Defaults to the injector of the current view container.\n *\n * * `ngComponentOutletContent`:

```
 Optional list of projectable nodes to insert into the content\n     * section of the component, if exists.\n     *\n     * * `ngComponentOutletNgModuleFactory`: Optional module factory to allow dynamically loading other\n     * module, then load a component from that module.\n     *\n     * ### Syntax\n     *\n     * Simple\n     * ```\n     * <ng-container *ngComponentOutlet=\"componentTypeExpression\"></ng-container>\n     * ```\n     *\n     * Customized injector/content\n     * ```\n     * <ng-container *ngComponentOutlet=\"componentTypeExpression;\n     *                 injector: injectorExpression;\n     *                 content: contentNodesExpression;\">\n     * </ng-container>\n     * ```\n     *\n     * Customized ngModuleFactory\n     * ```\n     * <ng-container *ngComponentOutlet=\"componentTypeExpression;\n     *                 ngModuleFactory: moduleFactory;\">\n     * </ng-container>\n
     * ```\n     *\n     * ### A simple example\n     *\n     * {@example common/ngComponentOutlet/ts/module.ts region='SimpleExample'}\n     *\n     * A more complete example with additional options:\n     *\n     * {@example common/ngComponentOutlet/ts/module.ts region='CompleteExample'}\n     *\n     * @publicApi\n     * @ngModule CommonModule\n     */\n    var NgComponentOutlet = /** @class */ (function () {\n        function NgComponentOutlet(_viewContainerRef) {\n            this._viewContainerRef = _viewContainerRef;\n            this._componentRef = null;\n            this._moduleRef = null;\n        }\n        NgComponentOutlet.prototype.ngOnChanges = function (changes) {\n            this._viewContainerRef.clear();\n            this._componentRef = null;\n            if (this.ngComponentOutlet) {\n                var elInjector = this.ngComponentOutletInjector || this._viewContainerRef.parentInjector;\n                if (changes['ngComponentOutletNgModuleFactory']) {\n                    if (this._moduleRef)\n                        this._moduleRef.destroy();\n                    if (this.ngComponentOutletNgModuleFactory) {\n                        var parentModule = elInjector.get(i0.NgModuleRef);\n                        this._moduleRef = this.ngComponentOutletNgModuleFactory.create(parentModule.injector);\n                    }\n                    else {\n                        this._moduleRef = null;\n                    }\n                }\n                var componentFactoryResolver = this._moduleRef ? this._moduleRef.componentFactoryResolver :\n                    elInjector.get(i0.ComponentFactoryResolver);\n                var componentFactory = componentFactoryResolver.resolveComponentFactory(this.ngComponentOutlet);\n                this._componentRef = this._viewContainerRef.createComponent(componentFactory, this._viewContainerRef.length, elInjector, this.ngComponentOutletContent);\n            }\n        };\n        NgComponentOutlet.prototype.ngOnDestroy = function () {\n            if (this._moduleRef)\n                this._moduleRef.destroy();\n        };\n        return NgComponentOutlet;\n    }());\n    NgComponentOutlet.decorators = [\n        { type: i0.Directive, args: [{ selector: '[ngComponentOutlet]' },] }\n    ];\n    NgComponentOutlet.ctorParameters = function () { return [\n        { type: i0.ViewContainerRef }\n    ]; };\n    NgComponentOutlet.propDecorators = {\n        ngComponentOutlet: [{ type: i0.Input }],\n        ngComponentOutletInjector: [{ type: i0.Input }],\n        ngComponentOutletContent: [{ type: i0.Input }],\n        ngComponentOutletNgModuleFactory: [{ type: i0.Input }]\n    };\n\n    /**\n     * @license\n     * Copyright Google LLC All Rights Reserved.\n     *\n     * Use of this source code is governed by an MIT-style license that can be\n     * found in the LICENSE file at https://angular.io/license\n     */\n    /**\n     * @publicApi\n     */\n    var NgForOfContext = /** @class */ (function () {\n        function NgForOfContext($implicit, ngForOf, index, count) {\n            this.$implicit = $implicit;\n            this.ngForOf = ngForOf;\n            this.index = index;\n            this.count = count;\n        }\n        Object.defineProperty(NgForOfContext.prototype, \"first\", {\n            get: function () {\n                return this.index === 0;\n            },\n            enumerable: false,\n            configurable: true\n        });\n        Object.defineProperty(NgForOfContext.prototype, \"last\", {\n            get: function () {\n                return this.index === this.count - 1;\n            },\n            enumerable: false,\n            configurable: true\n        });\n        Object.defineProperty(NgForOfContext.prototype, \"even\", {\n            get: function () {\n                return this.index % 2 === 0;\n            },\n            enumerable: false,\n            configurable: true\n        });\n        Object.defineProperty(NgForOfContext.prototype,
```

```
\"odd\", {\n            get: function () {\n                return !this.even;\n            },\n            enumerable: false,\n
configurable: true\n        });\n        return NgForOfContext;\n    }());\n    /**\n     * A [structural
directive](guide/structural-directives) that renders\n     * a template for each item in a collection.\n     * The directive
