### Variable

**variable**

- **variableDeclarationType**: String
- **variableName**: volumeType
- **variableType**: String
- **documentation**: The volume type. <code>gp2</code> for General Purpose SSD, <code>io1</code> for Provisioned IOPS SSD, Throughput Optimized HDD for <code>st1</code>, Cold HDD for <code>sc1</code>, or <code>standard</code> for Magnetic. Default: <code>standard</code>

### Iops

- **c2jName**: Iops
- **c2jShape**: Integer
- **deprecated**: false
- **documentation**: The number of I/O operations per second (IOPS) that the volume supports. For <code>io1</code> volumes, this represents the number of IOPS that are provisioned for the volume. For <code>gp2</code> volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about <code>gp2</code> baseline performance, I/O credits, and bursting, see [Amazon EBS Volume Types](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html) in the Amazon Elastic Compute Cloud User Guide. Constraint: Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes. Condition: This parameter is required for requests to create <code>io1</code> volumes; it is not used in requests to create <code>gp2</code>, <code>st1</code>, <code>sc1</code>, or <code>standard</code> volumes.

### Fluent Setter Documentation

The number of I/O operations per second (IOPS) that the volume supports. For <code>io1</code> volumes, this represents the number of IOPS that are provisioned for the volume. For <code>gp2</code> volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about <code>gp2</code> baseline performance, I/O credits, and bursting, see [Amazon EBS Volume Types](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html) in the Amazon Elastic Compute Cloud User Guide. Constraint: Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes. Condition: This parameter is required for requests to create <code>io1</code> volumes; it is not used in requests to create <code>gp2</code>, <code>st1</code>, <code>sc1</code>, or <code>standard</code> volumes. For <code>io1</code> volumes, this represents the number of IOPS that are provisioned for the volume. For <code>gp2</code> volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about <code>gp2</code> baseline performance, I/O credits, and bursting, see [Amazon EBS Volume Types](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html) in the Amazon Elastic Compute Cloud User Guide. Constraint: Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes.
This parameter is required for requests to create <code>io1</code>volumes; it is not used in requests to create
<code>gp2</code>, <code>st1</code>, <code>sc1</code>, or <code>standard</code> volumes.

   * credits for bursting. For more information about <code>gp2</code> baseline performance, I/O credits, and bursting,
   * Volume Types</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.</p> <p>Constraint: Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes.

   <p>Condition: This parameter is required for requests to create <code>io1</code>volumes; it is not used in requests to create
   <code>gp2</code>, <code>st1</code>, <code>sc1</code>, or <code>standard</code> volumes.*/
```
The number of I/O operations per second (IOPS) that the volume supports. For io1 volumes, this represents the number of IOPS that are provisioned for the volume. For <code>gp2</code> volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about <code>gp2</code> baseline performance, I/O credits, and bursting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html">Amazon EBS Volume Types</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.</p>

**Constraint:**
- Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes.

**Condition:**
- This parameter is required for requests to create <code>io1</code> volumes; it is not used in requests to create <code>gp2</code>, <code>st1</code>, <code>sc1</code>, or <code>standard</code> volumes.

```java
@param iops The number of I/O operations per second (IOPS) that the volume supports. For io1 volumes, this represents the number of IOPS that are provisioned for the volume. For <code>gp2</code> volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about <code>gp2</code> baseline performance, I/O credits, and bursting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html">Amazon EBS Volume Types</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.</p>

**Constraint:**
- Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes.

**Condition:**
- This parameter is required for requests to create <code>io1</code> volumes; it is not used in requests to create <code>gp2</code>, <code>st1</code>, <code>sc1</code>, or <code>standard</code> volumes.

```return

```java
public boolean isEbsOptimized() {
    return EbsOptimized;
}
```

**@return** Returns a reference to this object so that method calls can be chained together.*"*/

```
// Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Default: false

```java
public void setEbsOptimized(boolean ebsOptimized) {
    this.ebsOptimized = ebsOptimized;
}
```

**@param** ebsOptimized Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Default: false

```java
public Boolean getEbsOptimized() {
    return EbsOptimized;
}
```

