This error is also thrown when the class not marked
with { @link Injectable} has parameter types.\n *\n * ```typescript\n * class B {\n *\n * class A {\n *
constructor(b:B) {\n * // no information about the parameter types of A is available at runtime.\n * }\n *\n * expect(()
=> Injector.resolveAndCreate([A,B])).toThrowError();\n *
```\n *\n * export function
noAnnotationError(typeOrFunc: Type<any>|Function,
 params: any[]): Error {\n const signature: string[] = [];\n for (let i = 0, ii = params.length; i < ii; i++) {\n const
parameter = params[i];\n if (!parameter || parameter.length == 0) {\n signature.push('?');\n } else {\n
signature.push(parameter.map(stringify).join(' '));\n }\n }\n return Error(\n `Cannot resolve all parameters for
${stringify(typeOrFunc)} + ${signature.join(' ')} + '.\n ' +\n `Make sure that all the parameters are
decorated with Inject or have valid type annotations and that ${stringify(typeOrFunc)} + '' is decorated with
Injectable.`);\n }\n *\n * Thrown when getting an object by index.\n *\n * @usageNotes\n * ### Example\n *\n *
```\n * class A {\n *\n * var injector = Injector.resolveAndCreate([A]);\n *\n * expect(() =>
injector.getAt(100)).toThrowError();\n *
```\n *\n * export function outOfBoundsError(index: number) {\n   return
Error(`Index ${index} is out-of-bounds.`);\n }\n *\n *
TODO: add a working example after alpha38 is released\n *\n * Thrown when a multi provider and a regular
provider are bound to the same token.\n *\n * @usageNotes\n * ### Example\n *\n * ```typescript\n * expect(() =>
Injector.resolveAndCreate([\n * { provide: 'Strings', useValue: 'string1', multi: true },\n * { provide:

* NOTE: The word `styling` is used interchangeably as style or class styling.\n *\n * This file contains code to link
styling instructions together so that they can be replayed in\n * priority order. The file exists because Ivy styling
instruction execution order does not match\n * that of the priority order. The purpose of this code is to create a
linked list so that the\n * instructions can be traversed in priority order when computing the styles.\n *\n * Assume
we are dealing with the following code:\n *\n * ```\n * @Component({\n *   template: `<my-cmp [style]=\"
{color: '#001'} \"\n *     [style.color]=\" #002 \"\n *     dir-style-color-1\n *     dir-style-color-2>`\n *

```

```

})\n * class ExampleComponent {\n *   static ngComp = ... {\n *     ...\n *     // Compiler ensures that `styleProp` is
after `styleMap`\n *     styleMap({color: '#001'});\n *     styleProp('color', '#002');\n *     ...\n *   }\n * }\n *
@Directive({\n *   selector:
`[dir-style-color-1]',\n * })\n * class Style1Directive {\n *   @HostBinding('style') style = {color: '#005'};\n *
@HostBinding('style.color') color = '#006';\n *   static ngDir = ... {\n *     ...\n *     // Compiler ensures that
`styleProp` is after `styleMap`\n *     styleMap({color: '#005'});\n *     styleProp('color', '#006');\n *     ...\n *   }\n *
}\n *
@Directive({\n *   selector: `[dir-style-color-2]',\n * })\n * class Style2Directive {\n *
@HostBinding('style') style = {color: '#007'};\n *   @HostBinding('style.color') color = '#008';\n *   static ngDir
= ... {\n *     ...\n *     // Compiler ensures that `styleProp` is after `styleMap`\n *     styleMap({color: '#007'});\n *
styleProp('color', '#008');\n *     ...\n *   }\n * }\n *
}\n *
@Directive({\n *   selector: `my-cmp',\n * })\n * class
MyComponent {\n *   @HostBinding('style') style = {color: '#003'};\n *   @HostBinding('style.color') color =
'#004';\n *   static ngComp =
... {\n *     ...\n *     // Compiler ensures that `styleProp` is after `styleMap`\n *     styleMap({color: '#003'});\n *
styleProp('color', '#004');\n *     ...\n *   }\n * }\n *
```\n *
The Order of instruction execution is:\n *
NOTE:
the comment binding location is for illustrative purposes only.\n *
```\n *
// Template: (ExampleComponent)\n *
styleMap({color: '#001'}); // Binding index: 10\n *
styleProp('color', '#002'); // Binding index: 12\n *
//
MyComponent\n *
styleMap({color: '#003'}); // Binding index: 20\n *
styleProp('color', '#004'); // Binding
index: 22\n *
// Style1Directive\n *
styleMap({color: '#005'}); // Binding index: 24\n *
styleProp('color',
'#006'); // Binding index: 26\n *
// Style2Directive\n *
styleMap({color: '#007'}); // Binding index: 28\n *
styleProp('color', '#008'); // Binding index: 30\n *
```\n *
The correct priority order of concatenation is:\n *
\n *
```\n *
// MyComponent\n
*
styleMap({color: '#003'}); // Binding index: 20\n *
styleProp('color', '#004'); // Binding index: 22\n *
//
Style1Directive\n *
styleMap({color: '#005'}); // Binding index: 24\n *
styleProp('color', '#006'); // Binding
index: 26\n *
// Style2Directive\n *
styleMap({color: '#007'}); // Binding index: 28\n *
styleProp('color',
'#008'); // Binding index: 30\n *
// Template: (ExampleComponent)\n *
styleMap({color: '#001'}); // Binding
index: 10\n *
styleProp('color', '#002'); // Binding index: 12\n *
```\n *
What color should be rendered?\n *
\n *
*
Once the items are correctly sorted in the list, the answer is simply the last item in the\n *
concatenation list which
is `#002`.\n *
\n *
To do so we keep a linked list of all of the bindings which pertain to this element.\n *
Notice that
the bindings are inserted in the order of execution, but the `TVView.data` allows\n *
us to traverse them in the order
of priority.\n
*\n *
|Idx|`TVView.data`|`LView` | Notes\n *
|---|-----|-----|-----|-----\n *
|...| | | | |
|\n *
|10|`null` |`{color: '#001'}|`styleMap('color', {color: '#001'})`\n *
|11|`30 | 12` |`...` |\n *
|12|`color` |`'#002` |`styleProp('color', '#002')`\n *
|13|`10 | 0` |`...` |\n *
|...| | | | |
|\n *
|20|`null` |`'#004` |`styleProp('color', '#004')`\n *
|21|`0 | 22` |`...` |\n *
|22|`color` |`'#004` |`styleProp('color', '#004')`\n *
|23|`20 | 24` |`...` |\n *
|24|`null` |`{color: '#005'}|`styleMap('color',
{color: '#005'})`\n *
|25|`22 | 26` |`...` |\n *
|26|`color` |`'#006` |`styleProp('color', '#006')`\n *
|27|`24 | 28` |`...` |\n *
|28|`null` |`{color: '#007'}|`styleMap('color', {color: '#007'})`\n *
|29|`26 | 30` |`...` |
|\n *
|30|`color` |`'#008` |`styleProp('color', '#008')`\n *
|31|`28 | 10` |`...` |
|\n *
\n *
The above
data structure allows us to re-concatenate the styling no matter which data binding\n *
changes.\n *
\n *
NOTE: in
addition to keeping track of next/previous index the `TVView.data` also stores prev/next\n *
duplicate bit. The
duplicate bit if true says there either is a binding with the same name or\n *
there is a map (which may contain the
name). This information is useful in knowing if other\n *
styles with higher priority need to be searched for
overwrites.\n *
\n *
NOTE: See `should support example in 'tnode_linked_list.ts' documentation` in\n *
`tnode_linked_list_spec.ts` for working example.\n *
\n *
nlet
__unused_const_as_closure_does_not_like_standalone_comment_blocks__: undefined;\n *
\n *
\n *
Insert new
`tStyleValue` at `TData` and link existing style bindings such that we maintain linked\n *
list of styles and compute
the duplicate flag.\n *
\n *

```

Note: this function is executed during `firstUpdatePass` only to populate the `TView.data`. The function works by keeping track of `tStylingRange` which contains two pointers pointing to the head/tail of the template portion of the styles. - if `isHost === false` (we are template) then insertion is at tail of `TStylingRange` - if `isHost === true` (we are host binding) then insertion is at head of `TStylingRange`.

@param tData The `TData` to insert into.

@param tNode `TNode` associated with the styling element.

@param tStylingKey See `TStylingKey`.

@param index location of where `tStyleValue` should be stored (and linked into list).

@param isHostBinding `true` if the insertion is for a `hostBinding`. (insertion is in front of template.)

@param isClassBinding True if the associated `tStylingKey` as a `class` styling.

`tNode.classBindings` should be used (or `tNode.styleBindings` otherwise).