is placed on an element, which becomes the parent\n     * of the cloned templates.\n     *\n     * The `ngForOf`
directive is generally used in the\n     * [shorthand form](guide/structural-directives#the-asterisk--prefix) `*ngFor`.\n
   * In this form, the template to be rendered for each iteration is the content\n     * of an anchor element containing
the directive.\n     *\n     * The following example shows the shorthand syntax with some options,\n     * contained in
an `<li>` element.\n     *\n     * ```\n     * <li *ngFor=\"let item of items; index as i; trackBy: trackByFn\">...</li>\n
* ```\n
     *\n     * The shorthand form expands into a long form that uses the `ngForOf` selector\n     * on an `<ng-
template>` element.\n     * The content of the `<ng-template>` element is the `<li>` element that held the\n     *
short-form directive.\n     *\n     * Here is the expanded version of the short-form example.\n     *\n     * ```\n     *
<ng-template ngFor let-item [ngForOf]=\"items\" let-i=\"index\" [ngForTrackBy]=\"trackByFn\">\n     *
<li>...</li>\n     * </ng-template>\n     * ```\n     *\n     * Angular automatically expands the shorthand syntax as it
compiles the template.\n     * The context for each embedded view is logically merged to the current component\n
* context according to its lexical position.\n     *\n     * When using the shorthand syntax, Angular allows only [one
structural directive\n     * on an element](guide/structural-directives#one-structural-directive-per-host-element).\n
* If you want to iterate conditionally, for example,\n     * put the
 `*ngIf` on a container element that wraps the `*ngFor` element.\n     * For futher discussion, see\n     * [Structural
Directives](guide/structural-directives#one-per-element).\n     *\n     * @usageNotes\n     *\n     * ### Local
variables\n     *\n     * `NgForOf` provides exported values that can be aliased to local variables.\n     * For
example:\n     *\n     * ```\n     * <li *ngFor=\"let user of users; index as i; first as isFirst\">\n     *
{{i}}/{{users.length}}. {{user}} <span *ngIf=\"isFirst\">default</span>\n     * </li>\n     * ```\n     *\n     * The
following exported values can be aliased to local variables:\n     *\n     * - `$implicit: T`: The value of the individual
items in the iterable (`ngForOf`).\n     * - `ngForOf: NgIterable<T>`: The value of the iterable expression. Useful
when the expression is\n     * more complex then a property access, for example when using the async pipe
(`userStreams |\n     * async`).\n     * - `index: number`: The index of the current
 item in the iterable.\n     * - `count: number`: The length of the iterable.\n     * - `first: boolean`: True when the item
is the first item in the iterable.\n     * - `last: boolean`: True when the item is the last item in the iterable.\n     * -
`even: boolean`: True when the item has an even index in the iterable.\n     * - `odd: boolean`: True when the item
has an odd index in the iterable.\n     *\n     * ### Change propagation\n     *\n     * When the contents of the iterator
changes, `NgForOf` makes the corresponding changes to the DOM:\n     *\n     * * When an item is added, a new
instance of the template is added to the DOM.\n     * * When an item is removed, its template instance is removed
from the DOM.\n     * * When items are reordered, their respective templates are reordered in the DOM.\n     *\n     *
Angular uses object identity to track insertions and deletions within the iterator and reproduce\n     * those changes
in the DOM. This has important implications
 for animations and any stateful\n     * controls that are present, such as `<input>` elements that accept user input.
Inserted rows can\n     * be animated in, deleted rows can be animated out, and unchanged rows retain any unsaved
state\n     * such as user input.\n     * For more on animations, see [Transitions and Triggers](guide/transition-and-
triggers).\n     *\n     * The identities of elements in the iterator can change while the data does not.\n     * This can
happen, for example, if the iterator is produced from an RPC to the server, and that\n     * RPC is re-run. Even if the
data hasn't changed, the second response produces objects with\n     * different identities, and Angular must tear
down the entire DOM and rebuild it (as if all old\n     * elements were deleted and all new elements inserted).\n
*\n     * To avoid this expensive operation, you can customize the default tracking algorithm.\n     * by supplying the
`trackBy` option to `NgForOf`.\n     * `trackBy` takes
 a function that has two arguments: `index` and `item`.\n     * If `trackBy` is given, Angular tracks changes by the
return value of the function.\n     *\n     * @see [Structural Directives](guide/structural-directives)\n     *

*/\n    /**\n     * A structural directive that conditionally includes a template based on the value of\n     * an
expression coerced to Boolean.\n     * When the expression evaluates to true, Angular renders the template\n     *
provided in a `then` clause, and when  false or null,\n     * Angular renders the template provided in an optional
`else` clause. The default\n     * template for the `else` clause is blank.\n     *\n     * A [shorthand
form](guide/structural-directives#the-asterisk--prefix) of the directive,\n     * `*ngIf=\"condition\"`, is generally
