Options to enable, disable, and specify the properties of EBS storage volumes. For more information, see [Configuring EBS-based Storage](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createdomain-configure-ebs.html#es-createdomain-configure-ebs).

Specifies whether EBS-based storage is enabled. When the [Consumer] completes, a [Boolean.Builder] is called immediately and its result is passed to [ebsEnabled(Boolean)].

Returns a reference to this object so that method calls can be chained together.

Specifies whether EBS-based storage is enabled.

Returns a reference to this object so that method calls can be chained together.

Set the EBS options for the specified Elasticsearch domain.

```java
public void setOptions(EBSOptions options) {
    // Implementation
}
```

```
@Default
@Put
@Response(200)
@Result(200, "EBSOptions")
@Param("EBSOptions")
public EBSOptions options
```

This method sets the EBS options for the specified Elasticsearch domain. The parameters include the EBS options model.

```
EBSOptions options
```

The EBS options model is defined as follows:

```
public class EBSOptions {
    // Properties
    private String property1;
    private String property2;

    // Constructor
    public EBSOptions(String property1, String property2) {
        this.property1 = property1;
        this.property2 = property2;
    }

    // Getters and Setters
    public String getProperty1() {
        return property1;
    }

    public void setProperty1(String property1) {
        this.property1 = property1;
    }

    // Other methods
}
```

The model includes properties for `property1` and `property2`. These properties can be set using the `setProperty1` method.

```
public void setProperty1(String property1) {
    this.property1 = property1;
}
```

This method allows setting the value of `property1`. The `EBSOptions` model represents the EBS options for the Elasticsearch domain.
Elasticsearch domain.

This is a convenience that creates an instance of the {@link OptionStatus.Builder} avoiding the need to create one manually via {@link OptionStatus#builder()}. When the {@link Consumer} completes, {@link OptionStatus.Builder#build()} is called immediately and its result is passed to {@link OptionStatus#status(OptionStatus)}. See method calls on {@link OptionStatus.Builder} to return a reference to this object so that method calls can be chained together.

### VPCOptions

- **setterMethodName**: `setVpcOptions`
- **setterModel**: `{ variableDeclarationType: "VPCDerivedInfoStatus", variableName: "vpcOptions", variableType: "VPCDerivedInfoStatus", documentation: null, simpleType: "VPCDerivedInfoStatus", variableSetterType: "VPCDerivedInfoStatus" }`

### CognitoOptions

- **beanStyleGetterMethodName**: `getCognitoOptions`
- **beanStyleSetterMethodName**: `setCognitoOptions`
- **c2jName**: "CognitoOptions"
- **c2jShape**: "CognitoOptionsStatus"

This is a convenience that creates an instance of the `CognitoOptionsStatus` avoiding the need to create one manually via `CognitoOptionsStatus#builder()`. When the `Consumer` completes, `CognitoOptionsStatus.Builder#build()` is called immediately and its result is passed to `CognitoOptionsStatus`. This returns a consumer that will call methods on `CognitoOptionsStatus.Builder`.

- **defaultConsumerFluentSetterDocumentation**: "The `CognitoOptions` for the specified domain. For more information, see [Amazon Cognito Authentication for Kibana](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-cognito-auth.html)"
- **deprecated**: false
- **documentation**: "The `CognitoOptions` for the specified domain. For more information, see [Amazon Cognito Authentication for Kibana](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-cognito-auth.html)"
- **endpointDiscoveryId**: false
- **enumType**: null
- **eventHeader**: false
- **eventPayload**: false

Specifies the EncryptionAtRestOptions for the Elasticsearch domain.

- **setterMethodName**: `setEncryptionAtRestOptions`
- **variableName**: `encryptionAtRestOptions`
- **variableType**: `EncryptionAtRestOptionsStatus`
- **documentation**: Specifies the EncryptionAtRestOptions for the Elasticsearch domain.

Alternatively, you can use the `LogPublishingOptionsStatus.Builder` convenience method to create the `LogPublishingOptionsStatus` object:

```
@LogPublishingOptions
@see LogPublishingOptionsStatus
```

This method allows you to create a `LogPublishingOptionsStatus` object using a `Consumer` interface, which simplifies the process of configuring log publishing options. The `LogPublishingOptionsStatus.Builder` is called immediately when the `LogPublishingOptions` consumer is complete, and its result is passed to the `LogPublishingOptionsStatus` object. The `LogPublishingOptionsStatus.Builder` method returns a reference to the object, allowing you to chain calls and pass the resulting object to other methods. This approach ensures that log publishing options can be easily configured and updated as needed.

