Status of the advanced options for the specified Elasticsearch domain. Currently, the following advanced options are available:

- Option to allow references to indices in an HTTP request body. Must be `false` when configuring access to individual sub-resources. By default, the value is `true`. See [Configuration Advanced Options](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options) for more information.

- Option to specify the percentage of heap space that is allocated to field data. By default, this setting is unbounded.

For more information, see [Configuring Advanced Options](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options).

This is a convenience that creates an instance of the `Map<String,String>.Builder` avoiding the need to create one manually via `Map<String,String>#builder()`. When the `Consumer` completes, `Map<String,String>.Builder#build()` is called immediately and its result is passed to a consumer that will call methods on `Map<String,String>`. The reference to this object so that method calls can be chained together.

Creating Elasticsearch Domains

From the Amazon Elasticsearch Service Developer Guide:

"Creating Elasticsearch Domains" in the Amazon Elasticsearch Service Developer Guide.

Specifies the instance type and number of instances in the domain cluster.

This is a convenience that creates an instance of the ElasticsearchClusterConfig.Builder avoiding the need to create one manually via ElasticsearchClusterConfig#builder(). When the ElasticsearchClusterConfig.Builder#build() is called immediately and its result is passed to ElasticsearchClusterConfig a consumer that will call methods on ElasticsearchClusterConfig.Builder#return Returns a reference to this object so that method calls can be chained together.

Configuration options for an Elasticsearch domain.

}
Options to specify the Cognito user and identity pools for Kibana authentication. For more information, see [Amazon Cognito Authentication for Kibana](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-cognito-auth.html). This is a convenience that creates an instance of the `CognitoOptions` avoiding the need to create one manually via `CognitoOptions.Builder`. When the `Consumer` completes, `cognitoOptions(CognitoOptions)` is called immediately and its result is passed to the `CognitoOptions` instance.

```java
public void cognitoOptions(Consumer<CognitoOptions> cognitoOptions) {
    // ... (method implementation)
}
```

The `cognitoOptions` method accepts a `Consumer` that will call methods on the `CognitoOptions.Builder`, creating an instance of `CognitoOptions`.

```java
CognitoOptions cognitoOptions = new CognitoOptions.Builder()
    .addUserPool(...)
    .addIdentityPool(...)
    .build();
```

This method allows method calls to be chained together.

```java
public CognitoOptions cognitoOptions(CognitoOptions cognitoOptions) {
    // ... (method implementation)
    return this;
}
```

The `cognitoOptions` method returns a reference to this object so that method calls can be chained together.

```java
CognitoOptions.Builder builder = CognitoOptions.builder()
    .addUserPool(...)
    .addIdentityPool(...)
    .build();
```

This method returns a reference to the object so that method calls can be chained together.

```java
public CognitoOptions.Builder cognitoOptionsBuilder() {
    return new CognitoOptions.Builder();
}
```

This method returns a reference to the object so that method calls can be chained together.

```java
public void addCognitoOptions(Consumer<CognitoOptions> cognitoOptions) {
    // ... (method implementation)
}
```

This method adds Cognito options to the Kibana authentication configuration.

```java
addCognitoOptions(Consumer<CognitoOptions> cognitoOptions);
```

This method adds Cognito options to the Kibana authentication configuration.

```java
addCognitoOptionsBuilder(CognitoOptions.Builder.Builder builder);
```

This method adds Cognito options builder to the Kibana authentication configuration.

```java
addCognitoOptionsBuilder(CognitoOptions.Builder builder);
```

This method adds Cognito options builder to the Kibana authentication configuration.

Creating a VPC in VPC Endpoints for Amazon Elasticsearch Service Domains in VPC Endpoints for Amazon Elasticsearch Service Domains.

Options to specify the subnets and security groups for VPC endpoint. For more information, see Creating a VPC in VPC Endpoints for Amazon Elasticsearch Service Domains.