used, provided\n     * as an attribute of the anchor element for the
 inserted template.\n     * Angular expands this into a more explicit version, in which the anchor element\n     * is
contained in an `<ng-template>` element.\n     *\n     * Simple form with shorthand syntax:\n     *\n     * ```\n     *
<div *ngIf=\"condition\">Content to render when condition is true.</div>\n     * ```\n     *\n     * Simple form with
expanded syntax:\n     *\n     * ```\n     * <ng-template [ngIf]=\"condition\"><div>Content to render when condition
is\n     * true.</div></ng-template>\n     * ```\n     *\n     * Form with an \"else\" block:\n     *\n     * ```\n     * <div
*ngIf=\"condition; else elseBlock\">Content to render when condition is true.</div>\n     * <ng-template
#elseBlock>Content to render when condition is false.</ng-template>\n     * ```\n     *\n     * Shorthand form with
\"then\" and \"else\" blocks:\n     *\n     * ```\n     * <div *ngIf=\"condition; then thenBlock else elseBlock\"></div>\n
   * <ng-template #thenBlock>Content to render when condition
 is true.</ng-template>\n     * <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n
 * ```\n     *\n     * Form with storing the value locally:\n     *\n     * ```\n     * <div *ngIf=\"condition as value; else
elseBlock\">{{value}}</div>\n     * <ng-template #elseBlock>Content to render when value is null.</ng-
template>\n     * ```\n     *\n     * @usageNotes\n     *\n     * The `*ngIf` directive is most commonly used to
conditionally show an inline template,\n     * as seen in the following  example.\n     * The default `else` template is
blank.\n     *\n     * {@example common/ngIf/ts/module.ts region='NgIfSimple'}\n     *\n     * ### Showing an
alternative template using `else`\n     *\n     * To display a template when `expression` evaluates to false, use an
`else` template\n     * binding as shown in the following example.\n     * The `else` binding points to an `<ng-
template>`  element labeled `#elseBlock`.\n     * The template can be defined
 anywhere in the component view, but is typically placed right after\n     * `ngIf` for readability.\n     *\n     *
{@example common/ngIf/ts/module.ts region='NgIfElse'}\n     *\n     * ### Using an external `then` template\n
*\n     * In the previous example, the then-clause template is specified inline, as the content of the\n     * tag that
```

contains the `ngIf` directive. You can also specify a template that is defined\n * externally, by referencing a labeled `<ng-template>` element. When you do this, you can\n * change which template to use at runtime, as shown in the following example.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfThenElse'}\n *\n * ### Storing a conditional result in a variable\n *\n * You might want to show a set of properties from the same object. If you are waiting\n * for asynchronous data, the object can be undefined.\n * In this case, you can use `ngIf` and store the result of the condition in a local\n

* variable as shown in the the following example.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfAs'}\n *\n * This code uses only one `AsyncPipe`, so only one subscription is created.\n * The conditional statement stores the result of `userStream|async` in the local variable `user`.\n * You can then bind the local `user` repeatedly.\n *\n * The conditional displays the data only if `userStream` returns a value,\n * so you don't need to use the\n * safe-navigation-operator (`?.`)\n * to guard against null values when accessing properties.\n * You can display an alternative template while waiting for the data.\n *\n * ### Shorthand syntax\n *\n * The shorthand syntax `*ngIf` expands into two separate template specifications\n * for the \"then\" and \"else\" clauses. For example, consider the following shorthand statement,\n * that is meant to show a loading page while waiting for data to be loaded.\n

*\n * ```\n * <div class=\"hero-list\" *ngIf=\"heroes else loading\">\n * ...\n * </div>\n *\n * <ng-template #loading>\n * <div>Loading...</div>\n * </ng-template>\n * ```\n *\n * You can see that the \"else\" clause references the `<ng-template>`\n * with the `#loading` label, and the template for the \"then\" clause\n * is provided as the content of the anchor element.\n *\n * However, when Angular expands the shorthand syntax, it creates\n * another `<ng-template>` tag, with `ngIf` and `ngIfElse` directives.\n * The anchor element containing the template for the \"then\" clause becomes\n * the content of this unlabeled `<ng-template>` tag.\n *\n * ```\n * <ng-template [ngIf]=\"heroes\" [ngIfElse]=\"loading\">\n * <div class=\"hero-list\">\n * ...\n * \n * </ng-template>\n *\n * <ng-template #loading>\n * Loading... \n * </ng-template>\n *

```\n *\n * The presence of the implicit template object has implications for the nesting of\n * structural directives. For more on this subject, see\n * [Structural Directives](https://angular.io/guide/structural-directives#one-per-element).\n *\n * @ngModule CommonModule\n * @publicApi\n */\n var NgIf = /** @class */ (function () {\n function NgIf(_viewContainer, templateRef) {\n this._viewContainer = _viewContainer;\n this._context = new NgIfContext();\n this._thenTemplateRef = null;\n this._elseTemplateRef = null;\n this._thenViewRef = null;\n this._elseViewRef = null;\n this._thenTemplateRef = templateRef;\n }\n Object.defineProperty(NgIf.prototype, \"ngIf\", {\n /**\n * The Boolean expression to evaluate as the condition for showing a template.\n */\n set: function (condition) {\n this._context.$implicit