This is a convenience that creates an instance of the {@link AccessPoliciesStatus.Builder} avoiding the need to create one manually via {@link AccessPoliciesStatus#builder()}. When the {@link Consumer} completes, {@link AccessPoliciesStatus.Builder#build()} is called immediately and its result is passed to {@link AccessPolicies(AccessPoliciesStatus)}. 

@see #accessPolicies(AccessPoliciesStatus)

### Returns

Returns a reference to this object so that method calls can be chained together.

@see #accessPolicies(AccessPoliciesStatus)

### Throws

The following errors can be returned:

- **InvalidRequestException** - The request is not valid.
- **ResourceNotFoundException** - The resource specified in the request does not exist.
- **ResourceActionException** - An action is not permitted on the specified resource.
- **ServiceUnavailableException** - The service is not able to process the request.
- **ResourceLimitExceededException** - A resource policy is limiting the request.

### Examples

#### Example 1: Create a new AccessPolicies object

```java
// Create a new AccessPolicies object
AccessPoliciesStatus accessPolicies = AccessPoliciesStatus.builder().build();
```

#### Example 2: Accessing the AccessPolicies object

```java
// Accessing the AccessPolicies object
```

---

**New in SDWan 20.1.1**

- Enhanced support for Open Company Used in SDWan
- **New Feature:** Improved data handling for AccessPolicies
- **Bug Fix:** Resolved issues with endpoint discovery
- **Compatibility:** Updated for compatibility with the latest SDK versions

---

**Open Source Used In SDWan 20.1.1 3815**
IAM access policy as a JSON-formatted string.

This is a convenience that creates an instance of the class avoiding the need to create one manually via the method. When the method completes, it is passed to the method. 

- **AccessPolicies**: A JSON-formatted string. 
  - **documentation**: IAM access policy as a JSON-formatted string. 
  - **returnType**: `String`
  - **getterModel**:
    - **returnType**: `String`
    - **documentation**: IAM access policy as a JSON-formatted string.
  - **getterMethod**: `accessPolicies`
  - **getterDocumentation**: IAM access policy as a JSON-formatted string.
  - **getterModel**:
    - **returnType**: `String`
    - **documentation**: IAM access policy as a JSON-formatted string.

- **http**: A JSON-formatted string.
IAM access policy as a JSON-formatted string.

```java
public class AdvancedOptions {
    private Map<String, String> advancedOptions;

    public AdvancedOptions() {
        this.advancedOptions = new HashMap<>();
    }

    public AdvancedOptions advancedOptions(Map<String, String> advancedOptions) {
        this.advancedOptions = advancedOptions;
        return this;
    }

    public Map<String, String> getAdvancedOptions() {
        return new HashMap<>(advancedOptions);
    }

    public void setAdvancedOptions(Map<String, String> advancedOptions) {
        this.advancedOptions = advancedOptions;
    }

    // Other methods...
}
```

This is a convenience that creates an instance of the `Map<String, String>` avoiding the need to create one manually via `Map<String, String> builder().build()`. When the `Consumer<Map<String, String>>` completes, a consumer that will call methods on `advancedOptions`.

---

For more information, please refer to the documentation provided with the SDK or framework you are using. If you have any specific questions or need further assistance, feel free to ask!

The Elasticsearch domain endpoint that you use to submit index and search requests.

This is a convenience that creates an instance of the `Map<String, String>.Builder` avoiding the need to create one manually via `Map<String, String>#builder()`. When the `@link Consumer` completes, `Map<String, String>.Builder#build()` is called immediately and its result is passed to `#endpoints(Map<String, String>)`

Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example `<code>key, value</code>: `<code>'vpc','vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>`

Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example `<code>key, value</code>: `<code>'vpc','vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>`

Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`. Returns a reference to this object so that method calls can be chained together.

Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example `<code>key, value</code>: `<code>'vpc','vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>`

Specifies the option to enable Encryption At Rest.

```java
public boolean setEnabled(boolean enabled)
```

Specifies the option to enable Encryption At Rest options.

```java
public String.Builder kmsKeyId(String kmsKeyId)
```

Specifies the KMS Key ID for Encryption At Rest options.

```java
public KmsKeyId(KmsKeyId kmsKeyId)
```

Defines the option to enable Encryption At Rest.

```java
public boolean isEnabled()
```
kmsKeyId Specifies the KMS Key ID for Encryption At Rest options.

@return Returns a reference to this object so that method calls can be chained together.

Sets the value of the NextToken property for this object.

@returns {String} The new value for the NextToken property for this object.

The setter documentation details the behavior and usage of the setter method. The setter is called by the client to update the object with new properties.

The setter is declared as a method in the class that defines the object. The method signature includes the name of the property being updated (NextToken in this case) and a list of arguments that correspond to the input parameters specified in the setter documentation.

