If you're deleting the VPC and its associated components, we recommend that you detach the virtual private gateway from the VPC and delete the VPC before deleting the VPN connection. If you believe that the tunnel credentials for your VPN connection have been compromised, you can delete the VPN connection and create a new one that has new keys, without needing to delete the VPC or virtual private gateway. If you create a new VPN connection, you must reconfigure the customer gateway using the new configuration information returned with the new VPN connection ID."

The list of snapshots returned can be modified by specifying snapshot IDs, snapshot owners, or AWS accounts with create volume permissions. If no options are specified, Amazon EC2 returns all snapshots for which you have create volume permissions.

If you specify one or more snapshot IDs, only snapshots that have the specified IDs are returned. If you specify an invalid snapshot ID, an error is returned. If you specify a snapshot ID for which you do not have access, it is not included in the returned results.

If you specify one or more snapshot owners using the <code>OwnerIds</code> option, only snapshots from the specified owners and for which you have access are returned. The results can include the AWS account IDs of the specified owners, <code>amazon</code> for snapshots owned by Amazon, or <code>self</code> for snapshots that you own.

If you specify a list of restorable users, only snapshots with create snapshot permissions for those users are returned. You can specify AWS account IDs (if you own the snapshots), <code>self</code> for snapshots for which you own or have explicit permissions, or <code>all</code> for public snapshots.

If you are describing a long list of snapshots, you can paginate the output to make the list more manageable. The <code>MaxResults</code> parameter sets the maximum number of results returned in a single page. If the list of results exceeds your <code>MaxResults</code> value, then that number of results is returned along with a <code>NextToken</code> value that can be passed to a subsequent <code>DescribeSnapshots</code> request to retrieve the remaining results.

For more information about EBS snapshots, see [Amazon EBS Snapshots](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSSnapshots.html) in the Amazon Elastic Compute Cloud User Guide.

Spot instances are instances that Amazon EC2 launches when the bid price that you specify exceeds the current Spot price. Amazon EC2 periodically sets the Spot price based on available Spot instance capacity and current Spot instance requests. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-requests.html">Spot Instance Requests</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>. You can use <code>DescribeSpotInstanceRequests</code> to find a running Spot instance by examining the response. If the status of the Spot instance is <code>fulfilled</code>, the instance ID appears in the response and contains the identifier of the instance. Alternatively, you can use <code>DescribeInstances</code> with a filter to look for instances where the instance lifecycle is <code>spot</code>. Spot instance requests are deleted 4 hours after they are canceled and their instances are terminated."