**@return** Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Default: false

```java
public static class EbsOptimized {
    private static final long serialVersionUID = 1L;
    private boolean ebsOptimized;

    public EbsOptimized() {
        this.ebsOptimized = false;
    }

    public boolean isEbsOptimized() {
        return this.ebsOptimized;
    }

    public void setEbsOptimized(boolean ebsOptimized) {
        this.ebsOptimized = ebsOptimized;
    }

    public Boolean getEbsOptimized() {
        return this.ebsOptimized;
    }

    @Override
    public boolean equals(Object obj) {
        if (obj instanceof EbsOptimized) {
            EbsOptimized other = (EbsOptimized) obj;
            return this.ebsOptimized == other.ebsOptimized;
        }
        return false;
    }

    @Override
    public int hashCode() {
        return Objects.hash(ebsOptimized);
    }
}
```

**Note:**

- This class is a representation of the `EbsOptimized` parameter in the AWS SDK for Java. It includes methods to set and get the `ebsOptimized` attribute, which indicates whether the instances are optimized for EBS I/O.
- The `equals` and `hashCode` methods ensure proper comparison and hashing of instances of this class.

**Example Usage:**

```java
EbsOptimized ebsOptimized = new EbsOptimized();
ebsOptimized.setEbsOptimized(true);
```

This example demonstrates setting the `ebsOptimized` attribute to `true` for an instance.
Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Default: false

@ebsOptimized Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Default: false

"simple" : true,
of one or more security groups.

```java
@Retention(RetentionPolicy.RUNTIME)
public @interface SecurityGroupReference {
    String value();
    String prefix();
    String delimiter();
    boolean override();
    boolean autoCreate();
}
```

The IDs of one or more security groups.

```java
public List<String> getGroups();
```

Returns a reference to this object so that method calls can be chained together.

```java
public SecurityGroupReference withGroups(String... groups)
```

The IDs of one or more security groups.

```java
public SecurityGroupReference withGroups(List<String> groups)
```

Returns a reference to this object so that method calls can be chained together.

```java
public List<String> getGroupList();
```

The IDs of one or more security groups.

```java
public SecurityGroupReference withGroupList(List<String> groupList)
```

Returns a reference to this object so that method calls can be chained together.

```java
public String getGroupName();
```

The name of this security group.

```java
public SecurityGroupReference withGroupName(String name)
```

Returns a reference to this object so that method calls can be chained together.

**ClientToken**

A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see [Ensuring Idempotency](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html).

```java
public void setClientToken(String clientToken) {
    // Set the clientToken
}

// Get the clientToken
public String getClientToken() {
    // Get the clientToken
}
```

### setterDocumentation

> A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see [Ensuring Idempotency](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html).

Information about the launch specifications for the Spot fleet request.

**NOTE:** This method appends the values to the existing list (if any). Use [@link #setLaunchSpecifications(java.util.Collection)] or [@link #withLaunchSpecifications(java.util.Collection)] if you want to override the existing values.

```java
public void varargSetterMethod(SpotFleetLaunchSpecification... launchSpecifications) {
    this.launchSpecifications.addAll(Arrays.asList(launchSpecifications));
}
```

A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html">Ensuring Idempotency</a>.

### Fluent Setter Documentation

A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html">Ensuring Idempotency</a>.

```java
@Param
@Fluent
public String getClientToken();
```

### Getter Documentation

A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html">Ensuring Idempotency</a>.

```java
public String getClientToken();
```

### Fluent Setter Method Name

`getClientToken`

### Getter Method Name

`getClientToken`
A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see Ensuring Idempotency.

```java
@get
public String getClientToken();
```

```java
public void setClientToken(String clientToken);
```

A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see Ensuring Idempotency.

```java
public void withExcessCapacityTerminationPolicy(ExcessCapacityTerminationPolicy excessCapacityTerminationPolicy);
```

Indicates whether running Spot instances should be terminated if the target capacity of the Spot fleet request is decreased below the current size of the Spot fleet.

```java
public void withExcessCapacityTerminationPolicy(ExcessCapacityTerminationPolicy excessCapacityTerminationPolicy);
```

Indicates whether running Spot instances should be terminated if the target capacity of the Spot fleet request is decreased below the current size of the Spot fleet.

- `<code>Server.InsufficientInstanceCapacity</code>`: There was insufficient instance capacity to satisfy the launch request.