```

function insertTStylingBinding(
 tData: TData, tNode: TNode, tStylingKeyWithStatic: TStylingKey, index:
 number, isHostBinding: boolean, isClassBinding: boolean): void {
 ngDevMode &&
 assertFirstUpdatePass(getTView());
 let tBindings = isClassBinding ? tNode.classBindings :
 tNode.styleBindings;
 let tmplHead = getTStylingRangePrev(tBindings);
 let tmplTail =
 getTStylingRangeNext(tBindings);
 tData[index] = tStylingKeyWithStatic;
 let isKeyDuplicateOfStatic =
 false;
 let tStylingKey: TStylingKeyPrimitive;

*\n * This function takes user input which could be `string`, Object literal, or iterable and converts\n * it into a
consistent representation. The output of this is `KeyValueArray` (which is an array\n * where\n * even indexes
contain keys and odd indexes contain values for those keys).\n * The advantage of converting to
`KeyValueArray` is that we can perform diff in an input\n * independent\n * way.\n * (ie we can compare `foo bar`
to `['bar', 'baz']` and determine a set of changes which need to be\n * applied)\n * The fact that `KeyValueArray`
is sorted is very important because it allows us to compute the\n * difference in linear fashion without the need to
allocate any additional data.\n * For example if we kept this as a `Map` we would have to iterate over previous
`Map` to determine\n * which values need to be deleted, over the new `Map` to determine additions, and we would
have to\n * keep additional `Map` to keep track of duplicates or items which have
not yet been visited.\n * @param keyValueArraySet (See `keyValueArraySet` in `util/array_utils`) Gets
passed in as a\n * function so that `style` can be processed. This is done\n * for tree shaking purposes.\n *

    COMMENT = 0b10,
}

Stores DOM operations which need to be applied to update DOM render tree due to changes in expressions.

The basic idea is that `i18nExp` OpCodes capture expression changes and update a change mask bit. (Bit 1 for expression 1, bit 2 for expression 2 etc..., bit 32 for expression 32 and higher.) The OpCodes then compare its own change mask against the expression change mask to determine if the OpCodes should execute.

NOTE: 32nd bit is special as it says 32nd or higher. This way if we have more than 32 bindings the code still works, but with lower efficiency. (it is unlikely that a translation would have more than 32 bindings.)

These OpCodes can be used by both the i18n block as well as ICU sub-block.

### Example

Assume `ts` if `(rf & RenderFlags.Update)`

{
    i18nExp(ctx.exp1); // If changed set mask bit 1
    i18nExp(ctx.exp2); // If changed set mask bit 2
    i18nExp(ctx.exp3); // If changed set mask bit 3
    i18nExp(ctx.exp4); // If changed set mask bit 4
    i18nApply(0); // Apply all changes by executing the OpCodes.
}

We can assume that each call to `i18nExp` sets an internal `changeMask` bit depending on the index of `i18nExp`.

#### OpCodes

`<I18nUpdateOpCodes>`

// The following OpCodes represent:

`<div i18n-title=\`pre\${exp1}\`in\${exp2}\`post\`>`

// If `changeMask & 0b11` has changed then execute update OpCodes.

// has NOT changed then skip `8` values and start processing next OpCodes.

0b11, 8, // Concatenate `newValue = 'pre'+IView[bindIndex-4]+'in'+IView[bindIndex-3]+'post';`

'pre', -4, 'in', -3, 'post', // Update attribute: `elementAttribute(1, 'title', sanitizerFn(newValue));`

1 << SHIFT_REF | Attr, 'title', sanitizerFn,

// The following OpCodes represent:

`<div i18n>Hello \${exp3}\`!>`

// If `changeMask & 0b100` has changed then execute update OpCodes.

