Rights Reserved.\n *\n * Use of this source code is governed by an MIT-style license that can be\n * found in the LICENSE file at https://angular.io/license\n */\n /**\n * Creates a token that can be used in a DI Provider.\n *\n * Use an `InjectionToken` whenever the type you are injecting is not reified (does not have a\n * runtime representation) such as when injecting an interface, callable type, array or\n * parameterized type.\n *\n * `InjectionToken` is parameterized on `T` which is the type of object which will be returned by\n * the `Injector`. This provides additional level of type safety.\n *\n * ```\n * interface MyInterface {...}\n * var myInterface = injector.get(new InjectionToken<MyInterface>('SomeToken'));\n * // myInterface is inferred to be MyInterface.\n * ```\n *\n * When creating an `InjectionToken`, you can optionally specify a factory function which returns\n * (possibly by creating) a default value of the parameterized type `T`. This sets up the\n * `InjectionToken` using this factory as a provider as if it was defined explicitly in the\n * application's root injector. If the factory function, which takes zero arguments, needs to inject\n * dependencies, it can do so using the `inject` function. See below for an example.\n *\n * Additionally, if a `factory` is specified you can also specify the `providedIn` option, which\n * overrides the above behavior and marks the token as belonging to a particular `@NgModule`. As\n * mentioned above, `'root'` is the default value for `providedIn`.\n *\n * @usageNotes\n * ### Basic Example\n *\n * ### Plain InjectionToken\n *\n * {@example core/di/ts/injector_spec.ts region='InjectionToken'}\n *\n * ### Tree-shakable InjectionToken\n *\n * {@example core/di/ts/injector_spec.ts region='ShakableInjectionToken'}\n *\n *\n * @publicApi\n */\n var InjectionToken = /** @class */ (function () {\n function InjectionToken(_desc, options) {\n this._desc = _desc;\n /** @internal */\n this.ngMetadataName = 'InjectionToken';\n this.prov = undefined;\n if (typeof options == 'number') {\n (typeof ngDevMode === 'undefined' || ngDevMode) &&\n assertLessThan(options, 0, 'Only negative numbers are supported here');\n // This is a special hack to assign __NG_ELEMENT_ID__ to this instance.\n // See `InjectorMarkers`\n this.__NG_ELEMENT_ID__ = options;\n }\n else if (options !== undefined) {\n this.prov = defineInjectable({\n token: this,\n providedIn: options.providedIn || 'root',\n factory: options.factory,\n });\n }\n }\n InjectionToken.prototype.toString = function () {\n return \"InjectionToken \" + this._desc;\n };\n return InjectionToken;\n }());\n\n /**\n * @license\n * Copyright Google LLC All Rights Reserved.\n *\n * Use of this source code is governed by an MIT-style license that can be\n * found in the LICENSE file at https://angular.io/license\n */\n /**\n * A DI token that you can use to create a virtual [provider](guide/glossary#provider)\n * that will populate the `entryComponents` field of components and NgModules\n * based on its `useValue` property value.\n * All components that are referenced in the `useValue` value (either directly\n * or in a nested array or map) are added to the `entryComponents` property.\n *\n * @usageNotes\n *\n * The following example shows how the router can populate the `entryComponents`\n * field of an NgModule based on a router configuration that refers\n * to components.\n *\n * ```typescript\n * // helper function inside the router\n * function provideRoutes(routes) {\n * return [\n * {provide: ROUTES, useValue: routes},\n * {provide: ANALYZE_FOR_ENTRY_COMPONENTS, useValue: routes, multi: true}\n * ];\n * }\n *\n * // user code\n * let routes = [\n * {path: '/root', component: RootComp},\n * {path: '/teams', component: TeamsComp}\n * ];\n *\n * @NgModule({\n * providers: [provideRoutes(routes)]\n * })\n * class ModuleWithRoutes {}\n * ```\n *\n * @publicApi\n * @deprecated Since 9.0.0. With Ivy, this property is no longer necessary.\n */\n var ANALYZE_FOR_ENTRY_COMPONENTS = new InjectionToken('AnalyzeForEntryComponents');\n /**\n * Base class for query metadata.\n *\n * @see `ContentChildren`.\n * @see `ContentChild`.\n * @see `ViewChildren`.\n * @see `ViewChild`.\n *\n * @publicApi\n */\n var Query = /** @class */ (function () {\n function Query() {\n }\n return Query;\n }());\n var 0$1 = function (selector, data) {\n if (data === void 0) { data = {}; }\n return (Object.assign({ selector: selector, first: false, isViewQuery: false, descendants: false }, data));\n };\n /**\n *

```
`template`.\n            return undefined;\n        }\n        return tData[getTStylingRangePrev(bindings)];\n    }\n    /**\n
 * Update the `TStylingKey` of the first template instruction in `TNode`.\n     *\n     * Logically `hostBindings`
styling instructions are of lower priority than that of the template.\n
 * However, they execute after the template styling instructions. This means that they get inserted\n     * in front of
the template styling instructions.\n     *\n     * If we have a template styling instruction and a new `hostBindings`
styling instruction is\n     * executed it means that it may need to steal static fields from the template instruction.
