The goal is to allow users to avoid the\n most obvious pitfalls and do so without compromising performance significantly.\n For ShadowDOM styling that's not covered here, a set of best practices\n can be provided that should allow users to accomplish more complex styling.\n\n The following is a list of specific ShadowDOM styling features and a brief\n discussion of the approach used to shim.\n\n Shimmed features:\n\n * :host, :host-context: ShadowDOM allows styling of the shadowRoot's host\n element using the :host rule. To shim this feature, the :host styles are\n reformatted and prefixed with a given scope name and promoted to a\n document level stylesheet.\n For example, given a scope name of .foo, a rule like this:\n\n :host {\n background: red;\n }\n }\n\n becomes:\n\n .foo {\n background: red;\n }\n\n * encapsulation: Styles defined within ShadowDOM, apply only to\n dom inside the ShadowDOM. Polymer uses one of two techniques to implement\n this feature.\n\n By default, rules are prefixed with the host element tag name\n as a descendant selector. This ensures styling does not leak out of the 'top'\n of the element's ShadowDOM. For example,\n\n div {\n font-weight: bold;\n }\n\n becomes:\n\n x-foo div {\n font-weight: bold;\n }\n\n becomes:\n\n\n Alternatively, if WebComponents.ShadowCSS.strictStyling is set to true then\n selectors are scoped by adding an attribute selector suffix to each\n simple selector that contains the host element tag name. Each element\n in the element's ShadowDOM template is also given the scope attribute.\n Thus, these rules match only elements that have the scope attribute.\n For example, given a scope name of x-foo, a rule like this:\n\n div {\n font-weight: bold;\n }\n\n becomes:\n\n div[x-foo] {\n font-weight: bold;\n }\n\n Note that elements that are dynamically added to a scope must have the scope\n selector added to them manually.\n\n * upper/lower bound encapsulation: Styles which are defined

```
 outside a\n      shadowRoot should not cross the ShadowDOM boundary and should not apply\n      inside a shadowRoot.\n\n      This styling behavior is not emulated. Some possible ways to do this that\n      were rejected due to complexity and/or performance concerns include: (1) reset\n      every possible property for every possible selector for a given scope name;\n      (2) re-implement css in javascript.\n\n      As an alternative, users should make sure to use selectors\n      specific to the scope in which they are working.\n\n      * ::distributed: This behavior is not emulated. It's often not necessary\n      to style the contents of a specific insertion point and instead, descendants\n      of the host element can be styled selectively. Users can also create an\n      extra node around an insertion point and style that node's contents\n      via descendent selectors. For example, with a shadowRoot like this:\n\n      <style>\n        ::content(div) {\n          background:
 red;\n        }\n      </style>\n      <content></content>\n\n      could become:\n\n      <style>\n        / *@polyfill .content-container div * /\n        ::content(div) {\n          background: red;\n        }\n      </style>\n      <div class=\"content-container\">\n        <content></content>\n      </div>\n\n      Note the use of @polyfill in the comment above a ShadowDOM specific style\n      declaration. This is a directive to the styling shim to use the selector\n      in comments in lieu of the next selector when running under polyfill.\n    */\n    var ShadowCss = /**\n    @class */ (function () {\n        function ShadowCss() {\n            this.strictStyling = true;\n        }\n        /*\n        * Shim some cssText with the given selector.