    "asyncHandlerType" : "com.amazonaws.handlers.AsyncHandler<DescribeVolumeStatusRequest,
    DescribeVolumeStatusRequestResult>",
    "asyncReturnType" : "DescribeVolumeStatusResult",
    "authenticated" : true,
    "deprecated" : false,
    "documentation" : "<p>Describes the status of the specified volumes. Volume status provides the result of the checks performed on your volumes to determine events that can impair the performance of your volumes. The performance of a volume can be affected if an issue occurs on the volume's underlying host. If the volume's underlying host experiences a power outage or system issue, after the system is restored, there could be data inconsistencies on the volume. Volume events notify you if this occurs. Volume actions notify you if any action needs to be taken in response to the event.</p>
    <p>The <code>DescribeVolumeStatus</code> operation provides the following information about the specified volumes: Status reflects the current status of the volume. The possible values are <code>ok</code>, <code>impaired</code>, <code>warning</code>, or <code>insufficient-data</code>. If all checks pass, the overall status of the volume is <code>ok</code>. If the check fails, the overall status is <code>impaired</code>. If the status is <code>insufficient-data</code>, then the checks may still be taking place on your volume at the time. We recommend that you retry the request. For more information on volume status, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/monitoring-volume-status.html">Monitoring the Status of Your Volumes</a>.</p>
    <p>Events reflect the cause of a
volume status and may require you to take action. For example, if your volume returns an <code>impaired</code> status, then the volume event might be <code>potential-data-inconsistency</code>. This means that your volume has been affected by an issue with the underlying host, has all I/O operations disabled, and may have inconsistent data. </p>

```xml
<ip.Actions>
  <i>Actions</i>: Reflect the actions you may have to take in response to an event. For example, if the status of the volume is <code>impaired</code> and the volume event shows <code>potential-data-inconsistency</code>, then the action shows <code>enable-volume-io</code>. This means that you may want to enable the I/O operations for the volume by calling the <a>EnableVolumeIO</a> action and then check the volume for data consistency. </p>

-<note>
  Volume status is based on the volume status checks, and does not reflect the volume state. Therefore, volume status does not indicate volumes in the <code>error</code> state (for example, when a volume is incapable of accepting I/O.)</note>

  "documentation" : "Retrieves the encrypted administrator password for an instance running Windows.

The Windows password is generated at boot if the EC2Config service plugin, Ec2SetPassword, is enabled. This usually only happens the first time an AMI is launched, and then is automatically disabled. The password is not generated for rebundled AMIs unless Ec2SetPassword is enabled before bundling.

The password is encrypted using the key pair that you specified when you launched the instance. You must provide the corresponding key pair file.

Password generation and encryption takes a few moments. We recommend that you wait up to 15 minutes after launching an instance before trying to retrieve the generated password.

  "documentation" : "<p>Modifies the ID format for the specified resource on a per-region basis. You can specify
that resources should receive longer IDs (17-character IDs) when they are created. The following resource types support longer IDs: <code>instance</code> | <code>reservation</code> | <code>snapshot</code> | <code>volume</code>.

This setting applies to the IAM user who makes the request; it does not apply to the entire AWS account. By default, an IAM user defaults to the same settings as the root user. If you’re using this action as the root user, then these settings apply to the entire account, unless an IAM user explicitly overrides these settings for themselves. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/resource-ids.html">Resource IDs</a> in the Amazon Elastic Compute Cloud User Guide. Resources created with longer IDs are visible to all IAM roles and users, regardless of these settings and provided that they have permission to use the relevant <code>Describe</code> command for the resource type.

By default, all I/O operations for the volume are suspended when the data on the volume is determined to be potentially inconsistent, to prevent undetectable, latent data corruption. The I/O access to the volume can be resumed by first enabling I/O access and then checking the data consistency on your volume. You can change the default behavior to resume I/O operations. We recommend that you change this only for boot volumes or for volumes that are stateless or disposable.

before you can launch an instance from the AMI. For more information about creating AMIs, see </p>
"
Creating Your Own AMIs</p> in the <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/creating-an-ami.html">Amazon Elastic Compute Cloud User Guide</a>.</p> <note> For Amazon EBS-backed instances, <code>CreateImage</code> creates and registers the AMI in a single request, so you don't have to register the AMI yourself.</note> <p>You can also use <code>RegisterImage</code> to create an Amazon EBS-backed Linux AMI from a snapshot of a root device volume. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/Using_LaunchingInstanceFromSnapshot.html">Launching Instance from a Snapshot</a> in the Amazon Elastic Compute Cloud User Guide.</p> <important><p>Some Linux distributions, such as Red Hat Enterprise Linux (RHEL) and SUSE Linux Enterprise Server (SLES), use the EC2 <code>billingProduct</code> code associated with an AMI to verify subscription status for package updates. Creating an AMI from an EBS snapshot does not maintain this billing code, and subsequent instances launched from such an AMI will not be able to connect to package update infrastructure.</p> <p>Similarly, although you can create a Windows AMI from a snapshot, you can't successfully launch an instance from the AMI.</p> <p>To create Windows AMIs or to create AMIs for Linux operating systems that must retain AMI billing codes to work properly, see <a>CreateImage</a>.</p> <important><p>If needed, you can deregister an AMI at any time. Any modifications you make to an AMI backed by an instance store volume invalidates its registration. If you make changes to an image, deregister the previous image and register the new image.</p> <p>You can't register an image where a secondary (non-root) snapshot has AWS Marketplace product codes.</p></important></note>
peering connection request that you initiated, use <a>DeleteVpcPeeringConnection</a>.</p>

<p>Removes one or more ingress rules from a security group. The values that you specify in the revoke request (for example, ports) must match the existing rule's values for the rule to be removed.</p>

<p>Each rule consists of the protocol and the CIDR range or source security group. For the TCP and UDP protocols, you must also specify the destination port or range of ports. For the ICMP protocol, you must also specify the ICMP type and code.</p>

<p>Rule changes are propagated to instances within the security group as quickly as possible. However, a small delay might occur.</p>

<p>Launches the specified number of instances using an AMI for which you have permissions.</p>

<p>You can specify a number of options, or leave the default options. The following rules apply:</p>

<ul>
<li>[EC2-VPC] If you don't specify a subnet ID, we choose a default subnet from your default VPC for you. If you don't have a default VPC, you must specify a subnet ID in the request.</li>
<li>[EC2-Classic] If don't specify an Availability Zone, we choose one for you.</li>
<li>Some instance types must
be launched into a VPC. If you do not have a default VPC, or if you do not specify a subnet ID, the request fails. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-vpc.html#vpc-only-instance-types">Instance Types Available Only in a VPC</a>. If you don't specify this address, we choose one from the IPv4 range of your subnet.</li> <li>Not all instance types support IPv6 addresses. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-types.html">Instance Types</a>.</li> 

If you don't specify a security group ID, we use the default security group. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-network-security.html">Security Groups</a>.</li> <li>If any of the AMIs have a product code attached for which the user has not subscribed, the request fails.</li> <li>To ensure faster instance launches, break up large requests into smaller batches. For example, create 5 separate launch requests for 100 instances each instead of 1 launch request for 500 instances.</li> <li>An instance is ready for you to use when it's in the <code>running</code> state. You can check the state of your instance using <code>DescribeInstances</code>. After launch, you can apply tags to your running instance (requires a resource ID). For more information, see <code>CreateTags</code> and <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/Using_Tags.html">Tagging Your Amazon EC2 Resources</a>.</li> <li>Linux instances have access to the public key of the key pair at boot. You can use this key to provide secure access to the instance. Amazon EC2 public images use this feature to provide secure access without passwords. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-key-pairs.html">Key Pairs</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.</li> <li>For troubleshooting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/Using_InstanceStraightToTerminated.html">What To Do If An Instance Immediately Terminates</a>, and <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/TroubleshootingInstancesConnecting.html">Troubleshooting Connecting to Your Instance</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.</li>

One or more IP addresses to be assigned as a secondary private IP address to the network interface. You can't specify this parameter when also specifying a number of secondary IP addresses. If you don't specify an IP address, Amazon EC2 automatically selects an IP address within the subnet range.

If you don't specify an IP address, Amazon EC2 automatically selects an IP address within the subnet range.