|\n *\n * Note that timezone correction is not applied to an ISO string that has no time
component, such as \"2016-09-19\"\n *\n * ### Format examples\n *\n * These examples transform a date
into various formats,\n * assuming that `dateObj` is a JavaScript `Date` object for\n * year: 2015, month: 6,
day: 15, hour: 21, minute: 43, second: 11,\n
* given in the local time for the `en-US` locale.\n *\n * ```\n * {{ dateObj | date }} // output is
'Jun 15, 2015'\n * {{ dateObj | date:'medium' }} // output is 'Jun 15, 2015, 9:43:11 PM'\n * {{ dateObj |
date:'shortTime' }} // output is '9:43 PM'\n * {{ dateObj | date:'mm:ss' }} // output is '43:11'\n * ```\n *\n
* ### Usage example\n *\n * The following component uses a date pipe to display the current date in
different formats.\n *\n * ```\n * @Component({\n * selector: 'date-pipe',\n * template: ` \n *
Today is {{today | date}} \n * Or if you prefer, {{today | date:'fullDate'}} \n * The time
is {{today | date:'h:mm a z'}} \n * `\n * })\n * // Get the current date and time as a date-time
value.\n * export class DatePipeComponent {\n * today: number = Date.now();\n * }\n * ```\n *\n *

Host View into current View.\n * `NgComponentOutlet` provides a declarative approach for dynamic component
creation.\n *\n * `NgComponentOutlet` requires a component type, if a falsy value is set the view will clear and\n *
any existing component will get destroyed.\n *\n * @usageNotes\n *\n * ### Fine tune control\n *\n * You can
control the component creation process by using the following optional attributes:\n *\n * *
`ngComponentOutletInjector`: Optional custom {@link Injector} that will be used as parent for\n * the Component.
Defaults to the injector of the current
view container.\n *\n * * `ngComponentOutletContent`: Optional list of projectable nodes to insert into the
content\n * section of the component, if exists.\n *\n * * `ngComponentOutletNgModuleFactory`: Optional module
factory to allow dynamically loading other\n * module, then load a component from that module.\n *\n * ###
Syntax\n *\n * Simple\n * ```\n * <ng-container *ngComponentOutlet=\"componentTypeExpression\"></ng-
container>\n * ```\n *\n * Customized injector/content\n * ```\n * <ng-container
*ngComponentOutlet=\"componentTypeExpression;\n * injector: injectorExpression;\n *
content: contentNodesExpression;\">\n * </ng-container>\n * ```\n *\n * Customized
ngModuleFactory\n * ```\n * <ng-container *ngComponentOutlet=\"componentTypeExpression;\n *
ngModuleFactory: moduleFactory;\">\n * </ng-container>\n * ```\n *\n * ### A simple example\n *\n *
{@example common/ngComponentOutlet/ts/module.ts
region='SimpleExample'}\n *\n * A more complete example with additional options:\n *\n * {@example
common/ngComponentOutlet/ts/module.ts region='CompleteExample'}\n *\n * @publicApi\n * @ngModule

Useful when the expression is\n * more complex then a property access, for example when using the async pipe (`userStreams |\n * async`).\n * - `index: number`: The index of the current item in the iterable.\n * - `count: number`: The length of the iterable.\n * - `first: boolean`: True when the item is the first item in the iterable.\n * - `last: boolean`: True when the item is the last item in the iterable.\n * - `even: boolean`: True when the item has an even index in the iterable.\n * - `odd: boolean`: True when the item has an odd index in the iterable.\n *\n * ### Change propagation\n *\n * When the contents of the iterator changes,

`NgForOf` makes the corresponding changes to the DOM:\n *\n * * When an item is added, a new instance of the template is added to the DOM.\n * * When an item is removed, its template instance is removed from the DOM.\n * * When items are reordered, their respective templates are reordered in the DOM.\n *\n * Angular uses object identity to track insertions and deletions within the iterator and reproduce\n * those changes in the DOM. This has important implications for animations and any stateful\n * controls that are present, such as `<input>` elements that accept user input. Inserted rows can\n * be animated in, deleted rows can be animated out, and unchanged rows retain any unsaved state\n * such as user input.\n * For more on animations, see [Transitions and Triggers](guide/transition-and-triggers).\n *\n * The identities of elements in the iterator can change while the data does not.\n * This can happen, for example, if the iterator is produced from an RPC to the server, and that\n * RPC is re-run. Even if the data hasn't changed, the second response produces objects with\n * different identities, and Angular must tear down the entire DOM and rebuild it (as if all old\n * elements were deleted and all new elements inserted).\n *\n * To avoid this expensive operation, you can customize the default tracking algorithm.\n * by supplying the `trackBy` option to `NgForOf`.\n * `trackBy` takes a function that has two arguments: `index` and `item`.\n * If `trackBy` is given, Angular tracks changes by the return value of the function.