This\n     * method allows us to update the first template instruction `TStylingKey` with a new value.\n     *\n     *
Assume:\n     * ```\n     * <div my-dir style=\"color: red\" [style.color]=\"tmplExp\"></div>\n     *\n     *
@Directive({\n     *   host: {\n     *     'style': 'width: 100px',\n     *     '[style.color]': 'dirExp',\n     *   }\n     * })\n     *
class MyDir {}\n     * ```\n     *\n     * when `[style.color]=\"tmplExp\"` executes it creates this data structure.\n     *
```\n     *  ['', 'color', 'color', 'red', 'width', '100px'],\n     * ```\n     *\n     * The reason for this is that the template
instruction does not
 know if there are styling\n     * instructions and must assume that there are none and must collect all of the static
styling.\n     * (both\n     * `color' and 'width`)\n     *\n     * When `'[style.color]': 'dirExp',` executes we need to insert
a new data into the linked list.\n     * ```\n     *  ['', 'color', 'width', '100px'],  // newly inserted\n     *  ['', 'color', 'color',
'red', 'width', '100px'], // this is wrong\n     * ```\n     *\n     * Notice that the template statics is now wrong as it
incorrectly contains `width` so we need to\n     * update it like so:\n     * ```\n     *  ['', 'color', 'width', '100px'],\n     *
['', 'color', 'color', 'red'],    // UPDATE\n     * ```\n     *\n     * @param tData `TData` where the linked list is stored.\n

ngAfterContentCheck, ngAfterContentInit,\n    // ngAfterViewCheck, and ngAfterViewInit lifecycle hooks
(depending on the node\n    // flags in lifecycle). Unlike ngDoCheck, ngOnChanges and ngOnInit, which are\n    //
called during a pre-order traversal of the view tree (that is calling the\n    // parent hooks before the child hooks)
these events are sent in using a\n    // post-order traversal of the tree (children before parents). This changes the\n    //
meaning of initIndex in the view state. For ngOnInit, initIndex tracks the\n    // expected nodeIndex which a
ngOnInit should be called. When sending\n    // ngAfterContentInit and ngAfterViewInit it is the expected count
 of\n    // ngAfterContentInit or ngAfterViewInit methods that have been called. This\n    // ensure that despite being
called recursively or after picking up after an\n    // exception, the ngAfterContentInit or ngAfterViewInit will be
called on the\n    // correct nodes. Consider for example, the following (where E is an element\n    // and D is a
directive)\n    //  Tree:       pre-order index  post-order index\n    //    E1        0                6\n    //      E2      1
1\n    //       D3     2                0\n    //      E4      3                5\n    //       E5     4                4\n    //        E6    5
2\n    //        E7    6                3\n    // As can be seen, the post-order index has an unclear relationship to the\n    // pre-
order index (postOrderIndex === preOrderIndex - parentCount +\n    // childCount). Since number of calls to
ngAfterContentInit and ngAfterViewInit\n    // are stable (will be the same for the same view regardless
 of exceptions or\n    // recursion) we just need to count them which will roughly correspond to the\n    // post-order
index (it skips elements and directives that do not have\n    // lifecycle hooks).\n    //\n    // For example, if an
exception is raised in the E6.onAfterViewInit() the\n    // initIndex is left at 3 (by shouldCallLifecycleInitHook()
which set it to\n    // initIndex + 1). When checkAndUpdateView() is called again D3, E2 and E6 will\n    // not have
their ngAfterViewInit() called but, starting with E7, the rest of\n    // the view will begin getting ngAfterViewInit()
called until a check and\n    // pass is complete.\n    //\n    // This algorthim also handles recursion. Consider if E4's