```java
public class PrivateIpAddresses {
    public List<String> getPrivateIpAddresses()
    {
        // Implementation...
    }
}

A set of IP permissions. You can't specify a destination security group and a CIDR IP address range.

```java
public class IpPermissions {
    private List<IpPermission> ipPermissions;

    public IpPermissions(List<IpPermission> ipPermissions) {
        this.ipPermissions = ipPermissions;
    }

    public List<IpPermission> getIpPermissions() {
        return new ArrayList<>(ipPermissions);
    }

    public IpPermissions withIpPermissions(List<IpPermission> ipPermissions) {
        this.ipPermissions = ipPermissions;
        return this;
    }
}
```

  "documentation" : "<p>The full ARN of the AWS Key Management Service (AWS KMS) CMK to use when encrypting the snapshots of an image during a copy operation. This parameter is only required if you want to use a non-default CMK; if this parameter is not specified, the default CMK for EBS is used. The ARN contains the <code>arn:aws:kms</code> namespace, followed by the region of the CMK, the AWS account ID of the CMK owner, the <code>key</code> namespace, and then the CMK ID. For example, arn:aws:kms:<i>us-east-1</i>:<i>012345678910</i>:<i>key</i>/<i>abcd1234-a123-456a-a12b-a123b4cd56ef</i>. The specified CMK must exist in the region that the snapshot is being copied to. If a <code>KmsKeyId</code> is specified, the <code>Encrypted</code> flag must also be set.</p>",

the snapshot copy to the regional endpoint that you send the HTTP request to, such as `<code>ec2.us-east-1.amazonaws.com</code>` (in the AWS CLI, this is specified with the `<code>--region</code>` parameter or the default region in your AWS configuration file). 

```java
@note
@param destinationRegion
The destination region to use in the `<code>PresignedUrl</code>` parameter of a snapshot copy operation. This parameter is only valid for specifying the destination region in a `<code>PresignedUrl</code>` parameter, where it is required.

```java
</note>

```java
</p><note>
CopySnapshot sends the snapshot copy to the regional endpoint that you send the HTTP request to, such as `<code>ec2.us-east-1.amazonaws.com</code>` (in the AWS CLI, this is specified with the `<code>--region</code>` parameter or the default region in your AWS configuration file). 