Returns a reference to this object so that method calls can be chained together.

more information, see <a href="http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-vpc.html#es-creating-vpc" target="_blank">Creating a VPC</a> in <i>VPC Endpoints for Amazon Elasticsearch Service Domains</i>.

setterMethodName

setterModel
Container for the parameters to the `DescribeElasticsearchDomains` operation. By default, the API returns the status of all Elasticsearch domains.

```

```

The Elasticsearch domains for which you want information.

```

```

This is a convenience that creates an instance of the `List<String>.Builder` avoiding the need to create one manually via `List<String>#builder()`. When the `Consumer` completes, `List.Builder#build()` is called immediately and its result is passed to `domainNames(List<String>)`.

```

```

Attempts
to modify the collection returned by this method will result in an UnsupportedOperationException.

\[\text{return}\] The Elasticsearch domains for which you want information.

```

</p>
When the `@link Consumer` completes, `@link String.Builder#build()` is called immediately and its result is passed to `@link reservedElasticsearchInstanceId(String)`.

```java
public void reservedElasticsearchInstanceId(@Nullable String reservedElasticsearchInstanceId) {
    // Implementation goes here
}
```

The reserved instance identifier filter value. Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

```java
public class ReservedElasticsearchInstanceId {
    public String reservedElasticsearchInstanceId;

    public ReservedElasticsearchInstanceId(String reservedElasticsearchInstanceId) {
        this.reservedElasticsearchInstanceId = reservedElasticsearchInstanceId;
    }
}
```

Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

```java
public class ReservedElasticsearchInstanceId {
    public String reservedElasticsearchInstanceId;

    public ReservedElasticsearchInstanceId(String reservedElasticsearchInstanceId) {
        this.reservedElasticsearchInstanceId = reservedElasticsearchInstanceId;
    }
}
```

Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

```java
public class ReservedElasticsearchInstanceId {
    public String reservedElasticsearchInstanceId;

    public ReservedElasticsearchInstanceId(String reservedElasticsearchInstanceId) {
        this.reservedElasticsearchInstanceId = reservedElasticsearchInstanceId;
    }
}
```

Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

```java
public class ReservedElasticsearchInstanceId {
    public String reservedElasticsearchInstanceId;

    public ReservedElasticsearchInstanceId(String reservedElasticsearchInstanceId) {
        this.reservedElasticsearchInstanceId = reservedElasticsearchInstanceId;
    }
}
```

Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

```java
public class ReservedElasticsearchInstanceId {
    public String reservedElasticsearchInstanceId;

    public ReservedElasticsearchInstanceId(String reservedElasticsearchInstanceId) {
        this.reservedElasticsearchInstanceId = reservedElasticsearchInstanceId;

Specifies the cluster configuration for the specified Elasticsearch domain.

This is a convenience that creates an instance of the `ElasticsearchClusterConfig.Builder` avoiding the need to create one manually via `ElasticsearchClusterConfig#builder()`.

When the `@link ElasticsearchConsumer#complete()` completes, the `@link ElasticsearchClusterConfig.Builder#build()` is called immediately and its result is passed to `@link ElasticsearchClusterConfig.Builder#options(ElasticsearchClusterConfig)`.

@param options a consumer that will call methods on `@link ElasticsearchClusterConfig.Builder`

@return Returns a reference to this object so that method calls can be chained together.

    },
    "idempotencyToken" : false,
The domain deletion status. <code>True</code> if a delete request has been received for the domain but resource cleanup is still in progress. <code>False</code> if the domain has not been deleted. Once domain deletion is complete, the status of the domain is no longer returned.

```java
public Boolean getDeleted() {
    return deleted;
}
```

```
public void setDeleted(Boolean value) {
    this.deleted = value;
}
```

When a delete request is received, the domain deletion status is set to <code>True</code>. Resource cleanup is performed, but the status of the domain is retained until the cleanup is complete. Once domain deletion is complete, the status of the domain is no longer returned.

The Elasticsearch domain endpoint that you use to submit index and search requests.

```java
public String getEndpoint() {
    return endpoint;
}
```

```
public void setEndpoint(String value) {
    this.endpoint = value;
}
```

When the <code>setEndpoint</code> method is called, the provided string is used to create an instance of the <code>String.Builder</code> class. The resulting <code>String</code> instance is returned.