// has NOT changed then skip `4` values and start processing next OpCodes.

0b100, 4, // Concatenate `newValue = 'Hello ' + IView[bindIndex -2] + '!';`

'Hello ', -2, '!', // Update text: `IView[1].textContent = newValue;`

1 << SHIFT_REF | Text,

// The following OpCodes represent:

`<div i18n>\${exp4, plural, ... }\`>`

// If `changeMask & 0b1000` has changed then execute update OpCodes.

// has NOT changed then skip `2` values and start processing next OpCodes.

0b1000, 2, // Concatenate `newValue = IView[bindIndex -1];`

-1, // Switch ICU: `icuSwitchCase(IView[1], 0, newValue);`

0 << SHIFT_ICU | 1 << SHIFT_REF | IcuSwitch,

// Note `changeMask & -1` is always true, so the IcuUpdate will always execute.

-1, 1, // Update ICU: `icuUpdateCase(IView[1], 0);`

0 << SHIFT_ICU | 1 << SHIFT_REF | IcuUpdate,

];

export interface I18nUpdateOpCodes extends Array<string|number|SanitizerFn|null>, I18nDebug {
    __brand__: 'I18nUpdateOpCodes';
}

Store information for the i18n translation block.

export interface TI18n {
    /**
     * A set of OpCodes which will create the Text Nodes and ICU anchors for the translation blocks.
     */
}

NOTE: The ICU anchors are filled in with ICU Update OpCode.

create: I18nCreateOpCodes;

A set of OpCodes which will be executed on each change detection to determine if any changes to DOM are required.

update: I18nUpdateOpCodes;

Defines the ICU type of `select` or `plural`

export const enum IcuType {
    select = 0,
    plural = 1,
}

export interface TIcu {
    /**
     * Defines the ICU type of `select` or `plural`
     */
    type: IcuType;
    /**
     * Index in `LView` where the anchor node is stored.
     */
    anchorIdx: number;
    /**
     * Currently selected ICU case pointer.
     */
    IView[currentCaseLViewIndex] stores the currently selected case. This is needed to know how to clean up the current case when transitioning to the new case.

    If the value stored is `null`: No current case selected.

    `<0` : A flag which means that the ICU just switched and that `icuUpdate`
```

```

must be executed\n *      regardless of the `mask`. (After the execution the flag is cleared)\n *      `>=0` A

`previousTNodes` list\n * `tNode.insertBeforeIndex`.\n * \n * Things to keep in mind:\n * 1. All i18n text nodes are
encoded as `TNodeType.Element` and are created eagerly by the\n * `i18nStart` instruction.\n * 2. All
`TNodeType.Placeholder` `TNodes` are elements which will be created later by\n * `elementStart` instruction.\n *
3. `elementStart` instruction will create `TNode`s in the ascending `TNode.index` order. (So a\n * smaller index
`TNode` is guaranteed to be created before a larger one)\n * \n * We use the above three invariants to determine
`TNode.insertBeforeIndex`.\n * \n * In an ideal world `TNode.insertBeforeIndex` would always be
`TNode.next.index`. However,\n * this will not work because `TNode.next.index` may be larger than `TNode.index`
which means that\n
* the next node is not yet created and therefore we can't insert in front of it.\n * \n * Rule1:
`TNode.insertBeforeIndex = null` if `TNode.next === null` (Initial condition, as we don't\n * know if there will
be further `TNode`s inserted after.)\n * Rule2: If `previousTNode` is created after the `tNode` being inserted, then\n
* `previousTNode.insertBeforeIndex = tNode.index` (So when a new `tNode` is added we check\n *
previous to see if we can update its `insertBeforeIndex`)\n * \n * See `TNode.insertBeforeIndex` for more
context.\n * \n * @param previousTNodes A list of previous TNodes so that we can easily traverse `TNode`s in\n *
reverse order. (If `TNode` would have `previous` this would not be necessary.)\n * \n * @param newTNode A TNode to

 * This file re-exports all symbols contained in this directory.
 * Why is this file not `index.ts`?
 * There seems to be an inconsistent path resolution of an `index.ts` file when only the parent directory is referenced. This could be due to the node module resolution configuration differing from rollup and/or typescript.
 * With commit <https://github.com/angular/angular/commit/d5e3f2c64bd13ce83e7c70788b7fc514ca4a9918> the `instructions.ts` file was moved to `instructions/instructions.ts` and an `index.ts` file was used to re-export everything. Having had file names that were importing from `instructions` directly (not the from the sub file or the `index.ts` file) caused strange CI issues. `index.ts` had to be renamed to `all.ts` for this to work.

