    "The MIB module for managing the new Ethernet OAM features
    introduced by the Ethernet in the First Mile taskforce (IEEE
    802.3ah).  The functionality presented here is based on IEEE
    802.3ah [802.3ah], released in October, 2004.  [802.3ah] was
    prepared as an addendum to the standing version of IEEE 802.3
    [802.3-2002].  Since then, [802.3ah] has been
    merged into the base IEEE 802.3 specification in [802.3-2005].

    In particular, this MIB focuses on the new OAM functions
```

introduced in Clause 57 of [802.3ah]. The OAM functionality
of Clause 57 is controlled by new management attributes
introduced in Clause 30 of [802.3ah]. The OAM functions are
not specific to any particular Ethernet
physical layer, and
can be generically applied to any Ethernet interface of
[802.3-2002].

An Ethernet OAM protocol data unit is a valid Ethernet frame
with a destination MAC address equal to the reserved MAC
address for Slow Protocols (See 43B of [802.3ah]), a
lengthOrType field equal to the reserved type for Slow
Protocols, and a Slow Protocols subtype equal to that of the
subtype reserved for Ethernet OAM. OAMPDU is used throughout
this document as an abbreviation for Ethernet OAM protocol
data unit.

The following reference is used throughout this MIB module:

::= { dot3OamEntry 1 }

dot3OamOperStatus OBJECT-TYPE
SYNTAX INTEGER {
disabled(1),
linkFault(2),
passiveWait(3),
activeSendLocal(4),
sendLocalAndRemote(5),
sendLocalAndRemoteOk(6),
oamPeeringLocallyRejected(7),
oamPeeringRemotelyRejected(8),
operational(9),
nonOperHalfDuplex(10)
}
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"At initialization and failure conditions, two OAM entities on

the same full-duplex Ethernet link begin a discovery phase to
determine what OAM capabilities may be used on that link. The
progress of this initialization is controlled by the OA
sublayer.

This value is always disabled(1) if OAM is disabled on this
interface via the dot3OamAdminState.

If the link has detected a fault and is transmitting OAMPDUs
with a link fault indication, the value is linkFault(2).
Also, if the interface is not operational (ifOperStatus is
not up(1)), linkFault(2) is returned. Note that the object
ifOperStatus may not be up(1) as a result of link failure or
administrative

action (ifAdminState being down(2) or
testing(3)).

The passiveWait(3) state is returned only by OAM entities in passive mode (dot3OamMode) and reflects the state in which the OAM entity is waiting to see if the peer device is OA capable. The activeSendLocal(4) value is used by active mode devices (dot3OamMode) and reflects the OAM entity actively trying to discover whether the peer has OAM capability but has not yet made that determination.

The state sendLocalAndRemote(5) reflects that the local OA entity has discovered the peer but has not yet accepted or rejected the configuration of the peer. The local device can, for whatever reason, decide that the peer device is unacceptable and decline OAM peering. If the local OAM entity rejects the peer OAM entity, the state becomes oamPeeringLocallyRejected(7). If the OAM peering is allowed by the local device, the state moves
to
sendLocalAndRemoteOk(6). Note that both the sendLocalAndRemote(5) and oamPeeringLocallyRejected(7) states fall within the state SEND_LOCAL_REMOTE of the Discovery state diagram [802.3ah, Figure 57-5], with the difference being whether the local OAM client has actively rejected the peering or has just not indicated any decision yet. Whether a peering decision has been made is indicated via the local flags field in the OAMPDU (reflected in the aOAMLocalFlagsField of 30.3.6.1.10).

If the remote OAM entity rejects the peering, the state becomes oamPeeringRemotelyRejected(8). Note that both the sendLocalAndRemoteOk(6) and oamPeeringRemotelyRejected(8) states fall within the state SEND_LOCAL_REMOTE_OK of the Discovery state diagram [802.3ah, Figure 57-5], with the difference being whether the remote OAM client has rejected

the peering or has just not yet decided. This
is indicated
via the remote flags field in the OAMPDU (reflected in the aOAMRemoteFlagsField of 30.3.6.1.11).

When the local OAM entity learns that both it and the remote OAM entity have accepted the peering, the state moves to operational(9) corresponding to the SEND_ANY state of the Discovery state diagram [802.3ah, Figure 57-5].

```
    Since Ethernet OAM functions are not designed to work
    completely over half-duplex interfaces, the value
    nonOperHalfDuplex(10) is returned whenever Ethernet OAM is
    enabled (dot3OamAdminState is enabled(1)), but the interface
    is in half-duplex operation.

  ::= { dot3OamEntry 2 }

 dot3OamMode OBJECT-TYPE
  SYNTAX      INTEGER {
                passive(1),
                active(2)
              }
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
    "This object configures
the mode of OAM operation for this
    Ethernet-like interface.  OAM on Ethernet interfaces may be in
    'active' mode or 'passive' mode.  These two modes differ in
    that active mode provides additional capabilities to initiate
    monitoring activities with the remote OAM peer entity, while
    passive mode generally waits for the peer to initiate OA
    actions with it.  As an example, an active OAM entity can put
    the remote OAM entity in a loopback state, where a passive OA
    entity cannot.

    The default value of dot3OamMode is dependent on the type of
    system on which this Ethernet-like interface resides.  The
    default value should be 'active(2)' unless it is known that
    this system should take on a subservient role to the other
    device connected over this interface.

    Changing this value results in incrementing the configuration
    revision field of locally generated OAMPDUs (30.3.6.1.12) and
    potentially
re-doing the OAM discovery process if the
    dot3OamOperStatus was already operational(9).

  STATUS      current
  DESCRIPTION
    "The OAM functions supported on this Ethernet-like interface.
    OAM consists of separate functional sets beyond the basic
    discovery process that is always required.  These functional
    groups can be supported independently by any implementation.
    These values are communicated to the peer via the local
    configuration field of Information OAMPDUs.

    Setting 'unidirectionalSupport(0)' indicates that the
OA
```

entity supports the transmission of OAMPDUs on links that are
operating in unidirectional mode (traffic flowing in one
direction only). Setting 'loopbackSupport(1)' indicates that
the OAM entity can initiate and respond to loopback commands.
Setting 'eventSupport(2)' indicates that the OAM entity can
send and receive Event Notification OAMPDUs. Setting
'variableSupport(3)' indicates that the OAM entity can send
and receive Variable Request and Response OAMPDUs.

dot3OamLoopbackTable OBJECT-TYPE
SYNTAX SEQUENCE OF Dot3OamLoopbackEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"This table contains controls for the loopback state of the local link as well as indicates the status of the loopback function. There is one entry in this table for each entry in dot3OamTable that supports loopback functionality (where dot3OamFunctionsSupported includes the loopbackSupport bit set).

Loopback can be used to place the remote OAM entity in a state where every received frame (except OAMPDUs) is echoed back

over the same interface on which they were received. In this state, at the remote entity, 'normal' traffic is disabled as only the looped back frames are transmitted on the interface. Loopback is thus an intrusive operation that prohibits normal

```
    data flow and should be used accordingly.
    "
  ::= { dot3OamObjects 3 }

dot3OamLoopbackEntry OBJECT-TYPE
  SYNTAX      Dot3OamLoopbackEntry
  MAX-ACCESS  not-accessible

  SEQUENCE {
    dot3OamLoopbackStatus
          INTEGER,
    dot3OamLoopbackIgnoreRx          INTEGER
  }

dot3OamLoopbackStatus OBJECT-TYPE
  SYNTAX      INTEGER {
                -- all values, except where noted, can be read
                -- but cannot be written
                noLoopback (1),

                -- initiatingLoopback can be read or written
                initiatingLoopback (2),
                remoteLoopback (3),

                -- terminatingLoopback can be read or written
                terminatingLoopback (4),
                localLoopback (5),
                unknown (6)
              }
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
    "The loopback status of the OAM entity.  This status is
```

determined by a combination of the local parser and multiplexer states, the remote parser and multiplexer states, as well as by the actions of the local OAM client. When operating in normal mode
with no loopback in progress, the
status reads noLoopback(1).

The values initiatingLoopback(2) and terminatingLoopback(4) can be read or written. The other values can only be read - they can never be written. Writing initiatingLoopback causes the local OAM entity to start the loopback process with its peer. This value can only be written when the status is noLoopback(1). Writing the value initiatingLoopback(2) in any other state has no effect. When in remoteLoopback(3), writing terminatingLoopback(4) causes the local OAM entity to initiate the termination of the loopback state. Writing terminatingLoopack(4) in any other state has no effect.

If the OAM client initiates a loopback and has sent a Loopback OAMPDU and is waiting for a response, where the local parser and multiplexer states are DISCARD (see [802.3ah, 57.2.11.1]), the status is 'initiatingLoopback'. In this

case, the local OAM entity has yet to receive any acknowledgment that the remote OAM entity has received its loopback command request.

If the local OAM client knows that the remote OAM entity is in loopback mode (via the remote state information as described in [802.3ah, 57.2.11.1, 30.3.6.1.15]), the status is remoteLoopback(3). If the local OAM client is in the process of terminating the remote loopback [802.3ah, 57.2.11.3, 30.3.6.1.14] with its local multiplexer and parser states in DISCARD, the status is terminatingLoopback(4). If the remote OAM client has put the local OAM entity in loopback mode as indicated by its local parser state, the status is localLoopback(5).

The unknown(6) status indicates that the parser and multiplexer combination is unexpected. This status may be returned if the OAM loopback is in a transition state but should not persist.

```
The values of this attribute correspond to the following
    values of the local and remote parser and multiplexer states.

      value           LclPrsr   LclMux    RmtPrsr   RmtMux
      noLoopback        FWD       FWD       FWD       FWD

STATUS current
DESCRIPTION
"A count of the number of frames that were dropped by the OA
multiplexer. Since the OAM multiplexer has multiple inputs
and a single output, there may be cases where frames are
dropped due to transmit resource contention. This counter is
incremented whenever a frame is dropped by the OAM layer.
Note that any Ethernet frame, not just OAMPDUs, may be dropped
by the OAM layer. This can occur when an OAMPDU takes
precedence over a 'normal' frame resulting in the 'normal'
frame being dropped.

When this counter
is incremented, no other counters in this
MIB are incremented.

```
    Discontinuities of this counter can occur at re-initialization
    of the management system, and at other times as indicated by
    the value of the ifCounterDiscontinuityTime.

 dot3OamEventConfigTable OBJECT-TYPE
  SYNTAX     SEQUENCE OF Dot3OamEventConfigEntry
  MAX-ACCESS not-accessible
  STATUS     current
  DESCRIPTION
    "Ethernet OAM includes the ability to generate and receive
    Event Notification OAMPDUs to indicate various link problems.
    This table contains the mechanisms to enable Event

    Notifications and configure the thresholds to generate the
    standard Ethernet OAM events.  There is one entry in the table
    for every entry in
dot3OamTable that supports OAM events
    (where dot3OamFunctionsSupported includes the eventSupport
    bit set).  The values in the table are maintained across
    changes to dot3OamOperStatus.

    The standard threshold crossing events are:
      - Errored Symbol Period Event.  Generated when the number of
        symbol errors exceeds a threshold within a given window
        defined by a number of symbols (for example, 1,000 symbols
        out of 1,000,000 had errors).
      - Errored Frame Period Event.  Generated when the number of
        frame errors exceeds a threshold within a given window
        defined by a number of frames (for example, 10 frames out
        of 1000 had errors).
      - Errored Frame Event.  Generated when the number of frame
        errors exceeds a threshold within a given window defined
        by a period of time (for example, 10 frames in 1 second
        had errors).
      - Errored Frame Seconds
Summary Event.  Generated when the
        number of errored frame seconds exceeds a threshold within
        a given time period (for example, 10 errored frame seconds
```

```
        within the last 100 seconds).  An errored frame second is
        defined as a 1 second interval which had >0 frame errors.
      There are other events (dying gasp, critical events) that are
      not threshold crossing events but which can be
      enabled/disabled via this table.

 dot3OamEventLogTable OBJECT-TYPE
  SYNTAX       SEQUENCE OF Dot3OamEventLogEntry
  MAX-ACCESS   not-accessible
  STATUS       current
  DESCRIPTION
    "This table records
a history of the events that have occurred
    at the Ethernet OAM level.  These events can include locally
    detected events, which may result in locally generated
    OAMPDUs, and remotely detected events, which are detected by
    the OAM peer entity and signaled to the local entity via

    Ethernet OAM.  Ethernet OAM events can be signaled by Event
    Notification OAMPDUs or by the flags field in any OAMPDU.

    This table contains both threshold crossing events and
    non-threshold crossing events.  The parameters for the
    threshold window, threshold value, and actual value
    (dot3OamEventLogWindowXX, dot3OamEventLogThresholdXX,
    dot3OamEventLogValue) are only applicable to threshold
    crossing events, and are returned as all F's (2^32 - 1) for
    non-threshold crossing events.

    Entries in the table are automatically created when such
    events are detected.  The size of the table is implementation
    dependent.
 When the table reaches its maximum size, older
    entries are automatically deleted to make room for newer
    entries.

 -- sysApplInstalled Group
 -- This group provides information about application
```

```
packages
-- that have been installed on the host computer.  The group
-- contains two tables.  The first, the sysApplInstallPkgTable,
-- describes the application packages, the second, the
-- sysApplInstallElmtTable, describes the constituent elements
-- (files and executables) which compose an application package.

--
-- In order to appear in this group, an application and its
-- component files must be discoverable by the system itself,
-- possibly through some type of software installation mechanism
-- or registry.

-- sysApplInstallPkgTable
-- The system installed application packages table provides
-- information on the software packages installed on a system.
-- These packages may consist of many different files including
-- executable and non-executable files.

              unknown(5)
                -- Default value for the case when an operator
                -- has not yet assigned one of the other values.
                -- When set, bits 1, 2, 3, and 4 have no meaning.
              }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
        "An operator assigned value used in the determination of
        application status. This value is used by the agent to
        determine both the mapping of started processes to the
        initiation of an application, as well as to allow for a
        determination of application health. The default value,
        unknown(5), is used when an operator has not yet assigned
        one of the other values.  If unknown(5) is set, bits
        1 - 4 have no meaning.  The possible values are:

              executable(0),
                An application may have one or
                more executable elements.  The rest of the
                bits have no meaning if the element is not
                executable.
              exclusive(1),
                Only one copy of an exclusive element may be
```

```
                running per invocation of the running
                application.
            primary(2),
                The primary executable.  An application can
                have one, and only one element that is designated
                as the primary executable.  The execution of
                this element constitutes an invocation of
                the application.  This is used by the agent
                implementation to determine the initiation of
                an application.  The primary executable must
                remain running long enough for
the agent
                implementation to detect its presence.
            required(3),
                An application may have zero or more required
                elements. All required elements must be running
                in order for the application to be judged to be
                running and healthy.
            dependent(4),
                An application may have zero or more
                dependent elements. Dependent elements may
                not be running unless required elements are.
            unknown(5)
                Default value for the case when an operator
                has not yet assigned one of the other values.
                When set, bits 1, 2, 3, and 4 have no meaning.

        sysApplInstallElmtRole is used by the agent implementation
        in determining the initiation of an application, the
        current state of a running application (see
         sysApplRunCurrentState), when an application invocation is
        no longer running, and the exit status of a terminated
        application invocation (see sysApplPastRunExitState)."

-- sysApplRun Group
-- This group models activity information for applications
-- that have been invoked and are either currently running,
-- or have previously run on the host system.  Likewise,
-- the individual elements of an invoked application are
-- also modeled to show currently running processes, and
-- processes that
have run in the past.

-- sysApplRunTable
-- The sysApplRunTable contains the application instances
-- which are currently running on the host.  Since a single
-- application might be invoked multiple times, an entry is
-- added to this table for each INVOCATION of an application.
-- The table is indexed by sysApplInstallPkgIndex, sysApplRunIndex
-- to enable managers to easily locate all invocations of
-- a particular application package.

sysApplRunTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF SysApplRunEntry
   MAX-ACCESS  not-accessible
```

```
    STATUS      current
    DESCRIPTION
        "The table describes the applications which are executing
        on the host.  Each time an application is invoked,
        an entry is created in this table. When an application ends,
        the entry is removed from this table and a corresponding
              entry is created in the SysApplPastRunTable.

        A new entry is created in this table whenever
the agent
        implementation detects a new running process that is an
        installed application element whose sysApplInstallElmtRole
        designates it as being the application's primary executable
        (sysApplInstallElmtRole = primary(2) ).

        The table is indexed by sysApplInstallPkgIndex,
        sysApplRunIndex to enable managers to easily locate all
        invocations of a particular application package."

            RunState
}

sysApplRunIndex OBJECT-TYPE
    SYNTAX      Unsigned32 (1..'ffffffff'h)
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
        "Part of the index for this table. An arbitrary
        integer used only for indexing purposes. Generally
        monotonically increasing from 1 as new applications are
        started on the host, it uniquely identifies application
        invocations.
```

The numbering for this index increases by 1 for each
INVOCATION of an application, regardless of which
installed application package this entry represents a
running instance of.

An example of the indexing for a couple of entries is
shown below.

:
sysApplRunStarted.17.14
sysApplRunStarted.17.63
sysApplRunStarted.18.13
:

In this example, the agent has observed 12
application
invocations when the application represented by entry 18
in the sysApplInstallPkgTable is invoked. The next
invocation detected by the agent is an invocation of
installed application package 17. Some time later,
installed application 17 is invoked a second time.

NOTE: this index is not intended to reflect a real-time
(wall clock time) ordering of application invocations;
it is merely intended to uniquely identify running
instances of applications. Although the
sysApplInstallPkgIndex is included in the INDEX clause
for this table, it serves only to ease searching of
this table by installed application and does not
contribute to uniquely identifying table entries."
::= { sysApplRunEntry 1 }

sysApplRunCurrentState OBJECT-TYPE
SYNTAX RunState
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The current state of the running application instance.
The possible values are running(1), runnable(2) but waiting

for a resource such as CPU, waiting(3) for an event,
exiting(4), or other(5). This value is based on an evaluation
of the running elements of this application instance (see
sysApplElmRunState) and their Roles as defined by
sysApplInstallElmtRole. An agent implementation may
detect that an application instance is in the process of
exiting if one or more of its REQUIRED elements are no
longer running. Most agent implementations will wait until
a second internal poll has been completed to give the
system time to start REQUIRED elements before
marking the
application instance as exiting."
::= { sysApplRunEntry 3 }

-- sysApplPastRunTable
-- The sysApplPastRunTable provides a history of applications
-- previously run on the host computer. Entries are removed from
-- the sysApplRunTable and corresponding entries are added to this
-- table when an application becomes inactive. Entries remain in
-- this table until they are aged out when either the table size
-- reaches a maximum as determined by the sysApplPastRunMaxRows,
-- or when an entry has aged to exceed a time limit as set be
-- sysApplPastRunTblTimeLimit.
--
-- When aging out entries, the oldest entry, as determined by

-- the value of sysApplPastRunTimeEnded, will be removed first.

sysApplPastRunTable OBJECT-TYPE
SYNTAX SEQUENCE OF SysApplPastRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"A history of the applications that have previously run
on the host
computer. An entry's information is moved to
this table from the sysApplRunTable when the invoked
application represented by the entry ceases to be running.

An agent implementation can determine that an application
invocation is no longer running by evaluating the running
elements of the application instance and their Roles as
defined by sysApplInstallElmtRole. Obviously, if there
are no running elements for the application instance,
then the application invocation is no longer running.
If any one of the REQUIRED elements is not running,
the application instance may be in the process of exiting.

```
        Most agent implementations will wait until a second internal
        poll has been completed to give the system time to either
        restart partial failures or to give all elements time to
        exit.  If, after the second poll, there are REQUIRED
        elements that
are not running, then the application
        instance may be considered by the agent implementation
        to no longer be running.

        Entries remain in the sysApplPastRunTable until they
        are aged out when either the table size reaches a maximum
        as determined by the sysApplPastRunMaxRows, or when an entry
        has aged to exceed a time limit as set by
        sysApplPastRunTblTimeLimit.

        Entries in this table are indexed by sysApplInstallPkgIndex,
        sysApplPastRunIndex to facilitate retrieval of all past
        run invocations of a particular installed application."

-- sysApplElmtRunTable
-- The sysApplElmtRunTable contains an entry for each process that
-- is currently running on the host.  An entry is created in
-- this table for each process at the time it is started, and will
-- remain in the table until the process terminates.
--
-- The table
is indexed by sysApplElmtRunInstallPkg,
-- sysApplElmtRunInvocID, and sysApplElmtRunIndex to make it easy
-- to locate all running elements of a particular invoked application
-- which has been installed on the system.

sysApplElmtRunTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF SysApplElmtRunEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "The table describes the processes which are
      currently executing on the host system. Each entry
      represents a running process and is associated with
      the invoked application of which that process is a part, if
      possible.  This table contains an entry for every process
      currently running on the system, regardless of whether its
      'parent' application can be determined.  So, for example,
      processes like 'ps' and 'grep' will have entries though they
      are not associated with an installed application package.

      Because
a running application may involve
      more than one executable, it is possible to have
      multiple entries in this table for each application.
      Entries are removed from this table when the process
      terminates.
      The table is indexed by sysApplElmtRunInstallPkg,
      sysApplElmtRunInvocID, and sysApplElmtRunIndex to
      facilitate the retrieval of all running elements of a
      particular invoked application which has been installed on

    ::= { sysApplElmtRunEntry 12 }

-- sysApplElmtPastRunTable
-- The sysApplElmtPastRunTable maintains a history of
-- processes which have previously executed on
-- the host as part of an application. Upon termination
-- of a process, the entry representing the process is removed from
-- the sysApplElmtRunTable and a corresponding entry is created in
-- this table provided that the process was part of an
-- identifiable application.  If the process could not be associated

-- with an invoked application, no corresponding entry is created.
-- Hence, whereas the sysApplElmtRunTable contains an entry for
-- every process currently executing on the system, the
-- sysApplElmtPastRunTable only contains entries for processes
-- that previously executed as part of an invoked application.
--
-- Entries
remain in this table until they are aged out when
-- either the number of entries in the table reaches a
```

```
-- maximum as determined by sysApplElmtPastRunMaxRows, or
-- when an entry has aged to exceed a time limit as set by
-- sysApplElmtPastRunTblTimeLimit.  When aging out entries,
-- the oldest entry, as determined by the value of
-- sysApplElmtPastRunTimeEnded, will be removed first.
--
-- The table is indexed by sysApplInstallPkgIndex (from the
-- sysApplInstallPkgTable), sysApplElmtPastRunInvocID, and
-- sysApplElmtPastRunIndex to make it easy to locate all
-- previously executed processes of a particular invoked application
-- that has been installed on the system.

sysApplElmtPastRunTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF SysApplElmtPastRunEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "The table describes the processes which have previously
      executed on the host system as part of an application.
       Each entry represents a process which has previously
      executed and is associated with the invoked application
      of which it was a part.  Because an invoked application
      may involve more than one executable, it is possible
      to have multiple entries in this table for
      each application invocation. Entries are added
      to this table when the corresponding process in the
      sysApplElmtRun Table terminates.

      Entries remain in this table until they are aged out when
      either the number of entries in the table reaches a
      maximum as determined by sysApplElmtPastRunMaxRows, or
      when an entry has aged to exceed a time limit as set by
      sysApplElmtPastRunTblTimeLimit.  When aging out entries,
      the oldest entry, as determined by the value of
      sysApplElmtPastRunTimeEnded, will be removed first.

      The table is indexed by sysApplInstallPkgIndex (from the
       sysApplInstallPkgTable), sysApplElmtPastRunInvocID,
      and sysApplElmtPastRunIndex to make it easy to locate all
      previously executed processes of a particular invoked
      application that has been installed on the system."

"The minimum interval in seconds that the management
subsystem implementing this MIB will poll the status
of the managed resources. Because of the non-trivial
effort involved in polling the managed resources,
and because the method for obtaining the status of
the managed resources is implementation-dependent,
a conformant implementation
may chose a lower bound
greater than 0.

A value of 0 indicates that there is no delay
in the passing of information from the managed
resources to the agent."
DEFVAL { 60 }
::= { sysApplRun 11 }

-- sysApplMap Group
-- This group contains a table, the sysApplMapTable,
-- whose sole purpose is to provide a 'backwards'
-- mapping so that, given a known sysApplElmtRunIndex
-- (process identification number), the corresponding invoked
-- application (sysApplRunIndex), installed element
-- (sysApplInstallElmtIndex), and installed application
-- package (sysApplInstallPkgIndex) can be quickly determined.
--
-- The table will contain one entry for each process
-- currently running on the system.
--
-- A backwards mapping is extremely useful since the tables
-- in this MIB module are typically indexed with the
-- installed application package (sysApplInstallPkgIndex)
-- as the primary key, and on down
as required by the
-- specific table, with the process ID number (sysApplElmtRunIndex)
-- being the least significant key.
--
-- It is expected that management applications will use
-- this mapping table by doing a 'GetNext' operation with
-- the known process ID number (sysApplElmtRunIndex) as the partial
-- instance identifier. Assuming that there is an entry for
-- the process, the result should return a single columnar value,
-- the sysApplMapInstallPkgIndex, with the sysApplElmtRunIndex,
-- sysApplRunIndex, and sysApplInstallElmtIndex contained in the
-- instance identifier for the returned MIB object value.
--
-- NOTE: if the process can not be associated back to an
-- invoked application installed on the system, then the

```
-- value returned for the columnar value sysApplMapInstallPkgIndex
-- will be '0' and the instance portion of the object-identifier
-- will be the process ID number (sysApplElmtRunIndex) followed

-- by 0.0.