\n *\n * @see [Structural Directives](guide/structural-directives)\n * @ngModule CommonModule\n * @publicApi\n */\n@Directive({selector: '[ngFor][ngForOf]'})\nexport class NgForOf<T, U extends NgIterable<T> = NgIterable<T>> implements DoCheck {\n  /**\n   * The value of the iterable expression, which can be used as a\n   * [template input variable](guide/structural-directives#template-input-variable).\n   */\n  @Input()\n  set ngForOf(ngForOf: U&NgIterable<T>|undefined|null) {\n    this._ngForOf = ngForOf;\n    this._ngForOfDirty = true;\n  }\n  /**\n   * A function that defines how to track changes for items in the iterable.\n   *\n   * When items are added, moved, or removed in the iterable,\n   * the directive must re-render the appropriate DOM nodes.\n   * To minimize churn in the DOM, only nodes that have changed\n   * are re-rendered.\n   *\n   * By default, the change detector assumes that\n   * the object instance identifies the node in the iterable.\n   * When this function is supplied, the directive uses\n   * the result of calling this function to identify the item node,\n   * rather than the identity of the object itself.\n   *\n   * The function receives two inputs,\n   * the iteration index and the associated node data.\n   */\n  @Input()\n  set ngForTrackBy(fn: TrackByFunction<T>) {\n    if ((typeof ngDevMode === 'undefined' || ngDevMode) && fn != null && typeof fn !== 'function') {\n      // TODO(vicb): use a log service once there is a public one available\n      if (<any>console && <any>console.warn) {\n        console.warn(\n            `trackBy must be a function, but received ${JSON.stringify(fn)}. ` +\n            `See https://angular.io/api/common/NgForOf#change-propagation for more information.`);\n      }\n    }\n    this._trackByFn = fn;\n  }\n\n  get ngForTrackBy(): TrackByFunction<T> {\n    return this._trackByFn;\n  }\n\n  private _ngForOf: U|undefined|null = null;\n  private _ngForOfDirty: boolean = true;\n  private _differ: IterableDiffer<T>|null = null;\n  // TODO(issue/24571): remove '!'.\n  private _trackByFn!: TrackByFunction<T>;\n\n  constructor(\n      private _viewContainer: ViewContainerRef,\n      private _template: TemplateRef<NgForOfContext<T, U>>, private _differs: IterableDiffers) {}\n\n  /**\n   * A reference to the template that is stamped out for each item in the iterable.\n   * @see [template reference variable](guide/template-reference-variables)\n   */\n  @Input()\n  set ngForTemplate(value: TemplateRef<NgForOfContext<T, U>>) {\n    // TODO(TS2.1): make TemplateRef<Partial<NgForRowOf<T>>> once we move to TS v2.1\n    // The current type is too restrictive; a template that just uses index, for example,\n    // should be acceptable.\n    if (value) {\n      this._template = value;\n    }\n  }\n\n  /**\n   * Applies the changes when needed.\n   */\n  ngDoCheck(): void {\n    if (this._ngForOfDirty) {\n      this._ngForOfDirty = false;\n      // React on ngForOf changes only once all inputs have been initialized\n      const value = this._ngForOf;\n      if (!this._differ && value) {\n        try {\n          this._differ = this._differs.find(value).create(this.ngForTrackBy);\n        } catch {\n          throw new Error(`Cannot find a differ supporting object '${value}' of type '${\n              getTypeName(value)}'. The default\n * template for the `else` clause is blank.\n *\n * A [shorthand form](guide/structural-directives#the-asterisk--prefix) of the directive,\n * `*ngIf=\"condition\"`, is generally used, provided\n * as an attribute of the anchor element for the inserted template.\n * Angular expands this into a more explicit version, in which the anchor element\n * is contained in an `<ng-template>` element.\n *\n * Simple form with shorthand syntax:\n *\n * ```\n * <div *ngIf=\"condition\">Content to render when condition is true.</div>\n * ```\n *\n * Simple form with expanded syntax:\n *\n * ```\n * <ng-template [ngIf]=\"condition\"><div>Content to render when condition is\n * true.</div></ng-template>\n * ```\n *\n * Form with an \"else\" block:\n *\n * ```\n * <div *ngIf=\"condition; else elseBlock\">Content to render when condition is true.</div>\n * <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n * ```\n *\n * Shorthand form with \"then\" and \"else\" blocks:\n *\n * ```\n * <div *ngIf=\"condition; then thenBlock else elseBlock\"></div>\n * <ng-template #thenBlock>Content to render when condition is true.</ng-template>\n * <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n * ```\n *\n * Form with storing the value locally:\n *\n * ```\n * <div *ngIf=\"condition as value; else elseBlock\">{{value}}</div>\n * <ng-template #elseBlock>Content to render when value is null.</ng-template>\n * ```\n *\n * @usageNotes\n *\n *

The `*ngIf` directive is most commonly used to conditionally show an inline template,\n * as seen in the following example.\n * The default `else` template is blank.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfSimple'}\n *\n * ### Showing an alternative template using `else`\n *\n * To display a template when `expression` evaluates to false, use an `else` template\n * binding as shown in the following example.\n * The `else` binding points to an `<ng-template>` element labeled `#elseBlock`.\n * The template can be defined anywhere in the component view, but is typically placed right after\n * `ngIf` for readability.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfElse'}\n *\n * ### Using an external `then` template\n *\n * In the previous example,
