 * See `I18nCreateOpCodes`\n */\nexport enum I18nCreateOpCode {\n  /**\n   * Number of bits to shift index so that it can be combined with the `APPEND_EAGERLY` and\n   * `COMMENT`.\n   */\n  SHIFT = 2,\n\n  /**\n   * Should the node be appended to parent imedditatly after creation.\n   */\n  APPEND_EAGERLY = 0b01,\n\n  /**\n * If set the node should be comment (rather than a text) node.\n   */\n  COMMENT = 0b10,\n}\n\n\n/**\n * Stores DOM operations which need to be applied to update DOM render tree due to changes in\n * expressions.\n *\n * The basic idea is that `i18nExp` OpCodes capture expression changes and update a change\n * mask bit. (Bit 1 for expression 1, bit 2 for expression 2 etc..., bit 32 for expression 32 and\n * higher.) The OpCodes then compare its own change mask against the expression change mask to\n * determine if the OpCodes should execute.\n *\n * NOTE: 32nd bit is special as it says 32nd or higher. This way if we have more than 32 bindings\n *
 the code still works, but with lower efficiency. (it is unlikely that a translation would have\n * more than 32 bindings.)\n *\n * These OpCodes can be used by both the i18n block as well as ICU sub-block.\n *\n * ## Example\n *\n * Assume\n * ```ts\n *   if (rf & RenderFlags.Update) {\n *     i18nExp(ctx.exp1); // If changed set mask bit 1\n *     i18nExp(ctx.exp2); // If changed set mask bit 2\n *     i18nExp(ctx.exp3); // If changed set mask bit 3\n *     i18nExp(ctx.exp4); // If changed set mask bit 4\n *     i18nApply(0);              // Apply all changes by executing the OpCodes.\n *   }\n * ```\n * We can assume that each call to `i18nExp` sets an internal `changeMask` bit depending on the\n * index of `i18nExp`.\n *\n * ### OpCodes\n * ```ts\n * <I18nUpdateOpCodes>[\n *   // The following OpCodes represent: `<div i18n-title=\"pre{{exp1}}in{{exp2}}post\">`\n *   // If `changeMask & 0b11`\n *   //        has changed then execute update OpCodes.\n *   //        has NOT changed then skip `8`

Unlike ngDoCheck, ngOnChanges and ngOnInit, which are\n// called during a pre-order traversal of the view tree (that is calling the\n// parent hooks before the child hooks) these events are sent in using a\n// post-order traversal of the tree (children before parents). This changes the\n// meaning of initIndex in the view state. For ngOnInit, initIndex tracks the\n// expected nodeIndex which a ngOnInit should be called. When sending\n// ngAfterContentInit and ngAfterViewInit it is the expected count of\n// ngAfterContentInit or ngAfterViewInit methods that have been called. This\n// ensure that despite being called recursively or after picking up after an\n// exception, the ngAfterContentInit or ngAfterViewInit will be called on the\n// correct nodes. Consider for example, the following (where E is an element\n// and D is a directive)\n// Tree: pre-order index post-order index\n// E1 0 6\n// E2
1 1\n// D3 2 0\n// E4 3 5\n// E5 4 4\n// E6 5
2\n// E7 6 3\n// As can be seen, the post-order index has an unclear relationship to the\n// pre-order

index (postOrderIndex === preOrderIndex - parentCount +\n// childCount). Since number of calls to ngAfterContentInit and ngAfterViewInit\n// are stable (will be the same for the same view regardless of exceptions or\n// recursion) we just need to count them which will roughly correspond to the\n// post-order index (it skips elements and directives
that do not have\n// lifecycle hooks).\n//\n// For example, if an exception is raised in the E6.onAfterViewInit() the\n// initIndex is left at 3 (by shouldCallLifecycleInitHook() which set it to\n// initIndex + 1). When checkAndUpdateView() is called again D3, E2 and E6 will\n// not have their ngAfterViewInit() called but, starting with E7, the rest of\n// the view will begin getting ngAfterViewInit() called until a check and\n// pass is complete.\n//\n// This algorthim also handles recursion. Consider if E4's ngAfterViewInit()\n// indirectly calls E1's ChangeDetectorRef.detectChanges(). The expected\n// initIndex is set to 6, the recusive checkAndUpdateView() starts walk again.\n// D3, E2, E6, E7, E5 and E4 are skipped, ngAfterViewInit() is called on E1.\n// When the recursion returns the initIndex will be 7 so E1 is skipped as it\n// has already been called in the recursively called checkAnUpdateView().\nexport function callLifecycleHooksChildrenFirst(view: ViewData, lifecycles:

