**DeleteOnTermination**

Indicates whether the network interface is deleted when the instance is terminated.

```java
public class DeleteOnTermination {

    private Boolean deleteOnTermination;

    public DeleteOnTermination setDeleteOnTermination(Boolean deleteOnTermination) {
        this.deleteOnTermination = deleteOnTermination;
        return this;
    }

    public Boolean getDeleteOnTermination() {
        return deleteOnTermination;
    }
}
```

---

```
Indicates whether the network interface is deleted when the instance is terminated.

@Param deleteOnTermination Indicates whether the network interface is deleted when the instance is terminated.

@Returns Returns a reference to this object so that method calls can be chained together.

If true, enables a local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

```java
@Param
@AllowDnsResolutionFromRemoteVpc

public boolean getAllowDnsResolutionFromRemoteVpc()
```

If true, enables a local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

```java
public void setAllowDnsResolutionFromRemoteVpc(boolean value)
```

Documentation:

The `allowDnsResolutionFromRemoteVpc` variable is a boolean that, when set to true, enables a local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

*/
"}
host count). If the total upfront cost is greater than the specified price limit, the request will fail. This is used to ensure that the purchase does not exceed the expected upfront cost of the purchase. At this time, the only supported currency is <code>USD</code>. For example, to indicate a limit price of USD 100, specify 100.00.

```java
public class OfferingsRequest {
    // Fields and methods...

    @Override
    public OfferingsRequest withLimitPrice(Double limitPrice) {
        // Implementation...
        return this;
    }
}
```

The specified limit is checked against the total upfront cost of the reservation (calculated as the offering's upfront cost multiplied by the host count). If the total upfront cost is greater than the specified price limit, the request will fail. This is used to ensure that the purchase does not exceed the expected upfront cost of the purchase. At this time, the only supported currency is <code>USD</code>. For example, to indicate a limit price of USD 100, specify 100.00.

The ID of an Internet gateway or virtual private gateway.

@returns A reference to this object so that method calls can be chained together.

In the constructor:

public GatewayId(String gatewayId) {
    // implementation
}

The class methods

public GatewayId withGatewayId(String gatewayId) {
    this.gatewayId = gatewayId;
    return this;
}

public String getGatewayId() {
    return gatewayId;
}

public void setGatewayId(String gatewayId) {
    this.gatewayId = gatewayId;
}

The documentation of the model

**GatewayId**

- **gatewayId** (String)
  - The ID of an Internet gateway or virtual private gateway.
  - **Required**: true
  - **Type**: string
  - **Location**: Query
  - **Marshalling**: optional
  - **Unmarshalling**: optional

Idempotent: false

List: false

Map: false

Simple: true

Vararg: false

Additional Marshalling: false

Additional Unmarshalling: false

Flattened: false

Greedy: false

Header: false

Is payload: false

Is streaming: false

Location: Query

Marshall Location Name: gatewayId

QueryString: false

StatusCode: false

Unmarshall Location Name: gatewayId

Uri: false

Vararg Setter Documentation:

**GatewayId**

- **gatewayId** (String)
  - The ID of an Internet gateway or virtual private gateway.
  - **Required**: true
  - **Type**: string

Idempotent Token: false

List Model: false

Map Model: false

Simple Type: String

Variable Setter Type: String

The user-specified name for a logical grouping of bids. When you specify an Availability Zone group in a Spot Instance request, all Spot instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not.

The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active.

If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group.

Default: Instances are launched in any available Availability Zone.

@availabilityZoneGroup The user-specified name for a logical grouping of bids.

When you specify an Availability Zone group in a Spot Instance request, all Spot instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not.

The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active.

If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group.

Default: Instances are launched in any available Availability Zone.

At this time, the only supported currency is `USD`.

```java
// Set the currency code
public ReservedInstanceLimitPrice setCurrencyCode(String currencyCode) {
    this.currencyCode = currencyCode;
    return this;
}
```

This method sets the currency code for the `ReservedInstanceLimitPrice` object. The `currencyCode` parameter is a `String` that represents the currency in which the limit price is specified. At this time, the only supported currency is `USD`. The method returns a reference to the current object so that method calls can be chained together.