    }
    /** Marks a view and all
    of its ancestors dirty.
    * It also triggers change detection by calling `scheduleTick` internally, which
    coalesces
    * multiple `markForCheck` calls to into one change detection run.
    * This can be used to ensure
    an { @link ChangeDetectionStrategy#OnPush OnPush } component is
    * checked when it needs to be re-rendered
    but the two normal triggers haven't marked it
    * dirty (i.e. inputs haven't changed and events haven't fired in the
    view).
    * <!-- TODO: Add a link to a chapter on OnPush components -->
    * @usageNotes
    * ###
    Example
    * ```typescript
    * @Component({
    *   selector: 'my-app',
    *   template: `Number of ticks:
    {{numberOfTicks}}`
    *   changeDetection: ChangeDetectionStrategy.OnPush,
    * })
    * class AppComponent
    {
    *   numberOfTicks = 0;
    *   constructor(private ref: ChangeDetectorRef) {
    *     setInterval(() => {
    *       this.numberOfTicks++;
    *       // the following is required, otherwise the view will not be updated
    *       this.ref.markForCheck();
    *     }, 1000);
    *   }
    *   markForCheck(): void {
    markViewDirty(this._cdRefInjectingView || this._IView);
    }
    }
    * ```
    * Detaches the view from the change
    detection tree.
    * Detached views will not be checked during change detection runs until they are
    * re-
    attached, even if they are dirty. `detach` can be used in combination with
    * { @link ChangeDetectorRef#detectChanges detectChanges } to implement local change
    * detection checks.
    * <!-- TODO: Add a link to a chapter on detach/reattach/local digest -->
    * <!-- TODO: Add a live demo
    once ref.detectChanges is merged into master -->
    * @usageNotes
    * ### Example
    * The
    following example defines a component with a large list of readonly data.
    * Imagine the data changes constantly,
    many times per second. For performance reasons,
    * we want to check and update the list every five seconds. We
    can do that by detaching
    * the component's change detector and doing a local check every five seconds.
    * ```typescript
    * class DataProvider {
    *   // in a real application the returned data will be different every time
    *   get data() {
    *     return [1,2,3,4,5];
    *   }
    * }
    * @Component({
    *   selector: 'giant-list',
    *   template: `
    *     <li *ngFor="let d of dataProvider.data">Data
    {{d}}</li>
    *   `
    * })
    * class GiantList {
    *   constructor(private ref: ChangeDetectorRef, private
    dataProvider: DataProvider) {
    *     ref.detach();
    *     setInterval(() => {
    *       this.ref.detectChanges();
    *     }, 5000);
    *   }
    * }
    * @Component({
    *   selector: 'app',
    *   providers: [DataProvider],
    *   template: `
    *     <giant-list><giant-list>
    *   `
    * })
    * class App {
    *   detach(): void
    {
    this._IView[FLAGS] &= ~LViewFlags.Attached;
    }
    }
    * Re-attaches a view to the change detection

```

tree.
 * This can be used to re-attach views that were previously detached from the tree
 * using { @link ChangeDetectorRef#detach detach}. Views are attached to the tree by default.
 * <!-- TODO: Add a link to a chapter on detach/reattach/local digest -->
 * @usageNotes
 * ### Example
 * The following example creates a component displaying

```
`live` data. The component will detach its change detector from the main change detector tree when the
component's live property is set to false.
`typescript`
class DataProvider {
  data = 1;
  constructor() {
    setInterval(() => {
      this.data = this.data * 2;
    }, 500);
  }
  @Component({
    selector: 'live-data',
    inputs: ['live'],
    template: 'Data:
    {{dataProvider.data}}'
  })
  class LiveData {
    constructor(private ref: ChangeDetectorRef, private
    dataProvider: DataProvider) {}
    set live(value) {
      if (value) {
        this.ref.reattach();
      }
      else {
        this.ref.detach();
      }
    }
    @Component({
      selector: 'my-app',
      providers: [DataProvider],
      template: `
      Live Update: <input type="checkbox" [(ngModel)]="live">
      * <live-data [live]="live"><live-data>
      * `
    })
    class AppComponent {
      live = true;
    }
  }
  reattach(): void {
    this._View[FLAGS] |= LViewFlags.Attached;
  }
  /** Checks the view and its children.
  * This can also be used in combination with { @link ChangeDetectorRef#detach detach} to implement
  * local change detection checks.
  * <!-- TODO: Add a link to a chapter on detach/reattach/local digest -->
  * <!-- TODO: Add a live demo once ref.detectChanges is merged into master -->
  * @usageNotes
  * ### Example
  * The following example defines a component with a large list of readonly data.
  * Imagine, the data changes
  * constantly, many times per second. For performance reasons,
  * we want to check and update the list every five
  * seconds.
  * We can do that by detaching the component's change detector and doing a local change
  * detection
  * check every five seconds.
  * See { @link ChangeDetectorRef#detach
  * detach} for more information.
  * detectChanges(): void {
    detectChangesInternal(this._View[TVIEW],
    this._View, this.context);
  }
  /** Checks the change detector and its children, and throws if any changes
  * are detected.
  * This is used in development mode to verify that running change detection doesn't
  * introduce other changes.
  * checkNoChanges(): void {
    checkNoChangesInternal(this._View[TVIEW],
    this._View, this.context);
  }
  attachToViewContainerRef(vcRef: viewEngine_ViewContainerRef) {
    if
    (this._appRef) {
      throw new Error('This view is already attached directly to the ApplicationRef!');
    }
    this._viewContainerRef = vcRef;
  }
  detachFromAppRef() {
    this._appRef = null;
  }
  renderDetachView(this._View[TVIEW], this._View);
  attachToAppRef(appRef: ViewRefTracker) {
    if
    (this._viewContainerRef) {
      throw new Error('This view is already attached to a ViewContainer!');
    }
    this._appRef = appRef;
  }
  /** @internal */