will be injected into the directive.\n *\n * Content queries are set before the `ngAfterContentInit` callback is called.\n * View queries are set before the `ngAfterViewInit`
callback is called.\n *\n * @usageNotes\n *\n * The following example shows how queries are defined\n * and when their results are available in lifecycle hooks:\n *\n * ```ts\n * @Component({\n * selector: 'someDir',\n * queries: {\n * contentChildren: new ContentChildren(ChildDirective),\n * viewChildren: new ViewChildren(ChildDirective)\n * },\n * template: '<child-directive></child-directive>'\n * })\n * class SomeDir {\n * contentChildren: QueryList<ChildDirective>,\n * viewChildren: QueryList<ChildDirective>\n *\n * ngAfterContentInit() {\n * // contentChildren is set\n * }\n *\n * ngAfterViewInit() {\n * // viewChildren is set\n * }\n * }\n * ```\n *\n * @Annotation\n */\n queries?: {[key: string]: any};\n\n /**\n * Maps class properties to host element bindings for properties,\n * attributes, and events, using a set of key-value pairs.\n *\n * Angular automatically
checks host property bindings during change detection.\n * If a binding changes, Angular updates the directive's host element.\n *\n * When the key is a property of the host element, the property value is\n * the propagated to the specified DOM property.\n *\n * When the key is a static attribute in the DOM, the attribute value\n * is propagated to the specified property in the host element.\n *\n * For event handling:\n * - The key is the DOM event that the directive listens to.\n * To listen to global events, add the target to the event name.\n * The target can be `window`, `document` or `body`.\n * - The value is the statement to execute when the event occurs. If the\n * statement evaluates to `false`, then `preventDefault` is applied on the DOM\n * event. A handler method can refer to the `$event` local variable.\n *\n */\n host?: {[key: string]: string};\n\n /**\n * When present, this directive/component is ignored by the AOT compiler.\n
* It remains in distributed code, and the JIT compiler attempts to compile it\n * at run time, in the browser.\n * To ensure the correct behavior, the app must import `@angular/compiler`.\n */\n jit?: true;\n}\n\n/**\n * Type of the Directive metadata.\n *\n * @publicApi\n */\nexport const Directive: DirectiveDecorator = makeDecorator(\n 'Directive', (dir: Directive = {}) => dir, undefined, undefined,\n (type: Type<any>, meta: Directive) => SWITCH_COMPILE_DIRECTIVE(type, meta));\n\n/**\n * Component decorator interface\n *\n * @publicApi\n */\nexport interface ComponentDecorator {\n /**\n * Decorator that marks a class as an Angular component and provides configuration\n * metadata that determines how the component should be processed,\n * instantiated, and used at runtime.\n *\n * Components are the most basic UI building block of an Angular app.\n * An Angular app contains a tree of Angular components.\n *\n * Angular components are a subset of directives,
always associated with a template.\n * Unlike other directives, only one component can be instantiated for a given element in a\n * template.\n *\n * A component must belong to an NgModule in order for it to be available\n * to another component or application. To make it a member of an NgModule,\n * list it in the `declarations` field of the `NgModule` metadata.\n *\n * Note that, in addition to these options for configuring a directive,\n * you can control a component's runtime behavior by implementing\n * life-cycle hooks. For more information, see the\n * [Lifecycle Hooks](guide/lifecycle-hooks) guide.\n *\n * @usageNotes\n *\n * ### Setting component inputs\n *\n * The following example creates a component with two data-bound properties,\n * specified by the `inputs` value.\n *\n * <code-example path=\"core/ts/metadata/directives.ts\" region=\"component-input\"></code-example>\n *\n *\n * ### Setting component outputs\n *\n * The