IANAItuProbableCause ::= TEXTUAL-CONVENTION
   STATUS current
   DESCRIPTION
```

"ITU-T probable cause values. Duplicate values defined in
X.733 are appended with X733 to ensure syntactic uniqueness.
Probable cause value 0 is reserved for special purposes.

The Internet Assigned Number Authority (IANA) is responsible
for the assignment of the enumerations in this TC.
IANAItuProbableCause value of 0 is reserved for special
purposes and MUST NOT be assigned.

Values of IANAItuProbableCause in the range 1 to 1023 are
reserved for causes that correspond to ITU-T probable cause.

All other requests for new causes will be handled on a
first-come, first served basis and will be assigned
enumeration values starting with 1025.

Request should come in the form of well-formed

SMI [RFC2578] for enumeration names that are unique and
sufficiently descriptive.

While some effort will be taken to ensure that new probable
causes do not conceptually duplicate existing probable
causes it is acknowledged that the existence of conceptual
duplicates in the starting probable cause list is an known
industry reality.

To aid IANA in the administration of probable cause names
and values, the OPS Area Director will appoint one or more
experts to help review requests.

See http://www.iana.org"

        " This object indicates the completion state of the MTA
          device provisioning process.

          pass:
          If the configuration file could be parsed successfully
          and the MTA is able to reflect the same in its
          MIB, the MTA MUST return the value 'pass'.

          inProgress:
          If the MTA is in the process of being provisioned,
          the MTA MUST return the value 'inProgress'.
```

failConfigFileError:
If the configuration file was in error due to incorrect
values in the mandatory parameters, the MTA MUST reject
the configuration file, and the MTA MUST return the value

'failConfigFileError'.

passWithWarnings:
If the configuration file had proper values for all the
mandatory parameters but has errors in any of the optional
parameters (this includes any vendor-specific Object
Identifiers (OIDs) that are incorrect or not known
to the MTA), the MTA MUST return the value
'passWithWarnings'.

passWithIncompleteParsing:
If the configuration file is valid but the MTA cannot
reflect the same in its configuration (for example, too
many entries caused memory exhaustion), it must accept
the CMS configuration entries related, and the MTA MUST
return the value 'passWithIncompleteParsing'.

failureInternalError:
If the configuration file cannot be parsed due to an
Internal error, the MTA MUST return the value
'failureInternalError'.

failureOtherReason:
If the MTA cannot accept the configuration file for any
other reason than the ones stated above, the MTA MUST
return the value 'failureOtherReason'.

When a final SNMP INFORM is sent as part of Step 25 of the
MTA Provisioning process, this parameter is also included
in the final INFORM message."

    pktcMtaDevErrorValue    SnmpAdminString,
    pktcMtaDevErrorReason   SnmpAdminString
    }

pktcMtaDevErrorOidIndex  OBJECT-TYPE
    SYNTAX      Unsigned32 (1..1024)
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
       " This object is the index of the MTA configuration error
        table.  It is an integer value that starts at value '1'
        and is incremented for each encountered configuration
        file error or warning.
```

The maximum number of errors or warnings that can be
recorded in the pktcMtaDevErrorOidsTable is set to 1024 as
a configuration file is usually validated by operators
before deployment. Given the possible number of
configuration parameter assignments in the MTA
configuration file, 1024 is perceived as a sufficient
limit even with future extensions.

If the number of the errors in the configuration
file
exceeds 1024, all errors beyond the 1024th one MUST
be ignored and not be reflected in the
pktcMtaDevErrorOidsTable."

::= {pktcMtaDevErrorOidsEntry 1}

pktcMtaDevErrorOid OBJECT-TYPE
SYNTAX SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
" This object contains a human readable representation
(character string) of the OID corresponding to the
configuration file parameter that caused the particular
error.
For example, if the value of the pktcMtaDevEnabled object
in the configuration file caused an error, then this
object instance will contain the human-readable string of
'1.3.6.1.2.1.140.1.1.6.0'.
If the MTA generated an error because it was not able
to recognize a particular OID, then this object
instance would contain an empty value (zero-length
string).
For example,
if the value of an OID in the configuration
file was interpreted by the MTA as being 1.2.3.4.5, and if
the MTA was not able to recognize this OID as a valid one,
this object instance will contain a zero-length string.

If the number of errors in the configuration file exceeds
1024, then for all subsequent errors, the
pktcMtaDevErrorOid of the table's 1024th entry MUST
contain a human-readable representation of the
pktcMtaDevErrorsTooManyErrors object; i.e., the string

'1.3.6.1.2.1.140.1.1.4.1.0'.
Note that the syntax of this object is SnmpAdminString
instead of OBJECT IDENTIFIER because the object value may
not be a valid OID due to human or configuration tool
encoding errors."

::= {pktcMtaDevErrorOidsEntry 2}

pktcMtaDevErrorValue OBJECT-TYPE
SYNTAX SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
" This
object contains the value of the OID corresponding to
the configuration file parameter that caused the error.
If the MTA cannot recognize the OID of the
configuration parameter causing the error, then this
object instance contains the OID itself as interpreted
by the MTA in human-readable representation.
If the MTA can recognize the OID but generate an error due
to a wrong value of the parameter, then the object

instance contains the erroneous value of the parameter as
read from the configuration file.
In both cases, the value of this object must be
represented in human-readable form as a character string.
For example, if the value of the pktcMtaDevEnabled object
in the configuration file was 3 (invalid value), then the
pktcMtaDevErrorValue object instance will contain the
human-readable (string) representation of value '3'.

Similarly, if the OID in the configuration file has been
interpreted by the MTA as being 1.2.3.4.5 and the MTA
cannot recognize this OID as a valid one, then this
pktcMtaDevErrorValue object instance will contain human
readable (string) representation of value '1.2.3.4.5'.

If the number of errors in the configuration file exceeds
1024, then for all subsequent errors, the
pktcMtaDevErrorValue of the table's 1024th entry MUST
contain a human-readable representation of the
pktcMtaDevErrorsTooManyErrors object; i.e., the string
'1.3.6.1.2.1.140.1.1.4.1.0'."

::= {pktcMtaDevErrorOidsEntry 3}

```
pktcMtaDevErrorReason  OBJECT-TYPE
  SYNTAX      SnmpAdminString
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
     " This object indicates the reason for the error or warning,
       as per the MTA's interpretation, in human-readable form.
       For example:

     'VALUE NOT IN RANGE', 'VALUE DOES NOT MATCH TYPE',
       'UNSUPPORTED VALUE', 'LAST 4 BITS MUST BE SET TO ZERO',
       'OUT OF MEMORY - CANNOT STORE'.
       This object may also contain vendor specific errors for
       private vendor OIDs and any proprietary error codes or
       messages that can help diagnose configuration errors.

       If the number of errors in the configuration file exceeds
       1024, then for all subsequent errors, the
       pktcMtaDevErrorReason of the table's 1024th entry MUST
       contain a human-readable string indicating the reason
       for an error; for example,
       'Too many errors in the configuration file'."

   MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
     " This object contains the Internet Address of the Time
       Server used by an S-MTA for Time Synchronization.  The type
```

of this address is determined by the value of the
pktcMtaDevTimeServerAddressType object.
When the latter has the value 'ipv4(1)', this object
contains the IP address of the Time Server used for Time
Synchronization.
In the case of an S-MTA, this object must be
populated with a value other than 0.0.0.0 as obtained
from DHCP option 4. The protocol by which the time of day
MUST be retrieved is defined in RFC 868.
In the case of an E-MTA, this object must contain a
value of 0.0.0.0 if the address type is 'ipv4(1)' since
an E-MTA does not use the Time Protocol for time
synchronization (an E-MTA uses the time retrieved by the
DOCSIS cable modem).
The behavior of this object when the value of
pktcMtaDevTimeServerAddressType is other than 'ipv4(1)'
is not presently specified, but it may be specified in
future versions of this MIB module.
If a value is written into an instance of
pktcMtaDevTimeServer, the agent MUST NOT retain the

DESCRIPTION
" This object specifies the MTA device configuration file
information, including the access method, the server name,
and the configuration file name. The value of this object
is the Uniform Resource Locator (URL)
of the configuration
file for TFTP or HTTP download.
If this object value is a TFTP URL, it must be formatted
as defined in RFC 3617.
If this object value is an HTTP URL, it must be formatted
as defined in RFC 2616.
If the MTA SNMP Enrollment mechanism is used, then the MTA
must download the file provided by the Provisioning Server

during provisioning via an SNMP SET on this object.

```
        If the MTA SNMP Enrollment mechanism is not used, this
        object MUST contain the URL value corresponding to the
        'siaddr' and 'file' fields received in the DHCP ACK to
        locate the configuration file: the 'siaddr' and 'file'
        fields represent the host and file of the TFTP URL,
        respectively.  In this case, the MTA MUST return an
        'inconsistentValue' error in response to SNMP SET
        operations.
        The MTA MUST return a zero-length string if the server
         address (host part of the URL) is unknown.
        If a value is written into an instance of
        pktcMtaDevConfigFile, the agent MUST NOT retain the
        supplied value across MTA re-initializations or reboots."

pktcMtaDevSnmpEntity  OBJECT-TYPE
    SYNTAX      SnmpAdminString
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
       " This object contains the FQDN of the SNMP entity of the
        Provisioning Server.  When the MTA SNMP Enrollment
        Mechanism is used, this object represents the server that
        the MTA communicates with, that it receives the
        configuration file URL from, and that it sends the
        enrollment notification to.  The SNMP entity is also the
        destination entity for all the provisioning
        notifications.  It
   may be used for post-provisioning
        SNMP operations.  During the provisioning phase, this
        SNMP entity FQDN is supplied to the MTA via DHCP option
        122, sub-option 3, as defined in RFC 3495.  The MTA must
        resolve the FQDN value before its very first network
        interaction with the SNMP entity during the provisioning
        phase."

  DESCRIPTION
     " This object contains the hash value of the contents of the
       configuration file.
       The authentication algorithm is Secure Hashing Algorithm
       1 (SHA-1), and the length is 160 bits.  The hash
       calculation MUST follow the requirements defined in the

       PacketCable Security Specification.  When the MTA SNMP
       Enrollment mechanism is used, this hash value is
       calculated and sent to the MTA prior to sending the
       config file.  This object value is then provided by the
       Provisioning server via an SNMP SET operation.
       When the MTA SNMP Enrollment mechanism is not in use, the
       hash value is provided in the configuration file itself,
       and it is also calculated by the MTA.  This object value
       MUST represent the hash value calculated by the MTA.
       When the MTA SNMP Enrollment mechanism is not in use, the
       MTA must reject all SNMP SET operations on this object and
       return an 'inconsistentValue' error.
       If a value is written into an instance of
       pktcMtaDevProvConfigHash, the agent MUST NOT retain the
       supplied value across MTA re-initializations or reboots."

  STATUS      current
  DESCRIPTION
     " This object contains the key used to encrypt/decrypt
       the configuration file when secure SNMPv3 provisioning
       is used.
       The value of this object is provided along with the
       configuration file information (pktcMtaDevConfigFile)
       and hash (pktcMtaDevProvConfigHash) by the Provisioning
       Server via SNMP SET once the configuration file has been
       created, as defined by the PacketCable Security
       specification.

       The privacy algorithm is defined by the
       pktcMtaDevProvConfigEncryptAlg MIB object.  The
```

MTA requirements related to the privacy algorithm are
defined in the PacketCable Security Specification.

If this object is set at
any other provisioning step than
that allowed by the PacketCable MTA Device

Provisioning Specification, the MTA SHOULD return
an 'inconsistentValue' error.
This object must not be used in non secure provisioning
mode. In non-secure provisioning modes, the MTA SHOULD
return an 'inconsistentValue' in response to SNMP SET
operations, and the MTA SHOULD return a zero-length
string in response to SNMP GET operations.
If a value is written into an instance of
pktcMtaDevProvConfigKey, the agent MUST NOT retain the
supplied value across MTA re-initializations or reboots."

pktcMtaDevProvSolicitedKeyTimeout OBJECT-TYPE
SYNTAX Unsigned32 (0..180)
UNITS "seconds"
MAX-ACCESS read-write
STATUS current
DESCRIPTION
" This object defines a Kerberos Key Management timer on the
MTA. It is the time period during which the MTA saves the
nonce and Server Kerberos Principal Identifier to match an
AP Request and its associated AP Reply response from the
Provisioning Server.
After the timeout has been exceeded, the client discards
this (nonce, Server Kerberos Principal Identifier) pair,

after which it will no longer accept a matching AP Reply.
This timer only applies when the Provisioning Server
initiated key management for SNMPv3 (with a
Wake
Up message).
If this object is set to a zero value, the MTA MUST return
an 'inconsistentValue' in response to SNMP SET operations.
This object should not be used in non-secure provisioning
modes. In non-secure provisioning modes, the MTA MUST
return an 'inconsistentValue' in response to SNMP SET
operations, and the MTA MUST return a zero value in

response to SNMP GET operations.
If a value is written into an instance of
pktcMtaDevProvSolicitedKeyTimeout, the agent MUST NOT
retain the supplied value across MTA re-initializations
or reboots."
DEFVAL { 3 }
::= { pktcMtaDevServer 14 }

--==
--
-- Unsolicited key updates are retransmitted according to an
-- exponential back-off mechanism using two timers and a maximum
-- retry counter for AS replies.
-- The initial retransmission timer value is the nominal
timer
-- value (pktcMtaDevProvUnsolicitedKeyNomTimeout). The
-- retransmissions occur with an exponentially increasing interval
-- that caps at the maximum timeout value
-- (pktcMtaDevProvUnsolicitedKeyMaxTimeout).
-- Retransmissions stop when the maximum retry counter is reached
-- (pktcMtaDevProvUnsolicitedKeyMaxRetries).
-- For example, with values of 3 seconds for the nominal
-- timer, 100 seconds for the maximum timeout, and 8 retries max,
-- and with an exponential value of 2, this results in
-- retransmission intervals will be 3 s, 6 s, 12 s, 24 s, 48 s,
-- 96 s, 100 s, and 100 s;
-- retransmissions then stop because the maximum number of
-- retries (8) has been reached.
--
--==
--
-- Timeouts for unsolicited key management updates are only
-- pertinent before the first SNMPv3 message is sent between the
-- MTA and the Provisioning Server and before the configuration

```
--  file is loaded.

--================================================================
--
--   Informative Procedures for Setting up Security Associations
--

--   A Security Association may be set up either via configuration or
--   via NCS signaling.
--
--   I.   Security association setup via configuration.
--
--   The realm must be configured first.  Associated with the realm
--   is a KDC.  The realm table (pktcMtaDevRealmTable)
 indicates
--   information about the realm (e.g., name, organization name) and
--   parameters associated with KDC communications (e.g., grace
--   periods, AS Request/AS Reply adaptive back-off parameters).
```

```
--
--  Once the realm is established, one or more CMS(es) may be
--  defined in the realm.  Associated with each CMS
--  entry in the pktcMtaDevCmsTable is an explicit reference
--  to a Realm via the realm name (pktcMtaDevCmsKerbRealmName),
--  the FQDN of the CMS, and parameters associated with IPSec
--  key management with the CMS (e.g., clock skew, AP Request/
--  AP Reply adaptive back-off parameters).
--
--  II.  Security association setup via NCS signaling.
--
--  The procedure of establishing the Security Associations
--  for NCS signaling is described in the PacketCable Security
--  specification.
--  It involves the analysis of the pktcNcsEndPntConfigTable row
--  for the corresponding endpoint number and the correlation of
--  the CMS FQDN from this row
 with the CMS Table and
--  consequently, with the Realm Table.  Both of these tables
--  are defined below.  The pktcNcsEndPntConfigTable is defined in
--  the IP over Cable Data Network (IPCDN)
--  NCS Signaling MIB [NCSSIGMIB].
--
--  III.  When the MTA receives wake-up or re-key messages from a
--  CMS, it performs key management based on the corresponding
--  entry in the CMS table.  If the matching CMS entry does not
--  exist, it must ignore the wake-up or re-key messages.
--
--================================================================
--================================================================
--
--  pktcMtaDevRealmTable
--
--  The pktcMtaDevRealmTable shows the KDC realms.  The table is
--  indexed with pktcMtaDevRealmIndex.  The Realm Table contains the
--  pktcMtaDevRealmName in conjunction with any server that needs
--  a Security Association with the MTA.  Uppercase must be used
--  to compare the pktcMtaDevRealmName content.
--

pktcMtaDevRealmAvailSlot
  OBJECT-TYPE
  SYNTAX      Unsigned32 (0..64)
  MAX-ACCESS  read-only
```

```
  STATUS      current
  DESCRIPTION
     " This object contains the index number of the first
       available entry in the realm table (pktcMtaDevRealmTable).
       If all the entries in the realm table have been assigned,
       this object contains the value of zero.
       A management station should create new entries in the
       realm table, using the following procedure:

       First, issue a management protocol retrieval operation
       to determine the value of the first available index in the
       realm table (pktcMtaDevRealmAvailSlot).

       Second, issue a management protocol SET operation
       to create an instance of the pktcMtaDevRealmStatus
       object by setting its value to 'createAndWait(5)'.

       Third, if the SET operation succeeded, continue

   modifying the object instances corresponding to the newly
       created conceptual row, without fear of collision with
       other management stations.  When all necessary conceptual
       columns of the row are properly populated (via SET
       operations or default values), the management station may
       SET the pktcMtaDevRealmStatus object to 'active(1)'."

  STATUS      current
  DESCRIPTION
     " This object specifies the maximum time the MTA will
       attempt to perform the exponential back-off algorithm.
       This timer only applies when the MTA initiated key
       management.  If the DHCP option code 122, sub-option 4, is
       provided to the MTA, it overwrites this value.

       Unsolicited key updates are retransmitted according to an
       exponential back-off mechanism using two timers and a
       maximum retry counter for AS replies.
       The initial retransmission timer value is the nominal
       timer value (pktcMtaDevRealmUnsolicitedKeyNomTimeout).  The
       retransmissions occur with an exponentially increasing
       interval that caps at the maximum timeout value
       (pktcMtaDevRealmUnsolicitedKeyMaxTimeout).
        Retransmissions stop when the maximum retry counter is
       reached (pktcMatDevRealmUnsolicitedMaxRetries).

       For example, with values of 3 seconds for the nominal
       timer, 20 seconds for the maximum timeout, and 5 retries
       max, retransmission intervals will be 3 s, 6 s,
       12 s, 20 s, and 20 s, and retransmissions then stop because
       the maximum number of retries has been reached."

```

```
  DESCRIPTION
      " This object specifies the initial timeout value
        for the AS-REQ/AS-REP exponential back-off and retry
        mechanism.  If the DHCP option code 122, sub-option 4, is
        provided to the MTA, it
overwrites this value.
        This value should account for the average roundtrip
        time between the MTA and the KDC, as well as the
        processing delay on the KDC.

        Unsolicited key updates are retransmitted according to an
        exponential back-off mechanism using two timers and a
        maximum retry counter for AS replies.
        The initial retransmission timer value is the nominal
        timer value (pktcMtaDevRealmUnsolicitedKeyNomTimeout).  The
        retransmissions occur with an exponentially increasing
        interval that caps at the maximum timeout value
        (pktcMtaDevRealmUnsolicitedKeyMaxTimeout).
        Retransmissions stop when the maximum retry counter is
        reached (pktcMatDevRealmUnsolicitedMaxRetries).

        For example, with values of 3 seconds for the nominal
        timer, 20 seconds for the maximum timeout, and 5 retries
        max, in retransmission intervals will be 3 s, 6 s,

    12 s, 20 s, and 20 s; retransmissions then stop because

--================================================================

pktcMtaDevCmsAvailSlot   OBJECT-TYPE
  SYNTAX      Unsigned32 (0..128)
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION

      " This object contains the index number of the first
        available entry in the CMS table (pktcMtaDevCmsTable).
        If all the entries in the CMS table have been assigned,
        this object contains the value of zero.
        A management station should create new entries in the
        CMS table, using the following procedure:

        First, issue a management protocol retrieval operation

 to determine the value of the first available index in the
        CMS table (pktcMtaDevCmsAvailSlot).

        Second, issue a management protocol SET operation
        to create an instance of the pktcMtaDevCmsStatus
        object by setting its value to 'createAndWait(5)'.

        Third, if the SET operation succeeded, continue
        modifying the object instances corresponding to the newly
        created conceptual row, without fear of collision with
        other management stations.  When all necessary conceptual
        columns of the row are properly populated (via SET
        operations or default values), the management station may
        SET the pktcMtaDevCmsStatus object to 'active(1)'."

OBJECT pktcMtaDevRealmOrgName
SYNTAX LongUtf8String (SIZE (1..384))
DESCRIPTION
"The Organization Name field in X.509 certificates
can contain up to 64 UTF-8 encoded characters,
as defined in RFCs 3280 and 4630. Therefore, compliant

devices are only required to support Organization
Name values of up to 64 UTF-8 encoded characters.
Given that RFCs 3280 and 4630 define the UTF-8 encoding,
compliant devices must support a maximum size of 384
octets for pktcMtaDevRealmOrgName. The calculation of
384 octets comes from the RFC 3629 UTF-8 encoding
definition whereby the UTF-8 encoded characters
are encoded as sequences of 1 to 6 octets,
assuming that code points as high as 0x7fffffff
might be used. Subsequent versions of Unicode and ISO
10646 have limited the upper bound to 0x10ffff.

Consequently, the current version of UTF-8, defined in
RFC 3629, does not require more than four octets to
encode a valid code point."