  /** Base class that provides change
  * detection functionality.
  * A change-detection tree collects all views that are to be checked for changes.
  * Use the
  * methods to add and remove views from the tree, initiate change-detection,
  * and explicitly mark views as _dirty_,
  * meaning that they have changed and need to be re-rendered.
  * @see [Using change detection
```

`hooks](guide/lifecycle-hooks#using-change-detection-hooks)\n * @see [Defining custom change detection](guide/lifecycle-hooks#defining-custom-change-detection)\n *\n * The following examples demonstrate how to modify default change-detection behavior\n * to perform explicit detection when needed.\n`

`\n * ### Use `markForCheck()` with `CheckOnce` strategy\n *\n * The following example sets the `OnPush` change-detection strategy for a component\n * (`CheckOnce`, rather than the default `CheckAlways`), then forces a second check\n * after an interval. See [live demo](http://plnr.co/edit/GC512b?p=preview).\n *\n * <code-example path=\"core/ts/change_detect/change-detection.ts\" \n * region=\"mark-for-check\"></code-example>\n *\n * ### Detach change detector to limit how often check occurs\n *\n * The following example defines a component with a large list of read-only data\n * that is expected to change constantly, many times per second.\n * To improve performance, we want to check and update the list\n * less often than the changes actually occur. To do that, we detach\n * the component's change detector and perform an explicit local check every five seconds.\n *\n * <code-example path=\"core/ts/change_detect/change-detection.ts\" \n * region=\"detach\"></code-example>\n *\n * ### Reattaching a detached component\n *\n * The following example creates a component displaying live data.\n * The component detaches its change detector from the main change detector tree\n * when the `live` property is set to false, and reattaches it when the property\n * becomes true.\n *\n * <code-example path=\"core/ts/change_detect/change-detection.ts\" \n * region=\"reattach\"></code-example>\n *`

ngAfterContentCheck, ngAfterContentInit,\n    // ngAfterViewCheck, and ngAfterViewInit lifecycle hooks (depending
on the node\n    // flags in lifecycle). Unlike ngDoCheck, ngOnChanges and ngOnInit, which are\n    // called during a
pre-order traversal of the view tree (that is calling the\n    // parent hooks before the child hooks) these events are sent
in using a\n    // post-order traversal of the tree (children before parents). This changes the\n    // meaning of initIndex in
the view state. For ngOnInit, initIndex tracks the\n    // expected nodeIndex which a ngOnInit should be called. When
sending\n    // ngAfterContentInit
and ngAfterViewInit it is the expected count of\n    // ngAfterContentInit or ngAfterViewInit methods that have been
called. This\n    // ensure that despite being called recursively or after picking up after an\n    // exception, the
ngAfterContentInit or ngAfterViewInit will be called on the\n    // correct nodes. Consider for example, the following
(where E is an element\n    // and D is a directive)\n    // Tree:      pre-order index  post-order index\n    // E1      0
6\n    // E2      1          1\n    // D3      2          0\n    // E4      3          5\n    // E5      4          4\n    // E6      5          2\n    // E7      6          3\n    // As can be seen, the post-order index has an unclear relationship to

```

the\n// pre-order index (postOrderIndex === preOrderIndex - parentCount +\n// childCount). Since number of calls to ngAfterContentInit and ngAfterViewInit\n// are stable (will be the same for the same view regardless of exceptions

or\n// recursion) we just need to count them which will roughly correspond to the\n// post-order index (it skips elements and directives that do not have\n// lifecycle hooks).\n//\n// For example, if an exception is raised in the E6.onAfterViewInit() the\n// initIndex is left at 3 (by shouldCallLifecycleInitHook() which set it to\n// initIndex + 1). When checkAndUpdateView() is called again D3, E2 and E6 will\n// not have their ngAfterViewInit() called but, starting with E7, the rest of\n// the view will begin getting ngAfterViewInit() called until a check and\n// pass is complete.\n//\n// This algorithm also handles recursion. Consider if E4's ngAfterViewInit()\n// indirectly calls E1's ChangeDetectorRef.detectChanges(). The expected\n// initIndex is set to 6, the recursive checkAndUpdateView() starts walk again.\n// D3, E2, E6, E7, E5 and E4 are skipped, ngAfterViewInit() is called on E1.\n// When the recursion returns the initIndex will be 7 so E1 is skipped as it\n// has already

been called in the recursively called checkAnUpdateView().\nexport function callLifecycleHooksChildrenFirst(view: ViewData, lifecycles: NodeFlags) {\n if (!(view.def.nodeFlags & lifecycles)) {\n return;\n }\n const nodes = view.def.nodes;\n let initIndex = 0;\n for (let i = 0; i < nodes.length; i++) {\n const nodeDef = nodes[i];\n let parent = nodeDef.parent;\n if (!parent && nodeDef.flags & lifecycles) {\n // matching root node (e.g. a pipe)\n callProviderLifecycles(view, i, nodeDef.flags & lifecycles, initIndex++);\n }\n if ((nodeDef.childFlags & lifecycles) === 0) {\n // no child matches one of the lifecycles\n i += nodeDef.childCount;\n }\n while (parent && (parent.flags & NodeFlags.TypeElement) &&\n i === parent.nodeIndex + parent.childCount) {\n // last child of an element\n if (parent.directChildFlags & lifecycles) {\n initIndex = callElementProvidersLifecycles(view, parent, lifecycles, initIndex);\n

(modules get registered when expected)\n      // without bloating bundles (modules are registered when otherwise not
referenced).\n      /\n      // In View Engine, registration occurs in the .ngfactory.js file as a side effect. This has\n
// several practical consequences:\n      /\n      // - If an .ngfactory file is not imported from, the module won't be
registered (and can be\n      // tree shaken).\n      // - If an .ngfactory file is imported from, the module will be
registered even if an instance\n      // is not actually created (via `create` below).\n      // - Since an .ngfactory file in
View Engine references the .ngfactory files of the NgModule's\n      // imports,\n
      /\n      // In Ivy, things are a bit different. .ngfactory files still exist for compatibility, but are\n      // not a
required API to use - there are other ways to obtain an NgModuleFactory for a given\n      // NgModule. Thus,
relying on a side effect in the .ngfactory file is not sufficient. Instead,\n      // the side effect of registration is added
here, in the constructor of NgModuleFactory,\n      // ensuring no matter how a factory is created, the module is
registered correctly.\n      /\n      // An alternative would be to include the registration side effect inline following the
actual\n      // NgModule definition. This also has the correct timing, but breaks tree-shaking - modules\n      // will
be registered and retained even if they're otherwise never referenced.\n      registerNgModuleType(moduleType as