following example shows two event emitters that emit on an interval. One\n * emits an output every second, while the other emits every five seconds.\n *\n * {@example core/ts/metadata/directives.ts region='component-output-interval'}\n *\n * ### Injecting a class with a view provider\n *\n * The following simple example injects a class into a component\n * using the view provider specified in component metadata:\n *\n * ```ts\n * class Greeter {\n * greet(name:string) {\n * return 'Hello ' + name + '!';\n * }\n * }\n *\n * @Directive({\n * selector: 'needs-greeter'\n * })\n * class NeedsGreeter {\n * greeter:Greeter;\n *\n * constructor(greeter:Greeter) {\n * this.greeter = greeter;\n * }\n * }\n *\n * @Component({\n * selector: 'greet',\n * viewProviders: [\n * Greeter\n * ],\n * template: `<needs-greeter></needs-greeter>`\n * })\n * class HelloWorld {\n * }\n *\n * ```\n

*\n * ### Preserving whitespace\n *\n * Removing whitespace can greatly reduce AOT-generated code size and speed up view creation.\n * As of Angular 6, the default for `preserveWhitespaces` is false (whitespace is removed).\n * To change the default setting for all components in your application, set\n * the `preserveWhitespaces` option of the AOT compiler.\n *\n * By default, the AOT compiler removes whitespace characters as follows:\n * * Trims all whitespaces at the beginning and the end of a template.\n * * Removes whitespace-only text nodes. For example,\n *\n * ```html\n * <button>Action 1</button> <button>Action 2</button>\n * ```\n *\n * becomes:\n *\n * ```html\n * <button>Action 1</button><button>Action 2</button>\n * ```\n *\n * * Replaces a series of whitespace characters in text nodes with a single space.\n * For example, `<span>\\n some text\\n</span>` becomes `<span> some text </span>`.\n * * Does NOT alter text nodes inside
HTML tags such as `<pre>` or `<textarea>`,\n * where whitespace characters are significant.\n *\n * Note that these transformations can influence DOM nodes layout, although impact\n * should be minimal.\n *\n * You can override the default behavior to preserve whitespace characters\n * in certain fragments of a template. For example, you can exclude an entire\n * DOM sub-tree by using the `ngPreserveWhitespaces` attribute:\n *\n * ```html\n * <div ngPreserveWhitespaces>\n * whitespaces are preserved here\n * <span> and here </span>\n * </div>\n * ```\n *\n * You can force a single space to be preserved in a text node by using `&ngsp;`,\n * which is replaced with a space character by Angular's template\n * compiler:\n *\n * ```html\n * <a>Spaces</a>&ngsp;<a>between</a>&ngsp;<a>links.</a>\n * <!-- compiled to be equivalent to:\n * <a>Spaces</a> <a>between</a> <a>links.</a> -->\n * ```\n *\n * Note that sequences of `&ngsp;`
are still collapsed to just one space character when\n * the `preserveWhitespaces` option is set to `false`.\n *\n * ```html\n * <a>before</a>&ngsp;&ngsp;&ngsp;<a>after</a>\n * <!-- compiled to be equivalent to:\n * <a>before</a> <a>after</a> -->\n * ```\n *\n * To preserve sequences of whitespace characters, use the\n * `ngPreserveWhitespaces` attribute.\n *\n * @Annotation\n */\n (obj: Component): TypeDecorator;\n /**\n * See the `Component` decorator.\n */\n new(obj: Component): Component;\n}\n\n/**\n * Supplies configuration metadata for an Angular component.\n *\n * @publicApi\n */\nexport interface Component extends Directive {\n /**\n * The change-detection strategy to use for this component.\n *\n * When a component is instantiated, Angular creates a change detector,\n * which is responsible for propagating the component's bindings.\n * The strategy is one of:\n * - `ChangeDetectionStrategy#OnPush` sets the strategy to `CheckOnce`
