This method appends the values to the existing list (if any). Use {@link #setSecurityGroups(java.util.Collection)} or
@link #withSecurityGroups(java.util.Collection) if you want to override the existing values.

**Parameter:**

- `securityGroups` (class: java.util.List<GroupIdentifier>): One or more security groups for the instance.

**Return:**

- `variable`: a reference to this object so that method calls can be chained together.

**Documentation:**

One or more security groups for the instance.

**Variable:**

- `variableDeclarationType`: com.amazonaws.internal.SdkInternalList<GroupIdentifier>
- `variableName`: securityGroups
- `variableType`: java.util.List<GroupIdentifier>
- `documentation`: Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform NAT. For more information, see [NAT Instances](http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html) in the Amazon Virtual Private Cloud User Guide.

**Fluent Setter:**

- `c2jName`: SourceDestCheck
- `c2jShape`: Boolean
- `deprecated`: false
- `documentation`: Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform NAT. For more information, see [NAT Instances](http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html) in the Amazon Virtual Private Cloud User Guide.

- `getterDocumentation`: Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform NAT. For more information, see [NAT Instances](http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html) in the Amazon Virtual Private Cloud User Guide.

- `fluentSetterMethodName`: withSourceDestCheck
- `fluentSetterDocumentation`: Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform NAT. For more information, see [NAT Instances](http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html) in the Amazon Virtual Private Cloud User Guide.

"varargSetterDocumentation" : "/**<p>Indicates whether source/destination checking is enabled. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT.*/

In param sourceDestCheck Indicates
whether source/destination checking is enabled. A value of `<code>true</code>` means checking is enabled, and `<code>false</code>` means checking is disabled. This value must be `<code>false</code>` for a NAT instance to perform NAT.

```java
@Override
public void instantiate(String instanceId) throws Exception {
    if (sourceDestCheck) {
        // Perform source/destination checking...
    } else {
        // Perform NAT...
    }
}
```

The `sourceDestCheck` flag is useful for scenarios where you need to control the way traffic is routed. It's recommended to keep it disabled for a NAT instance to perform NAT.

```java
public void start() throws Exception {
    if (isNAT) {
        // Start NAT process...
    } else {
        // Start source/destination checking...
    }
}
```

In summary, enabling source/destination checking adds an additional layer of security by ensuring that traffic is only processed if it matches the configured rules. Disabling it is generally sufficient for a NAT setup to function correctly.

If set to `<code>true</code>`, the interface is deleted when the instance is terminated. You can specify `<code>true</code>` only if creating a new network interface when launching an instance. 

You cannot specify this option if you're launching more than one instance in a `<a href="/a">RunInstances</a>` request.

```
if (deleteOnTermination)
    deleteOnTermination = true;
```

The `deleteOnTermination` option allows you to specify whether the network interface should be deleted when the instance is terminated. This can be useful for cleaning up resources when an instance is no longer needed. By default, if you do not specify `deleteOnTermination`, it will be set to `false`.

When creating a new network interface, you can specify `deleteOnTermination` only if you're launching a single instance. If you're launching multiple instances, you cannot specify `deleteOnTermination`.

```
private IpAddresses privateIpAddresses = new IpAddresses();
```

The `privateIpAddresses` option allows you to specify one or more private IPv4 addresses to assign to the network interface. Only one private IPv4 address can be designated as primary. You cannot specify this option if you're launching more than one instance in a `<a href="/a">RunInstances</a>` request.

```
private IpAddresses privateIpAddresses = new IpAddresses();
```

The `privateIpAddresses` option is a list of `IpAddress` objects. You can specify multiple private IPv4 addresses to assign to the network interface. The primary address is the one that is designated as primary. You cannot specify this option if you're launching more than one instance in a `<a href="/a">RunInstances</a>` request.
Returns a reference to this object so that method calls can be chained together.*"/

One or more private IPv4 addresses to assign to the network interface. Only one private IPv4 address can be designated as primary. You cannot specify this option if you're launching more than one instance in a `<a>RunInstances</a> request.