string} >,\n

```

style values to a host element. Since attribute values can consist of different types of values, the `hostAttrs` array must include the values in the following format:

- `attr1, value1, attr2, value2` // a single namespace value (like ``x:id``)
- `NAMESPACE_MARKER, namespaceUri1, name1, value1` // another single namespace value (like ``x:name``)
- `NAMESPACE_MARKER, namespaceUri2, name2, value2` // a series of CSS classes that will be applied to the element (no spaces)
- `CLASSES_MARKER, class1, class2, class3` // a series of CSS styles (property + value) that will be applied to the element
- `STYLES_MARKER, prop1, value1, prop2, value2`

All non-class and non-style attributes must be defined at the start of the list first before all class and style values are set. When there is a change in value type (like when classes and styles are introduced) a marker must be used to separate the entries. The marker values themselves are set via entries found in the `[AttributeMarker]` enum.

`readonly hostAttrs: TAttributes | null` // Token representing the directive. Used by DI.

`readonly type: Type<T>`

Function that resolves providers and publishes them into the DI system.

`providersResolver: (<U extends T> (def: DirectiveDef<U>, processProvidersFn?: ProcessProvidersFunction) => void) | null` // The selectors that will be used to match nodes to this directive.

`readonly selectors: CssSelectorList`

`readonly Name` under which the directive is exported (for use with local references in template)

`readonly exportAs: string[] | null`

Factory function used to create a new directive instance. Will be null initially. Populated when the factory is first requested by directive instantiation logic.

`readonly factory: FactoryFn<T> | null`

The features applied to this directive

`readonly features: DirectiveDefFeature[] | null`

`setInput: (<U extends T> (this: DirectiveDef<U>, instance: U, value: any, publicName: string, privateName: string) => void) | null`

`@codeGenApi` export type `ComponentDefWithMeta<T, Selector extends String, ExportAs extends string[], InputMap extends {[key: string]: string}, OutputMap extends {[key: string]: string}, QueryFields extends string[], NgContentSelectors extends string[]> = ComponentDef<T>`

`@codeGenApi` export type `FactoryDef<T, CtorDependencies extends CtorDependency[]> = () => T`

Runtime link information for Components.

This is an internal data structure used by the render to link components into templates.

NOTE: Always use `defineComponent` function to create this object, never create the object directly since the shape of this object can change between versions.

See: `{ @link defineComponent }`

export interface `ComponentDef<T> extends DirectiveDef<T>`

`{ id: string` // Runtime unique component ID

`id: string` // The View template of the component

`readonly template: ComponentTemplate<T>`

Constants associated with the component's view.

`readonly consts: TConstantsOrFactory | null`

An array of `ngContent[selector]` values that were found in the template.

`readonly ngContentSelectors?: string[]`

A set of styles that the component needs to be present for component to render correctly.

`readonly styles: string[]`

The number of nodes, local refs, and pipes in this component template.

`readonly nodes: number`

Used to calculate the length of the component's LView array, so we can pre-fill the array and set the binding start index.

`TODO(kara): remove queries from this count`

`readonly decls: number`

The number of bindings in this component template (including pure fn bindings).

`readonly bindings: number`

Used to calculate the length of the component's LView array, so we can pre-fill the array and set the host binding start index.

`readonly vars: number`

Query-related instructions for a component.

`viewQuery: ViewQueriesFunction<T> | null`

The view encapsulation type, which determines how styles are applied to DOM elements. One of

- `Emulated` (default): Emulate native scoping of styles.
- `Native`: Use the native encapsulation mechanism of the renderer.
- `ShadowDom`: Use modern [ShadowDOM](https://w3c.github.io/webcomponents/spec/shadow/) and create a ShadowRoot for component's host element.
- `None`: Do not provide any template or style encapsulation.

`readonly encapsulation: ViewEncapsulation`

Defines arbitrary developer-defined data to be stored on a renderer instance. This is useful for renderers that delegate to other renderers.

`readonly data: {[kind: string]: any}`

Whether or not this component's ChangeDetectionStrategy is OnPush

```

During change detection,\n * Angular automatically updates

the data property with the DOM property's value.\n * \n * @usageNotes\n * \n * You can supply an optional name to use in templates when the\n * component is instantiated, that maps to the\n * name of the bound property.

By default, the original name of the bound property is used for input binding. The following example creates a component with two input properties, one of which is given a special binding name.

```

`typescript
@Component({
  selector: 'bank-account',
  template: `
    Bank Name:
    {{bankName}}
    Account Id: {{id}}
  `
})
class BankAccount {
  // This property is bound
  // using its original name.
  @Input() bankName: string;
  // this property value is bound to a different
  // property name
  // when this component is instantiated in a template.
  @Input('account-id') id: string;
}
// this property is not bound, and is not automatically updated
by Angular
normalizedBankName: string;
}
@Component({
  selector: 'app',
  template: `
    <bank-account bankName="RBC" account-id="4747"></bank-account>
  `
})
class App {}
`
`
@see [Input and Output properties](guide/inputs-outputs)

(bindingPropertyName?: string): any;
new(bindingPropertyName?: string): any;
}
Type of metadata
for an `Input` property.
@publicApi
export interface Input {
  /**
   * The name of the DOM
   * property to which the input property is bound.
   */
  bindingPropertyName?: string;
}
@Annotation
@publicApi
export const Input: InputDecorator =
  makePropDecorator('Input', (bindingPropertyName?:
  string) => ({bindingPropertyName}));
Type of the Output decorator / constructor function.
@publicApi
export interface OutputDecorator {
  /**
   * Decorator that marks a class field as an output
   * property
   * and supplies configuration metadata.
   * The DOM property bound to the output property is automatically updated
   * during change detection.
   */
  @usageNotes
  You can supply an optional name to use in templates
  when the component is instantiated, that maps to the name of the bound property.
  By default, the
  original name of the bound property is used for output binding.
  See `Input` decorator for an example
  of providing a binding name.
  @see [Input and Output properties](guide/inputs-outputs)
  (bindingPropertyName?: string): any;
  new(bindingPropertyName?: string): any;
}
Type of the Output
metadata.
@publicApi
export interface Output {
  /**
   * The name of the DOM property to which
   * the output property is bound.
   */
  bindingPropertyName?: string;
}
@Annotation
@publicApi
export const Output: OutputDecorator =
  makePropDecorator('Output', (bindingPropertyName?:
  string) => ({bindingPropertyName}));
Type of the HostBinding decorator / constructor function.
@publicApi
export interface HostBindingDecorator {
  /**
   * Decorator that marks a DOM property
   * as a host-binding property and supplies configuration
   * metadata.
   * Angular automatically checks host
   * property bindings during change detection, and
   * if a binding changes it updates the host element of the
   * directive.
   */
  @usageNotes
  The following example creates a directive that sets the `valid` and
  `invalid` properties on the DOM element that has an `ngModel` directive on it.
  `typescript
  @Directive({selector: '[ngModel]'})
  class NgModelStatus {
    constructor(public control: NgModel) {}
    @HostBinding('class.valid') get valid() { return this.control.valid; }
    @HostBinding('class.invalid') get
    invalid() { return this.control.invalid; }
  }
  @Component({
    selector: 'app',
    template: `<input [(ngModel)]="prop">`,
  })
  class App {
    prop;
  }
  `
  (hostPropertyName?: string): any;
  new(hostPropertyName?: string): any;
}
Type of
the HostBinding metadata.
@publicApi
export interface HostBinding {
  /**
   * The DOM property
   * that is bound to a data property.
   */
  hostPropertyName?: string;
}
@Annotation
@publicApi
export const HostBinding: HostBindingDecorator =
  makePropDecorator('HostBinding',
  (hostPropertyName?: string) => ({hostPropertyName}));
Type of the HostListener decorator /
constructor function.
@publicApi
export interface HostListenerDecorator {
  /**
   * Decorator that
   * declares a DOM event to listen for,
   * and provides a handler method to run when that event occurs.
   */
  (eventName: string, args?: string[]): any;
  new(eventName: string, args?: string[]): any;
}
Type of the HostListener metadata.
@publicApi
export interface HostListener {
  /**
   * The DOM
   * event to listen for.
   */
  eventName?: string;
  /**
   * A set of arguments to pass to the handler method when
   * the event occurs.
   */
  args?: string[];
}
Decorator that binds a DOM event to a host listener and
supplies configuration metadata.
Angular invokes the supplied handler method when the host element emits the