- `<code>Server.ScheduledStop</code>`: The instance was stopped due to a scheduled retirement.

- `<code>Server.SpotInstanceTermination</code>`: A Spot instance was terminated due to an increase in the market price.

- `<code>Client.InternalError</code>`: A client error caused the instance to terminate on launch.

- `<code>Client.InstanceInitiatedShutdown</code>`: The instance was shut down using the `<code>shutdown -h</code>` command from the instance.

- `<code>Client.UserInitiatedShutdown</code>`: The instance was shut down using the Amazon EC2 API.

- `<code>Client.VolumeLimitExceeded</code>`: The limit on the number of EBS volumes or total storage was exceeded. Decrease usage or request an increase in your limits.

- `<code>Client.InvalidSnapshot.NotFound</code>`: The specified snapshot was not found.

**Tags**

The `Tags` object represents any tags assigned to the subnet. The tags should be provided in the `tags` parameter as a list of `Tag` objects.

### Setter Documentation

**setTags**

```java
@Basic
@Setter
public void setTags(java.util.Collection<Tag> tags) {
    this.tags.addAll(tags);
}
```

**withTags**

```java
@Basic
@With
public Tags withTags(java.util.Collection<Tag> tags) {
    this.tags.addAll(tags);
    return this;
}
```

### Vararg Setter Documentation

**withTags**

```java
@Basic
@With
public Tags withTags(java.util.Collection<Tag>... tags) {
    this.tags.addAll(Arrays.asList(tags));
    return this;
}
```

### Description

- **Any tags assigned to the subnet.**
- **Note:** This method appends the values to the existing list (if any). Use `withTags(java.util.Collection)` or `withTags(java.util.Collection)` if you want to override the existing values.
- **Returns:** A reference to the object so that method calls can be chained together.

### Examples

**Set Tags Manually**

```java
Set<Tag> tags = new LinkedHashSet<>();
tags.add(new Tag("Key", "Value"));
Tags subnetTags = subnet.setTags(tags);
```

**Set Tags with Tags Method**

```java
Set<Tag> tags = new LinkedHashSet<>();
tags.add(new Tag("Key", "Value"));
subnet.withTags(tags);
```

**Set Tags with Varargs**

```java
Set<Tag> tags = new LinkedHashSet<>();
tags.add(new Tag("Key", "Value"));
subnet.withTags(tags.toArray(new Tag[0]));

encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

```java
@JsonProperty("data")
public String getData() {
    return data;
}
```

If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

```java
public void setData(String data) {
    this.data = data;
}
```

The user data. If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

```java
public void setUserData(UserData userData) {
    this.userData = userData;
}
```

Returns a reference to this object so that method calls can be chained together. If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

```java

For Provisioned IOPS SSD volumes, this represents the number of IOPS that are provisioned for the volume. For General Purpose SSD volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information on General Purpose SSD baseline performance, I/O credits, and bursting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest>UserGuide/EBSVolumeTypes.html">Amazon EBS Volume Types</a>.

For Provisioned IOPS SSD volumes, this represents the number of IOPS that are provisioned for the volume. For General Purpose SSD volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information on General Purpose SSD baseline performance, I/O credits, and bursting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html">Amazon EBS Volume Types</a>.

Constraint: Range is 100-20000 IOPS for io1 volumes and 100-10000 IOPS for gp2 volumes.

Condition: This parameter is required for requests to create io1 volumes; it is not used in requests to create gp2 volumes, st1 volumes, or standard volumes.

### Returns

Returns a reference to this object so that method calls can be chained together.

The attachment state of the volume.

```java
/**
 * The attachment state of the volume.
 */

public enum VolumeAttachmentState {
    Unattached,
    Attached
}
```

- **Variable Declaration**:
  - `state` (String)

- **Method Documentation**:
  - `setAttachmentState(String state)`
    - Parameter: `state` (The attachment state of the volume)
    - Description: Returns a reference to this object so that method calls can be chained together.
    - See: `VolumeAttachmentState`

Describes the modification status of an EBS volume. If the volume has never been modified, some element values will be null.

- **VolumeId**: ID of the volume being modified.

```java
@returns ID of the volume being modified.
```

```java
@returns Get a reference to this object so that method calls can be chained together.