OBJECT pktcMtaDevProvConfigEncryptAlg
SYNTAX PktcMtaDevProvEncryptAlg
DESCRIPTION
"An implementation is only required to support
values of none(0) and des64Cbcmode(1).
An IV of zero is used to encrypt

```
in des64Cbcmode, and
        the length of pktcMtaDevProvConfigKey is 64 bits, as
        defined in the PacketCable Security specification.
        Other encryption types may be defined in future
        versions of this MIB module."

    OBJECT pktcMtaDevRealmOrgName
        SYNTAX LongUtf8String (SIZE (1..384))
        DESCRIPTION
            "The Organization Name field in X.509 certificates
        can contain up to 64 UTF-8 encoded characters, as
        defined in RFCs 3280 and 4630.  Therefore, compliant
        devices are only required to support Organization
        Name values of up to 64 UTF-8 encoded characters.
        Given that RFCs 3280 and 4630 define the UTF-8 encoding,
        compliant devices must support a maximum size of 384
        octets for pktcMtaDevRealmOrgName.  The calculation of
        384 octets comes from the RFC 3629 UTF-8 encoding
        definition whereby the UTF-8 encoded
characters
        are encoded as sequences of 1 to 6 octets,
        assuming that code points as high as 0x7fffffff
        might be used.  Subsequent versions of Unicode and ISO
        10646 have limited the upper bound to 0x10ffff.
        Consequently, the current version of UTF-8, defined in
        RFC 3629 does not require more than four octets to
        encode a valid code point."

    DISPLAY-HINT "d-1"
    STATUS       current
    DESCRIPTION
        "This TEXTUAL-CONVENTION represents power levels that are
         normally expressed in dBm.  Units are in tenths of a dBm;
         for example, -13.5 dBm will be represented as -135."
    SYNTAX       Integer32

PktcCodecType ::= TEXTUAL-CONVENTION
    STATUS       current
```

DESCRIPTION
" This TEXTUAL-CONVENTION defines various types of codecs

that MAY be supported. The description for each
enumeration is listed below:

Enumeration	Description
other	a defined codec not in the enumeration
unknown	a codec not defined by the PacketCable Codec Specification
g729	ITU-T Recommendation G.729
reserved	for future use
g729E	ITU-T Recommendation G.729E
pcmu	Pulse Code Modulation u-law (PCMU)
g726at32	ITU-T Recommendation G.726-32 (32 kbit/s)
g728	ITU-T Recommendation G.728
pcma	Pulse Code Modulation a-law (PCMA)
g726at16	ITU-T Recommendation G.726-16 (16 kbit/s)
g726at24	ITU-T Recommendation G.726-24 (24 kbit/s)
g726at40	ITU-T Recommendation G.726-40 (40 kbit/s)
ilbc	IETF Internet low-bit rate codec
bv16	Broadcom BroadVoice16

The list of codecs is consistent with the IETF
Real-Time Transport Protocol (RTP) Profile registry and

the RTP Map Parameters Table in PacketCable Audio/Video
Codecs Specification [PKT-SP-CODEC]. The literal codec
name for each codec is listed below:

Codec	Literal Codec Name
g729	G729
g729E	G729E
pcmu	PCMU
g726at32	G726-32
g728	G728
pcma	PCMA
g726at16	G726-16
g726at24	G726-24
g726at40	G726-40
ilbc	iLBC
bv16	BV16

The literal codec name is the second column of the table
with codec RTP Map Parameters. The Literal Codec Name Column
contains the codec name used in the local connection

options (LCO) of the NCS messages create connection

(CRCX)/modify connection (MDCX) and is also used to identify the codec in the Call Management System (CMS) Provisioning Specification. The RTP Map Parameter column of the Table contains the string used in the media attribute line (a=) of the session description protocol (SDP) parameters in NCS messages."

PktcRingCadence   ::= TEXTUAL-CONVENTION
  STATUS       current
  DESCRIPTION
      "This object provides an encoding scheme for ring
```

cadences, including repeatability characteristics. All fields in this object MUST be encoded in network-byte order.

The first three higher-order octets are reserved. The octets that follow are used to encode a 'bit-string', with each bit corresponding to 50 milliseconds. A bit value of '1' indicates the presence of a ring-tone, and a bit value of '0' indicates the absence of a ring-tone, for that duration (50 ms) (Note: A minimum number of octets required to encode the bit-string MUST be used).

The first two of the reserved octets MUST indicate the length of the encoded cadence (in bits) and MUST range between 1 and 264. (Note: The length in bits MUST also be

consistent with the number of octets that encode the
cadence). The MTA MUST ignore any unused bits in the last
octet, but MUST reflect the value as provided on
subsequent SNMP GETs.

The
third of the reserved octets indicates 'repeatability'
and MUST be either 0x80 or 0x00 -- the former value
indicating 'non-repeatability', and the latter indicating
'repeatability'.

The MTA MUST reject attempts to set a value that violates
any of the above requirements."

-- of codecs supported by the Multimedia Terminal Adapter (MTA).
--
```

pktcSigDevCodecTable OBJECT-TYPE
SYNTAX SEQUENCE OF PktcSigDevCodecEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
" This table describes the MTA-supported codec types. An MTA
MUST populate this table with all possible combinations of
codecs it supports for simultaneous operation. For example,
an MTA with two endpoints may be designed with a particular
Digital Signal Processing (DSP) and memory architecture that
allows it to support the following fixed combinations of
codecs for simultaneous operation:

Codec Type Maximum Number of Simultaneous Codecs
PCMA 3

PCMA 2
PCMU 1

PCMA 1

PCMU 2

PCMU 3

PCMA 1
G729 1

G729 2

PCMU 1
G729 1

Based on this example, the entries
in the codec table
would be:

pktcSigDev pktcSigDev pktcSigDev
CodecComboIndex CodecType CodecMax
1 pcma 3
2 pcma 2
2 pcmu 1

3 pcma 1
3 pcmu 2
4 pcmu 3

```
            5           pcma          1
            5           g729          1
            6           g729          2
            7           pcmu          1
            7           g729          1

        An operator querying this table is able to determine all
        possible codec combinations the MTA is capable of
        simultaneously supporting.

        This table MUST NOT include non-voice codecs."

            lrETS(5)
            }
    MAX-ACCESS read-write
    STATUS current
    DESCRIPTION
       " For on-hook caller id, pktcSigDevCidMode selects the method
        for representing and signaling caller identification.  For
        the duringRingingETS method, the Frequency Shift Keying
        (FSK) or the Dual-Tone Multi-Frequency (DTMF) containing
        the caller identification information is sent between the
        first and second ring pattern.

        For the dtAsETS,rpAsETS, lrAsETS and lrETS
        methods, the FSK or DTMF containing the caller id
        information is sent before the first ring pattern.

        For the dtAsETS method, the FSK or DTMF is sent after the
        Dual
   Tone Alert Signal.  For the rpAsETS method, the FSK or
        DTMF is sent after a Ring Pulse.

        For the lrAsETS method, the Line Reversal occurs first,
        then the Dual Tone Alert Signal, and, finally, the FSK or
        DTMF is sent.

        For the lrETS method, the Line Reversal occurs first,
        then the FSK or DTMF is sent.

        The value of this MIB object MUST NOT persist across MTA
        reboots."

  DESCRIPTION
     " For visual message waiting indicator (VMWI),
       pktcSigDevVmwiMode selects the alerting signal method.  For
       the dtAsETS, rpAsETS, lrAsETS, osi, and lrETS methods,
       the FSK containing the VMWI information is sent after an
       alerting signal.

       For the dtAsETS method,
 the FSK, or DTMF
       is sent after the Dual Tone Alert Signal.  For the rpAsETS
       method, the FSK or DTMF is sent after a Ring Pulse.

       For the lrAsETS method, the Line Reversal occurs first,
       then the Dual Tone Alert Signal, and, finally, the FSK or
       DTMF is sent.

       For the OSI method, the FSK or DTMF is sent after the Open
       Switching Interval.

       For the lrETS method, the Line Reversal occurs first,
       then the FSK or DTMF is sent.

       The value of this MIB object MUST NOT persist across MTA

    MAX-ACCESS   not-accessible
    STATUS       current
    DESCRIPTION
       "Cadence rings are defined by the telco governing
        body for each country.  The MTA must be able to support
        various ranges of cadence patterns and cadence periods.
        The
 MTA will be able to support country-specific
        provisioning of the cadence and idle period.  Each
        cadence pattern will be assigned a unique value ranging
        from 0-127 (inclusive) corresponding to the value of x,
        where x is the value sent in the cadence ringing (cr)
        signal cr(x), requested per the appropriate NCS
        message, and defined in the E package.  The MTA will derive
        the cadence periods from the ring cadence table entry, as
        provisioned by the customer.  The MTA is allowed to provide
        appropriate default values for each of the ring cadences.
        This table only needs to be supported when the MTA
        implements the E package."

pktcSigDevToneTable    OBJECT-TYPE
   SYNTAX       SEQUENCE OF PktcSigDevToneEntry
   MAX-ACCESS   not-accessible
   STATUS       current
   DESCRIPTION
      " The Tone Table defines the composition of tones and
        various tone operations.

        The definition of the tones callWaiting1 through
        callWaiting4 in this table MUST only contain the
        audible tone itself; the delay between tones or the value
        of the tone repeat count are not applicable for the call
        waiting tones.

        The delay between tones or the repeat count is controlled
```

```
        by the objects pktcSigEndPntConfigCallWaitingDelay and
        pktcSigEndPntConfigCallWaitingMaxRep.  If the
        pktcSigDevToneType is set to either
 of the values
        callWaiting1, callWaiting2, callWaiting3, or callWaiting4,
        then the value of the pktcSigDevToneWholeToneRepeatCount
        object indicates that the particular frequency group is
        applicable, as a repeatable part of the tone, based on the
        value of the MIB object
        pktcSigDevToneWholeToneRepeatCount.

        The MTA MUST make sure that, after the provisioning
        cycle, the table is fully populated (i.e., for each
        possible index, an entry MUST be defined) using
        reasonable defaults for each row that was not defined
        by the provisioning information delivered via MTA
        Configuration.

        The frequency composition of each tone is defined by the
        pktcSigDevMultiFreqToneTable.  For each tone type defined
        in pktcSigDevToneTable, the MTA MUST populate at least
        one entry in the pktcSigDevMultiFreqToneTable.

        For each particular value of pktcSigDevToneType,
 the
        pktcSigDevToneTable table can define non-repeating and
        repeating groups of the frequencies defined by the
        pktcSigDevMultiFreqToneTable, such that each group is
        represented by the set of the consecutive rows
        (frequency group) in the pktcSigDevMultiFreqToneTable.

        Objects in this table do not persist across MTA reboots.
        For tones with multiple frequencies refer to the MIB table
        pktcSigDevMultiFreqToneTable."

    MAX-ACCESS   read-only
    STATUS       current
    DESCRIPTION
       "This is the repeat count,
 which signifies how many times
       to repeat the entire on-off cadence sequence.  Setting this
       object may result in a cadence duration longer or shorter
       than the overall signal duration specified by the time out
```

(TO) object for a particular signal. If the repeat count
results in a longer tone duration than the signal duration
specified by the TO, the tone duration defined by the
TO object for a particular signal always represents
the overall signal duration for a tone. In this case, the
tone duration repeat count will not be fully exercised, and
the desired tone duration will be truncated per the TO
setting. If the repeat count results in a shorter tone
duration than the signal duration specified by the TO, the
tone duration defined by the repeat count takes precedence
over the TO and will end the signal event. In this case,

the TO represents a
time not to be exceeded for the signal.
It is recommended to ensure proper telephony signaling so that
the TO duration setting should always be longer than the
desired repeat count-time duration."
::={ pktcSigDevToneEntry 4 }

pktcSigDevToneSteady OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This MIB object represents the steady tone status. A value
of 'true(1)' indicates that the steady tone is applied, and
a value of 'false(2)' indicates otherwise.
Devices must play out the on-off cadence sequence for
the number of times indicated by the MIB object
'pktcSigDevToneWholeToneRepeatCount' prior to applying the
last tone steadily, indefinitely. If the MIB table
'pktcSigDevToneTable' contains multiple rows with this
Object set to a value of 'true(1)', the steady tone is
applied to the last repeating frequency
group of the tone.

Setting this MIB object may result in a tone duration that is
longer or shorter than the overall signal duration
specified by the time out (TO) MIB object for a particular
signal. If the repeat count results in a longer tone
duration than the signal duration specified by the TO, the
tone duration defined by the TO object for a particular
signal always represents the overall signal duration for a
tone. In this case, the tone duration repeat count will
not be fully exercised, and the desired tone duration will
be truncated per the TO setting. If the repeat count

```
      results in a shorter tone duration than the signal duration
      specified by the TO, the tone duration defined by the
      repeat count takes precedence over the TO and will end the
      signal event.  In this case, the TO represents a time not to
      be exceeded for the signal.

   It is recommended to ensure proper telephony signaling that
      The TO duration setting should always be longer than the
      desired repeat count-time duration, plus the desired maximum
      steady tone period."

pktcSigDevToneFreqMode OBJECT-TYPE
    SYNTAX      INTEGER {
                firstModulatedBySecond(1),
                summation(2)

                }
    MAX-ACCESS   read-only
    STATUS      current
    DESCRIPTION
    "This MIB object provides directive on the
     modulation or summation of the frequencies
     involved in the tone.

     It is to be noted that while summation can
     be done without any constraint on the number
     of frequencies, the modulation (amplitude)
     holds good only when there are two frequencies
     (first and second).

     Thus:
       - If the mode is set to a value of
         'firstModulatedBySecond(1)', the first frequency
         MUST be modulated by the second, and the remaining
         frequencies (third and fourth) ignored.  The
```

```
        percentage
of amplitude modulation to be applied
        is defined by the MIB object
        pktcSigDevToneFreqAmpModePrtg.

       - If the mode is set to a value of
        'summation(2)', all the frequencies MUST be
        summed without any modulation.
    "
    ::={ pktcSigDevMultiFreqToneEntry 6}

pktcSigDevToneFreqAmpModePrtg OBJECT-TYPE
    SYNTAX      Unsigned32(0..100)

    DESCRIPTION
      "This MIB object represents the percentage of amplitude
       modulation applied to the second frequency
       when the MIB object pktcSigDevToneFreqMode is
       set to a value of 'firstModulatedBySecond (1)'.

       If the MIB object pktcSigDevToneFreqMode is set to
       value of 'summation (2)', then this MIB object MUST be
       ignored."
    ::={ pktcSigDevMultiFreqToneEntry 7}

pktcSigDevToneDbLevel    OBJECT-TYPE
   SYNTAX      TenthdBm (-250..-110)
   UNITS
     "1/10 of a dBm"
   MAX-ACCESS   read-only

   STATUS      current
   DESCRIPTION
      "This MIB object contains the decibel level for each
       analog signal (tone) that is locally generated
       (versus in-band supervisory tones) and sourced to
       the a-b terminals (TE connection point).  Each tone
       in itself may consist of multiple frequencies, as
       defined by the MIB table pktcSigDevMultiFreqToneTable.

       This MIB object reflects the desired level at
       the Telco (POTS) a-b (T/R) terminals, including the
       effect of any MTA receiver gain (loss).  This is required
       so that locally generated tones are consistent with
       remotely generated in-band tones at the a-b terminals,
```

```
        consistent with user expectations.

        This MIB object must be set for each tone.
        When tones are formed by combining multi-frequencies,
        the level of each frequency
shall be set so as to result
        in the tone level specified in this object at the a-b
        (T/R) terminals.

        The wide range of levels for this Object is required
        to provide signal-generator levels across the wide
        range of gains (losses) -- but does not imply the entire
        range is to be achievable given the range of gains (losses)
        in the MTA."

 pktcSigDevToneFreqRepeatCount OBJECT-TYPE
    SYNTAX      Unsigned32(0..5000)
    MAX-ACCESS   read-only
    STATUS      current
    DESCRIPTION
```

"This MIB object indicates the number of times
to repeat the cadence cycle represented by the
on/off durations (refer to the MIB objects
pktcSigDevToneFreqOnDuration and
pktcSigDevToneFreqOffDuration).

Setting this object may result in a tone duration that is
longer or shorter than the overall signal duration
specified by the time out (TO) object for the
corresponding tone type. If the value of this MIB
Object indicates a longer duration than that
specified by the TO, the latter overrules
the former,
and the desired tone duration will be truncated according
to the TO.

However, if the repeat count results in a shorter
tone duration than the signal duration specified by
the TO, the tone duration defined by the repeat count
takes precedence over the TO and will end the signal
event. In this case, the TO represents a time not to
be exceeded for the signal. It is recommended, to
ensure proper telephony signaling, that the TO
duration setting should always be longer than the
desired repeat count-time duration. A value of zero
means the tone sequence is to be played once but not
repeated."
::={ pktcSigDevMultiFreqToneEntry 11}

pktcSigDevCidDelayAfterLR OBJECT-TYPE
SYNTAX Unsigned32 (300..800)
UNITS "Milliseconds"
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"This object specifies the delay between
the end of the
Line Reversal and the start of the FSK or DTMF signal.
This MIB object is used only when pktcSigDevCidMode is
set to a value of 'lrETS'. This timing has a range of
300 to 800 ms.

The following table defines the default values
for this MIB object, depending on the signal type
(pktcSigDevCidMode), and MUST be followed:

Value of pktcSigDevCidMode Default value

duringringingETS any value (not used)
dtAsETS any value (not used)
rpAsETS any value (not used)
lrAsETS any value (not used)
lrETS 400

An attempt to set this object while the value of
pktcSigDevCidMode is not set to a value of 'lrETS' will
result in an 'inconsistentValue' error.

The value of this
MIB object MUST NOT persist across MTA
reboots."

       (FQDN) and MUST have a corresponding pktcMtaDevCmsFqdn
       entry in the pktcMtaDevCmsTable.  The object
       pktcMtaDevCmsFqdn is defined in the PacketCable MIBMTA
       Specification.  For each particular endpoint, the MTA MUST
       use the current value of this object to communicate with
       the corresponding CMS.  The MTA MUST update this object
       with the value of the 'Notified Entity' parameter of the
       NCS message.  Because of the high importance of this object
       to the ability of the MTA to maintain reliable NCS
       communication with the CMS, it is highly recommended not
       to change this object's value using SNMP during normal

    operation."

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this
License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the
Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or
Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices
stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works
that You distribute, all copyright, patent, trademark, and
attribution notices from the Source form of the Work,
excluding those notices that do not pertain to any part of
the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its
distribution, then any Derivative Works that You distribute must
include a readable copy of the attribution notices contained
within such NOTICE file, excluding
those notices that do not
pertain to any part of the Derivative Works, in at least one
of the following places: within a NOTICE text file distributed
as part of the Derivative Works; within the Source form or
documentation, if provided along with the Derivative Works; or,
within a display generated by the Derivative Works, if and
wherever such third-party notices normally appear. The contents
of the NOTICE file are for informational purposes only and
do not modify the License. You may add Your own attribution
notices within Derivative Works that You distribute, alongside
or as an addendum to the NOTICE text from the Work, provided
that such additional attribution notices cannot be construed
as modifying the License.

You may add Your own copyright statement to Your modifications and
may provide additional or different license terms and conditions

for use, reproduction, or distribution of Your modifications, or
for any such Derivative Works as a whole, provided Your use,
reproduction, and distribution of the Work otherwise complies with
the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise,
any Contribution intentionally submitted for inclusion in the Work
by You to the Licensor shall be under the terms and conditions of
this License, without any additional terms or conditions.
Notwithstanding the above, nothing herein shall supersede or modify
the terms of any separate license agreement you may have executed
with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade
names, trademarks, service marks, or product names of the Licensor,

except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the

same "printed page" as the copyright notice for easier
identification within third-party archives.

/**
* Provides an implementation of the NTLM authentication protocol.
* <p>
* This class provides methods for generating authentication
* challenge responses for the NTLM authentication protocol.  The NTLM
* protocol is a proprietary Microsoft protocol and as such no RFC
* exists for it.  This class is based upon the reverse engineering
* efforts of a wide range of people.</p>
*
* <p>Please note that an implementation of JCE must be correctly installed and configured when
* using NTLM support.</p>
*
* <p>This class should not be used externally to HttpClient as it's API is specifically
* designed to work with HttpClient's use
 case, in particular it's connection management.</p>

1.178 scala-library 2.10.4

1.178.1 Available under license :

No license file was found, but licenses were detected in source scan.

/**
*
* A `ClassTag[T]` stores the erased class of a given type `T`, accessible via the `runtimeClass`
* field. This is particularly useful for instantiating `Array`s whose element types are unknown
* at compile time.
*
* `ClassTag`s are a weaker special case of [[scala.reflect.api.TypeTags#TypeTag]]s, in that they
* wrap only the runtime class of a given type, whereas a `TypeTag` contains all static type
* information. That is, `ClassTag`s are constructed from knowing only the top-level class of a
* type, without necessarily knowing all of its argument types. This runtime information is enough
* for runtime `Array` creation.
*
* For example:
* {{{
*   scala> def mkArray[T : ClassTag](elems: T*) = Array[T](elems: _*)
*   mkArray: [T](elems: T*)(implicit evidence$1: scala.reflect.ClassTag[T])Array[T]
*
*   scala> mkArray(42, 13)
*   res0: Array[Int] = Array(42, 13)
*
*   scala> mkArray("Japan","Brazil","Germany")
 *   res1: Array[String] = Array(Japan, Brazil, Germany)
* }}}
*
* See [[scala.reflect.api.TypeTags]] for more examples, or the
* [[http://docs.scala-lang.org/overviews/reflection/typetags-manifests.html Reflection Guide: TypeTags]]
* for more details.
*

```
/**
* A token issued by {@link TokenService}.
*
* <p>
* It is important that the keys assigned to tokens are sufficiently randomised and secured that
* they can serve as identifying a unique user session. Implementations of {@link TokenService}
* are free to use encryption or encoding strategies of their choice. It is strongly recommended that
* keys are of sufficient length to balance safety against persistence cost. In relation to persistence
* cost, it is strongly recommended that returned keys are small enough for encoding in a cookie.
* </p>
*

/**
* Reviews the <code>Object</code> returned from a secure object invocation,
* being able to modify the <code>Object</code> or throw an {@link
* AccessDeniedException}.
* <p>
* Typically used to ensure the principal is permitted to access the domain
* object instance returned by a service layer bean.
 Can also be used to
* mutate the domain object instance so the principal is only able to access
* authorised bean properties or <code>Collection</code> elements.
* <p>
* Special consideration should be given to using an
* <code>AfterInvocationManager</code> on bean methods that modify a database.
* Typically an <code>AfterInvocationManager</code> is used with read-only
* methods, such as <code>public DomainObject getById(id)</code>. If used with
* methods that modify a database, a transaction manager should be used to
* ensure any <code>AccessDeniedException</code> will cause a rollback of the
* changes made by the transaction.
* </p>
*

snmp        OBJECT IDENTIFIER ::= { mib-2 11 }

-- the System group

-- Implementation of the System group is mandatory for all
-- systems.  If an agent is not configured to have a value
-- for any of these variables, a string of length 0 is
-- returned.
```

```
sysDescr OBJECT-TYPE
  SYNTAX  DisplayString (SIZE (0..255))
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
        "A textual description of the entity.  This value
        should include the full name and version
        identification of the
 system's hardware type,
        software operating-system, and networking
        software.  It is mandatory that this only contain
        printable ASCII characters."
  ::= { system 1 }

sysObjectID OBJECT-TYPE
  SYNTAX  OBJECT IDENTIFIER
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
        "The vendor's authoritative identification of the
        network management subsystem contained in the
        entity.  This value is allocated within the SMI
        enterprises subtree (1.3.6.1.4.1) and provides an
        easy and unambiguous means for determining `what
        kind of box' is being managed.  For example, if
        vendor `Flintstones, Inc.' was assigned the
        subtree 1.3.6.1.4.1.4242, it could assign the
        identifier 1.3.6.1.4.1.4242.1.1 to its `Fred
        Router'."
  ::= { system 2 }

sysUpTime OBJECT-TYPE
  SYNTAX  TimeTicks
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
         "The time (in hundredths of a second) since the
        network management portion of the system was last
        re-initialized."
  ::= { system 3 }

sysContact OBJECT-TYPE
  SYNTAX  DisplayString (SIZE (0..255))
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
        "The textual identification of the contact person
        for this managed node, together with information
```

```
        on how to contact this person."
    ::= { system 4 }

sysName OBJECT-TYPE
    SYNTAX  DisplayString (SIZE (0..255))
    ACCESS  read-write
    STATUS  mandatory
    DESCRIPTION
        "An administratively-assigned name for this
        managed node.  By convention, this is the node's
        fully-qualified domain name."
    ::= { system 5 }

sysLocation OBJECT-TYPE
    SYNTAX  DisplayString (SIZE (0..255))
    ACCESS  read-write
    STATUS  mandatory
    DESCRIPTION
        "The physical location of this node (e.g.,
        `telephone closet,
 3rd floor')."
    ::= { system 6 }

sysServices OBJECT-TYPE
    SYNTAX  INTEGER (0..127)
    ACCESS  read-only
    STATUS  mandatory
    DESCRIPTION
        "A value which indicates the set of services that
        this entity primarily offers.

        The value is a sum.  This sum initially takes the
        value zero, Then, for each layer, L, in the range
        1 through 7, that this node performs transactions
        for, 2 raised to (L - 1) is added to the sum.  For
        example, a node which performs primarily routing
        functions would have a value of 4 (2^(3-1)).  In
        contrast, a node which is a host offering
        application services would have a value of 72
        (2^(4-1) + 2^(7-1)).  Note that in the context of
        the Internet suite of protocols, values should be
        calculated accordingly:

            layer  functionality
                1  physical (e.g., repeaters)

            2  datalink/subnetwork (e.g., bridges)
                3  internet (e.g., IP gateways)
```

```
                4  end-to-end  (e.g., IP hosts)
                7  applications (e.g., mail relays)

        For systems including OSI protocols, layers 5 and
        6 may also be counted."
  ::= { system 7 }

-- the Interfaces group

-- Implementation of the Interfaces group is mandatory for
-- all systems.

ifNumber OBJECT-TYPE
  SYNTAX  INTEGER
  ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
        "The number of network interfaces (regardless of
        their current state) present on this system."
  ::= { interfaces 1 }

-- the Interfaces table

-- The Interfaces table contains information on the entity's
-- interfaces.  Each interface is thought of as being
-- attached to a `subnetwork'.  Note that this term should
-- not be confused with `subnet' which refers to an
-- addressing partitioning scheme used in the Internet suite
-- of
 protocols.

ifTable OBJECT-TYPE
  SYNTAX  SEQUENCE OF IfEntry
  ACCESS  not-accessible

  DESCRIPTION
        "A reference to MIB definitions specific to the
        particular media being used to realize the
        interface.  For example, if the interface is
        realized by an ethernet, then the value of this
```

```
            object refers to a document defining objects
            specific to ethernet.  If this information is not
            present, its value should be set to the OBJECT
            IDENTIFIER { 0 0 }, which is a syntatically valid
            object identifier, and any conformant
            implementation of ASN.1 and BER must be able to
            generate and recognize this value."
    ::= { ifEntry 22 }

-- the Address Translation group

-- Implementation of the Address Translation group is
-- mandatory for all
 systems.  Note however that this group
-- is deprecated by MIB-II. That is, it is being included

-- solely for compatibility with MIB-I nodes, and will most
-- likely be excluded from MIB-III nodes.  From MIB-II and
-- onwards, each network protocol group contains its own
-- address translation tables.

-- The Address Translation group contains one table which is
-- the union across all interfaces of the translation tables
-- for converting a NetworkAddress (e.g., an IP address) into
-- a subnetwork-specific address.  For lack of a better term,
-- this document refers to such a subnetwork-specific address
-- as a `physical' address.

-- Examples of such translation tables are: for broadcast
-- media where ARP is in use, the translation table is
-- equivalent to the ARP cache; or, on an X.25 network where
-- non-algorithmic translation to X.121 addresses is
-- required, the translation table contains the
-- NetworkAddress to X.121 address equivalences.

atTable OBJECT-TYPE
    SYNTAX
  SEQUENCE OF AtEntry
    ACCESS  not-accessible
    STATUS  deprecated
    DESCRIPTION
            "The Address Translation tables contain the
            NetworkAddress to `physical' address equivalences.
            Some interfaces do not use translation tables for
            determining address equivalences (e.g., DDN-X.25
            has an algorithmic method); if all interfaces are
            of this type, then the Address Translation table
```

```
        is empty, i.e., has zero entries."
  ::= { at 1 }

atEntry OBJECT-TYPE
  SYNTAX  AtEntry

ipRouteAge OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-write
STATUS mandatory
DESCRIPTION
"The number of seconds since this route was last updated or otherwise determined to be correct. Note that no semantics of `too old' can be implied except through knowledge of the routing protocol by which the route was learned."
::= { ipRouteEntry 10 }

ipRouteMask OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-write
STATUS mandatory
DESCRIPTION
"Indicate the mask to be logical-ANDed with the destination address before being compared to the value in the ipRouteDest field. For those systems that do not support arbitrary subnet masks, an agent constructs the value of the ipRouteMask by determining whether the value of the correspondent ipRouteDest field belong to a class-A, B, or C network, and then using one of:

mask	network
255.0.0.0	class-A
255.255.0.0	class-B
255.255.255.0	class-C

If the value of the ipRouteDest is 0.0.0.0 (a default route), then the mask value is also 0.0.0.0. It should be noted that all IP routing subsystems implicitly use this mechanism."
::= { ipRouteEntry 11 }

ipRouteMetric5 OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-write
STATUS mandatory
DESCRIPTION
"An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route's ipRouteProto value. If this metric is not used, its value should be set to -1."