**NOTE:** This method appends the values to the existing list (if any). Use { @link #setPrivateIpAddresses(java.util.Collection) } or { @link #withPrivateIpAddresses(java.util.Collection) } if you want to override the existing values.

```java
@Param privateIpAddresses One or more private IPv4 addresses to assign to the network interface. Only one private IPv4 address can be designated as primary. You cannot specify this option if you're launching more than one instance in a `<a>RunInstances</a> request.
```

```
privateIpAddresses:
```

```
}.
```

```
SecondaryPrivateIpAddressCount:
```

```
public Integer getSecondaryPrivateIpAddressCount();
```

```
public SecondaryPrivateIpAddressCount withSecondaryPrivateIpAddressCount(Integer secondaryPrivateIpAddressCount);
```

```
```
**setterDocumentation**: 

```xml
/**
 * The number of secondary private IPv4 addresses. You can't specify this option and specify more than one private IP address using the private IP addresses option. You cannot specify this option if you're launching more than one instance in a `<a>RunInstances</a>` request.
 * @param secondaryPrivateIpAddressCount The number of secondary private IPv4 addresses. You can't specify this option if you're launching more than one instance in a `<a>RunInstances</a>` request.
 * @return Returns a reference to this object so that method calls can be chained together.
 */
```

**variable**:

@return Returns a reference to this object so that method calls can be chained.
*/"}
The IP protocol name (\texttt{tcp}, \texttt{udp}, \texttt{icmp}) or number (see \url{http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml}) Protocol Numbers. Use \texttt{-1} to specify all protocols. When authorizing security group rules, specifying \texttt{-1} or a protocol number other than \texttt{tcp}, \texttt{udp}, or \texttt{icmp} allows traffic on all ports, regardless of any port range you specify. For \texttt{tcp}, \texttt{udp}, and \texttt{icmp}, you must specify a port range. For \texttt{-1} (ICMPv6), you can optionally specify a port range; if you don't, traffic for all types and codes is allowed when authorizing rules.

```java
public class SecurityGroupRule {
    private String fromPort;
    private String toPort;
    private String cidrBlock;
    private String ipProtocol;
}
```

Methods:

- **getFromPort()**: Returns the start of port range for the TCP and UDP protocols, or an ICMP/ICMPv6 type number. A value of \texttt{-1} indicates all ICMP/ICMPv6 types.
- **withFromPort(int fromPort)**: Returns a reference to this object so that method calls can be chained together.

```java
public SecurityGroupRule withFromPort(int fromPort) {
    this.fromPort = String.valueOf(fromPort);
    return this;
}
```

In an <a>AuthorizeSecurityGroupEgress</a> request, this is the AWS service that you want to access

Open Source Used In Virtualized Voice Browser 12.6(1) 24077"
through a VPC endpoint from instances associated with the security group. 

**NOTE:** This method appends the values to the existing list (if any). Use @link #setPrefixListIds(java.util.Collection) or @link #withPrefixListIds(java.util.Collection) if you want to override the existing values.

### Method chaining

When using the fluent API, you can chain calls together like this:

```java
AutoscalingGroupSecurityGroupEgressUpdatedWithPrefixListIds
  .prefixListIds(PREFIX_LIST_ID_1, PREFIX_LIST_ID_2)
```

This will add `PREFIX_LIST_ID_1` and `PREFIX_LIST_ID_2` to the list of prefix list IDs, replacing any existing entries.

### Example

Here is an example of how to use the fluent API to set prefix list IDs:

```java
AutoscalingGroupSecurityGroupEgressUpdatedWithPrefixListIds
  .prefixListIds(PREFIX_LIST_ID_1, PREFIX_LIST_ID_2)
```

This will add `PREFIX_LIST_ID_1` and `PREFIX_LIST_ID_2` to the list of prefix list IDs, replacing any existing entries.

### Other related methods

- `withPrefixListIds(java.util.Collection)`: This method overrides the existing values with the provided prefix list IDs.
- `setPrefixListIds(java.util.Collection)`: This method sets the prefix list IDs.