This is a convenience that creates an instance of the <code>String.Builder</code> class avoiding the need to create one manually via <code>String#builder()</code>. When the <code>Consumer</code> completes, <code>String.Builder#build()</code> is called immediately and its result is passed to the <code>Endpoint</code> object.

Returns a reference to this object so that method calls can be chained together.

**Open Source Used In SDWan 20.6.1 24467**
The Elasticsearch domain endpoint that you use to submit index and search requests.

@<p>param endpoint The Elasticsearch domain endpoint that you use to submit index and search requests.

@<p>return Returns a reference to this object so that method calls can be chained together.

@getterDocumentation" : "<p>The Elasticsearch domain endpoint that you use to submit index and search requests.

@getterModel" : {"returnType" : "String","documentation" : null},

@http" : {

The Elasticsearch domain endpoint that you use to submit index and search requests.

Example <code>

```java
Map<String, String> endpoints = Map.of('vpc', 'vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com');
```

This is a convenience that creates an instance of the <a>Map<String, String>.Builder</a> avoiding the need to create one manually via <a>Map<String, String>#builder()</a>. When the <a>Map<String, String> .Builder#build()</a> is called immediately and its result is passed to <a>#endpoints(Map<String, String>)</a>.

```
@link Map<String, String> .Builder

@link Map<String, String> .Builder#build()
```

Returns a reference to this object so that method calls can be chained together.

```java
@link Map<String, String> .Builder
```

@link Map<String, String> #endpoints

```
@link Map<String, String> .Builder
```

@link Map<String, String> .Builder#build()

```java
@link Map<String, String> #endpoints
```

```
@link Map<String, String> .Builder
```

@link Map<String, String> .Builder#build()
and search requests. Example <code>key, value</code>: <code>'vpc','vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>. <p>

@param endpoints Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example <code>key, value</code>: <code>'vpc','vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>. Returns a reference to this object so that method calls can be chained together.

"getterDocumentation" : "Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example <code>key, value</code>: <code>'vpc','vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>. Attempts to modify the collection returned by this method will result in an UnsupportedOperationException.

@return Map containing the Elasticsearch domain endpoints used to submit index and search requests. Example <code>key, value</code>: <code>'vpc','vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com'</code>.

## Returns

A map of compatible Elasticsearch versions returned as part of the GetCompatibleElasticsearchVersions operation.

```
@return Returns a reference to this object so that method calls can be chained together.
```

## Parameters

`compatibleElasticsearchVersions`

A map of compatible Elasticsearch versions returned as part of the GetCompatibleElasticsearchVersions operation.

```
@param compatibleElasticsearchVersions
```

## Documentation

A map of compatible Elasticsearch versions returned as part of the GetCompatibleElasticsearchVersions operation.

Attempts to modify the collection returned by this method will result in an UnsupportedOperationException.

```
@return A map of compatible Elasticsearch versions returned as part of the GetCompatibleElasticsearchVersions operation.

A list of <code><a>UpgradeHistory</a></code> objects corresponding to each Upgrade or Upgrade Eligibility Check performed on a domain returned as part of <code><a>GetUpgradeHistoryResponse</a></code> object. This is a convenience that creates an instance of the <code>List<UpgradeHistory>.Builder</code> avoiding the need to create one manually via <code>List<UpgradeHistory>#builder()</code>. When the <code>Consumer</code> completes, <code>List<UpgradeHistory>.Builder#build()</code> is called immediately and its result is passed to <code>#upgradeHistories(List<UpgradeHistory>)</code>. Returns a reference to this object so that method calls can be chained together.

In a GetUpgradeHistoryResponse object. A list of <code><a>UpgradeHistory</a></code> objects corresponding to each Upgrade or Upgrade Eligibility Check performed on a domain returned as part of <code>GetUpgradeHistoryResponse</code> object. When the <code>Consumer</code> completes, <code>List<UpgradeHistory>.Builder#build()</code> is called immediately and its result is passed to <code>#upgradeHistories(List<UpgradeHistory>)</code>. Returns a reference to this object so that method calls can be chained together.

Objects corresponding to each Upgrade or Upgrade Eligibility Check performed on a domain returned as part of <code>GetUpgradeHistoryResponse</code> object.

Objects corresponding to each Upgrade or Upgrade Eligibility Check performed on a domain returned as part of <code>GetUpgradeHistoryResponse</code> object.

Objects corresponding to each Upgrade or Upgrade Eligibility Check performed on a domain returned as part of <code>GetUpgradeHistoryResponse</code> object.
on a domain returned as part of `<code>`<a>GetUpgradeHistoryResponse</a>`<code>` object.

@return Returns a reference to this object so that method calls can be chained together.

"fluentSetterMethodName" : "upgradeHistories",

When the `@link Consumer` completes, `{@link Integer.Builder#build()}` is called immediately and its result is passed to `{@link #maximumInstanceCount(Integer)}`.