```
  ::= { ipRouteEntry 12 }

ipRouteInfo OBJECT-TYPE
  SYNTAX  OBJECT IDENTIFIER
   ACCESS  read-only
  STATUS  mandatory
  DESCRIPTION
        "A reference to MIB definitions specific to the
        particular routing protocol which is responsible
        for this route, as determined by the value
        specified in the route's ipRouteProto value.  If
        this information is not present, its value should
        be set to the OBJECT IDENTIFIER { 0 0 }, which is
        a syntatically valid object identifier, and any
        conformant implementation of ASN.1 and BER must be
        able to generate and recognize this value."
  ::= { ipRouteEntry 13 }

-- the IP Address Translation table

-- The IP address translation table contain the IpAddress to
-- `physical' address equivalences.  Some interfaces do not
-- use translation tables for determining address
-- equivalences (e.g., DDN-X.25 has an algorithmic method);
-- if all interfaces are of this type, then the Address
-- Translation table is empty, i.e., has zero
 entries.

          invalid(2),     -- an invalidated mapping
          dynamic(3),
```

```
            static(4)
        }
  ACCESS  read-write
  STATUS  mandatory
   DESCRIPTION
        "The type of mapping.

        Setting this object to the value invalid(2) has
        the effect of invalidating the corresponding entry
        in the ipNetToMediaTable.  That is, it effectively
        dissasociates the interface identified with said
        entry from the mapping identified with said entry.
        It is an implementation-specific matter as to
        whether the agent removes an invalidated entry
        from the table.  Accordingly, management stations
        must be prepared to receive tabular information
        from agents that corresponds to entries not
        currently in use.  Proper interpretation of such
        entries requires examination of the relevant
        ipNetToMediaType object."

              deleteTCB(12)
          }
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
          "The state of this TCP connection.

          The only value which may
 be set by a management
          station is deleteTCB(12).  Accordingly, it is
          appropriate for an agent to return a `badValue'
          response if a management station attempts to set
          this object to any other value.

          If a management station sets this object to the
          value deleteTCB(12), then this has the effect of
          deleting the TCB (as defined in RFC 793) of the
          corresponding connection on the managed node,
          resulting in immediate termination of the
          connection.

          As an implementation-specific option, a RST
          segment may be sent from the managed node to the
          other TCP endpoint (note however that RST segments
          are not sent reliably)."

  SYNTAX  INTEGER
 { start(1), stop(2) }
  ACCESS  read-write
  STATUS  mandatory
  DESCRIPTION
        "A control variable used to trigger operator-
        initiated Start and Stop events.  When read, this
        variable always returns the most recent value that
        egpNeighEventTrigger was set to.  If it has not
        been set since the last initialization of the
        network management subsystem on the node, it
        returns a value of `stop'.

        When set, this variable causes a Start or Stop
        event on the specified neighbor, as specified on
        pages 8-10 of RFC 904.  Briefly, a Start event
        causes an Idle peer to begin neighbor acquisition
        and a non-Idle peer to reinitiate neighbor
        acquisition.  A stop event causes a non-Idle peer
        to return to the Idle state until a Start event
        occurs, either via egpNeighEventTrigger or
        otherwise."

  ::= { egp 6 }

-- the Transmission group

-- Based on the transmission media underlying each interface
-- on a system, the corresponding portion of the Transmission
-- group is mandatory for that system.

-- When Internet-standard definitions for managing
-- transmission media are defined, the transmission group is
-- used to provide a prefix for the names of those objects.

-- Typically, such definitions reside in the experimental
-- portion of the MIB until they are "proven", then as a
-- part of the Internet standardization process, the
-- definitions are accordingly elevated and a new object
-- identifier, under the transmission group is defined. By
-- convention, the name assigned is:
--
--     type OBJECT IDENTIFIER    ::= { transmission number }
--
-- where "type" is the symbolic
 value used for the media in
-- the ifType column of the ifTable object, and "number" is
-- the actual integer value corresponding to the symbol.

-- the SNMP group

-- Implementation of the SNMP group is mandatory for all
-- systems which support an SNMP protocol entity.  Some of
-- the objects defined below will be zero-valued in those
-- SNMP implementations that are optimized to support only
-- those functions specific to either a management agent or
-- a management station.  In particular, it should be
-- observed that the objects below refer to an SNMP entity,
-- and there may be several SNMP entities residing on a
-- managed node (e.g., if the node is hosting acting as
-- a management station).

```
    REVISION     "200003060000Z"  -- Mar 6, 2000
    DESCRIPTION  "Fixed a missing semi-colon in the IMPORT.
                  Also cleaned up the REVISION log a bit.
                  It is not complete, but from now on it will
                  be maintained and kept up to date with
each
                  change to this MIB module."

    REVISION     "199910081430Z"  -- Oct 08, 1999
    DESCRIPTION  "Include new name assignments up to cnr(85).
                  This is the first version available via the WWW
                  at: ftp://ftp.isi.edu/mib/ianaiftype.mib"

    REVISION     "199401310000Z"  -- Jan 31, 1994
    DESCRIPTION  "Initial version of this MIB as published in
                  RFC 1573."

    ::= { mib-2 30 }

 IANAifType ::= TEXTUAL-CONVENTION
    STATUS       current
    DESCRIPTION
            "This data type is used as the syntax of the ifType
            object in the (updated) definition of MIB-II's
            ifTable.

            The definition of this textual convention with the
            addition of newly assigned values is published
            periodically by the IANA, in either the Assigned
            Numbers RFC, or some derivative of it specific to
            Internet
Network Management number assignments.  (The
            latest arrangements can be obtained by contacting the
            IANA.)

            Requests for new values should be made to IANA via
            email (iana&iana.org).

            The relationship between the assignment of ifType
            values and of OIDs to particular media-specific MIBs
            is solely the purview of IANA and is subject to change
            without notice.  Quite often, a media-specific MIB's
            OID-subtree assignment within MIB-II's 'transmission'
            subtree will be the same as its ifType value.
            However, in some circumstances this will not be the
            case, and implementors must not pre-assume any
            specific relationship between ifType values and
```

```
        transmission subtree OIDs."

IANAtunnelType ::= TEXTUAL-CONVENTION
  STATUS     current
  DESCRIPTION
        "The encapsulation method used by a tunnel. The value
        direct indicates that a packet is encapsulated
        directly within a normal IP header, with no
        intermediate header, and unicast to the remote tunnel
        endpoint (e.g., an RFC 2003 IP-in-IP tunnel, or an RFC
        1933 IPv6-in-IPv4 tunnel). The value minimal indicates
        that a Minimal Forwarding Header (RFC 2004) is
```

```
        inserted between the outer header and the payload
        packet. The value UDP indicates that the payload
        packet is encapsulated within a normal UDP packet
        (e.g., RFC 1234).

        The values sixToFour, sixOverFour, and isatap
        indicates that an IPv6 packet is encapsulated directly
        within an IPv4 header, with no intermediate header,

        and unicast to the destination determined by the 6to4,
        6over4, or ISATAP protocol.

        The remaining protocol-specific values indicate that a
        header of the protocol of that name is inserted
        between the outer header and the payload header.

        The assignment policy for IANAtunnelType values is
        identical to the policy for assigning IANAifType
        values."

apmCompliances
OBJECT IDENTIFIER ::= { apmConformance 1 }
apmGroups OBJECT IDENTIFIER ::= { apmConformance 2 }

AppLocalIndex ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"A locally arbitrary unique identifier associated with an
application or application verb.

All objects of type AppLocalIndex are assigned by the agent
out of a common number space. In other words, AppLocalIndex
values assigned to entries in one table must not overlap with
AppLocalIndex values assigned to entries in another
table. Further, every protocolDirLocalIndex value registered
by the agent automatically assigns the same value out of the

AppLocalIndex number space.

For example, if the protocolDirLocalIndex values { 1, 3, 5, 7 }
have been assigned, and the apmHttpFilterAppLocalIndex values
{ 6, 8, 9 } have been assigned:

- Assignment of new AppLocalIndex values must not use
the
values { 1, 3, 5, 6, 7, 8, 9 }.
- AppLocalIndex values { 1, 3, 5, 7 } are automatically
assigned and are associated with the identical value of
protocolDirLocalIndex. In particular, an entry in the
apmAppDirTable indexed by a value provides further
information about a protocol indexed by the same value
in the protocolDirTable of RMON2.

The value for each supported application must remain constant
at least from one re-initialization of the entity's network
management system to the next re-initialization, except that
if an application is deleted and re-created, it must be
re-created with a new value that has not been used since the
last re-initialization.

The specific value is meaningful only within a given SNMP

entity. An AppLocalIndex value must not be re-used until the
next agent restart."
SYNTAX Unsigned32
(1..2147483647)

ProtocolDirNetworkAddress ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"A network level address whose semantics and encoding are
specified by an associated protocolDirLocalIndex
value. Objects of this type must specify which
protocolDirLocalIndex value is used. This value is encoded
according to the encoding rules for the identified
protocolDirectory entry.

For example, if the associated protocolDirLocalIndex indicates
an encapsulation of ip, this object is encoded as a length
octet of 4, followed by the 4 octets of the ip address,
in network byte order.

Objects of this type may allow this value to be the zero
length string. If so, they must identify they meaning of this
value."
SYNTAX OCTET STRING (SIZE(0..255))

DataSourceOrZero ::= TEXTUAL-CONVENTION

STATUS current
DESCRIPTION
"Identifies the source of
the data that the associated
function is configured to analyze. This source can be any
interface on this device.

In order to identify a particular interface, this
object shall identify the instance of the ifIndex
object, defined in [4], for the desired interface.

For example, if an entry were to receive data from
interface #1, this object would be set to ifIndex.1.

If the source of the data isn't an interface or cannot be
localized to an interface, this object would be set to 0.0"

REFERENCE "The DataSource textual convention is defined in
RFC 2021 [5]."

```
  SYNTAX      OBJECT IDENTIFIER

RmonClientID ::= TEXTUAL-CONVENTION
  STATUS      current
  DESCRIPTION
      "A long-lived unique ID assigned to an end-system. This ID is
      assigned by the agent using an implementation-specific
      algorithm.

      Because a client machine may be assigned multiple addresses

     over any time period it can be difficult to attribute
      behavior to a particular client based solely on its
      address. A ClientID may be assigned to provide a more
      stable handle for referencing that client. The entity that
      assigns the ClientID may use various implementation
      techniques to keep track of a client but if the assigning
      entity is unable to track client address mappings, it may map
      client identifiers to client addresses rather than to
      distinct client machines.

      This is named ClientID because it helps to solve a problem
      seen in network clients (servers usually have well-known,
      long-lived addresses). However, ClientID's may be assigned to
      any end-system regardless of its role on the network."
  SYNTAX      Unsigned32 (0..4294967295)

TransactionAggregationType ::= TEXTUAL-CONVENTION
  STATUS      current
  DESCRIPTION

      "Specifies one of 4 different techniques
 for aggregating
      transactions.

      The metrics for a single transaction are the responsiveness of
      the transaction and whether the transaction succeeded (a
      boolean). When such metrics are aggregated in this MIB Module,
      these metrics are replaced by averages and distributions of
      responsiveness and availability. The metrics describing
      aggregates are constant no matter which type of aggregation is
      being performed. These metrics may be found in the
      apmReportTable.

      The flows(1) aggregation is the simplest. All transactions
```

```
        that share common application/server/client 3-tuples are
        aggregated together, resulting in a set of metrics for all
        such unique 3-tuples.

        The clients(2) aggregation results in somewhat more
        aggregation (i.e., fewer resulting records). All transactions
        that share common application/client tuples are aggregated
        together, resulting in a
    set of metrics for all such unique
        tuples.

        The servers(3) aggregation usually results in still more
        aggregation (i.e., fewer resulting records). All transactions
        that share common application/server tuples are aggregated
        together, resulting in a set of metrics for all such unique
        tuples.

        The applications(4) aggregation results in the most
        aggregation (i.e., the fewest resulting records). All
        transactions that share a common application are aggregated
        together, resulting in a set of metrics for all such unique
        applications.

        Note that it is not meaningful to aggregate applications, as
        different applications have widely varying characteristics. As a
        result, this set of aggregations is complete."
    SYNTAX      INTEGER {
                    flows(1),    -- Least Aggregation
                    clients(2),
                    servers(3),
                    applications(4) -- Most Aggregation
                   }

-- The APM Application Directory Group

-- The Application Directory Table contains a record for every

-- application monitored by this agent. This table is also used to
-- configure whether or not an application will be measured and which
-- bucket boundaries will be used for the application.
--
-- The bucket boundaries define the break-points between bins of a
-- histogram analysis for that application. As an example of how this
-- works, consider an entry representing response-time for http.
-- If the boundaries are set as follows:
-- Boundary1: 500 milliseconds
```

```
-- Boundary2: 1 second
-- Boundary3: 2 seconds
-- Boundary4: 5
-- Boundary5: 15
-- Boundary6: 60
--
-- If the following measurements are made (all in milliseconds):
-- 377, 8645, 1300, 487, 1405, 775, 1115, 850, 945, 1054, 7745, 9380
--
-- A report run during this interval would report the following
-- counts:
-- Bucket1: 2
-- Bucket2: 3
-- Bucket3: 4
-- Bucket4: 0
-- Bucket5: 3
-- Bucket6: 0
--
 Bucket7: 0

apmAppDirTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF ApmAppDirEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "The APM MIB directory of applications and application
     verbs. The agent will populate this table with all
     applications/verbs of any responsivenessType it has the
     capability to monitor. Since the agent populates this table
     with every entry it has the capability to monitor, the
     entries in this table are read-write, allowing the management
     station to modify parameters in this table but not to add new
     entries or delete entries (however, entries may be
     disabled). If new entries are added to the apmHttpFilterTable
     or the apmUserDefinedAppTable, the agent will add the
     corresponding entries to this table.

     It is an implementation-dependent matter as to how the agent
     sets these default parameters. For example, it may leave
     certain entries
 in this table 'off(0)' if the agent developer

     believes that combination will be infrequently used, allowing
     a manager that needs that capability to set it to 'on(1)'.

     Some applications are registered in the RMON2 protocol
```

```
      directory and some are registered in other tables in this
      MIB Module. Regardless of where an application is originally
      registered, it is assigned an AppLocalIndex value that is the
      primary index for this table.

      The contents of this table affect all reports and exceptions
      generated by this agent. Accordingly, modification of this
      table should be performed by a manager acting in the role of
      administrator. In particular, management software should not
      require or enforce particular configuration of this table - it
      should reflect the preferences of the site administrator, not
      the software author. As a practical matter, this requires
      management
 software to allow the administrator to configure
      the values it will use so that it can be adapted to the site
      policy."

  STATUS      current
  DESCRIPTION
     "The AppLocalIndex assigned for this application Directory
     entry."
  ::= { apmAppDirEntry 1 }

apmAppDirResponsivenessType OBJECT-TYPE
  SYNTAX      INTEGER {
                transactionOriented(1),
                throughputOriented(2),
                streamingOriented(3)
              }
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "This object describes and configures the agent's support for
     application performance measurement for this application.
     There are 3 types of measurements for different types of
     applications:

     Transaction-Oriented applications have a fairly constant
     workload to perform for all transactions. The responsiveness
     metric for transaction-oriented
 applications is application
     response time (from first request to final delivery of
     service) and is measured in milliseconds. This is
     commonly referred to as end-user response time.

     Throughput-Oriented applications have widely varying workloads
     based on the nature of the client request. In particular,
     throughput-oriented applications vary widely in the amount of
     data that must be transported to satisfy the request. The
     responsiveness metric for throughput-oriented applications is
     kilobits per second.

     Streaming-Oriented applications deliver data at a constant
     metered rate of speed regardless of the responsiveness of the
     networking and computing infrastructure. This constant rate of
     speed is generally specified to be below (sometimes well
     below) the nominal capability of the infrastructure. However,
     when the infrastructures cannot deliver data at this speed,
      interruption of service or degradation of service can
     result. The responsiveness metric for streaming-oriented
     applications is the ratio of time that the service is degraded
     or interrupted to the total service time. This metric is
     measured in parts per million.
```

Note that for some applications, measuring more than one responsiveness type may be interesting. For agents that wish

to support more than one measurement for a application, they will populate this table with multiple entries for that application, one for each type."

      determine if two managers are both trying to enforce different
      configurations of this table."
   ::= { apmMibObjects 2 }

apmAppDirID OBJECT-TYPE
   SYNTAX     OBJECT IDENTIFIER
   MAX-ACCESS read-write
   STATUS     current
   DESCRIPTION
      "This object allows managers to avoid downloading application
      directory information when the directory is set to a known
      (usually fixed) configuration.

      If the value of this object isn't 0.0, it signifies
      that the entire contents of the apmAppDirTable,
      apmHttpFilterTable, apmUserDefinedAppTable and
       protocolDirTable are equal to a known state identified
      by the value of this object. If a manager recognizes this
      value as identifying a directory configuration it has a local
```

copy of, it may use this local copy rather than downloading these tables. Note that it may have downloaded this local copy (and the ID) from another agent and used this copy for all other agents that advertised the same ID.

If an agent recognizes that the entire contents of the apmAppDirTable, apmHttpFilterTable, apmUserDefinedAppTable and protocolDirTable are equal to a known state to which an ID has been assigned, it should set this object to that ID.

In many cases when this feature is used, the application directory information will be in read-only memory and thus the tables may not be modified via SNMP requests. In the event

that the tables are writable and a modification is made, the agent is responsible for setting this object to 0.0 if it cannot determine that the state is equal to a known state.

An agent is not obligated to recognize and advertise all such registered states as it may not have knowledge of all states. Thus, a manager may encounter agents whose DirectoryID value is 0.0 even though the contents of the directory were equal to a registered state.

Note that the contents of those tables includes the protocolDirLocalIndex and appLocalIndex values. In other words, these values can't be assigned randomly on each agent, but must be equal to values that are part of the known state. While it is possible for a manager to download application directory details using SNMP and to set the appropriate directoryID, the manager would need to have some scheme to ensure consistent values of LocalIndex variables from agent to agent. Such schemes are outside the scope of this specification.

Application directory registrations are unique within an administrative domain.

Typically these registrations will be made by an agent software developer who will set the application directory tables to a read-only state and assign a DirectoryID to that state. Thus, all agents running this software would share the same DirectoryID. As the application directory might change

```
      from one software release to the next, the developer may
      register different DirectoryID's for each software release.

      A customer could also create a site-wide application directory
      configuration and assign a DirectoryID to that configuration
      as long as consistent values of LocalIndex variables can be
      ensured.

      The value of this object must persist across reboots."
    ::= { apmMibObjects 3 }

-- APM HTTP Filter Table

-- The HTTP Filter Table
 creates virtual applications which measure the
-- performance of certain web pages  or sets of web pages. Some
-- circumstances where this is particularly useful are:
--
--      - An Intranet or ASP scenario where a business application is
--        running on one or more web pages or scripts.

--        (i.e., /expense/submit.cgi?employeeID=3426&...)
--      - A web-hosting scenario where one wants to measure the
--        service level for a particular customer
--      - An e-commerce scenario where the performance of certain
--        pages needs to be monitored more closely.
--        (i.e., shopping cart, shipping, credit card authorization)

apmHttpFilterTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF ApmHttpFilterEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "A table that creates virtual applications which measure the
      performance of certain web pages or sets of web pages.

      When an entry is added to this table, the agent
 will
      automatically create one or more entries in the
      apmAppDirTable (one for each responsivenessType it is
      capable of measuring).

      Note that when entries exist in this table some HTTP
      transactions will be summarized twice: in applications
      represented here as well as the HTTP application. If entries
      in this table overlap, these transactions may be summarized
```

```
      additional times.

      The contents of this table affect all reports and exceptions
      generated by this agent. Accordingly, modification of this
      table should be performed by a manager acting in the role of
      administrator. In particular, management software should not
      require or enforce particular configuration of this table - it
      should reflect the preferences of the site administrator, not
      the software author."

-- The APM Name Table

apmNameTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF ApmNameEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "A client machine may have multiple addresses during a period
     of monitoring. The apmNameTable assigns a long-lived
     identifier to a client and records what addresses
 were
     assigned to that client for periods of time. Various
     implementation techniques exist for tracking this mapping but
     if an agent is unable to track client address mappings, it may
     map client identifiers to client addresses rather than to
     distinct client machines.

     A particular apmNameClientID should be a constant attribute of
     a particular client. When available, the agent may also record
     the machine name and/or user name which may be valuable for
     displaying to humans. The apmNameMachineName and
     apmNameUserName are relatively constant, changing only if
     these attributes actually change on the client.
```

The agent will store a historical log of these entries, aging
out old entries as the log becomes too large. Since this table
contains information vital to the interpretation of other
tables (e.g., the apmReportTable), the agent should ensure that

the log doesn't
age out entries that would be referenced by
data in those tables.