ngAfterViewInit()\n    // indirectly calls E1's ChangeDetectorRef.detectChanges(). The expected\n    // initIndex is
set to 6, the recusive checkAndUpdateView() starts walk again.\n    // D3, E2, E6, E7, E5 and E4 are skipped,
ngAfterViewInit() is called on E1.\n    // When the
 recursion returns the initIndex will be 7 so E1 is skipped as it\n    // has already been called in the recursively called
checkAnUpdateView().\n    function callLifecycleHooksChildrenFirst(view, lifecycles) {\n        if

The tail allows us to quickly add a new state to the end of the view list\n * without having to propagate starting from the first child.\n */\n [CHILD_TAIL]: LView|LContainer|null;\n\n /**\n * View where this view's template was declared.\n *\n * The template for a dynamically created view may be declared in a different view than\n * it is inserted. We already track the \"insertion view\" (view where the template was\n * inserted) in LView[PARENT], but we also need access to the \"declaration view\"\n * (view where the template was declared). Otherwise, we wouldn't be able to call the\n * view's template function with the proper contexts. Context should be inherited from\n * the declaration view tree, not the insertion view tree.\n *\n * Example (AppComponent template):\n *\n * <ng-template #foo></ng-template> <-- declared here -->\n * <some-comp [tpl]=\"foo\"></some-comp> <-- inserted inside this component -->\n *\n * The <ng-template> above is declared in the AppComponent template, but it will be passed into\n * SomeComp and inserted there. In this case, the declaration view would be the AppComponent,\n * but the insertion view would be SomeComp. When we are removing views, we would want to\n * traverse through the insertion view to clean up listeners. When we are calling the\n * template function during change detection, we need the declaration view to get inherited\n * context.\n */\n [DECLARATION_VIEW]: LView|null;\n\n\n /**\n * Points to the declaration component view, used to track transplanted `LView`s.\n *\n * See: `DECLARATION_VIEW` which points to the actual `LView` where it was declared, whereas\n * `DECLARATION_COMPONENT_VIEW` points to the component which may not be same as\n * `DECLARATION_VIEW`.\n *\n * Example:\n * ```\n * <#VIEW #myComp>\n * <div *ngIf=\"true\">\n * <ng-template #myTmpl>...</ng-template>\n * </div>\n * </#VIEW>\n * ```\n * In the above case `DECLARATION_VIEW` for `myTmpl` points to the `LView` of `ngIf` whereas\n * `DECLARATION_COMPONENT_VIEW` points to `LView` of the `myComp` which owns the template.\n *\n * The reason for this is that all embedded views are always check-always whereas the component\n * view can be check-always or on-push. When we have a transplanted view it is important to\n * determine if we have transplanted a view from check-always declaration to on-push insertion\n * point. In such a case the transplanted view needs to be added to the `LContainer` in the\n * declared `LView` and CD during the declared view CD (in addition to the CD at the insertion\n * point.) (Any transplanted views which are intra Component are of no interest because the CD\n * strategy of declaration and insertion will always be the same, because it is the same\n * component.)\n *\n * Queries already track moved views in `LView[DECLARATION_LCONTAINER]` and\n * `LContainer[MOVED_VIEWS]`. However the queries also track `LView`s which moved within the same\n * component `LView`. Transplanted views are a subset of moved views, and we use\n * `DECLARATION_COMPONENT_VIEW` to differentiate them. As in this example.\n *\n * Example showing intra component `LView` movement.\n * ```\n * <#VIEW #myComp>\n * <div *ngIf=\"condition; then thenBlock else elseBlock\"></div>\n * <ng-template #thenBlock>Content to render when condition is true.</ng-template>\n * <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n * </#VIEW>\n * ```\n * The `thenBlock` and `elseBlock` is moved but not transplanted.