the then-clause template is specified inline, as the content of the\n * tag that contains the `ngIf` directive. You can also specify a template that is defined\n * externally, by referencing a labeled `<ng-template>` element. When you do this, you can\n * change which template to use at runtime, as shown in the following example.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfThenElse'}\n *\n * ### Storing a conditional result in a variable\n *\n * You might want to show a set of properties from the same object. If you are waiting\n * for asynchronous data, the object can be undefined.\n * In this case, you can use `ngIf` and store the result of the condition in a local\n * variable as shown in the the following example.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfAs'}\n *\n * This code uses only one `AsyncPipe`, so only one subscription is created.\n * The conditional statement stores the result of `userStream|async` in the local variable `user`.\n * You can then
bind the local `user` repeatedly.\n *\n * The conditional displays the data only if `userStream` returns a value,\n * so you don't need to use the\n * safe-navigation-operator (`?.`)\n * to guard against null values when accessing properties.\n * You can display an alternative template while waiting for the data.\n *\n * ### Shorthand syntax\n *\n * The shorthand syntax `*ngIf` expands into two separate template specifications\n * for the \"then\" and \"else\" clauses. For example, consider the following shorthand statement,\n * that is meant to show a loading page while waiting for data to be loaded.\n *\n * ```\n * <div class=\"hero-list\" *ngIf=\"heroes else loading\">\n * ...\n * </div>\n *\n * <ng-template #loading>\n * <div>Loading...</div>\n * </ng-template>\n * ```\n *\n * You can see that the \"else\" clause references the `<ng-template>`\n * with the `#loading` label, and the template for the \"then\" clause\n * is provided as the content of the anchor element.\n *\n * However,
when Angular expands the shorthand syntax, it creates\n * another `<ng-template>` tag, with `ngIf` and `ngIfElse` directives.\n * The anchor element containing the template for the \"then\" clause becomes\n * the content of this unlabeled `<ng-template>` tag.\n *\n * ```\n * <ng-template [ngIf]=\"heroes\" [ngIfElse]=\"loading\">\n * <div class=\"hero-list\">\n * ...\n * </div>\n * </ng-template>\n *\n * <ng-template #loading>\n * <div>Loading...</div>\n * </ng-template>\n * ```\n *\n * The presence of the implicit template object has implications for the nesting of\n * structural directives. For more on this subject, see\n * [Structural Directives](https://angular.io/guide/structural-directives#one-per-element).\n *\n * @ngModule CommonModule\n * @publicApi\n */\n@Directive({selector: '[ngIf]'})\nexport class NgIf<T = unknown> {\n private _context: NgIfContext<T> = new NgIfContext<T>();\n private _thenTemplateRef: TemplateRef<NgIfContext<T>>|null = null;\n private _elseTemplateRef:

directive](guide/structural-directives) that renders\n * a template for each item in a collection.\n * The directive is placed on an element, which becomes the parent\n * of the cloned templates.\n *\n * The `ngForOf` directive is generally used in the\n * [shorthand form](guide/structural-directives#the-asterisk--prefix) `*ngFor`.\n * In this form, the template to be rendered for each iteration is the content\n * of an anchor element containing the directive.\n *\n * The following example shows the shorthand syntax with some options,\n * contained in an `<li>` element.\n *\n * ```\n * <li *ngFor=\"let item of items; index as i; trackBy: trackByFn\">...</li>\n * ```\n *\n * The shorthand form expands into a long form that uses the `ngForOf` selector\n * on an `<ng-template>` element.\n * The content of the `<ng-template>` element is the `<li>` element that held the\n * short-form directive.\n *\n * Here is the expanded version of the short-form example.\n *\n * ```\n * <ng-template ngFor let-item [ngForOf]=\"items\" let-i=\"index\" [ngForTrackBy]=\"trackByFn\">\n *   <li>...</li>\n * </ng-template>\n * ```\n *\n * Angular automatically expands the shorthand syntax as it compiles the template.\n * The context for each embedded view is logically merged to the current component\n * context according to its lexical position.\n *\n * When using the shorthand syntax, Angular allows only [one structural directive\n * on an element](guide/structural-directives#one-structural-directive-per-host-element).\n * If you want to iterate conditionally, for example,\n * put the `*ngIf` on a container element that wraps the `*ngFor` element.\n * For futher discussion, see\n * [Structural Directives](guide/structural-directives#one-per-element).\n *\n * @usageNotes\n *\n * ### Local variables\n *\n * `NgForOf` provides exported values that can be aliased to local variables.\n * For example:\n *\n *  ```\n * <li *ngFor=\"let user of users; index as i; first as isFirst\">\n * {{i}}/{{users.length}}. {{user}} <span *ngIf=\"isFirst\">default</span>\n * </li>\n * ```\n *\n * The following exported values can be aliased to local variables:\n *\n * - `$implicit: T`: The value of the individual items in the iterable (`ngForOf`).