Note that an entry for a clientID is active from its
StartTime until the StartTime of another entry (for the same
clientID) that supersedes it, or 'now' if none supersede
it. Therefore, if a clientID only has a single entry, it is by
definition very new and should never be aged out. No entry for
a clientID should be aged out unless it has been updated by a
new entry for the client (i.e., with an updated address) and
only if the new entry is 'old' enough.

To determine how old is old enough, compute the maximum value
of Interval * (NumReports + 1) of all entries in the
apmReportControlTable (the '+ 1' is to allow a reasonable
period of time for the report to be downloaded). Then take the
larger of this value and the age in seconds of the oldest
entry in the current transaction table. If an entry for
a
clientID is superseded by another entry whose StartTime is
more than this many seconds ago, then the older entry may be
deleted."

        --      applications(4)
        --    }
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
     "The type of aggregation being performed for this set of
     reports.

     The metrics for a single transaction are the responsiveness of
     the transaction and whether the transaction succeeded (a
     boolean). When such metrics are aggregated in this MIB Module,
```

these metrics are replaced by averages and distributions of responsiveness and availability. The metrics describing aggregates are constant no matter which type of aggregation is being performed. These metrics may be found in the apmReportTable.

The flows(1) aggregation is the simplest. All transactions that share common application/server/client 3-tuples are aggregated together, resulting in a set of metrics for all such unique 3-tuples.

The clients(2) aggregation results in somewhat more aggregation (i.e., fewer resulting records). All transactions that share common application/client tuples are aggregated together, resulting in a set of metrics for all such unique tuples.

The servers(3) aggregation usually results in still more aggregation (i.e., fewer resulting records). All transactions that share common application/server tuples are aggregated together, resulting in a set of metrics for all such unique tuples.

The applications(4) aggregation results in the most aggregation (i.e., the fewest resulting records). All

transactions that share a common application are aggregated together, resulting in a set of metrics for all such unique applications.

Note that it is not meaningful to aggregate applications, as different applications have widely varying characteristics. As
a result, this set of aggregations is complete.

This object may not be modified if the associated apmReportControlStatus object is equal to active(1)."
::= { apmReportControlEntry 3 }

apmReportControlInterval OBJECT-TYPE
SYNTAX Unsigned32
UNITS "Seconds"
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The interval in seconds over which data is accumulated before

```
      being aggregated into a report in the apmReportTable.  All
      reports with the same apmReportControlIndex will be based on
      the same interval. This object must be greater than zero.

      Many users desire that these reports be synchronized to within
      seconds of the beginning of the hour because the results may
      be correlated more meaningfully to business behavior and so
      that data from multiple agents is aggregated over the same
      time periods. Thus management software may take extra effort
      to synchronize
 reports to the beginning of the hour and to one
      another. However, the agent must not allow reports to 'drift'
      over time as they will quickly become unsynchronized. In
      particular, if there is any fixed processing delay between
      reports, the reports should deduct this time from the interval
      so that reports don't drift.

      This object may not be modified if the associated
      apmReportControlStatus object is equal to active(1)."

  STATUS      current
  DESCRIPTION
      "The number of saved reports the agent has allocated
      based on the requested amount in
      apmReportControlRequestedReports. Since each report can have
      many entries, the total number of entries allocated will be
      this number multiplied by the value of
      apmReportControlGrantedSize, or 1 if that object doesn't
      exist.

      When the associated apmReportControlRequestedReports
 object is
      created or modified, the agent should set this object as
      closely to the requested value as is possible for the
      particular implementation and available resources. When
      considering resources available, the agent must consider its
      ability to allocate this many reports each with the number of
      entries represented by apmReportControlGrantedSize, or 1 if
      that object doesn't exist.
```

Note that while the storage required for each report may
fluctuate due to changing conditions, the agent must continue
to have storage available to satisfy the full report size for
all reports when necessary. Further, the agent must not lower
this value except as a result of a set to the associated
apmReportControlRequestedSize object."
::= { apmReportControlEntry 8 }

apmReportControlStartTime OBJECT-TYPE
SYNTAX TimeStamp
MAX-ACCESS read-only
STATUS current

DESCRIPTION
"The value of sysUpTime when the system began processing the
report in progress. Note that the report in progress is not
available.

This object may be used by the management station to figure
out the start time for all previous reports saved for this
apmReportControlEntry, as reports are started at fixed
intervals."
::= { apmReportControlEntry 9 }

apmReportControlReportNumber OBJECT-TYPE
SYNTAX Unsigned32 (1..4294967295)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The number of the report in progress. When an
apmReportControlEntry is activated, the first report will be
numbered one."
::= { apmReportControlEntry 10 }

apmReportControlDeniedInserts OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The number of failed attempts to add an entry to reports for

this apmReportControlEntry
because the number of entries
would have exceeded apmReportControlGrantedSize.

This number is valuable in determining if enough entries have

```
        been allocated for reports in light of fluctuating network
        usage. Note that since an entry that is denied will often be
        attempted again, this number will not predict the exact number
        of additional entries needed, but can be used to understand
        the relative magnitude of the problem.

        Also note that there is no ordering specified for the entries
        in the report, thus there are no rules for which entries will
        be omitted when not enough entries are available. As a
        consequence, the agent is not required to delete 'least
        valuable' entries first."
    ::= { apmReportControlEntry 11 }

apmReportControlDroppedFrames OBJECT-TYPE
    SYNTAX      Counter32
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
       "The total number of frames which were
 received by the agent
        and therefore not accounted for in the *StatsDropEvents, but
        for which the agent chose not to count for this entry for
        whatever reason.  Most often, this event occurs when the agent
        is out of some resources and decides to shed load from this
        collection.

        This count does not include packets that were not counted
        because they had MAC-layer errors.

        This counter is only relevant if this apm report is based on
        a data source whose collection methodology is based on
        analyzing network traffic.

        Note that if the apmReportTables are inactive because no
        applications are enabled in the application directory, this
        value should be 0.

        Note that, unlike the dropEvents counter, this number is the
        exact number of frames dropped."

```

MAX-ACCESS not-accessible

STATUS current
DESCRIPTION
"A conceptual row in the apmReportTable.
The apmReportControlIndex value in the index identifies the
apmReportControlEntry on whose behalf this entry was created.
The apmReportIndex value in the index identifies which report
(in the series of reports) this
entry is a part of.
The apmAppDirAppLocalIndex value in the index identifies
the common application of the transactions aggregated in this
entry.
The apmAppDirResponsivenessType value in the index
identifies the type of responsiveness metric reported by
this entry and uniquely identifies this entry when more
than one responsiveness metric is measured for a flow.
Entries will only exist in this table for those
combinations of AppLocalIndex and ResponsivenessType
that are configured 'on(1)'.
The protocolDirLocalIndex value in the index identifies
the network layer protocol of the apmReportServerAddress.
When the associated apmReportControlAggregationType value is
equal to applications(4) or clients(2), this
protocolDirLocalIndex value will equal 0.
The apmReportServerAddress value in the index identifies the
network layer address of the server in transactions
aggregated
in this entry.
The apmNameClientID value in the index identifies the
client in transactions aggregated in this entry. If the
associated apmReportControlAggregationType is equal to
applications(4) or servers(3), then this protocolDirLocalIndex
value will equal 0.

An example of the indexing of this entry is
apmReportTransactionCount.3.15.3.1.8.4.192.168.1.2.3232235788

Note that some combinations of index values may result in an
index that exceeds 128 sub-identifiers in length which exceeds
the maximum for the SNMP protocol. Implementations should take
care to avoid such combinations."

  DESCRIPTION
     "The network server address for this apmReportEntry.

     This is represented as an octet string with
     specific semantics and length as identified
     by the protocolDirLocalIndex component of the index.

     Since this object is an index variable, it is encoded in the
     index according to the index encoding rules.  For example, if
     the protocolDirLocalIndex indicates an encapsulation of ip,
```

```
      this object is encoded as a length octet of 4, followed by the
      4 octets of the ip address, in network byte order. Care
      should be taken to avoid values of this object that, in
      conjunction with the other index variables, would result in an
      index longer than SNMP's maximum of 128 subidentifiers.

      If the associated apmReportControlAggregationType is equal to
      applications(4) or clients(2), then this object will
 be a null
      string and will be encoded simply as a length octet of 0."

-- The APM Exception table
-- The APM Exception Table creates filters so that a management
-- station can get immediate notification of a transaction that has
-- had poor availability or responsiveness.
--
-- This function is particularly helpful in unaggregated situations
-- where the numbers of agents is relatively high and the transaction
-- rate per agent is relatively low (such as agents for desktops or
-- dedicated to small workgroups). Polling agents in such an
-- environment would either cause scalability problems (high rate) or
-- lead to long notification delays (low rate).

apmExceptionTable
OBJECT-TYPE
SYNTAX SEQUENCE OF ApmExceptionEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"This table creates filters so that a management station can
get immediate notification of a transaction that has had poor

availability or responsiveness.

Each apmExceptionEntry is associated with a particular type of
transaction and is applied to all transactions of that
type. Multiple apmExceptionEntries may be associated with a

```
      particular type of transaction. A transaction type is
      identified by the value of the apmAppDirAppLocalIndex
      component of the index.

      Because the quality of a transaction is not known until it is
      completed, these thresholds are only applied after the
      transaction has completed."

      apmExceptionUnsuccessfulException."
  ::= { apmExceptionEntry 9 }

apmThroughputExceptionMinTime OBJECT-TYPE
  SYNTAX      Unsigned32
  UNITS       "seconds"
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
      "Because the responsiveness for throughput-oriented
      transactions is divided by the elapsed time, it can be very
      sensitive to short-term performance variations for
      transactions that take a short period of time. For example,
      when downloading
 a very short file, a single dropped packet
      could double or triple the total response time.

      Further, throughput is usually examined for applications that
      transfer a lot of data, and when doing so it is helpful to
      conceptualize transaction costs that are proportional to the
      amount of data separately from those costs that are relatively
      fixed (i.e., independent of the amount of data).  For very
      short transactions, these fixed transaction costs (handshake,
      setup time, authentication, round-trip time) may dominate the
      total response time for the transaction, resulting in
      throughput measurements that aren't really proportional to the
      network's, server's and client's combined data throughput
      capability.

      This object controls the minimum number of seconds that an
      throughput-based transaction must exceed before an exception
      can be generated for it. If this object is set
 to zero, then
      all throughput-based transactions are candidates for
      exceptions.

      The value of this object must persist across reboots."

apmTransactionResponsivenessAlarm NOTIFICATION-TYPE
  OBJECTS     { apmExceptionResponsivenessThreshold,
                apmTransactionResponsiveness }
  STATUS      current
  DESCRIPTION
      "Notification sent when a transaction exceeds a threshold
      defined in the apmException table. The index of the

      included apmExceptionResponsivenessThreshold object identifies
      the apmExceptionEntry that specified the threshold. The
      apmTransactionResponsiveness variable identifies the actual
      transaction and its responsiveness.

      Agent implementors are urged to include additional data
      objects in the alarm that may explain the reason for the
      alarm. It is helpful to include such data in the alarm because
      it describes the situation at the time the alarm was
      generated, where polls after the fact may not provide
      meaningful information. Examples of such information are CPU
      load, memory utilization, network utilization, and transaction
      statistics."
  ::= { apmNotifications 1 }

apmTransactionUnsuccessfulAlarm NOTIFICATION-TYPE

DESCRIPTION
"This is the MIB Module for DOCSIS 2.0-compliant Radio

Frequency (RF) interfaces in Cable Modems and
Cable Modem Termination Systems.

Copyright (C) The Internet Society (2006). This
version of this MIB module is part of RFC 4546; see
the RFC itself for full legal notices."

REVISION "200605240000Z"
DESCRIPTION
"Revision of the IETF RF MIB module for DOCSIS 2.0.
This version published as RFC 4546.
This MIB module revision includes the following
among others:
Usage of ifType (205) for upstream logical channels.
Addition of downstream and upstream utilization
counters.
Additional statistics per upstream interface.
Upstream channel offline configuration mechanism.
Added MIB support for new DOCSIS 2.0 modulation
attributes.

```
        Euro-DOCSIS downstream interleave values.
        Adjustments to RFC 2670 definitions based on
        the MIB review guidelines from the IETF

        Operations and Management Area (OPS)."

    REVISION "199908190000Z"
    DESCRIPTION
       "Initial version, published as RFC 2670.
        Modified by Mike St. Johns to fix problems identified by
        the first pass of the MIB doctor.  Of special note,
        docsIfRangingResp and docsIfCmtsInsertionInterval were
        obsoleted and replaced by other objects with the same
        functionality, but with more appropriate syntax."

DocsEqualizerData ::= TEXTUAL-CONVENTION
    STATUS       current
    DESCRIPTION
        "This data type represents the equalizer data
         as measured at the receiver interface.
         The format of the equalizer follows the structure of the
```

```
        Transmit Equalization Adjust RNG-RSP TLV of DOCSIS RFI
        v2.0 :
        1 byte Main tap location 1..(n + m)
         1 byte Number of forward taps per symbol
        1 byte Number of forward taps: n
        1 byte Number of reverse taps: m

        Following are the equalizer coefficients:
        First, forward taps coefficients:
        2 bytes F1 (real),  2 bytes  F1 (imag)

        ...
        2 bytes Fn (real),  2 bytes  Fn (imag)

        Then, reverse taps coefficients:
        2 bytes D1 (real),  2 bytes  D1 (imag)
        ...

        2 bytes Dm (real),  2 bytes  Dm (imag)

        The equalizer coefficients are considered signed 16-bit
        integers in the range from -32768 (0x8000) to 32767
        (0x7FFF).

        DOCSIS specifications require up to a maximum of
        64 equalizer taps (n + m); therefore, this object size
         can get up 260 bytes (4 + 4x64).
        The minimum object size (other than zero) for a t-spaced
        tap with a minimum of 8 symbols will be 36 (4 + 4x8)."

   DESCRIPTION
      "The Forward Error Correction (FEC) interleaving used
       for this downstream channel.
       Values are defined as follows:
```

taps8Increment16(3): protection 5.9/4.1 usec,
latency .22/.15 msec
taps16Increment8(4): protection 12/8.2 usec,
latency .48/.33 msec
taps32Increment4(5): protection 24/16 usec,
latency .98/.68 msec
taps64Increment2(6): protection 47/33 usec,
latency 2/1.4 msec
taps128Increment1(7): protection 95/66 usec,
latency 4/2.8 msec
taps12increment17(8):
protection 18/14 usec,
latency 0.43/0.32 msec

The value 'taps12increment17' is supported by EuroDOCSIS cable systems only, and the others by DOCSIS cable systems.

If the interface is down, this object either returns the configured value (CMTS), the most current value (CM), or the value of unknown(1).
The value of other(2) is returned if the interleave is known but not defined in the above list.
See the associated conformance object for write conditions and limitations. See the reference for the FEC configuration described by the setting of this object."

docsIfUpstreamChannelTable OBJECT-TYPE
   SYNTAX      SEQUENCE OF DocsIfUpstreamChannelEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "This table describes the attributes of attached upstream
       channels."
   ::= { docsIfBaseObjects 2 }

docsIfUpstreamChannelEntry OBJECT-TYPE
   SYNTAX      DocsIfUpstreamChannelEntry
   MAX-ACCESS  not-accessible
   STATUS      current
   DESCRIPTION
      "List of attributes for a single upstream channel.  For
       DOCSIS 2.0 CMTSs, an entry in this table exists for
       each ifEntry with an ifType of docsCableUpstreamChannel
       (205).
       For DOCSIS 1.x CM/CMTSs and DOCSIS 2.0 CMs, an entry in
       this table exists for each ifEntry with an ifType of
       docsCableUpstream (129).

       For DOCSIS 2.0 CMTSs, two classes of interfaces can be
       defined for this table:
        o Upstream Physical Interfaces: The traditional DOCSIS
          1.x CMTS upstream interface ifType 129 and the DOCSIS
          2.0 ifType 205 that are functional.  In other words,
          interfaces that represent upstream receivers within
          an RF MAC interface.
          Entries of physical interfaces are exposed to the
          management interface with their corresponding
          ifStack hierarchy and are not administratively
          created by this table.

        o Upstream Temporary Interfaces: A fictitious
          interface created for the purpose of manipulating
          physical interface parameters offline, then
          validating prior to updating the target physical
          interface.

       In case of a reinitialization of the managed system,
```

```
        physical interfaces values persist while the temporary
        interfaces are not recreated.

        This mechanism helps to minimize
 service disruptions
        originating in situations where a group of interface
        parameter values need to be consistent with each other
        in SET operations.  A temporary buffer
        (temporary interface) is provided to allow the CMTS
        to validate the parameters offline."

docsIfUpChannelCloneFrom OBJECT-TYPE
SYNTAX InterfaceIndexOrZero
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object contains the ifIndex value of the physical
interface row entry whose parameters are to be adjusted.

Upon setting this object to the ifIndex value of a
physical interface, the following interface objects values
are copied to this entry:
docsIfUpChannelFrequency,
docsIfUpChannelWidth,
docsIfUpChannelModulationProfile,
docsIfUpChannelSlotSize,
docsIfUpChannelRangingBackoffStart,
docsIfUpChannelRangingBackoffEnd,
docsIfUpChannelTxBackoffStart,
docsIfUpChannelTxBackoffEnd,
docsIfUpChannelScdmaActiveCodes,
docsIfUpChannelScdmaCodesPerSlot,
docsIfUpChannelScdmaFrameSize,

docsIfUpChannelScdmaHoppingSeed,
docsIfUpChannelType, and
docsIfUpChannelPreEqEnable
Setting this object to the value of a non-existent or
a temporary upstream interface returns the error
'wrongValue'.
This object MUST contain a value of zero for physical
interfaces entries.
Setting this object in row entries that correspond to
physical interfaces returns the error 'wrongValue'."
::= { docsIfUpstreamChannelEntry 16 }

docsIfUpChannelUpdate OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"Used to perform the copy of adjusted parameters from the
temporary interface entry to the physical interface
indicated by the docsIfUpChannelCloneFrom
object. The
transfer is initiated through an SNMP SET to 'true' of

this object.
A SET to 'true' fails and returns error 'commitFailed'
if docsIfUpChannelStatus value is 'notInService', which
means that the interface parameters values are not
compatible with each other or have not been validated yet.
Reading this object always returns 'false'."
::= { docsIfUpstreamChannelEntry 17 }

docsIfUpChannelStatus OBJECT-TYPE
SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object is only used for the creation of a temporary
upstream row with the purpose of updating the parameters
of a physical upstream channel entry.

The following restrictions apply to this object:
1. This object is not writable for physical interfaces.
2. Temporary interface entries are only created by a SET

of this object to createandWait(5).
3. ifAdminStatus from the Interface MIB RFC 2863 is used

to take a physical upstream channel offline, to be consistent with DOCSIS 1.x operation, as indicated in RFC 2670.
In addition,
o ifAdminStatus 'down' is reflected in this object as 'notInService'.
o ifOperStatus 'down' while ifAdminStatus 'up' is reflected in this object as 'notInservice'.
4. Temporary created rows MUST be set to 'active' with the purpose of validating upstream parameter consistency prior to transferring the parameters to the physical interface.

Below is a mandatory procedure for adjusting the values of a physical interface:
1. Create a temporary interface entry through an SNMP SET using 'createAndWait'. At this point, the RowStatus reports 'notReady'.
The Manager entity uses an ifIndex value outside the operational range of the physical interfaces for the creation of a temporary interface.
2. Set the docsIfUpChannelCloneFrom object to the ifIndex value of the physical row to update. Now docsIfUpChannelStatus reports 'notInService'.
3. Change the upstream parameters to the desired values in the temporary row.

4. Validate that all parameters are consistent by setting docsIfUpChannelStatus to 'active'. A failure to set the RowStatus to 'active' returns the error 'commitFailed', which means the parameters are not compatible with the target physical interface.
5. With docsIfUpChannelStatus 'active', transfer the parameters to the target physical interface by setting the object docsIfUpChannelUpdate to 'true'.
6. Delete the temporary
row by setting
docsIfUpChannelStatus to 'destroy'."

        "Current cable modem connectivity state, as specified
        in the RF Interface Specification.  Returned status
        information is the CM status, as assumed by the CMTS,
        and indicates
 the following events:
        other(1)
          Any state other than below.
        ranging(2)
          The CMTS has received an Initial Ranging Request
          message from the CM, and the ranging process is not
          yet complete.
        rangingAborted(3)
          The CMTS has sent a Ranging Abort message to the CM.

        rangingComplete(4)
          The CMTS has sent a Ranging Complete message to the CM.
        ipComplete(5)
          The CMTS has received a DHCP reply message and
          forwarded it to the CM.
        registrationComplete(6)
          The CMTS has sent a Registration Response message to
```

the CM.
accessDenied(7)
The CMTS has sent a Registration Aborted message
to the CM.
operational(8)
Value 8 is considered reserved and should not be defined
in future revisions of this MIB module to avoid conflict
with documented
implementations that support value 8 to
indicate operational state after completing the BPI
initialization process.
registeredBPIInitializing(9)
Baseline Privacy (BPI) is enabled and the CMTS is in the
process of completing BPI initialization. This state
MAY last for a significant length of time if failures
occur during the initialization process. After
completion of BPI initialization, the CMTS will report
registrationComplete(6).
The CMTS only needs to report states it is able to
detect."

```

physical upstream or downstream channel, accurate as of the most recent docsIfCmtsChannelUtilizationInterval.

Upstream Channel Utilization Index:

The upstream channel utilization index is expressed as a percentage of mini-slots utilized on the physical channel, regardless of burst type. For an Initial Maintenance region, the mini-slots for the complete region are considered utilized if the CMTS received an upstream burst within the region from any CM on the physical channel. For contention REQ and REQ/DATA regions, the mini-slots for a transmission opportunity within the region are considered utilized if the CMTS received an upstream burst within the opportunity from any CM on the physical channel. For all other regions, utilized mini-slots are those in which the CMTS granted bandwidth to any unicast SID on the physical channel.

For an upstream interface that has multiple logical upstream channels enabled, the utilization index is a weighted sum of utilization indices for the logical channels. The weight for each utilization index is the percentage of upstream mini-slots allocated for the corresponding logical channel.

Example:

If 75% of bandwidth is allocated to the first logical channel and 25% to the second, and the utilization indices for each are 60 and 40, respectively, the utilization index for the upstream physical channel is (60 * 0.75) + (40 * 0.25) = 55. This figure applies to the most recent utilization interval.

Downstream Channel Utilization Index:

The downstream channel utilization index is a percentage expressing the ratio between bytes used to transmit data versus the total number of bytes transmitted in the raw bandwidth of the MPEG channel. As with the upstream utilization index, the calculated value represents the most recent utilization interval.

Formula:

Downstream utilization index =
(100 * (data bytes / raw bytes))

```
        Definitions:
        Data bytes:    Number of bytes transmitted as data in the

                       docsIfCmtsChannelUtilizationInterval.
                       Identical to docsIfCmtsDownChannelCtrUsed
                       Bytes measured over the utilization
                       interval.
        Raw bandwidth: Total number of bytes available for
                       transmitting data, not including bytes
                       used for headers and other overhead.
        Raw bytes:     (raw bandwidth *
                       docsIfCmtsChannelUtilizationInterval).
                       Identical to docsIfCmtsDownChannelCtrTotal

-- The following table provides operators with input data appropriate
-- for calculating upstream channel utilization, and for determining
-- the traffic characteristics of upstream channels.  Operators may
-- use the docsIfCmtsChannelUtilizationTable or perform their own
-- polling of the docsIfCmtsUpChannelCounterTable objects for
-- utilization determination.
-- The first four 32 and 64 objects in this table are mandatory.
-- Vendors may choose to implement the remaining optional objects to
-- provide operators with finer characterization of upstream channel
-- traffic patterns.  The 32-bit counter objects are included to
-- provide backward compatibility with SNMPv1 managers, which cannot
-- access
 64-bit counter objects.

DESCRIPTION "The SNMP Management Architecture MIB

Copyright (C) The Internet Society (2002). This
version of this MIB module is part of RFC 3411;
see the RFC itself for full legal notices.
"

REVISION "200210140000Z" -- 14 October 2002
DESCRIPTION "Changes in this revision:
- Updated various administrative information.