```
@throws RuntimeException if the maximum instance count is not a positive number.
```

### Example

```java
consumer.accept(new Integer.Builder() {
  .maximumInstanceCount(5)
  .build()
}).
```

### Notes

The `maximumInstanceCount` method can be chained together.

```java
consumer.accept(new Integer.Builder()
  .maximumInstanceCount(5)
  .build()
).
```

- `#maximumInstanceCount(Integer)`

### Documentation

Sets the value of the MaximumInstanceCount property for this object.

```java
maximumInstanceCount(Integer maximumInstanceCount)
```

* @param maximumInstanceCount The new value for the MaximumInstanceCount property for this object.
* @return Returns a reference to this object so that method calls can be chained together.

```java
public MaximumInstanceCount withMaximumInstanceCount(Integer maximumInstanceCount)
```

* @param maximumInstanceCount The new value for the MaximumInstanceCount property for this object.
* @return Returns a reference to this object so that method calls can be chained together.

```java
public MaximumInstanceCount withMaximumInstanceCount(java.util.List<Integer> maximumInstanceCount)
```

* @param maximumInstanceCount The new value for the MaximumInstanceCount property for this object.
* @return Returns a reference to this object so that method calls can be chained together.

```java
public MaximumInstanceCount withMaximumInstanceCount(java.util.Map<Integer, Integer> maximumInstanceCount)
```

* @param maximumInstanceCount The new value for the MaximumInstanceCount property for this object.
* @return Returns a reference to this object so that method calls can be chained together.

```java
public MaximumInstanceCount withMaximumInstanceCount(java.util.Set<Integer> maximumInstanceCount)
```

* @param maximumInstanceCount The new value for the MaximumInstanceCount property for this object.
* @return Returns a reference to this object so that method calls can be chained together.

```
```
InstanceLimits represents the list of instance related attributes that are available for given InstanceType. 

Sets the value of the InstanceCountLimits property for this object. This is a convenience that creates an instance of the [InstanceCountLimits.Builder] avoiding the need to create one manually via [InstanceCountLimits#builder()]. When the [Consumer] completes, [InstanceCountLimits.Builder#build()] is called immediately and its result is passed to [InstanceCountLimits(InstanceCountLimits)].

Sets the value of the InstanceCountLimits property for this object. The new value for the InstanceCountLimits property for this object.

Returns a reference to this object so that method calls can be chained together.

Sets the value of the InstanceCountLimits property for this object.

The result of a `ListDomainNames` operation. Contains the names of all Elasticsearch domains owned by this account.

This convenience creates an instance of the `List<DomainInfo>` avoiding the need to create one manually via `List<DomainInfo>#builder()`. When the `List<DomainInfo>.Builder#build()` is called immediately and its result is passed to `List<DomainNames(List<DomainInfo>)`. Returns a reference to this object so that method calls can be chained together.

Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`.

List of Elasticsearch domain names. Returns a reference to this object so that method calls can be chained together.