```java
// Get the currency code
public String getCurrencyCode() {
    return currencyCode;
}
```

This method retrieves the currency code that was set using the `setCurrencyCode` method. The method returns the current currency code as a `String`. The currency code represents the currency in which the limit price is specified. At this time, the only supported currency is `USD`.

This method appends the values to the existing list (if any). Use {@link #setPriceSchedules(java.util.Collection)} or {@link #withPriceSchedules(java.util.Collection)} if you want to override the existing values.

```
@parameter
public void setPriceSchedules(List<PriceSchedule> priceSchedules)
```

The price of the Reserved Instance listing.

```
@returns
public ReservedInstances returns
```

```
@returns
public String getReservedInstancesId
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns
public String getReservedInstancesId()
```

The ID of the Reserved Instance.

```
@returns

possible to perform an exchange.

```java
public static Class<OfferingClassType> getOfferingClassType() {
    return OfferingClassType.class;
}
```

### Setter Method:

```java
public static void setOfferingClass(String offeringClass) {
    OfferingClassType offeringClassType = OfferingClassType.valueOf(offeringClass);
    offeringClassType.setOfferingClass(offeringClass);
}
```

### Getter Method:

```java
public static String getOfferingClass() {
    OfferingClassType offeringClassType = OfferingClassType.convertible;
    return offeringClassType.getOfferingClass();
}
```

### Marshalling and Unmarshalling:

- **Marshalling**:
  - `marshallingType`: `OfferingClassType`
  - `marshallingLocationName`: `OfferingClass`

- **Unmarshalling**:
  - `unmarshallingType`: `OfferingClassType`
  - `unmarshallingLocationName`: `offeringClass`

### Additional Marshalling Path:

- `additionalMarshallingPath`: `null`

### Additional Unmarshalling Path:

- `additionalUnmarshallingPath`: `null`

### Idempotency Token:

- `idempotencyToken`: `true`

### List Model:

- `list`: `false`

### Map Model:

- `map`: `false`
If `<code>convertible</code>` it can be exchanged for Reserved Instances of the same or higher monetary value, with different configurations. If `<code>standard</code>`, it is not possible to perform an exchange.

```java
/**
 * If `<code>convertible</code>` it can be exchanged for Reserved Instances of the same or higher monetary value, with different configurations. If `<code>standard</code>`, it is not possible to perform an exchange.
 */

The route was propagated by route propagation.

The route was automatically created when the route table was created.

The route was manually added to the route table.

The route was propagated by route propagation.

Describes how the route was created.

The route was automatically created when the route table was created.

The route was manually added to the route table.

The route was propagated by route propagation.

Describes how the route was created.

The route was automatically created when the route table was created.

The route was manually added to the route table.

The route was propagated by route propagation.

Describes how the route was created.

The JSON object contains the following properties:

- `http`: Contains nested properties like `additionalMarshallingPath`, `additionalUnmarshallingPath`, `flattened`, `greedy`, `header`, `isPayload`, `isStreaming`, `location`, `marshallLocationName`, `queryString`, `statusCode`, `unmarshallLocationName`, `uri`.

- `idempotencyToken`: false

- `list`: false

- `listModel`: null

- `map`: false

- `mapModel`: null

- `name`: "Member"

- `setterDocumentation`: 

  ```
  /**
  * @param member */
  ```

- `setterMethodName`: "setMember"

- `setterModel`: 

  ```
  {
    "variableDeclarationType": "InstanceNetworkInterfaceSpecification",
    "variableName": "member",
    "variableType": "InstanceNetworkInterfaceSpecification",
    "documentation": "",
    "simpleType": "InstanceNetworkInterfaceSpecification",
    "variableSetterType": "InstanceNetworkInterfaceSpecification"
  }
  ```

- `simple`: false

- `varargSetterDocumentation`: 

  ```
  /**
  * @param member
  * @return Returns a reference to this object so that method calls can be chained together.*/
  ```

- `variable`: 

  ```
  {
    "variableDeclarationType": "InstanceNetworkInterfaceSpecification",
    "variableName": "member",
    "variableType": "InstanceNetworkInterfaceSpecification",
    "documentation": "",
    "simpleType": "InstanceNetworkInterfaceSpecification",
    "variableSetterType": "InstanceNetworkInterfaceSpecification"
  }
  ```

- `xmlNameSpaceUri`: null

- `memberLocationName`: "item"

- `memberType`: "InstanceNetworkInterfaceSpecification"

- `map`: false

- `marshallNonAutoConstructedEmptyLists`: false