```
                - Corrected some typos.
                - Corrected typo in description of SnmpEngineID
                  that led to range overlap for 127.
                - Changed '255a' to '255t' in definition of
                  SnmpAdminString to align with current SMI.
                - Reworded 'reserved' for value zero in
                  DESCRIPTION of SnmpSecurityModel.
                - The algorithm for allocating security models
                  should give
256 per enterprise block, rather
                  than 255.
                - The example engine ID of 'abcd' is not
                  legal. Replaced with '800002b804616263'H based
                  on example enterprise 696, string 'abc'.
                - Added clarification that engineID should
                  persist across re-initializations.
                 This revision published as RFC 3411.
                "
    REVISION     "199901190000Z"        -- 19 January 1999
    DESCRIPTION  "Updated editors' addresses, fixed typos.

    ::= { snmpModules 10 }

 -- Textual Conventions used in the SNMP Management Architecture ***

SnmpEngineID ::= TEXTUAL-CONVENTION
  STATUS       current
  DESCRIPTION "An SNMP engine's
administratively-unique identifier.
            Objects of this type are for identification, not for
            addressing, even though it is possible that an
            address may have been used in the generation of
            a specific value.

            The value for this object may not be all zeros or
            all 'ff'H or the empty (zero length) string.

            The initial value for this object may be configured
            via an operator console entry or via an algorithmic
            function.  In the latter case, the following
            example algorithm is recommended.
```

In cases where there are multiple engines on the
same system, the use of this algorithm is NOT
appropriate, as it would result in all of those
engines ending up with the same ID value.

1) The very first bit is used to indicate how the

rest of the data is composed.

0 - as defined by enterprise using former methods
that existed before SNMPv3. See item 2 below.

1 - as defined by this architecture, see item 3
below.

Note that this allows existing uses of the
engineID (also known as AgentID [RFC1910]) to
co-exist with any new uses.

2) The snmpEngineID has a length of 12 octets.

The first four octets are set to the binary
equivalent of the agent's SNMP management
private enterprise number as assigned by the
Internet Assigned Numbers Authority (IANA).
For example, if Acme Networks has been assigned
{ enterprises 696 }, the first four octets would
be assigned '000002b8'H.

The remaining eight octets
are determined via
one or more enterprise-specific methods. Such
methods must be designed so as to maximize the
possibility that the value of this object will
be unique in the agent's administrative domain.
For example, it may be the IP address of the SNMP
entity, or the MAC address of one of the
interfaces, with each address suitably padded
with random octets. If multiple methods are
defined, then it is recommended that the first
octet indicate the method being used and the
remaining octets be a function of the method.

3) The length of the octet string varies.

The first four octets are set to the binary

equivalent of the agent's SNMP management
private enterprise number as assigned by the
Internet Assigned Numbers Authority (IANA).
For example, if Acme Networks has been assigned
{ enterprises 696 }, the first four octets would
be assigned '000002b8'H.

The very first bit is set to 1. For example, the
above value for Acme Networks now changes to be
'800002b8'H.

The fifth octet indicates how the rest (6th and
following octets) are formatted. The values for
the fifth octet are:

0 - reserved, unused.

1 - IPv4 address (4 octets)
lowest non-special IP address

2 - IPv6 address (16 octets)
lowest non-special IP address

3 - MAC address (6 octets)
lowest IEEE MAC address, canonical

order

4 - Text, administratively assigned
Maximum remaining length 27

5 - Octets, administratively assigned
Maximum remaining length 27

6-127 - reserved, unused

128-255 - as defined by the enterprise
Maximum remaining length 27

"

SYNTAX OCTET STRING (SIZE(5..32))

```
SnmpSecurityModel ::= TEXTUAL-CONVENTION
  STATUS       current
  DESCRIPTION "An identifier that uniquely identifies a
               Security Model of the Security Subsystem within
               this SNMP Management Architecture.

               The values for securityModel are allocated as
               follows:

               - The zero value does not identify any particular
                 security model.

               - Values between 1 and 255, inclusive,
are reserved
                 for standards-track Security Models and are
                 managed by the Internet Assigned Numbers Authority
                 (IANA).
               - Values greater than 255 are allocated to
                 enterprise-specific Security Models.  An
                 enterprise-specific securityModel value is defined
                 to be:

                 enterpriseID * 256 + security model within
                 enterprise

                 For example, the fourth Security Model defined by
                 the enterprise whose enterpriseID is 1 would be
                 259.

               This scheme for allocation of securityModel
               values allows for a maximum of 255 standards-
               based Security Models, and for a maximum of
               256 Security Models per enterprise.

               It is believed that the assignment of new
               securityModel values will be rare in
practice
               because the larger the number of simultaneously
               utilized Security Models, the larger the
               chance that interoperability will suffer.
               Consequently, it is believed that such a range
               will be sufficient.  In the unlikely event that
               the standards committee finds this number to be
               insufficient over time, an enterprise number
               can be allocated to obtain an additional 256
               possible values.
```

Note that the most significant bit must be zero;
hence, there are 23 bits allocated for various
organizations to design and define non-standard

securityModels. This limits the ability to
define new proprietary implementations of Security
Models to the first 8,388,608 enterprises.

It is worthwhile to note that, in its encoded

form, the securityModel value will normally
require only a single byte since, in practice,
the leftmost bits will be zero for most messages
and sign extension is suppressed by the encoding
rules.

As of this writing, there are several values
of securityModel defined for use with SNMP or
reserved for use with supporting MIB objects.
They are as follows:

0 reserved for 'any'
1 reserved for SNMPv1
2 reserved for SNMPv2c
3 User-Based Security Model (USM)
"
SYNTAX INTEGER(0 .. 2147483647)

SnmpMessageProcessingModel ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION "An identifier that uniquely identifies a Message
Processing Model of the Message Processing
Subsystem within this SNMP Management
Architecture.

The values for messageProcessingModel are
allocated as follows:

- Values between 0 and 255, inclusive, are
reserved for standards-track Message Processing
Models and are managed by the Internet Assigned
Numbers Authority (IANA).

- Values greater than 255 are allocated to
enterprise-specific Message Processing Models.

An enterprise messageProcessingModel value is defined to be:

enterpriseID * 256 +
    messageProcessingModel within enterprise

For example, the fourth Message Processing Model defined by the enterprise whose enterpriseID

is 1 would be 259.

This scheme for allocating messageProcessingModel values allows for a maximum of 255 standards-based Message Processing Models, and for a maximum of 256 Message Processing Models per enterprise.

It is believed that the assignment of new messageProcessingModel values will be rare in practice because the larger the number of simultaneously utilized Message Processing Models, the larger the chance that interoperability will suffer. It is believed that such a range will be sufficient. In the unlikely event that the standards committee finds this number to be insufficient over time, an enterprise number can be allocated to obtain an additional 256 possible values.

Note that the most significant bit must be zero; hence, there are 23 bits allocated for various organizations to design and define non-standard messageProcessingModels. This limits the ability to define new proprietary implementations of Message Processing Models to the first 8,388,608 enterprises.

It is worthwhile to note that, in its encoded form, the messageProcessingModel value will normally require only a single byte since, in practice, the leftmost bits will be zero for most messages and sign extension is suppressed by the encoding rules.

As of this writing, there are several values of messageProcessingModel defined for use with SNMP.

```
            They are as follows:

               0  reserved for SNMPv1
               1  reserved for SNMPv2c
               2  reserved for SNMPv2u and SNMPv2*
               3  reserved for SNMPv3
            "
  SYNTAX       INTEGER(0 .. 2147483647)

SnmpSecurityLevel
 ::= TEXTUAL-CONVENTION
  STATUS       current
  DESCRIPTION "A Level of Security at which SNMP messages can be
            sent or with which operations are being processed;
            in particular, one of:

              noAuthNoPriv - without authentication and
                           without privacy,
              authNoPriv   - with authentication but
                           without privacy,
              authPriv     - with authentication and
                           with privacy.

            These three values are ordered such that
            noAuthNoPriv is less than authNoPriv and
            authNoPriv is less than authPriv.
           "
  SYNTAX       INTEGER { noAuthNoPriv(1),
                  authNoPriv(2),
                  authPriv(3)
                }

SnmpAdminString ::= TEXTUAL-CONVENTION
  DISPLAY-HINT "255t"
  STATUS
    current
  DESCRIPTION "An octet string containing administrative
            information, preferably in human-readable form.

            To facilitate internationalization, this
            information is represented using the ISO/IEC
            IS 10646-1 character set, encoded as an octet
            string using the UTF-8 transformation format
```

described in [RFC2279].

Since additional code points are added by amendments to the 10646 standard from time to time, implementations must be prepared to encounter any code point from 0x00000000 to 0x7fffffff. Byte sequences that do not correspond to the valid UTF-8 encoding of a code point or are outside this range are prohibited.

The use of control codes should be avoided.

When it is necessary to represent a newline,

the control code sequence CR LF should be used.

The use of leading or trailing white space should be avoided.

For code points not directly supported by user interface hardware or software, an alternative means of entry and display, such as hexadecimal, may be provided.

For information encoded in 7-bit US-ASCII, the UTF-8 encoding is identical to the US-ASCII encoding.

UTF-8 may require multiple bytes to represent a single character / code point; thus the length of this object in octets may be different from the number of characters encoded. Similarly, size constraints refer to the number of encoded octets, not the number of characters represented by an encoding.

Note that when this
TC is used for an object that
is used or envisioned to be used as an index, then a SIZE restriction MUST be specified so that the number of sub-identifiers for any object instance does not exceed the limit of 128, as defined by [RFC3416].

```
            Note that the size of an SnmpAdminString object is
            measured in octets, not characters.
           "

        DESCRIPTION
          "This is the MIB Module for DOCSIS-compliant cable modems

            and cable-modem
 termination systems.

            Copyright (C) The IETF Trust (2006).  This version
            of this MIB module was published in RFC 4639; for full
            legal notices see the RFC itself."

        REVISION "200612200000Z" -- December 20, 2006
```

DESCRIPTION
"Second version, published as RFC 4639.

Modifications to this MIB module since RFC 2669 include:
- Deprecation of the docsDevFilter group in favor of the DiffServ MIB groups, to enable support for IPv6 filtering and DiffServ Code Point (DSCP) marking.
- Deprecation of the docsDevCpeGroup in favor of the docsDevCpeInetGroup, to enable support of IPv6.
- Addition of various InetAddress objects to enable support of IPv6.
- Deprecation of docsDevNmAccessTable in favor of SNMP Coexistence and SNMPv3 -- yet adding docsDevNmAccessTrapVersion and clarifying docsDevNmAccessIp for current use of this table,
- Addition of docsDevIgmpModeControl for management and control of the IGMP mode of operation,
- Addition of docsDevMaxCpe for management of the maxmium number of CPEs permitted access through a cable modem,
- Addition of docsDevSwServerTransportProtocol, and modifications to docsDevSoftware object DESCRIPTIONS, to enable software downloads via either TFTP or HTTP,
- Replacement of docsDevEvThrottleInhibited with docsDevEvThrottleThresholdExceeded to simplify event threshold management,
- Modification of docsDevEvReporting to enable local logging to the internal volatile log, and not to the internal non-volatile log,
- Modification of the compliance statement to make the docsDevCpe objects optional
- Created placeholders for two OIDs in the docsDevFilterPolicyTable that were never used
- Modified the DESCRIPTION of docsDevSwServerTransportProtocol and docsDevSwServerAddressType to address the dependence between each object
- Added a reference to docsDevServerConfigTftpAddress
- Clarified the scope of notifications that are covered by docsDevEvThrottleThreshold
- Clarified an error condition that could occur when

doing a SET to docsDevEvReporting
- Defined each of the enumerated types for both docsDevEvLevel and docsDevEvPriority
- Added UNITS clause to docsDevFilterLLCMatches,

docsDevFilterIpMatches, docsDevMaxCpe,
docsDevEvThrottleThreshold and docsDevEvCounts.
- Added REFERENCE clause to docsDevFilterIpProtocol
- Modified DESCRIPTION
of docsDevCpeInetAddr to be
more protocol-neutral
- Removed the enumerated value (1) from both
docsDevCpeInetSource and docsDevCpeSource
- Covered additional read-write and read-create objects
in the Security Considerations section
- Modified the default value of docsDevNmAccessIpMask
to be consistent with OSSI specification
- Modified the SYNTAX of docsDevNmAccessCommunity and
docsDevNmAccessInterfaces in the Conformance
Statement section
- Added SYNTAX clause to docsDevEvReporting in the
Conformance Statement section
- Modified SYNTAX clause of docsDevEvReporting to
move new enumerated type to byte boundary
- Added references to DOCSIS 2.0 specifications to
multiple objects
- Clarified non-persistency across reboots for
all
tables
- Clarified functionality of docsDevSw objects as
they relate to docsDevSwOperStatus
- Clarified enumerated types (9) and (10) for
docsDevServerBootState
- Defined the state of unknown(0) for the following
objects: docsDevServerDhcpAddressType,
docsDevServerTimeAddressType,
docsDevServerConfigTftpAddressType and
docsDevServerConfigTftpAddressType
- Modified the value in docsDevFilterIpDaddr to be
consistent with the SYNTAX
- Specified which rows could be modified in an
active row for docsDevFilterPolicyStatus
- Defined the term 'manually' in docsDevCpeEnroll
- Clarified the description for
docsDevFilterTosOrMask
- Covered the case of a non-existent row for
docsDevFilterPolicyPtr
- Added DEFVAL clauses for multiple
objects
- Replaced docsDevNotification OBJECT IDENTIFIER
with docsDevNotifications to address possible
compatibility issues

```
            - Added support for the usage of RFC 3413 and RFC 3014
              as event notification mechanisms
            - Removed docsDevFilterPolicyObsoleteGroup
            - Added stdInterface(9) type to docsDevEvReporting to
              support the usage of RFC3413 and RFC3014
            - Modified DESCRIPTION for docsDevMaxCpe"

        REVISION "199908190000Z"

docsDevRole OBJECT-TYPE
       SYNTAX INTEGER {
          cm(1),
          cmtsActive(2),
          cmtsBackup(3)
        }
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION
           "Defines the current role of this device.  cm(1) is a
            Cable Modem, cmtsActive(2) is a Cable Modem Termination
            System that is controlling the system of cable modems,
            and cmtsBackup(3) is a CMTS that is currently connected
            but is not controlling the system (not currently used).

            In general, if this device is a 'cm', its role will not
            change during operation or between reboots.  If the
            device is a 'cmts' it may change between cmtsActive and
            cmtsBackup and back again during normal operation.  NB:
            At this time, the DOCSIS standards do not support the
            concept of a backup CMTS, but cmtsBackup is included for
            completeness."

            MUST NOT persist across reboots.  The objects in this
            table are only accessible from cable devices that are
            not capable of operating in SNMP Coexistence mode
            (RFC 3584) or in SNMPv3 mode (RFC 3410).
            See the conformance section for
            details.  Note that some devices are required by other
            specifications (e.g., the DOCSIS OSSIv1.1 specification)
            to support the legacy SNMPv1/v2c docsDevNmAccess mode
            for
 backward compatibility.

            This table is deprecated.  Instead, use the SNMP
```

```
            coexistence MIBs from RFC 3584, the TARGET and
            NOTIFICATION MIBs from RFC 3413, and
            the View-Based Access Control Model (VACM) MIBs for
            all SNMP protocol versions from RFC 3415."

-- The syntax of the following object was copied from RFC 1493,
-- dot1dStaticAllowedToGoTo.

docsDevNmAccessInterfaces OBJECT-TYPE
    SYNTAX      OCTET STRING (SIZE (1..32))
    MAX-ACCESS  read-create
    STATUS      deprecated
    DESCRIPTION
       "Specifies the set of interfaces from which requests from
        this NMS will be accepted.  Each octet within
        the value of this object specifies a set of eight

        interfaces, the first octet specifying ports 1
        through 8, the second octet specifying interfaces 9
        through 16, etc.  Within each octet, the most
        significant bit represents the lowest numbered
        interface, and the least significant bit represents the
        highest numbered
 interface.  Thus, each interface is
        represented by a single bit within the value of this
        object.  If that bit has a value of '1' then that
        interface is included in the set.

        Note that entries in this table apply only to link-layer
        interfaces (e.g., Ethernet and CATV MAC).  Bits
        representing upstream and downstream channel interfaces
        MUST NOT be set to '1'.

        Note that if bits corresponding to non-existing
        interfaces are set, the result is implementation
        specific.
```

```
            Note that according to the DOCSIS OSSIv1.1
            specification, when ifIndex '1' is included in the
            set, then this row applies to all CPE
            (customer-facing) interfaces.

            The size of this object is the minimum required to
            represent all configured interfaces for this device."

```
        ignoreProvisioningUpgrade(3)
    }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
        "If set to upgradeFromMgt(1), the device will initiate a
         TFTP or HTTP software image download.  After
         successfully receiving an image, the device will set
         its state to ignoreProvisioningUpgrade(3) and reboot.
         If the download process is interrupted (e.g., by a reset
         or power failure), the device will load the previous
         image and, after re-initialization, continue to attempt
         loading the image specified in docsDevSwFilename.

         If set to allowProvisioningUpgrade(2), the device will
         use the software version information supplied by the
         provisioning server when next rebooting (this does not
         cause a reboot).

        When set to ignoreProvisioningUpgrade(3), the device
         will disregard software image upgrade information
         from the provisioning server.

         Note that reading this object can return
         upgradeFromMgt(1).  This indicates that a software
         download is currently in progress, and that the device
         will reboot after successfully receiving an image."

DESCRIPTION
"The Internet address of the RFC 868 Time server,
as provided by DHCP option 4.

Note that if multiple values are provided to the
CM in DHCP option 4, the value of this MIB object
MUST be the Time server address from which the Time
of Day reference was acquired as based on the DOCSIS
RFI specification.
During the period of time where
the Time of Day have not been acquired, the Time
server address reported by the CM may report the
first address value in the DHCP option value or the
last server address the CM attempted to get the Time

```
            of day value.

            Returns the zero-length octet string if the time server
            IP address is not provisioned."

         inhibited(4)
      }
      MAX-ACCESS  read-write
      STATUS      current
      DESCRIPTION
         "Controls the transmission of traps and syslog messages
          with respect
 to the trap pacing threshold.

          unconstrained(1) causes traps and syslog messages to be
          transmitted without regard to the threshold settings.

          maintainBelowThreshold(2) causes trap transmission and
          syslog messages to be suppressed if the number of traps
          would otherwise exceed the threshold.
```

stopAtThreshold(3) causes trap transmission to cease at
the threshold and not to resume until directed to do so.

inhibited(4) causes all trap transmission and syslog
messages to be suppressed.

A single event is always treated as a single event for
threshold counting. That is, an event causing both a
trap and a syslog message is still treated as a single
event.

Writing to this object resets the thresholding state."

            "The priority level that is controlled by this
             entry.  These are ordered from most (emergency) to least
             (debug) critical.  Each event with a CM or CMTS has a
             particular priority level associated with it (as defined
             by the vendor).

             emergency(1) events indicate vendor-specific fatal
             hardware or software errors that prevent normal system
              operation.

             alert(2) events indicate a serious failure that causes
             the reporting system to reboot but is not caused by
             hardware or software malfunctioning.

             critical(3) events indicate a serious failure that
             requires attention and prevents the device from
             transmitting data but that could be recovered without
```

```
            rebooting the system.

            error(4) and warning(5) events indicate that a failure
            occurred that could interrupt the normal data flow but
            that does not cause the device to re-register.

            notice(6) and information(7) events indicate a
            milestone or checkpoint in normal operation that could
            be of particular importance for troubleshooting.

            debug(8) events are reserved for vendor-specific
            events.

            During normal operation, no event more
            critical than notice(6)
 should be generated.  Events
            between warning and emergency should be generated at
            appropriate levels of problems (e.g., emergency when the
            box is about to crash)."
        ::= { docsDevEvControlEntry 1 }

           syslog(2),
           -- The following are extensions to the original set of
           -- labels.  The extensions start at an octet boundary.
           -- So for bits 3 - 7, one MUST set them to zero on send
           -- and one MUST ignore them on receipt.
           localVolatile(8),
           stdInterface(9)
        }
        MAX-ACCESS  read-write
        STATUS      current
        DESCRIPTION
           "Defines the action to be taken on occurrence of this
            event class.  Implementations may not necessarily
            support all options for all event classes but at
            minimum must allow traps and
 syslogging to be
            disabled.

            If the local(0) bit is set, then log to the internal
            log and update non-volatile store, for backward
```

```
            compatibility with the original RFC 2669 definition.
            If the traps(1) bit is set, then generate
            an SNMP trap; if the syslog(2) bit is set, then
            send a syslog message (assuming that the syslog address
            is set).  If the localVolatile(8) bit is set, then
            log to the internal log without updating non-volatile
            store.  If the stdInterface(9) bit is set, then the
            agent ignores all other bits except the local(0),
            syslog(2), and localVolatile(8) bits.  Setting the
            stdInterface(9) bit indicates that RFC3413 and
            RFC3014 are being used to control event reporting
            mechanisms."

        DEFVAL { accept }
        ::= { docsDevFilter 3 }
```

```
docsDevFilterIpTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF DocsDevFilterIpEntry
    MAX-ACCESS
 not-accessible
    STATUS      deprecated
    DESCRIPTION
       "An ordered list of filters or classifiers to apply to
        IP traffic.  Filter application is ordered by the filter
        index, rather than by a best match algorithm (note that
        this implies that the filter table may have gaps in the
        index values).  Packets that match no filters will have
        policy 0 in the docsDevFilterPolicyTable applied to
        them, if it exists.  Otherwise, Packets that match no
        filters are discarded or forwarded according to the
        setting of docsDevFilterIpDefault.

        Any IP packet can theoretically match multiple rows of
        this table.  When considering a packet, the table is
        scanned in row index order (e.g., filter 10 is checked
        before filter 20).  If the packet matches that filter
        (which means that it matches ALL criteria for that
row),
        actions appropriate to docsDevFilterIpControl and
        docsDevFilterPolicyId are taken.  If the packet was
        discarded processing is complete.  If
        docsDevFilterIpContinue is set to true, the filter
        comparison continues with the next row in the table,
        looking for additional matches.

        If the packet matches no filter in the table, the packet
        is accepted or dropped for further processing
        according to the setting of docsDevFilterIpDefault.
        If the packet is accepted, the actions specified by
        policy group 0 (e.g., the rows in
        docsDevFilterPolicyTable that have a value of 0 for
        docsDevFilterPolicyId) are taken, if that policy

        group exists.

        Logically, this table is consulted twice during the
        processing of any IP packet: once upon its acceptance
        from the L2 entity, and once upon
its transmission to
        the L2 entity.  In actuality, for cable modems, IP
        filtering is generally the only IP processing done for
```

```
            transit traffic.  This means that inbound and outbound
            filtering can generally be done at the same time with
            one pass through the filter table.

            The objects in this table are only accessible from cable
            devices that are not operating in DiffServ MIB mode
            (RFC 3289).  See the conformance section for details.

            Note that some devices are required by other
            specifications (e.g., the DOCSIS OSSIv1.1 specification)
            to support the legacy SNMPv1/v2c docsDevFilter mode
            for backward compatibility.

            Table entries MUST NOT persist across reboots for any
            device.

            This table is deprecated.  Instead, use the DiffServ MIB
            from RFC 3289."

-- Policy Mapping Table
--

docsDevFilterPolicyTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF DocsDevFilterPolicyEntry
    MAX-ACCESS  not-accessible
    STATUS      deprecated
    DESCRIPTION
       "A Table that maps between a policy group ID and a set
        of pointers to policies to be applied.  All rows with
        the same docsDevFilterPolicyId are part of the same
        group of policy pointers and are applied in the order
        in this table.  docsDevFilterPolicyTable exists to
```

allow multiple policy actions (referenced by policy
pointers) to be applied to any given classified packet.
The policy actions are applied in index order.
For example:

Index ID Type Action
1 1 TOS 1
9 5 TOS 1
12 1 IPSEC 3

This says that a packet that matches a filter with
policy id 1 first has TOS policy 1 applied (which might
set the TOS bits to enable a higher priority) and next
has the IPSEC policy 3 applied (which may result in the
packets being dumped into a secure VPN to a remote
encryptor).

Policy ID 0 is reserved for default actions and is
applied only to packets that match no filters in
docsDevFilterIpTable.

Table entries MUST NOT persist across reboots for any
device.

This table is deprecated. Instead, use the DiffServ MIB

from RFC 3289."

        STATUS      deprecated
        DESCRIPTION
           "This object points to a row in an applicable filter
            policy table.  Currently, the only standard policy
            table is docsDevFilterTosTable.

            Per the textual convention, this object points to the
            first accessible object in the row; e.g., to point to a
            row in docsDevFilterTosTable with an index of 21, the
            value of this object would be the object identifier
            docsDevTosStatus.21.