```java
@note

The pre-singed URL that facilitates copying an encrypted snapshot. This parameter is only required when copying an encrypted snapshot with the Amazon EC2 Query API; it is available as an optional parameter in all other cases. The `PresignedUrl` should use the snapshot source endpoint, the `CopySnapshot` action, and include the `SourceRegion`, `SourceSnapshotId`, and `DestinationRegion` parameters. The `PresignedUrl` must be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic that is described in [Authenticating Requests by Using Query Parameters (AWS Signature Version 4)](http://docs.aws.amazon.com/AmazonS3/latest/API/sigv4-query-string-auth.html) in the Amazon Simple Storage Service API Reference. An invalid or improperly signed `PresignedUrl` will cause the copy operation to fail asynchronously, and the snapshot will move to an `error` state.

```

Encryption in the Amazon Elastic Compute Cloud User Guide.

The full ARN of the AWS Key Management Service (AWS KMS) CMK to use when creating the snapshot copy. This parameter is only required if you want to use a non-default CMK; if this parameter is not specified, the default CMK for EBS is used. The ARN contains the namespace, followed by the region of the CMK, the AWS account ID of the CMK owner, and then the CMK ID. For example, arn:aws:kms::<i>us-east-1</i>:<i>012345678910</i>:<i>key</i>:<i>abcd1234-a123-456a-a12b-a123b4cd56ef</i>

The specified CMK must exist in the region that the snapshot is being copied to. If a <code>KmsKeyId</code> is specified, the <code>Encrypted</code> flag must also be set.

```java
@n@return Returns a reference to this object so that method calls can be chained together.

The full ARN of the AWS Key Management Service (AWS KMS) CMK to use when creating the snapshot copy. This parameter is only required if you want to use a non-default CMK; if this parameter is not specified, the default CMK for EBS is used. The ARN contains the namespace, followed by the region of the CMK, the AWS account ID of the CMK owner, and then the CMK ID. </p> */"
region</code> parameter or the default region in your AWS configuration file).</p>

```java
public void copySnapshot(String sourceRegion, String destinationRegion, boolean encrypted) {
    // Copy the snapshot using the source region and destination region.
    // Check if the destination region is specified.
    // Create a presigned URL for the destination region.
    // Specify the encryption flag.
    // Return a reference for chaining.
}
```

Notes:
- The destination region parameter is only valid for specifying the destination region in a snapshot copy operation.
- The presigned URL parameter can be used to copy the snapshot to the regional endpoint that you send the HTTP request to.

Reference:
- Amazon EBS Encryption in the Amazon Elastic Compute Cloud User Guide.
destination snapshot should be encrypted. You can encrypt a copy of an unencrypted snapshot using this flag, but you cannot use it to create an unencrypted copy from an encrypted snapshot. Your default CMK for EBS is used unless a non-default AWS Key Management Service (AWS KMS) CMK is specified with <code>KmsKeyId</code>. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSEncryption.html">Amazon EBS Encryption</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.

The <code>PresignedUrl</code> should use the snapshot source endpoint, the <code>CopySnapshot</code> action, and include the <code>SourceRegion</code>, <code>SourceSnapshotId</code>, and <code>DestinationRegion</code> parameters. The <code>PresignedUrl</code> must be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic that is described in <a href="http://docs.aws.amazon.com/AmazonS3/latest/API/sigv4-query-string-auth.html">Authenticating Requests by Using Query Parameters (AWS Signature Version 4)</a> in the <i>Amazon Simple Storage Service API Reference</i>. An invalid or improperly signed <code>PresignedUrl</code> will cause the copy operation to fail asynchronously, and the snapshot will move to an <code>error</code> state.

**Documentation**

The IDs of one or more security groups.

```java
public void setGroups(java.util.Collection<String> groups) {
    // Method implementation
}
```

**NOTE:** This method appends the values to the existing list (if any). Use `@link #setGroups(java.util.Collection)` or `@link #withGroups(java.util.Collection)` if you want to override the existing values.

```java
public String[] getGroups() {
    return new String[] {
        // Method implementation
    };
}
```

**Return**

Returns a reference to this object so that method calls can be chained together.

```java
public void withGroups(java.util.Collection<String> groups) {
    // Method implementation
}
```

**See also**

- `@link #setGroups(java.util.Collection)` - Method that sets the IDs of one or more security groups.
- `@link #withGroups(java.util.Collection)` - Method that overrides the existing values.
- `@link #getGroups()` - Method that retrieves the IDs of one or more security groups.
- `@link #withGroups(java.util.Collection)` - Method that returns a reference to this object so that method calls can be chained together.