\n * - `ngForOf: NgIterable<T>`: The value of the iterable expression. Useful when the expression is\n * more complex then a property access, for example when using the async pipe (`userStreams |\n * async`).\n * - `index: number`: The index of the current item in the iterable.\n * - `count: number`: The length of the iterable.\n * - `first: boolean`: True when the item is the first item in the iterable.\n * - `last: boolean`: True when the item is the last item in the iterable.\n * - `even: boolean`: True when the item has an even index in the iterable.\n * - `odd: boolean`: True when the item has an odd index in the iterable.\n *\n * ### Change propagation\n *\n * When the contents of the iterator changes, `NgForOf` makes the corresponding changes to the DOM:\n *\n * * When an item is added, a new instance of the template is added to the DOM.\n * * When an item is removed, its template instance is removed from the DOM.\n * * When items are reordered, their respective templates are reordered in the DOM.\n *\n * Angular uses object identity to track insertions and deletions within the iterator and reproduce\n * those changes in the DOM. This has important implications for animations and any stateful\n * controls that are present, such as `<input>` elements that accept user input. Inserted rows can\n * be animated in, deleted rows can be animated out, and unchanged rows retain any unsaved state\n * such as user input.\n * For more on animations, see [Transitions and Triggers](guide/transition-and-triggers).\n *\n * The identities of elements in the iterator can change while the data does not.\n * This can happen, for example, if the iterator is produced from an RPC to the server, and that\n * RPC is re-run. Even if the data hasn't changed, the second response produces objects with\n * different identities, and Angular must tear down the entire DOM and rebuild it (as if all old\n * elements were deleted and all new elements inserted).\n *\n * To avoid this expensive operation, you can customize the default tracking algorithm.\n * by supplying the `trackBy` option to `NgForOf`.\n * `trackBy` takes a function that has two arguments: `index` and `item`.\n * If `trackBy` is given, Angular tracks changes by the return value of the function.\n *\n * @see [Structural Directives](guide/structural-directives)\n * @ngModule CommonModule\n * @publicApi\n */\n@Directive({selector: '[ngFor][ngForOf]'})\nexport class NgForOf<T, U extends NgIterable<T> = NgIterable<T>> implements DoCheck {\n  /**\n   * The value of the iterable expression, which can be used as a\n * [template input variable](guide/structural-directives#template-input-variable).\n   */\n  @Input()\n  set ngForOf(ngForOf: U&NgIterable<T>|undefined|null) {\n    this._ngForOf = ngForOf;\n    this._ngForOfDirty = true;\n  }\n  /**\n   * A function that defines how

to track changes for items in the iterable.\n *\n * When items are added, moved, or removed in the iterable,\n * the directive must re-render the appropriate DOM nodes.\n * To minimize churn in the DOM, only nodes that have changed\n * are re-rendered.\n *\n * By default, the change detector assumes that\n * the object instance identifies the node in the iterable.\n * When this function is supplied, the directive uses\n * the result of calling this function to identify the item node,\n * rather than the identity of the object itself.\n *\n * The function receives two inputs,\n * the iteration index and the associated node data.\n */\n @Input()\n set ngForTrackBy(fn: TrackByFunction<T>) {\n if ((typeof ngDevMode === 'undefined' || ngDevMode) && fn != null && typeof fn !== 'function') {\n // TODO(vicb): use a log service once there is a public one available\n if (<any>console && <any>console.warn) {\n console.warn(\n `trackBy must be a function, but received ${JSON.stringify(fn)}. ` +\n `See https://angular.io/api/common/NgForOf#change-propagation for more information.`);\n }\n }\n this._trackByFn = fn;\n }\n\n get ngForTrackBy(): TrackByFunction<T> {\n return this._trackByFn;\n }\n\n private _ngForOf: U|undefined|null = null;\n private _ngForOfDirty: boolean = true;\n private _differ: IterableDiffer<T>|null = null;\n // TODO(issue/24571): remove '!'.\n private _trackByFn!: TrackByFunction<T>;\n\n constructor(\n private _viewContainer: ViewContainerRef,\n private _template: TemplateRef<NgForOfContext<T, U>>, private _differs: IterableDiffers) {}\n\n /**\n * A reference to the template that is stamped out for each item in the iterable.\n * @see [template reference variable](guide/template-reference-variables)\n */\n @Input()\n set ngForTemplate(value: TemplateRef<NgForOfContext<T, U>>) {\n // TODO(TS2.1): make TemplateRef<Partial<NgForRowOf<T>>> once we move to TS v2.1\n // The current type is too restrictive; a template that just uses index, for example,\n // should be acceptable.\n if (value) {\n this._template = value;\n }\n }\n\n /**\n * Applies the changes when needed.\n */\n ngDoCheck(): void {\n if (this._ngForOfDirty) {\n this._ngForOfDirty = false;\n // React on ngForOf changes only once all inputs have been initialized\n const value = this._ngForOf;\n if (!this._differ && value) {\n try {\n this._differ = this._differs.find(value).create(this.ngForTrackBy);\n } catch {\n throw new Error(`Cannot find a differ supporting object '${value}' of type '${\n getTypeName(value)}'. The default\n * template for the `else` clause is blank.