            Vendors are recommended to adhere to the same convention
            when adding vendor-specific policy table extensions.

            If this pointer references an empty or non-existent

           row, then no policy action is taken.

            The default upon row creation is a null pointer that
            results in no policy action being taken."
        DEFVAL { zeroDotZero }
        ::= { docsDevFilterPolicyEntry 6 }

--
-- TOS Policy action table
--

docsDevFilterTosTable OBJECT-TYPE
        SYNTAX      SEQUENCE OF DocsDevFilterTosEntry
        MAX-ACCESS  not-accessible
        STATUS      deprecated
        DESCRIPTION
           "Table used to describe Type of Service (TOS) bits

            processing.

            This table is an adjunct to the docsDevFilterIpTable
            and the docsDevFilterPolicy table.  Entries in the
            latter table can point to specific rows in this (and
            other) tables and cause specific actions to be taken.
            This table permits the manipulation of the value of the
            Type of Service bits in the IP header of the matched
            packet as follows:
```

```
            Set the tosBits
 of the packet to
               (tosBits & docsDevFilterTosAndMask) |
               docsDevFilterTosOrMask

            This construct allows you to do a clear and set of all
            the TOS bits in a flexible manner.

            Table entries MUST NOT persist across reboots for any
            device.

            This table is deprecated.  Instead, use the DiffServ MIB
            from RFC 3289."

  DESCRIPTION
   "This MIB module defines configuration objects for managing
   IPsec Security Policies.  In general, this MIB can be
   implemented anywhere IPsec security services exist (e.g.,
   bump-in-the-wire, host, gateway, firewall, router, etc.).

   Copyright (C) The IETF Trust (2007).  This version of
   this MIB module is part of RFC 4807; see the RFC itself for
   full legal notices."

SpdBooleanOperator ::= TEXTUAL-CONVENTION
  STATUS   current
  DESCRIPTION
     "The SpdBooleanOperator operator is used to specify
      whether sub-components in a decision-making process are

      ANDed or ORed together to decide if the resulting
      expression is true or false."
  SYNTAX      INTEGER { or(1), and(2) }

SpdAdminStatus ::= TEXTUAL-CONVENTION
  STATUS   current
  DESCRIPTION
     "The SpdAdminStatus is used to specify the administrative
      status of an object.  Objects that are disabled MUST NOT
      be used by the packet processing engine."
  SYNTAX      INTEGER { enabled(1), disabled(2) }

SpdIPPacketLogging ::= TEXTUAL-CONVENTION
  DISPLAY-HINT "d"
  STATUS   current
  DESCRIPTION
     "SpdIPPacketLogging specifies
 whether an audit message
      SHOULD be logged if a packet is passed through a Security
      Association (SA) and if some of that packet is included in
      the log event.  A value of '-1' indicates no logging.  A
      value of '0' or greater indicates that logging SHOULD be
```

done and indicates the number of bytes starting at the
beginning of the packet to place in the log. Values greater
than the size of the packet being processed indicate that
the entire packet SHOULD be sent.

Examples:
'-1' no logging
'0' log but do not include any of the packet in the log
'20' log and include the first 20 bytes of the packet
in the log."

SYNTAX Integer32 (-1..65535)

SpdTimePeriod ::= TEXTUAL-CONVENTION
DISPLAY-HINT "31t"
STATUS current
DESCRIPTION
"This property identifies an overall range of calendar dates
and time. In a boolean context, a value
within this time
range, inclusive, is considered true.

This information is encoded as an octet string using
the UTF-8 transformation format described in STD 63,
RFC 3629.

It uses the format suggested in RFC 3060. An octet string

represents a start date and time and an end date and time.
For example:

yyyymmddThhmmss/yyyymmddThhmmss

Where: yyyy = year mm = month dd = day
hh = hour mm = minute ss = second

The first 'yyyymmddThhmmss' sub-string indicates the start
date and time. The second 'yyyymmddThhmmss' sub-string
indicates the end date and time. The character 'T' within
these sub-strings indicates the beginning of the time
portion of each sub-string. The solidus character '/'
separates the start from the end date and time. The end
date and time MUST be subsequent to the start date and

```
time.

        There are also two allowed substitutes for a
        'yyyymmddThhmmss' sub-string: one for the start date and
        time, and one for the end date and time.

        If the start date and time are replaced with the string
        'THISANDPRIOR', this sub-string would indicate the current
        date and time and the previous dates and time.

        If the end date and time are replaced with the string
        'THISANDFUTURE', this sub-string would indicate the current
        date and time and the subsequent dates and time.

        Any of the following SHOULD be considered a
        'wrongValue' error:
        - Setting a value with the end date and time earlier than
          or equal to the start date and time.
        - Setting the start date and time to 'THISANDFUTURE'.
        - Setting the end date and time to 'THISANDPRIOR'."

   STATUS      current
   DESCRIPTION
      "The priority (sequence number) of the sub-component in
       a group that this row represents.  This value indicates
       the order that each row of this table MUST be processed
       from low to high.  For example, a row with a priority of 0
       is processed before a row with a priority of 1, a 1 before
       a 2, etc."
   ::= { spdGroupContentsEntry 2 }

spdGroupContFilter OBJECT-TYPE
   SYNTAX      VariablePointer
   MAX-ACCESS  read-create
```

STATUS current
DESCRIPTION
"spdGroupContFilter points to a filter that is evaluated
to determine whether the spdGroupContComponentName within
this row is exercised. Managers can use this object to
classify groups of rules, or subgroups, together in order to
achieve a greater degree of control and optimization over
the execution order of the items within the group. If the

filter evaluates to false, the rule or subgroup will be
skipped and the next rule or subgroup will be evaluated
instead. This value can be used to indicate a scalar or
row in a table. When indicating a row in a table, this
value MUST point to the first column instance in that row.

An example usage of this object would be to limit a
group of rules to executing only when the IP packet
being processed is designated to be processed by IKE.
This effectively creates a group of IKE-specific rules.

The following tables and scalars can be pointed to by this
column. All but diffServMultiFieldClfrTable are defined in
this MIB:

diffServMultiFieldClfrTable
spdIpOffsetFilterTable
spdTimeFilterTable
spdCompoundFilterTable
spdTrueFilter
spdIpsoHeaderFilterTable

Implementations MAY choose to provide
support for other
filter tables or scalars.

If this column is set to a VariablePointer value, which
references a non-existent row in an otherwise supported
table, the inconsistentName exception MUST be returned. If
the table or scalar pointed to by the VariablePointer is
not supported at all, then an inconsistentValue exception
MUST be returned.

If, during packet processing, a row in this table is applied
to a packet and the value of this column in that row
references a non-existent or non-supported object, the

```
        packet MUST be dropped."

  DESCRIPTION
     "This defines the
 various tests that are used when
      evaluating a given filter.

      The various tests definable in this table are as follows:

      equal:
        - Tests if the OCTET STRING, 'spdIpOffFiltValue', matches

          a value in the packet starting at the given offset in
          the packet and comparing the entire OCTET STRING of
          'spdIpOffFiltValue'.  Any values compared this way are
          assumed to be unsigned integer values in network byte
          order of the same length as 'spdIpOffFiltValue'.

      notEqual:
        - Tests if the OCTET STRING, 'spdIpOffFiltValue', does
          not match a value in the packet starting at the given
          offset in the packet and comparing to the entire OCTET
          STRING of 'spdIpOffFiltValue'.  Any values compared
          this way are assumed to be unsigned integer values in
          network byte order of the same length as
          'spdIpOffFiltValue'.

      arithmeticLess:
        - Tests if the OCTET STRING, 'spdIpOffFiltValue', is
          arithmetically less than ('<') the value starting at
          the given offset within the packet.  The value in the
          packet is assumed to be an unsigned integer in network
          byte order of the same length as 'spdIpOffFiltValue'.
```

arithmeticGreaterOrEqual:
- Tests if the OCTET STRING, 'spdIpOffFiltValue', is arithmetically greater than or equal to ('>=') the value starting at the given offset within the packet. The value in the packet is assumed to be an unsigned integer in network byte order of the same length as 'spdIpOffFiltValue'.

arithmeticGreater:
- Tests if the OCTET STRING, 'spdIpOffFiltValue', is arithmetically greater than ('>') the value starting at the given offset within the packet. The value in the packet is
assumed to be an unsigned integer in network
byte order of the same length as 'spdIpOffFiltValue'.

arithmeticLessOrEqual:
- Tests if the OCTET STRING, 'spdIpOffFiltValue', is arithmetically less than or equal to ('<=') the value starting at the given offset within the packet. The value in the packet is assumed to be an unsigned integer in network byte order of the same length as 'spdIpOffFiltValue'."

```
        one notification sent per minute
    for any action
        notifications that do not have any other configuration
        controlling their send rate.

        Note that compound actions with multiple executed
        sub-actions may result in multiple notifications being sent
        from a single rule execution."
    ::= { spdNotifications 1 }

spdPacketNotification NOTIFICATION-TYPE
    OBJECTS { spdActionExecuted, spdIPEndpointAddType,
              spdIPEndpointAddress,
              spdIPSourceType, spdIPSourceAddress,
              spdIPDestinationType,
              spdIPDestinationAddress,
              spdPacketDirection,
              spdPacketPart }
    STATUS  current
    DESCRIPTION
       "Notification that a packet passed through a Security
        Association (SA).  Only SAs created by actions with packet
        logging enabled will result in this notification getting
        sent.  The objects sent MUST include the spdActionExecuted,
        which will indicate which action was executed
    within the
        scope of the rule.  Additionally, the spdIPSourceType,
        spdIPSourceAddress, spdIPDestinationType, and
        spdIPDestinationAddress objects MUST be included to
        indicate the packet source and destination of the packet
        that triggered the action.  The spdIPEndpointAddType,
        spdIPEndpointAddress, and spdPacketDirection objects are
        included to indicate which endpoint the packet was
        associated with.  Finally, spdPacketPart is included to
        enable sending a variable sized part of the front of the
        packet with the size dependent on the value of the object of
        TC syntax 'SpdIPPacketLogging', which indicated that logging
        should be done.

        A spdPacketNotification SHOULD be limited to a maximum of
        one notification sent per minute for any action
        notifications that do not have any other configuration
        controlling their send rate.

        An action notification
```

```
 SHOULD be limited to a maximum of
       one notification sent per minute for any action
       notifications that do not have any other configuration
       controlling their send rate."

      "An integer which may be used as a table index."
    SYNTAX    Unsigned32 (1..4294967295)

IndexIntegerNextFree ::= TEXTUAL-CONVENTION
    DISPLAY-HINT "d"
    STATUS    current
    DESCRIPTION
      "An integer which may be used as a new Index in a table.

      The special value of 0 indicates that no more new entries can be
      created in the relevant table.

      When a MIB is used for configuration, an object with this SYNTAX
      always contains a legal value (if non-zero) for an index that is
      not currently used in the relevant table. The Command Generator
      (Network Management Application) reads this variable and uses the
      (non-zero) value read when creating a new row with an SNMP SET.
      When the SET is performed, the Command Responder (agent) must
      determine whether the value is indeed
   still unused; Two Network
      Management Applications may attempt to create a row
      (configuration entry) simultaneously and use the same value. If
      it is currently unused, the SET succeeds and the Command
      Responder (agent) changes the value of this object, according to
      an implementation-specific algorithm.  If the value is in use,
```

```
      however, the SET fails.  The Network Management Application must
      then re-read this variable to obtain a new usable value.

      An OBJECT-TYPE definition using this SYNTAX MUST specify the
      relevant table for which the object is providing this
      functionality."
    SYNTAX   Unsigned32 (0..4294967295)

IfDirection ::= TEXTUAL-CONVENTION
    STATUS current
    DESCRIPTION
      "IfDirection specifies a direction of data travel on an
      interface. 'inbound' traffic is operated on during reception from
      the interface, while 'outbound' traffic is operated on prior to
      transmission on
 the interface."
    SYNTAX  INTEGER {
              inbound(1),     -- ingress interface
              outbound(2)     -- egress interface
}

--
-- Data Path
--

diffServDataPath       OBJECT IDENTIFIER ::= { diffServMIBObjects 1 }

--
-- Data Path Table
--
-- The Data Path Table enumerates the Differentiated Services
-- Functional Data Paths within this device.  Each entry in this table
-- is indexed by ifIndex and ifDirection.  Each entry provides the
-- first Differentiated Services Functional Data Path Element to
-- process data flowing along specific data path.  This table should
-- have at most two entries for each interface capable of
-- Differentiated Services processing on this device: ingress and
-- egress.

-- Note that Differentiated Services Functional Data Path Elements
-- linked together using their individual next pointers and anchored by
-- an entry of the diffServDataPathTable constitute a functional data
-- path.
--

diffServDataPathTable OBJECT-TYPE
```

```
  SYNTAX
    SEQUENCE OF DiffServDataPathEntry
  MAX-ACCESS   not-accessible
  STATUS       current

  DESCRIPTION
    "The data path table contains RowPointers indicating the start of
    the functional data path for each interface and traffic direction
    in this device. These may merge, or be separated into parallel
    data paths."
  ::= { diffServDataPath 1 }

diffServDataPathEntry OBJECT-TYPE
  SYNTAX       DiffServDataPathEntry
  MAX-ACCESS   not-accessible
  STATUS       current
  DESCRIPTION
    "An entry in the data path table indicates the start of a single
    Differentiated Services Functional Data Path in this device.

    These are associated with individual interfaces, logical or
    physical, and therefore are instantiated by ifIndex. Therefore,
    the interface index must have been assigned, according to the
    procedures applicable to that, before it can be meaningfully
    used. Generally, this means that the interface must
 exist.

    When diffServDataPathStorage is of type nonVolatile, however,
    this may reflect the configuration for an interface whose ifIndex
    has been assigned but for which the supporting implementation is
    not currently present."

--
-- Classifiers
--

diffServClassifier     OBJECT IDENTIFIER ::= { diffServMIBObjects 2 }

--

-- Classifier Table
--
-- The Classifier Table allows multiple classifier elements, of same or
-- different types, to be used together. A classifier must completely
-- classify all packets presented to it. This means that all traffic
-- presented to a classifier must match at least one classifier element
-- within the classifier, with the classifier element parameters
--
 specified by a filter.

-- If there is ambiguity between classifier elements of different
-- classifier, classifier linkage order indicates their precedence; the
-- first classifier in the link is applied to the traffic first.

-- Entries in the classifier element table serves as the anchor for
-- each classification pattern, defined in filter table entries.  Each
-- classifier element table entry also specifies the subsequent
-- downstream Differentiated Services Functional Data Path Element when
-- the classification pattern is satisfied. Each entry in the
-- classifier element table describes one branch of the fan-out
-- characteristic of a classifier indicated in the Informal
-- Differentiated Services Model section 4.1.  A classifier is composed
-- of one or more classifier elements.

  STATUS      current
  DESCRIPTION
    "This table enumerates all the diffserv classifier functional
    data path elements of this device.  The actual classification
    definitions are defined in diffServClfrElementTable entries
    belonging to each classifier.

    An entry in this table, pointed to by a RowPointer specifying an
    instance of diffServClfrStatus, is frequently used as the name
    for a set of classifier elements, which all use the index
    diffServClfrId. Per the semantics of the classifier element
    table, these entries constitute one or more unordered sets of
    tests which may be simultaneously applied to a message to

    classify it.

    The primary function of this table is to ensure that the value of
    diffServClfrId
 is unique before attempting to use it in creating
    a diffServClfrElementEntry. Therefore, the diffServClfrEntry must
    be created on the same SET as the diffServClfrElementEntry, or
    before the diffServClfrElementEntry is created."

  DESCRIPTION
    "The classifier element table enumerates the relationship between
    classification patterns and subsequent downstream Differentiated
    Services Functional Data Path elements.
    diffServClfrElementSpecific points to a filter that specifies the
    classification parameters. A classifier may use filter tables of
    different types together.

    One example of a filter table defined in this MIB is
    diffServMultiFieldClfrTable, for
IP Multi-Field Classifiers
    (MFCs). Such an entry might identify anything from a single
    micro-flow (an identifiable sub-session packet stream directed
    from one sending transport to the receiving transport or
    transports), or aggregates of those such as the traffic from a
    host, traffic for an application, or traffic between two hosts
    using an application and a given DSCP. The standard Behavior
    Aggregate used in the Differentiated Services Architecture is
    encoded as a degenerate case of such an aggregate - the traffic
    using a particular DSCP value.

    Filter tables for other filter types may be defined elsewhere."

--
-- Meters
--

diffServMeter         OBJECT IDENTIFIER ::= { diffServMIBObjects 3 }

--
-- This MIB supports a variety of Meters.  It includes a specific
-- definition for Token Bucket Meter, which are but one type of
-- specification. Other metering parameter sets can be defined in other
-- MIBs.

-- Multiple meter elements may be logically cascaded using their
-- diffServMeterSucceedNext and diffServMeterFailNext pointers if
-- required. One example of this might be for an AF PHB implementation
-- that uses multiple level conformance meters.

-- Cascading of individual meter elements in the MIB is intended to be
-- functionally equivalent to multiple level conformance determination
-- of a packet.
 The sequential nature of the representation is merely
-- a notational convenience for this MIB.

-- srTCM meters (RFC 2697) can be specified using two sets of
```

```
-- diffServMeterEntry and diffServTBParamEntry. The first set specifies
-- the Committed Information Rate and Committed Burst Size
-- token-bucket.  The second set specifies the Excess Burst Size
-- token-bucket.

-- trTCM meters (RFC 2698) can be specified using two sets of
-- diffServMeterEntry and diffServTBParamEntry. The first set specifies
-- the Committed Information Rate and Committed Burst Size
-- token-bucket.  The second set specifies the Peak Information Rate
-- and Peak Burst Size token-bucket.

-- tswTCM meters (RFC 2859) can be specified using two sets of
-- diffServMeterEntry and diffServTBParamEntry. The first set specifies
-- the Committed Target Rate token-bucket.  The second set specifies

-- the Peak Target Rate token-bucket. diffServTBParamInterval in each
-- token bucket reflects the Average Interval.

    MAX-ACCESS   read-create
    STATUS       current
    DESCRIPTION
      "If the traffic does not conform, this selects the next
      Differentiated Services Functional Data Path element to handle
      traffic for this data path. This RowPointer should point to an
      instance of one of:
        diffServClfrEntry
        diffServMeterEntry

        diffServActionEntry
        diffServAlgDropEntry
        diffServQEntry

      A value of zeroDotZero in this attribute indicates no further
      Differentiated Services treatment is performed on traffic of this
      data path. The use of zeroDotZero is the normal usage for the
      last functional data path element of the current data path.

      Setting this to point to a target that does not exist results in
      an inconsistentValue error.  If the row pointed to is removed or
      becomes inactive by other means, the treatment is as if this
       attribute contains a value of zeroDotZero."
    DEFVAL      { zeroDotZero }
    ::= { diffServMeterEntry 3 }

  diffServMeterSpecific OBJECT-TYPE
    SYNTAX       RowPointer
    MAX-ACCESS   read-create
    STATUS       current
    DESCRIPTION
      "This indicates the behavior of the meter by pointing to an entry
```

```
      containing detailed parameters. Note that entries in that
      specific table must be managed explicitly.

      For example, diffServMeterSpecific may point to an entry in
      diffServTBParamTable, which contains an instance of a single set
      of Token Bucket parameters.

      Setting this to point to a target that does not exist results in
      an inconsistentValue error.  If the row pointed to is removed or
      becomes inactive by other means, the meter always succeeds."

MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The type of algorithm used by this dropper. The value other(1)
requires further specification in some other MIB module.

In the tailDrop(2) algorithm, diffServAlgDropQThreshold
represents the maximum depth of the queue, pointed to by
diffServAlgDropQMeasure, beyond which all newly arriving packets

will be dropped.

In the headDrop(3) algorithm, if a packet arrives when the
current depth of the queue, pointed to by
diffServAlgDropQMeasure, is at diffServAlgDropQThreshold, packets
currently at the head of the queue are dropped to make room for
the new packet to be enqueued at the tail of the queue.

In the randomDrop(4) algorithm, on packet arrival, an Active
Queue Management algorithm is executed which may randomly drop a
packet. This algorithm may be proprietary, and it may drop either
the arriving packet or another packet in the queue.
diffServAlgDropSpecific points to a diffServRandomDropEntry that
describes the algorithm. For this algorithm,

diffServAlgDropQThreshold is understood to be the absolute
maximum size of the queue and additional parameters are described
in diffServRandomDropTable.

The alwaysDrop(5) algorithm is as its name specifies; always
drop. In
this case, the other configuration values in this Entry
are not meaningful; There is no useful 'next' processing step,
there is no queue, and parameters describing the queue are not

useful. Therefore, diffServAlgDropNext, diffServAlgDropMeasure,
and diffServAlgDropSpecific are all zeroDotZero."
::= { diffServAlgDropEntry 2 }

diffServAlgDropNext OBJECT-TYPE
SYNTAX RowPointer
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This selects the next Differentiated Services Functional Data
Path Element to handle traffic for this data path. This
RowPointer should point to an instance of one of:
diffServClfrEntry
diffServMeterEntry
diffServActionEntry
diffServQEntry

A value of zeroDotZero in this attribute indicates no further
Differentiated Services treatment is performed on traffic of this
data path. The use of zeroDotZero is the normal usage for the
last functional data path element of the current data path.

When diffServAlgDropType is alwaysDrop(5), this object is
ignored.

Setting this to point to a target that does not exist results in
an inconsistentValue error. If the row pointed to is removed or
becomes inactive by other means, the treatment is as if this
attribute contains a value of zeroDotZero."
::= { diffServAlgDropEntry 3 }

diffServAlgDropQMeasure OBJECT-TYPE
SYNTAX RowPointer
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"Points to an entry in the diffServQTable to indicate the queue
that a drop algorithm is to monitor when deciding whether to drop
a packet. If the row pointed to does not exist, the algorithmic
dropper element is considered inactive.