(on demand).\n * - `ChangeDetectionStrategy#Default` sets the strategy to `CheckAlways`.\n */\n changeDetection?: ChangeDetectionStrategy;\n\n /**\n * Defines the set of injectable objects that are visible to its view DOM children.\n * See [example](#injecting-a-class-with-a-view-provider).\n *\n */\n viewProviders?: Provider[];\n\n /**\n * The module ID of the module that contains the component.\n * The component must be able to resolve relative URLs for templates and styles.\n * SystemJS exposes the `__moduleName` variable within each module.\n * In CommonJS, this can be set to `module.id`.\n *\n */\n moduleId?: string;\n\n /**\n * The relative path or absolute URL of a template file for an Angular component.\n * If provided, do not supply an inline template using `template`.\n *\n */\n templateUrl?: string;\n\n /**\n * An inline template for an Angular component. the application will never be stable if you start any kind\n * of recurrent asynchronous task when the application starts\n * (for example for a polling process, started with a `setInterval`, a `setTimeout`\n * or using RxJS operators like `interval`);\n * - the `isStable` Observable runs outside of the Angular zone.\n *\n * Let's imagine that you start a recurrent task\n * (here incrementing a counter, using RxJS `interval`),\n * and at the same time subscribe to `isStable`.\n *\n * ```\n * constructor(appRef: ApplicationRef) {\n * appRef.isStable.pipe(\n * filter(stable => stable)\n * ).subscribe(() => console.log('App is stable now');\n * interval(1000).subscribe(counter => console.log(counter));\n * }\n * ```\n * In this example, `isStable` will never emit `true`,\n * and the trace \"App is stable now\" will never get logged.\n *\n * If you want to execute something when the app is stable,\n * you have to wait for the application to be stable\n * before starting your polling process.\n *\n * ```\n * constructor(appRef: ApplicationRef) {\n * appRef.isStable.pipe(\n * first(stable => stable),\n * tap(stable => console.log('App is stable now')),\n * switchMap(() => interval(1000))\n * ).subscribe(counter => console.log(counter));\n * }\n * ```\n * In this example, the trace \"App is stable now\" will be logged\n * and then the counter starts incrementing every second.\n *\n * Note also that this Observable runs outside of the Angular zone,\n * which means that the code in the subscription\n * to this Observable will not trigger the change detection.\n *\n * Let's imagine that instead of logging the counter value,\n * you update a field of your component\n * and display it in its template.\n *\n * ```\n * constructor(appRef: ApplicationRef) {\n * appRef.isStable.pipe(\n * first(stable => stable),\n * switchMap(() => interval(1000))\n * ).subscribe(counter => this.value = counter);\n * }\n * ```\n * As the `isStable` Observable runs outside the zone,\n * the `value` field will be updated properly,\n * but the template will not be refreshed!\n *\n * You'll have to manually trigger the change detection to update the template.\n *\n * ```\n * constructor(appRef: ApplicationRef, cd: ChangeDetectorRef) {\n * appRef.isStable.pipe(\n * first(stable => stable),\n * switchMap(() => interval(1000))\n * ).subscribe(counter => {\n * this.value = counter;\n * cd.detectChanges();\n * });\n * }\n * ```\n *\n * Or make the subscription callback run inside the zone.\n *\n * ```\n * constructor(appRef: ApplicationRef, zone: NgZone) {\n * appRef.isStable.pipe(\n * first(stable => stable),\n * switchMap(() => interval(1000))\n * ).subscribe(counter => zone.run(() => this.value = counter));\n * }\n * ```\n *\n * @publicApi\n */\n@Injectable()\nexport class ApplicationRef {\n /** @internal */\n private _bootstrapListeners: ((compRef: ComponentRef<any>) => void)[] = [];\n private _views: InternalViewRef[] = [];\n private _runningTick: boolean = false;\n private _stable = true;\n private _onMicrotaskEmptySubscription: Subscription;\n\n /**\n * Get a list of component types registered to this application.\n * This list is populated even before the component is created.\n */\n public readonly componentTypes: Type<any>[] = [];\n\n /**\n * Get a list of components registered to this application.\n */\n public readonly components: ComponentRef<any>[] = [];\n\n /**\n * Returns an Observable that indicates when the application is stable or unstable.\n *\n * @see [Usage notes](#is-stable-examples) for examples and caveats when using this API.\n */\n // TODO(issue/24571): remove '!'.\n public readonly isStable!: Observable<boolean>;\n\n /** @internal */\n constructor(\n private _zone: NgZone, private _console: Console, private _injector: Injector,\n private _exceptionHandler: ErrorHandler,\n private _componentFactoryResolver: ComponentFactoryResolver,\n private _initStatus: ApplicationInitStatus) {\n