```

specified event, and updates the bound element with the result. If the handler method returns false, applies `preventDefault` on the bound element.

`@usageNotes`

The following example declares a directive that attaches a click listener to a button and counts clicks.

```

@Directive({ selector:
'button[counting]'})
class CountClicks {
  numberOfClicks = 0;
  @HostListener('click',
['$event.target'])
  onClick(btn) {
    console.log('button', btn, 'number of clicks:', this.numberOfClicks++);
  }
}
@Component({
  selector: 'app',
  template: '<button counting>Increment</button>',
})
class App {}

```

The following example registers another DOM event handler that listens for key-press events.

```

import { HostListener, Component } from '@angular/core';
@Component({
  selector: 'app',
  template: `<h1>Hello, you have pressed keys {{ counter }} number of
times!</h1> Press any key to
  increment the counter.
  <button (click)="resetCounter()">Reset
Counter</button>`
})
class AppComponent {
  counter = 0;
  @HostListener('window:keydown',
['$event'])
  handleKeyDown(event: KeyboardEvent) {
    this.counter++;
    resetCounter() {
      this.counter = 0;
    }
  }
}

```

`Imports, Exports> = NgModuleDef<T>;`

`/**`

`A wrapper around an NgModule that associates it with`

`[providers](guide/glossary#provider`

`"Definition"). Usage without a generic type is deprecated.`

`@see`

`[Deprecations](guide/deprecations#modulewithproviders-type-without-a-generic)`

`@publicApi`

`export`

`interface ModuleWithProviders<T> {`

`ngModule: Type<T>;`

`providers?: Provider[];`

`/**`

`Type of`

`the NgModule decorator / constructor function.`

`@publicApi`

`export interface NgModuleDecorator {`

`/**`

`Decorator that marks a class as an NgModule and supplies configuration metadata.`

`(obj?:`

`NgModule): TypeDecorator;`

`new(obj?: NgModule): NgModule;`

`/**`

`Type of the NgModule`

`metadata.`

`@publicApi`

`export interface NgModule {`

`/**`

`The set of injectable objects that are`

`available in the injector`

`of this module.`

`@see [Dependency Injection guide](guide/dependency-`

`injection)`

`@see [NgModule guide](guide/providers)`

`@usageNotes`

`Dependencies whose`

`providers are listed here become available for injection`

`into any component, directive, pipe or service that is a`

`child of this injector.`

`The NgModule used for bootstrapping uses the root injector, and can provide`

`dependencies`

`to any part of the app.`

`A lazy-loaded module has its own injector, typically a child of`

`the app root injector.`

`Lazy-loaded services are scoped to the lazy-loaded module's injector.`

`If a lazy-`

`loaded`

`module also provides the `UserService`, any component created`

`within that module's context (such as by`

`router navigation) gets the local instance`

`of the service, not the instance in the root injector.`

`Components`

`in external modules continue to receive the instance provided by their injectors.`

`### Example`

The following example defines a class that is injected in the HelloWorld NgModule:

```

class Greeter {
  greet(name:string) {
    return 'Hello ' + name + '!';
  }
}
@NgModule({
  providers: [Greeter]
})
class HelloWorld {
  greeter:Greeter;
  constructor(greeter:Greeter) {
    this.greeter = greeter;
  }
}
providers?: Provider[];
  
```

The set of components, directives, and pipes ([declarables](guide/glossary#declarable)) that belong to this module.

The set of selectors that are available to a template include those declared here, and those that are exported from imported NgModules. Declarables must belong to exactly one module. The compiler emits an error if you try to declare the same class in more than one module. Be careful not to declare a class that is imported from another module.

Example

The following example allows the CommonModule to use the `NgFor` directive.

```

@NgModule({
  declarations: [NgFor]
})
class CommonModule {
}
declarations?: Array<Type<any>|any[]>;
  
```

The set of NgModules whose exported [declarables](guide/glossary#declarable) are available to templates in this module.

@usageNotes

A template can use exported declarables from any imported module, including those from modules that are imported indirectly

and re-exported. For example, `ModuleA` imports `ModuleB`, and also exports it, which makes the declarables from `ModuleB` available wherever `ModuleA` is imported.

Example

The following example allows `MainModule` to use anything exported by `CommonModule`:

```

@NgModule({
  imports: [CommonModule]
})
class MainModule {
}
imports?: Array<Type<any>|ModuleWithProviders<{}>|any[]>;
  
```

The set of components, directives, and pipes declared in this NgModule that can be used in the template of any component that is part of an NgModule that imports this NgModule. Exported declarations are the module's public API.

A declarable belongs to one and only one NgModule. A module can list another module among its exports, in which case all of that module's public declaration are exported.