\n *\n * A [shorthand form](guide/structural-directives#the-asterisk--prefix) of the directive,\n * `*ngIf=\"condition\"`, is generally used, provided\n * as an attribute of the anchor element for the inserted template.\n * Angular expands this into a more explicit version, in which the anchor element\n * is contained in an `<ng-template>` element.\n *\n * Simple form with shorthand syntax:\n *\n * ```\n * <div *ngIf=\"condition\">Content to render when condition is true.</div>\n * ```\n *\n * Simple form with expanded syntax:\n *\n * ```\n * <ng-template [ngIf]=\"condition\"><div>Content to render when condition is\n * true.</div></ng-template>\n * ```\n *\n * Form with an \"else\" block:\n *\n * ```\n * <div *ngIf=\"condition; else elseBlock\">Content to render when condition is true.</div>\n * <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n * ```\n *\n * Shorthand form with \"then\" and \"else\" blocks:\n *\n * ```\n * <div *ngIf=\"condition; then thenBlock else elseBlock\"></div>\n * <ng-template #thenBlock>Content to render when condition is true.</ng-template>\n * <ng-template #elseBlock>Content to render when condition is false.</ng-template>\n * ```\n *\n * Form with storing the value locally:\n *\n * ```\n * <div *ngIf=\"condition as value; else elseBlock\">{{value}}</div>\n * <ng-template #elseBlock>Content to render when value is null.</ng-template>\n * ```\n *\n * @usageNotes\n *\n * The `*ngIf` directive is most commonly used to conditionally show an inline template,\n * as seen in the following example.\n * The default `else` template is blank.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfSimple'}\n *\n * ### Showing an alternative template using `else`\n *\n * To display a template when `expression` evaluates to false, use an `else` template\n * binding as shown in the following example.\n * The `else` binding points to an `<ng-template>` element labeled `#elseBlock`.\n * The template can be defined anywhere in the component view, but is typically placed right after\n * `ngIf` for readability.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfElse'}\n *\n * ### Using an external `then` template\n *\n * In the previous example, the then-clause template is specified inline, as the content of the\n * tag that contains the `ngIf` directive. You can also specify a template that is defined\n * externally, by referencing a labeled `<ng-template>` element. When you do this, you can\n * change which template to use at runtime, as shown in the following example.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfThenElse'}\n *\n * ### Storing a conditional result in a variable\n *\n * You might want to show a set of properties from the same object. If you are waiting\n * for asynchronous data, the object can be undefined.\n * In this case, you can use `ngIf` and store the result of the condition in a local\n * variable as shown in the the following example.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfAs'}\n *\n * This code uses only one `AsyncPipe`, so only one subscription is created.\n * The conditional statement stores the result of `userStream|async` in the local variable `user`.\n * You can then bind the local `user` repeatedly.\n *\n * The conditional displays the data only if `userStream` returns a value,\n * so you don't need to use the\n * safe-navigation-operator (`?.`)\n * to guard against null values when accessing properties.\n * You can display an alternative template while waiting for the data.\n *\n * ### Shorthand syntax\n *\n * The shorthand syntax `*ngIf` expands into two separate template specifications\n * for the \"then\" and \"else\" clauses. For example, consider the

following shorthand statement,\n * that is meant to show a loading page while waiting for data to be loaded.\n *\n * ```\n * <div class=\"hero-list\" *ngIf=\"heroes else loading\">\n *  ...\n * </div>\n *\n * <ng-template #loading>\n * <div>Loading...</div>\n * </ng-template>\n * ```\n *\n * You can see that the \"else\" clause references the `<ng-template>`\n * with the `#loading` label, and the template for the \"then\" clause\n * is provided as the content of the anchor element.\n *\n * However, when Angular expands the shorthand syntax, it creates\n * another `<ng-template>` tag, with `ngIf` and `ngIfElse` directives.\n * The anchor element
 containing the template for the \"then\" clause becomes\n * the content of this unlabeled `<ng-template>` tag.\n *\n * ```\n * <ng-template [ngIf]=\"heroes\" [ngIfElse]=\"loading\">\n *  <div class=\"hero-list\">\n *  ...\n *  </div>\n * </ng-template>\n *\n * <ng-template #loading>\n *  <div>Loading...</div>\n * </ng-template>\n * ```\n *\n * The presence of the implicit template object has implications for the nesting of\n * structural directives. For more on this subject, see\n * [Structural Directives](https://angular.io/guide/structural-directives#one-per-element).\n *\n * @ngModule CommonModule\n * @publicApi\n */\n@Directive({selector: '[ngIf]'})\nexport class NgIf<T = unknown> {\n  private _context: NgIfContext<T> = new NgIfContext<T>();\n  private _thenTemplateRef: TemplateRef<NgIfContext<T>>|null = null;\n  private _elseTemplateRef: TemplateRef<NgIfContext<T>>|null = null;\n  private _thenViewRef: EmbeddedViewRef<NgIfContext<T>>|null = null;\n  private _elseViewRef: EmbeddedViewRef<NgIfContext<T>>|null