The setter method's implementation should validate the input parameters, perform any necessary operations, and update the object's instance variables accordingly. The method may perform input validation to ensure that the new value for NextToken is within acceptable bounds or meets specific requirements.

List of `Tag` for the requested Elasticsearch domain. This is a convenience that creates an instance of the `List<Tag>`, avoiding the need to create one manually. When the `Consumer` completes, the `List<Tag>Builder#build()` is called immediately and its result is passed to `tagList(List<Tag>)`. Returns a reference to this object so that method calls can be chained together.

```java
public List<Tag> tagList(List<Tag> tagList)
```

This method is idempotent. Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`. Returns a reference to this object so that method calls can be chained together.

```java
public List<Tag> tagList()
```

This is a convenience that creates an instance of the `List<Tag>Builder`, avoiding the need to create one manually.

```java
public List<Tag>Builder tagList()
```

This is a convenience that creates an instance of the `List<Tag>`, avoiding the need to create one manually.

} ]

This is a convenience that creates an instance of the <code>Map<String,LogPublishingOption>.Builder</code> avoiding the need to create one manually via <code>Map<String,LogPublishingOption>#builder()</code>. When the Consumer completes, the <code>Map<String,LogPublishingOption>.Builder#build()</code> is called immediately and its result is passed to the <code>optionsAsStrings(Map<String,LogPublishingOption>)</code>. Returns a reference to this object so that method calls can be chained together.

The current options of an Elasticsearch domain service software options.

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String.Builder().` When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `currentVersion(String)`.

```
public class CurrentVersion {

    // Getters
    public String getCurrentVersion() {
        return currentVersion;
    }

    // Setters
    public void setCurrentVersion(String currentVersion) {
        this.currentVersion = currentVersion;
    }

    // Default Consumer Fluent Setter Documentation
    public interface Consumer {
        default void currentVersion(String currentVersion) {
            this.currentVersion = currentVersion;
        }
    }

    // Getter Documentation
    public String getCurrentVersion() {
        return currentVersion;
    }

    // Fluent Setter Documentation
    public void currentVersion(String currentVersion) {
        this.currentVersion = currentVersion;
    }

    public CurrentVersion() {
        currentVersion = null;
    }

    private String currentVersion = null;
}

The current status of the Elasticsearch service software update.

This is a convenience that creates an instance of the `ServiceSoftwareOptions` avoiding the need to create one manually via `ServiceSoftwareOptions.Builder()`. When the `ServiceSoftwareOptions.Builder.build()` is called immediately and its result is passed to `ServiceSoftwareOptions(ServiceSoftwareOptions)` a consumer that will call methods on `ServiceSoftwareOptions.Builder` returns a reference to this object so that method calls can be chained together.

```java
return new ServiceSoftwareOptions(
    ServiceSoftwareOptions.builder()
        .build());
```

The current status of the Elasticsearch service software update.

```java
return new ServiceSoftwareOptions(ServiceSoftwareOptions.builder().build());
```

The current status of the Elasticsearch service software update.

```java
return new ServiceSoftwareOptions(ServiceSoftwareOptions.builder().build());
```

The current status of the Elasticsearch service software update.

```java
return new ServiceSoftwareOptions(ServiceSoftwareOptions.builder().build());
```

StorageTypes represents the list of storage related types and their attributes that are available for given InstanceType.

Sets the value of the StorageTypeName property for this object. This is a convenience that creates an instance of the String.Builder avoiding the need to create one manually via String.Builder(). When the Consumer completes, String.Builder#build() is called immediately and its result is passed to #storageTypeName(String) a consumer that will call methods on String.Builder.Returns a reference to this object so that method calls can be chained together.

Specify the type and size of the EBS volume that you want to use.

```java
public void setEbsOptions(String ebsOptions) {
    this.ebsOptions = ebsOptions;
}
```

Option to set the time, in UTC format, for the daily automated snapshot. Default value is 0 hours.

```java
public void setSNAPSHOT_OPTIONS(SnapshotOptions snapshotOptions) {
    this.snapshotOptions = snapshotOptions;
}
```

This is a convenience that creates an instance of the `SnapshotOptions` avoiding the need to create one manually via `SnapshotOptions.builder()` avoiding the need to create one manually via `SnapshotOptions#builder()`. When the `SnapshotOptions.Builder#build()` is called immediately and its result is passed to `SnapshotOptions(SnapshotOptions)` a consumer that will call methods on `SnapshotOptions.Builder#return` Returns a reference to this object so that method calls can be chained together.

```java
public void setSNAPSHOT_OPTIONS(SnapshotOptions snapshotOptions) {
    this.snapshotOptions = snapshotOptions;
}
```

Option to set the time, in UTC format, for the daily automated snapshot. Default value is 0 hours.

```java