### Related APIs

- `AuthorizeSecurityGroupEgress`: This operation allows you to control which AWS services can access your VPC through a VPC endpoint.
- `RevokeSecurityGroupEgress`: This operation removes the ability for an AWS service to access your VPC through a VPC endpoint.
- `DescribeSecurityGroups`: This operation returns information about the security groups that are associated with your VPC.
@param toPort The end of port range for the TCP and UDP protocols, or an ICMP/ICMPv6 code. A value of <code>-1</code> indicates all ICMP/ICMPv6 codes for the specified ICMP type.

This method appends the values to the existing list (if any). Use {@link #setBlockDeviceMappings(java.util.Collection)} or
{@link #withBlockDeviceMappings(java.util.Collection)} if you want to override the existing values.

To add instance store volumes to an Amazon EBS-backed instance, you must add them when you launch the instance.
For more information, see the Amazon Elastic Compute Cloud User Guide.

```java
public DeleteOnTermination withBlockDeviceMappings(InstanceBlockDeviceMappingSpecification... blockDeviceMappings)
```

### Documentation

**DeleteOnTermination**

Specifies whether source/destination checking is enabled. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT.

```java
public DeleteOnTermination withSourceDestCheck(Boolean sourceDestCheck)
```

### Documentation

Specifies whether source/destination checking is enabled. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT.

```java
public DeleteOnTermination withSourceDestCheck(Boolean sourceDestCheck)
```

### Documentation

Specifies whether source/destination checking is enabled. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT.

```java
public DeleteOnTermination withSourceDestCheck(Boolean sourceDestCheck)
```

### Documentation

Specifies whether source/destination checking is enabled. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT.

```java

If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version <code>2016-11-15</code> or later of the Amazon EC2 API.

```java
Specify true to indicate that network interfaces created in the specified subnet should be assigned an IPv6 address. This includes a network interface that's created when launching an instance into the subnet (the instance therefore receives an IPv6 address).
```

```java
If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version <code>2016-11-15</code> or later of the Amazon EC2 API.
```
**AssignIpv6AddressOnCreation**

Specify `true` to indicate that network interfaces created in the specified subnet should be assigned an IPv6 address. This includes a network interface that's created when launching an instance into the subnet (the instance therefore receives an IPv6 address).

*If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version `2016-11-15` or later of the Amazon EC2 API.*

```java
@Param
assignIpv6AddressOnCreation
```

Returns a reference to this object so that method calls can be chained together.

```java
public AssignIpv6AddressOnCreation withAssignIpv6AddressOnCreation(Boolean assignIpv6AddressOnCreation) {
    this.assignIpv6AddressOnCreation = assignIpv6AddressOnCreation;
    return this;
}
```

This method is guaranteed to never return `null`. You can set it to `null` only if you initially called this method with `null`.

---

**documentation**: 

> Specify `true` to indicate that network interfaces created in the specified subnet should be assigned an IPv6 address. This includes a network interface that's created when launching an instance into the subnet (the instance therefore receives an IPv6 address).

*If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version `2016-11-15` or later of the Amazon EC2 API.*

### Variables

#### AssignIpv6AddressOnCreation

```java
private Boolean assignIpv6AddressOnCreation;
```
If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version <code>2016-11-15</code> or later of the Amazon EC2 API.

@returns Returns a reference to this object so that method calls can be chained together.

### AssignIpv6AddressOnCreation

Specify <code>true</code> to indicate that network interfaces created in the specified subnet should be assigned an IPv6 address. This includes a network interface that's created when launching an instance into the subnet (the instance therefore receives an IPv6 address). If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version <code>2016-11-15</code> or later of the Amazon EC2 API.

Specify <code>true</code> to indicate that network interfaces created in the specified subnet should be assigned an IPv6 address. This includes a network interface that's created when launching an instance into the subnet (the instance therefore receives an IPv6 address). If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version <code>2016-11-15</code> or later of the Amazon EC2 API.

If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version `<code>2016-11-15</code>` or later of the Amazon EC2 API.*