@usageNotes

Declarations are private by default. If this ModuleA does not export `UserComponent`, then only the components within this ModuleA can use `UserComponent`.

ModuleA can import `ModuleB` and also export it, making exports from `ModuleB` available to an NgModule that imports `ModuleA`.

Example

The following example exports the `NgFor` directive from `CommonModule`.

```

@NgModule({
  exports: [NgFor]
})
class CommonModule {
}
exports?: Array<Type<any>|any[]>;
  
```

The set of components to compile when this NgModule is defined, so that they can be dynamically loaded into the view.

For each component listed here, Angular creates a `ComponentFactory` and stores it in the `ComponentFactoryResolver`.

Angular automatically adds components in the module's bootstrap and route definitions into the `entryComponents` list.

Use this

option to add components that are bootstrapped using one of the imperative techniques, such as `ViewContainerRef.createComponent()`.

@see [Entry Components](guide/entry-components)

@deprecated Since 9.0.0. With Ivy, this property is no longer necessary.

entryComponents?: Array<Type<any>|any[]>;

The set of components that are bootstrapped when this module is bootstrapped. The components listed here are automatically added to `entryComponents`.

bootstrap?: Array<Type<any>|any[]>;

The set of schemas that declare elements to be allowed in the NgModule.

Elements and properties that are neither Angular components nor directives must be declared in a schema.

Allowed value are `NO_ERRORS_SCHEMA` and `CUSTOM_ELEMENTS_SCHEMA`.

@security When using one of `NO_ERRORS_SCHEMA` or `CUSTOM_ELEMENTS_SCHEMA` you must ensure that allowed elements and properties securely escape inputs.

schemas?: Array<SchemaMetadata|any[]>;

A name or path that uniquely identifies this NgModule in `getModuleFactory`. If left `undefined`, the NgModule is not registered with `getModuleFactory`.

id?: string;

When present, this module is ignored by the AOT compiler.

```
* It remains in distributed code, and the JIT compiler attempts to compile it\n *  
To ensure the correct behavior, the app must import `@angular/compiler`. \n * \n jit?: true; \n } \n \n /** \n *

{ @a is-stable-examples }\n * ### isStable examples and caveats\n * \n * Note two important points about `isStable`,
demonstrated in the examples below:\n * - the application will never be stable if you start any kind\n * of recurrent
asynchronous task when the application starts\n * (for example for a polling process,
started with a `setInterval`, a `setTimeout`\n * or using RxJS operators like `interval`);\n * - the `isStable`
Observable runs outside of the Angular zone.\n * \n * Let's imagine that you start a recurrent task\n * (here
incrementing a counter, using RxJS `interval`),\n * and at the same time subscribe to `isStable`.\n * \n * \n *
constructor(appRef: ApplicationRef) {\n *   appRef.isStable.pipe(\n *     filter(stable => stable)\n *   ).subscribe(()
=> console.log('App is stable now'));\n *   interval(1000).subscribe(counter => console.log(counter));\n * }\n * \n *
* In this example, `isStable` will never emit `true`,\n * and the trace `\"App is stable now\"` will never get logged.\n
*\n * If you want to execute something when the app is stable,\n * you have to wait for the application to be stable\n
* before starting your polling process.\n * \n * \n *
constructor(appRef: ApplicationRef) {\n *
appRef.isStable.pipe(\n *   first(stable => stable),\n *   tap(stable => console.log('App
is stable now')),\n *   switchMap(() => interval(1000))\n * ).subscribe(counter => console.log(counter));\n * }\n *
*\n * In this example, the trace `\"App is stable now\"` will be logged\n * and then the counter starts incrementing
every second.\n * \n * Note also that this Observable runs outside of the Angular zone,\n * which means that the
code in the subscription\n * to this Observable will not trigger the change detection.\n * \n * Let's imagine that
instead of logging the counter value,\n * you update a field of your component\n * and display it in its template.\n
*\n * \n *
constructor(appRef: ApplicationRef) {\n *   appRef.isStable.pipe(\n *     first(stable => stable),\n *
switchMap(() => interval(1000))\n * ).subscribe(counter => this.value = counter);\n * }\n * \n *
*\n * As the `isStable`
Observable runs outside the zone,\n * the `value` field will be updated properly,\n * but the template will not be
refreshed!\n * \n * You'll have to manually trigger the
change detection to update the template.\n * \n * \n *
constructor(appRef: ApplicationRef, cd:
ChangeDetectorRef) {\n *   appRef.isStable.pipe(\n *     first(stable => stable),\n *
switchMap(() =>
interval(1000))\n * ).subscribe(counter => {\n *   this.value = counter;\n *   cd.detectChanges();\n * });\n * }\n
*\n * \n * Or make the subscription callback run inside the zone.\n * \n * \n *
constructor(appRef:
ApplicationRef, zone: NgZone) {\n *   appRef.isStable.pipe(\n *     first(stable => stable),\n *
switchMap(() =>
interval(1000))\n * ).subscribe(counter => zone.run(() => this.value = counter));\n * }\n * \n *
*\n * @publicApi\n
*\n * @Injectable()\n * export class ApplicationRef {\n *   /** @internal */\n *   private _bootstrapListeners: ((compRef:

/**\n
 * Bootstrap a new component at the root level of the application.\n
 * \n
 * @usageNotes\n
 * ### Bootstrap process\n
 * \n
 * When bootstrapping a new root component into an application, Angular mounts the\n
 * specified application component onto DOM elements identified by the\n
 * componentType's\n
 * selector and kicks off automatic change detection to finish initializing the component.\n
 * \n
 * Optionally, a component can be mounted onto a DOM element that does not match the\n
 * componentType's selector.\n
 * \n
 * ### Example\n
 * { @example core/ts/platform/platform.ts region='longform' }\n
 * \n
bootstrap<C>(componentOrFactory: ComponentFactory<C>|Type<C>, rootSelectorOrNode?: string|any):\n
ComponentRef<C> {\n
  if (!this._initStatus.done) {\n
    throw new Error(\n
      'Cannot bootstrap as there are still asynchronous initializers running. Bootstrap components in the `ngDoBootstrap` method of the root module.);\n