\n *\n * Example showing inter component `LView` movement (transplanted view).\n * ```\n * <#VIEW #myComp>\n * <ng-template #myTmpl>...</ng-template>\n * <insertion-component [template]=\"myTmpl\"></insertion-component>\n * </#VIEW>\n * ```\n * In the above example `myTmpl` is passed into a different component. If `insertion-component`\n * instantiates `myTmpl` and `insertion-component` is on-push then the `LContainer` needs to be\n * marked as containing transplanted views and those views need to be CD as part of the\n * declaration CD.\n *\n *\n * When change detection runs, it iterates over `[MOVED_VIEWS]` and CDs any child `LView`s where\n

* the `DECLARATION_COMPONENT_VIEW` of the current component and the child `LView` does not match\n * (it has been transplanted across components.)\n *\n * Note: `[DECLARATION_COMPONENT_VIEW]` points to itself if the LView is a component view (the\n * simplest / most common case).\n *\n * see also:\n * - https://hackmd.io/@mhevery/rJUJsvv9H write up of the problem\n * - `LContainer[HAS_TRANSPLANTED_VIEWS]` which marks which `LContainer` has transplanted views.\n * - `LContainer[TRANSPLANT_HEAD]` and `LContainer[TRANSPLANT_TAIL]`

storage for transplanted\n * - `LView[DECLARATION_LCONTAINER]` similar problem for queries\n * - `LContainer[MOVED_VIEWS]` similar problem for queries\n */\n [DECLARATION_COMPONENT_VIEW]: LView;\n\n /**\n * A declaration point of embedded views (ones instantiated based on the content of a\n * <ng-template>), null for other types of views.\n *\n * We need to track all embedded views created from a given declaration

new text nodes as a child of this `TNode`. In\n * such a case the value stores an array of text nodes to insert.\n *\n * Example:\n * ```\n * <div i18n>\n * Hello <span>World</span>!\n * </div>\n * ```\n * In the above example the `i18nStart` instruction can create `Hello `, `World` and `!` text\n * nodes. It can also insert `Hello ` and `!` text node as a child of `<div>`, but it can't\n * insert `World` because the `<span>` node has not yet been created. In such a case the\n * `<span>` `TNode` will have an array which will direct the `<span>` to not only insert\n * itself in front of `!` but also to insert the `World` (created by `i18nStart`) into\n * `<span>` itself.\n *\n * Pseudo code:\n * ```\n * if (insertBeforeIndex === null) {\n * // append as normal\n * } else if (Array.isArray(insertBeforeIndex)) {\n * // First insert current `TNode` at correct location\n * const currentNode = lView[this.index];\n *
parentNode.insertBefore(currentNode, lView[this.insertBeforeIndex[0]]);\n * // Now append all of the children\n * for(let i=1; i<this.insertBeforeIndex; i++) {\n * currentNode.appendChild(lView[this.insertBeforeIndex[i]]);\n * }\n * } else {\n * parentNode.insertBefore(lView[this.index], lView[this.insertBeforeIndex])\n * }\n * ```\n * - null: Append as normal using `parentNode.appendChild`\n * - `number`: Append using\n * `parentNode.insertBefore(lView[this.index], lView[this.insertBeforeIndex])`\n *\n * *Initialization*\n *\n * Because `i18nStart` executes before nodes are created, on `TView.firstCreatePass` it is not\n * possible for `i18nStart` to set the `insertBeforeIndex` value as the corresponding `TNode`\n * has not yet been created. For this

reason the `i18nStart` creates a `TNodeType.Placeholder`\n * `TNode` at that location. See `TNodeType.Placeholder` for more information.\n */\n insertBeforeIndex: InsertBeforeIndex;\n\n /**\n * The index of the closest injector in this node's LView.\n *\n * If the index === -1, there is no injector on this node or any ancestor node in this view.\n *\n * If the index !== -1, it is the index of this node's injector OR the index of a parent\n * injector in the same view. This happens when `styleProp`/`classProp` instruction\n *   is combined with directive which shadows its input `@Input('class')`. That way the binding\n *   should not participate in the styling resolution.\n */\nexport type TStylingKeyPrimitive = string|null|false;\n\n\n/**\n * Store the static values for the styling binding.\n *\n * The `TStylingStatic` is just `KeyValueArray` where key `\"\"` (stored at location 0) contains the\n * `TStylingKey` (stored at location 1). In other words this wraps the `TStylingKey` such that the\n * `\"\"` contains the wrapped value.\n *\n * When instructions
are resolving styling they may need to look forward or backwards in the linked\n * list to resolve the value. For this reason we have to make sure that he linked list also contains\n * the static values. However the list only has space for one item per styling instruction. For this\n * reason we store the static values here as part of the `TStylingKey`. This means that the\n * resolution function when looking for a value needs to first look at the binding value, and than\n * at `TStylingKey` (if it exists).\n *\n * Imagine we have:\n *\n * ```\n * <div class=\"TEMPLATE\" my-

dir>\n *\n * @Directive({\n *   host: {\n *     class: 'DIR',\n *     '[class.dynamic]': 'exp' // classProp('dynamic', ctx.exp);\n *   }\n * })\n * ```\n *\n * In the above case the linked list will contain one item:\n *\n * ```\n *   // assume binding location: 10 for `classProp('dynamic', ctx.exp);`\n *   tData[10] = <TStylingStatic>[\n *     '': 'dynamic', // This is the wrapped value of `TStylingKey`\n
 *     'DIR': true,   // This is the default static value of directive binding.\n *   ];\n *   tData[10 + 1] = 0; // We don't have prev/next.\n *\n *   lView[10] = undefined;     // assume `ctx.exp` is `undefined`\n *   lView[10 + 1] = undefined; // Just normalized `lView[10]`\n * ```\n *\n * So when the function is resolving styling value, it first needs to look into the linked list\n * (there is none) and than into the static `TStylingStatic` too see if there is a default value for\n * `dynamic` (there is not). Therefore it is safe to remove it.\n *\n * If setting `true` case:\n * ```\n *   lView[10] = true;     // assume `ctx.exp` is `true`\n *   lView[10 + 1] = true; // Just normalized `lView[10]`\n * ```\n * So when the function is resolving styling value, it first needs to look into the linked list\n * (there is none) and than into `TNode.residualClass` (TNode.residualStyle) which contains\n * ```\n *   tNode.residualClass = [\n *     'TEMPLATE': true,\n *   ];\n * ```\n *\n *
 This means that it is safe to add class.\n */\nexport interface TStylingStatic extends KeyValueArray<any> {}\n\n/**\n * This is a branded number which contains previous and next index.\n *\n * When we come across styling instructions we need to store the `TStylingKey` in the correct\n * order so that we can re-concatenate the styling value in the desired priority.\n *\n * The insertion can happen either at the:\n * - end of template as in the case of coming across additional styling instruction in the template\n * - in front of the template in the case of coming across additional instruction in the\n *   `hostBindings`.\n *\n * We use `TStylingRange` to store the previous and next index into the `TData` where the template\n * bindings can be found.\n *\n * - bit 0 is used to mark that the previous index has a duplicate for current value.\n * - bit 1 is used to mark that the next index has a duplicate for the current value.\n * - bits 2-16 are used to encode the next/tail of the template.\n
 * - bits 17-32 are used to encode the previous/head of template.\n *\n * NODE: *duplicate* false implies that it is statically known that this binding will not collide\n * with other bindings and therefore there is no need to check other bindings.