Setting this to point to a target that does not exist results in
an inconsistentValue error. If the row pointed to is removed or
becomes
inactive by other means, the treatment is as if this
attribute contains a value of zeroDotZero."

```

diffServAlgDropQThreshold OBJECT-TYPE
  SYNTAX      Unsigned32  (1..4294967295)
  UNITS       "Bytes"
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
    "A threshold on the depth in bytes of the queue being measured at
    which a trigger is generated to the dropping algorithm, unless
    diffServAlgDropType is alwaysDrop(5) where this object is
    ignored.

    For the tailDrop(2) or headDrop(3) algorithms, this represents
    the depth of the queue, pointed to by diffServAlgDropQMeasure, at
    which the drop action will take place. Other algorithms will need
    to define their own semantics for this threshold."
  ::= { diffServAlgDropEntry 5 }

diffServAlgDropSpecific OBJECT-TYPE
  SYNTAX      RowPointer
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION

  "Points to a table entry that provides further detail regarding a
    drop algorithm.

    Entries with diffServAlgDropType equal to other(1) may have this
    point to a table defined in another MIB module.

    Entries with diffServAlgDropType equal to randomDrop(4) must have
    this point to an entry in diffServRandomDropTable.

    For all other algorithms specified in this MIB, this should take
    the value zeroDotZero.

    The diffServAlgDropType is authoritative for the type of the drop
    algorithm and the specific parameters for the drop algorithm
    needs to be evaluated based on the diffServAlgDropType.

    Setting this to point to a target that does not exist results in
    an inconsistentValue error.  If the row pointed to is removed or
    becomes inactive by other means, the treatment is as if this
    attribute contains a value of zeroDotZero."

    diffServMinRateEntry of the queues/schedulers feeding this
    scheduler are used when determining the next packet to schedule."

  ::= { diffServSchedulers 2 }

diffServSchedulerWFQ OBJECT-IDENTITY
  STATUS       current
  DESCRIPTION
    "For use with diffServSchedulerMethod to indicate the Weighted
    Fair Queuing scheduling method, defined as any algorithm
 in which
    a set of queues are conceptually visited in some order, to
    implement an average output rate by class. Notice attributes from
    diffServMinRateEntry of the queues/schedulers feeding this
    scheduler are used when determining the next packet to schedule."
  ::= { diffServSchedulers 3 }

--
-- Minimum Rate Parameters Table
--
-- The parameters used by a scheduler for its inputs or outputs are
-- maintained separately from the Queue or Scheduler table entries for
-- reusability reasons and so that they may be used by both queues and
-- schedulers.  This follows the approach for separation of data path
-- elements from parameterization that is used throughout this MIB.
-- Use of these Minimum Rate Parameter Table entries by Queues and
-- Schedulers allows the modeling of hierarchical scheduling systems.
--
-- Specifically, a Scheduler has one or more inputs and one output.
-- Any queue feeding a scheduler, or any scheduler which feeds a second
-- scheduler,
 might specify a minimum transfer rate by pointing to an
-- Minimum Rate Parameter Table entry.
--
-- The diffServMinRatePriority/Abs/Rel attributes are used as
-- parameters to the work-conserving portion of a scheduler:
-- "work-conserving" implies that the scheduler can continue to emit
-- data as long as there is data available at its input(s).  This has
```

```
-- the effect of guaranteeing a certain priority relative to other
-- scheduler inputs and/or a certain minimum proportion of the
-- available output bandwidth. Properly configured, this means a
-- certain minimum rate, which may be exceeded should traffic be
-- available should there be spare bandwidth after all other classes
-- have had opportunities to consume their own minimum rates.
--

    to it results in destruction being delayed until the row is no
    longer used."
  ::= { diffServMinRateEntry 6 }

--
-- Maximum Rate Parameter Table
--
-- The parameters used by a scheduler for its inputs or outputs are
-- maintained
 separately from the Queue or Scheduler table entries for
-- reusability reasons and so that they may be used by both queues and
-- schedulers.  This follows the approach for separation of data path
-- elements from parameterization that is used throughout this MIB.
-- Use of these Maximum Rate Parameter Table entries by Queues and
-- Schedulers allows the modeling of hierarchical scheduling systems.
--
-- Specifically, a Scheduler has one or more inputs and one output.
-- Any queue feeding a scheduler, or any scheduler which feeds a second
-- scheduler, might specify a maximum transfer rate by pointing to a
-- Maximum Rate Parameter Table entry. Multi-rate shapers, such as a

-- Dual Leaky Bucket algorithm, specify their rates using multiple
-- Maximum Rate Parameter Entries with the same diffServMaxRateId but
-- different diffServMaxRateLevels.
--
-- The diffServMaxRateLevel/Abs/Rel attributes are used as
-- parameters to the non-work-conserving portion of a scheduler:
-- non-work-conserving
 implies that the scheduler may sometimes not
-- emit a packet, even if there is data available at its input(s).
-- This has the effect of limiting the servicing of the queue/scheduler
-- input or output, in effect performing shaping of the packet stream
-- passing through the queue/scheduler, as described in the Informal
-- Differentiated Services Model section 7.2.

mioxPleRefusedConnections OBJECT-TYPE
        SYNTAX  Counter
        ACCESS  read-only
        STATUS  mandatory
        DESCRIPTION
                "The number of X.25 calls from a remote
                systems to this system that were cleared by
                this system.  The interface instance should
                identify the X.25 interface the call came in
                on."
        ::= { mioxPleEntry 2 }

mioxPleEnAddrToX121LkupFlrs OBJECT-TYPE
        SYNTAX  Counter
        ACCESS  read-only
        STATUS  mandatory
        DESCRIPTION
                "The number of times a translation from an
                Encapsulated Address to an X.121 address
                failed to find a corresponding X.121
                address.  Encapsulated addresses can be
                looked up in the mioxPeerTable or translated
                via an algorithm as for the DDN.  Addresses

                that are successfully recognized do not
                increment this counter.  Addresses that are
                not recognized (reflecting an abnormal
                packet delivery condition) increment this
                counter.
```

```
            If an address translation fails, it may be
            difficult to determine which PLE entry
            should count the failure.  In such cases the
            first likely entry in this table should be
            selected.  Agents should record the failure
            even if they are unsure which PLE should be
            associated with the failure."
        ::= { mioxPleEntry 3 }

mioxPleLastFailedEnAddr OBJECT-TYPE
        SYNTAX  OCTET STRING (SIZE(2..128))
        ACCESS  read-only
        STATUS  mandatory
        DESCRIPTION
            "The last Encapsulated address that failed
            to find a corresponding X.121 address and
            caused mioxPleEnAddrToX121LkupFlrs
 to be
            incremented.  The first octet of this object
            contains the encapsulation type, the
            remaining octets contain the address of that
            type that failed.  Thus for an IP address,
            the length will be five octets, the first
            octet will contain 204 (hex CC), and the
            last four octets will contain the IP
            address.  For a snap encapsulation, the
            first byte would be 128 (hex 80) and the
            rest of the octet string would have the snap
            header."

-- clearCall or makeCall.
-- All other defined values must be accepted.
-- Implementors should realize that allowing these values
-- provides richer management, and implementations
-- are encouraged to accept these values.
mioxPeerStatus OBJECT-TYPE
        SYNTAX  INTEGER {
                    valid (1),
                    createRequest (2),
                    underCreation (3),
                    invalid (4),
                    clearCall (5),
                    makeCall (6)
                    }
        ACCESS  read-write
        STATUS  mandatory
        DESCRIPTION
            "This reports the status of a peer entry.
            A value of valid indicates a normal entry
            that is in use by the agent.  A value of

          underCreation indicates a newly created
            entry which isn't yet in use because the
            creating management station is still setting
            values.
```

The value of invalid indicates the entry is no longer in use and the agent is free to delete the entry at any time. A management station is also free to use an entry in the invalid state.

Entries are created by setting a value of createRequest. Only non-existent or invalid entries can be set to createRequest. Upon receiving a valid createRequest, the agent will create an entry in the underCreation state. This object can not be set to a value of underCreation directly, entries can only be created by setting a value of createRequest. Entries that exist in other

than the invalid state can not be set to createRequest.

Entries with a value of underCreation are not used by the system and the management station can change the values of other objects in the table entry. Management stations should also remember to configure values in the mioxPeerEncTable with the same peer index value as this peer entry.

An entry in the underCreation state can be set to valid or invalid. Entries in the underCreation state will stay in that state until 1) the agent times them out, 2) they are set to valid, 3) they are set to invalid. If an agent notices an entry has been in the underCreation state for an abnormally long time, it may decide the management station has failed and invalidate

the entry. A prudent agent will understand that the management station may need to wait for human input and will allow for that possibility in its determination of this abnormally long period.

Once a management station has completed all fields of an entry, it will set a value of valid. This causes the entry to be activated.

```
                Entries in the valid state may also be set
                to makeCall or clearCall to make or clear
                X.25 calls to the peer.  After such a set
                request the entry will still be in the valid
                state.  Setting a value of makeCall causes
                the agent to initiate an X.25 call request
                to the peer specified by the entry.  Setting
                a value of clearCall causes the agent to
                initiate clearing one X.25 call present
to
                the peer.  Each set request will initiate
                another call or clear request (up to the
                maximum allowed); this means that management
                stations that fail to get a response to a
                set request should query to see if a call
                was in fact placed or cleared before
                retrying the request.  Entries not in the
                valid state can not be set to makeCall or
                clearCall.

                The values of makeCall and clearCall provide
                for circuit control on devices which perform
                Ethernet Bridging using static circuit
                assignment without address recognition;
                other devices which dynamically place calls
                based on destination addresses may reject
                such requests.

                An agent that (re)creates a new entry
                because of a set with createRequest, should

            also (re)create a mioxPeerEncTable entry
                with a mioxPeerEncIndex of 1, and a
                mioxPeerEncType of 204 (hex CC)."

-- ###########################################################

mioxPeerEncTable OBJECT-TYPE
      SYNTAX  SEQUENCE OF MioxPeerEncEntry
      ACCESS  not-accessible
      STATUS
  mandatory
      DESCRIPTION
            "This table contains the list of
            encapsulations used to communicate with a
            peer.  This table has two indexes, the first
            identifies the peer, the second
            distinguishes encapsulation types.

            The first index identifies the corresponding
            entry in the mioxPeerTable.  The second
            index gives the priority of the different
            encapsulations.

            The encapsulation types are ordered in
            priority order.  For calling a peer, the
            first entry (mioxPeerEncIndex of 1) is tried
            first.  If the call doesn't succeed because
            the remote host clears the call due to
            incompatible call user data, the next entry
            in the list is tried.  Each entry is tried
            until the list is exhausted.

            For answering a call, the
```

```
 encapsulation type
            requested by the peer must be found the list
            or the call will be refused.  If there are
            no entries in this table for a peer, all
            call requests from the peer will be refused.

            Objects in this table can only be set when
            the mioxPeerStatus object with the same
            index has a value of underCreation.  When
            that status object is set to invalid and
            deleted, the entry in this table with that
            peer index must also be deleted."

        DESCRIPTION
            "The value of the encapsulation type.  For
            IP encapsulation this will have a value of
            204 (hex CC).  For SNAP encapsulated
```

```
            packets, this will have a value of 128 (hex
            80).  For CLNP, ISO 8473, this will have a
            value of 129 (hex 81).  For ES-ES, ISO 9542,
            this will have a value of 130 (hex 82).  A
            value of 197 (hex C5) identifies the Blacker
            X.25 encapsulation.  A value
 of 0,
            identifies the Null encapsulation.

            This value can only be written when the
            mioxPeerStatus object with the same
            mioxPeerIndex has a value of underCreation.
            Setting this object to a value of 256
            deletes the entry.  When deleting an entry,
            all other entries in the mioxPeerEncTable
            with the same mioxPeerIndex and with an
            mioxPeerEncIndex higher then the deleted
            entry, will all have their mioxPeerEncIndex
            values decremented by one."
      ::= { mioxPeerEncEntry 2 }

  SYNTAX     INTEGER  {
    none             (1),  -- does not support DLSw
                           -- Standard pacing scheme
    adaptiveRcvWindow (2),  -- the receive window size
```

```
                    -- varies
    fixedRcvWindow
   (3)   -- the receive window size
                    -- remains constant
  }
  MAX-ACCESS read-only
  STATUS     current
  DESCRIPTION
    "Circuit pacing, as defined in the DLSw Standard, allows each
     of the two DLSw nodes on a circuit to control the amount
     of data the other is permitted to send to them.  This object
     reflects the level of support the DLSw node has for this
     protocol.  (1) means the node has no support for the standard
     circuit pacing flows;  it may use RFC 1434+ methods only, or
     a proprietary flow control scheme.  (2) means the node supports
     the standard scheme and can vary the window sizes it grants as
     a data receiver.  (3) means the node supports the standard
     scheme but never varies its receive window size."

dlswNodeStatus
 OBJECT-TYPE
  SYNTAX     INTEGER  {
     active       (1),
     inactive     (2)
  }
  MAX-ACCESS read-write
  STATUS     current
  DESCRIPTION
    "The status of the DLSw part of the system.  Changing the
     value from active to inactive causes DLSw to take
     the following actions - (1) it disconnects all circuits
     through all DLSw partners, (2) it disconnects all
     transport connections to all DLSw partners, (3) it
     disconnects all local DLC connections, and (4) it stops
     processing all DLC connection set-up traffic.
     Since these are destructive actions, the user should
     query the circuit and transport connection tables in
     advance to understand the effect this action will have.
     Changing the value from inactive to active causes DLSw
     to come up in its initial state, i.e., transport
     connections established and ready to bring up circuits."

MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This value of the instance of a conceptual row
identifies the behavior of the collection of
transport
connections that this conceptual row
defines. The value of activePersistent, activeOnDemand
and passive means this DLSw will accept any transport
connections, initiated by partner DLSw nodes, which
are defined by this conceptual row. The value of
activePersistent means this DLSw will also initiate
the transport connections of this conceptual row and
retry periodically if necessary. The value of
activeOnDemand means this DLSw will initiate a
transport connection of this conceptual row, if
there is a directory cache hits. The value of
other is implementation specific. The value of exclude
means that the specified node is not allowed to be

```
      a partner to this DLSw node.  To take a certain
      conceptual row definition out of service, a value of
      notInService for dlswTConnConfigRowStatus should be
      used."

dlswTConnConfigSapList  OBJECT-TYPE
  SYNTAX     OCTET STRING  (SIZE(16))
  MAX-ACCESS read-create
  STATUS     current
  DESCRIPTION
    "The SAP list indicates which SAPs are advertised to
     the transport connection defined by this conceptual
     row.  Only SAPs with even numbers are represented,
     in the form of the most significant bit of the first
     octet representing the SAP 0, the next most significant
     bit representing the SAP 2, to the least significant
     bit of the last octet representing the SAP 254.  Data
     link switching is allowed for those SAPs which have
     one in its corresponding bit, not allowed otherwise.
     The whole SAP list has to be changed together.  Changing
     the SAP list affects only new circuit establishments
     and has no effect on established circuits.

     This list can be used to restrict specific partners
     from knowing about all the SAPs used by DLSw on all its

    interfaces (these are represented in dlswIfSapList for
     each interface).  For instance, one may want to run NetBIOS
     with some partners but not others.

     If a node supports sending run-time capabilities exchange
     messages, changes to this object should cause that action.
     When to start the run-time capabilities exchange is
     implementation-specific.
     The DEFVAL below indicates support for SAPs 0, 4, 8, and C."

      quiescing         (4),
      disconnecting      (5),
      disconnected       (6)
  }
  MAX-ACCESS read-write
  STATUS     current
  DESCRIPTION
     "The state of this transport connection.  The transport
      connection enters `connecting' state when DLSw makes
      a connection request to the transport layer.  Once initial
      Capabilities Exchange is sent, the transport connection
      enters enters `initCapExchange' state.  When partner
      capabilities have been determined and the transport
      connection is ready for sending CanUReach (CUR) messages,
      it moves
 to the `connected' state.  When DLSw is in the
      process of bringing down the connection, it is in the
      `disconnecting' state.  When the transport layer
      indicates one of its connections is disconnected, the
      transport connection moves to the `disconnected' state.

      Whereas all of the values will be returned in response
      to a management protocol retrieval operation, only two
      values may be specified in a management protocol set
      operation: `quiescing' and `disconnecting'.  Changing
      the value to `quiescing' prevents new circuits from being
      established, and will cause a transport disconnect when
      the last circuit on the connection goes away.  Changing
      the value to `disconnecting' will force off all circuits
      immediately and bring the connection to `disconnected'
      state."

--     Station   | remote   |     1           1           NA
--     Location  |          |
--
--     NA: Not applicable
--
--  Note:
--  (a) IfIndex and RouteInfo are applied only if location is local.
--  (b) TDomain and TAddr are applied only if location is remote.
--
-- Most of statistics related to circuits can be collected
-- from LLC-2 Link Station Table.
-- --------------------------------------------------------------------
dlswCircuitTable  OBJECT-TYPE
  SYNTAX     SEQUENCE OF DlswCircuitEntry
  MAX-ACCESS not-accessible
  STATUS
    current
  DESCRIPTION
     "This table is the circuit representation in the DLSw
      entity. Virtual data links are used to represent any internal
      end stations.  There is a conceptual row associated with
      each data link.  Thus, for circuits without an intervening
      transport connection, there are two conceptual rows
      for each circuit.

      The table consists of the circuits being established,
      established, and as an implementation option, circuits that
      have been disconnected.  For circuits carried over
      transport connections, an entry is created after
      the CUR_cs was sent or received.  For circuits between
      two locally attached devices, or internal virtual MAC
      addresses, an entry is created when the equivalent of
```

```
      CUR_cs sent/received status is reached.

      End station 1 (S1) and End station 2 (S2) are used to
      represent the two end stations of the circuit.
      S1 is always
 an end station which is locally attached.
      S2 may be locally attached or remote.  If it is locally
      attached, the circuit will be represented by two rows indexed
      by (A, B) and (B, A) where A & B are the relevant MACs/SAPs.

      The table may be used to store the causes of disconnection of
      circuits.  It is recommended that the oldest disconnected
      circuit entry be removed from this table when the memory
      space of disconnected circuits is needed."

  DESCRIPTION
    "The current state of this circuit.  The agent, implementation
     specific, may choose to keep entries for some period of time
     after circuit disconnect, so the manager can gather the time
     and cause of disconnection.

      While all of the specified values may be returned from a GET
     operation, the only SETable value is `disconnectPending'.
     When this value is set, DLSw should perform the appropriate
     action given its previous state (e.g., send HALT_DL if the
     state was `connected') to bring the circuit down to the
     `disconnected' state.  Both the partner DLSw and local end
     station(s) should be notified as appropriate.

     This MIB provides no facility to re-establish a disconnected
     circuit, because in DLSw this should be an end station-driven
     function."

    DESCRIPTION
      "Session Initiation Protocol (SIP) Common MIB module.  This
       module defines objects that may be common to all SIP entities.

        SIP is an application-layer signaling protocol for creating,
       modifying and terminating multimedia sessions with one or more
       participants.  These sessions include Internet multimedia
       conferences and Internet telephone calls.  SIP is defined in
       RFC 3261 (June 2002).

       This MIB is defined for managing objects that are common to
       SIP User Agents (UAs), Proxy, Redirect, and Registrar servers.
       Objects specific to each of these entities MAY be managed using
       entity specific MIBs defined in other modules.

       Copyright (C) The IETF Trust (2007).  This version of
       this MIB module is part of RFC 4780; see the RFC itself for
       full legal notices."

                  testing(7)
                }
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
      "This object contains the current operational state of
      the SIP application.
```

```
      unknown    : The operational status cannot be determined
                   for some reason.
      up         : The application is operating normally and is
                   processing (receiving and possibly issuing) SIP
                   requests and responses.
      down       : The application is currently unable to process
                   SIP messages.
      congested  : The application is operational but no additional
                   inbound transactions can be accommodated at the
                    moment.
      restarting : The application is currently unavailable, but it
                   is in the process of restarting and will
                   presumably, soon be able to process SIP messages.
      quiescing  : The application is currently operational
                   but has been administratively put into
                   quiescence mode.  Additional inbound
                   transactions MAY be rejected.
      testing    : The application is currently in test mode
                   and MAY not be able to process SIP messages.

      The operational status values defined for this object are not
      based on any specific information contained in the SIP
      standard."

--
```

```
sipCommonOptionTagTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF SipCommonOptionTagEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
    "This table contains a list of the SIP option tags (SIP
     extensions) that are either required, supported, or
     unsupported by the SIP entity.  These option tags are
      used in the Require, Proxy-Require, Supported, and
     Unsupported header fields.

     Example: If a user agent client supports, and requires the
     server to support, reliability of provisional responses
     (RFC 3262), this table contains a row with the option tag string
     '100rel' in sipCommonOptionTag and the OCTET STRING value of
     '1010 0000' or '0xA0' in sipCommonOptionTagHeaderField.

     If a server does not support the required feature (indicated in
     a Require header to a UAS, or in a Proxy-Require to a Proxy
     Server), the server returns a 420 Bad Extension listing the
     feature in an Unsupported header.

     Normally, the list of such features supported by an entity is
     static (i.e., will not change over time)."

sipCommonSummaryTotalTransactions OBJECT-TYPE
  SYNTAX      Counter32
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
    "This object contains a count of the number of transactions that
     are in progress and transactions that have reached the
     'Terminated' state.  It is not applicable to stateless SIP Proxy
     Servers.
```

A SIP transaction occurs between a client and a server, and
comprises all messages from the first request sent from the
client to the server, up to a final (non-1xx) response sent
from the server to the client.

If the request is INVITE and the final response is a non-2xx,
the transaction also include an ACK to the response. The ACK
for a 2xx response to an INVITE request is a separate
transaction.

The branch ID parameter in the Via header field values serves
as a transaction identifier.

A transaction is identified by the CSeq sequence number within
a single call leg. The ACK request has the same CSeq number as
the corresponding INVITE request, but comprises a transaction
of its own.

In the case of a forked request, each branch counts as a single
transaction.

For a transaction stateless Proxy Server, this counter is
always 0.

Discontinuities in the value of this counter can occur at
re-initialization of the SIP entity or service. A Management

Station can detect discontinuities in this counter by
monitoring the sipCommonSummaryDisconTime object in the same
row."

      sipCommonStatusCodeNotifInterval     Unsigned32
  }

sipCommonStatusCodeNotifSend OBJECT-TYPE
  SYNTAX      TruthValue
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
    "This object controls whether a sipCommonStatusCodeNotif is
     emitted when the status code value specified by
     sipCommonStatusCodeValue is sent or received.  If the value of
     this object is 'true', then a notification
 is sent.  If it is
     'false', no notification is sent.
     Note well that a notification MAY be emitted for every message
     sent or received that contains the particular status code.
     Depending on the status code involved, this can cause a
     significant number of notification emissions that could be
     detrimental to network performance.  Managers are forewarned to
     be prudent in the use of this object to enable notifications.
     Look to sipCommonStatusCodeNotifEmitMode for alternative
     controls for sipCommonStatusCodeNotif emissions."
  DEFVAL { false }
  ::= { sipCommonStatusCodeNotifEntry 1 }

sipCommonStatusCodeNotifEmitMode OBJECT-TYPE
  SYNTAX      INTEGER {
                normal(1),
                oneShot(2),
                triggered(3)  -- read-only
```

```
            }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION

        "The object sipCommonStatusCodeNotifSend MUST be set to 'true'
         for the values of this object to have any effect.  It is
        RECOMMENDED that the desired emit mode be established by this
        object prior to setting sipCommonStatusCodeNotifSend to 'true'.
        This object and the sipCommonStatusCodeNotifSend object can
        obviously be set independently, but their respective values
        will have a dependency on each other and the resulting
        notifications.

        This object specifies the mode for emissions of
        sipCommonStatusCodeNotif notifications.

        normal    : sipCommonStatusCodeNotif notifications will be
                    emitted by the system for each SIP response
                    message sent or received that contains the
                    desired status code.

        oneShot   : Only one sipCommonStatusCodeNotif notification
                    will be emitted.  It will be the next SIP response
                    message sent or received that contains the
                    desired
    status code.

                    No more notifications are emitted until this
                    object is set to 'oneShot' again or set to
                    'normal'.  This option is provided as a means of
                    quelling the potential promiscuous behavior that
                    can be associated with the
                    sipCommonStatusCodeNotif.

        triggered : This value is only readable and cannot be set.  It
                    reflects that the 'oneShot' case has occurred,
                    and indicates that the mode needs to be reset to
                    get further notifications.  The mode is reset by
                    setting this object to 'oneShot' or 'normal'."

  DESCRIPTION
     "The MIB module for managing remote monitoring
      device implementations.  This MIB module
      extends the architecture introduced in the original
      RMON MIB as specified in RFC 2819.

      Copyright (C) The Internet Society (2006).  This version of
      this MIB module is part of RFC 4502;  see the RFC itself for
      full legal notices."

  REVISION "200605020000Z"    -- May 2, 2006
  DESCRIPTION
     "This version updates the proposed-standard version of the
     RMON2 MIB (published
 as RFC 2021) by adding 2 new
     enumerations to the nlMatrixTopNControlRateBase object and
```

4 new enumerations to the alMatrixTopNControlRateBase object. These new enumerations support the creation of high-capacity topN reports in the High Capacity RMON MIB [RFC3273].

Additionally, the following objects have been deprecated, as they have not had enough independent implementations to demonstrate interoperability to meet the requirements of a Draft Standard:

probeDownloadFile
probeDownloadTFTPServer
probeDownloadAction
probeDownloadStatus

serialMode
serialProtocol
serialTimeout
serialModemInitString
serialModemHangUpString
serialModemConnectResp
serialModemNoConnectResp
serialDialoutTimeout
serialStatus
serialConnectDestIpAddress
serialConnectType
serialConnectDialString
serialConnectSwitchConnectSeq
serialConnectSwitchDisconnectSeq
serialConnectSwitchResetSeq
serialConnectOwner
serialConnectStatus
netConfigIPAddress
netConfigSubnetMask
netConfigStatus
netDefaultGateway
tokenRingMLStats2DroppedFrames
tokenRingMLStats2CreateTime
tokenRingPStats2DroppedFrames
tokenRingPStats2CreateTime
ringStationControl2DroppedFrames
ringStationControl2CreateTime
sourceRoutingStats2DroppedFrames
sourceRoutingStats2CreateTime
trapDestIndex
trapDestCommunity
trapDestProtocol

trapDestAddress
trapDestOwner
trapDestStatus

In addition, two corrections were made. The LastCreateTime Textual Convention had been defined with a base type of another textual convention, which isn't allowed in SMIv2. The definition has been modified to use TimeTicks as the base type.

Further,
the SerialConfigEntry SEQUENCE definition included sub-typing information that is not allowed in SMIv2. This information has been deleted. Ranges were added to a number of objects and textual-conventions to constrain their maximum (and sometimes minimum) sizes. The addition of these ranges documents existing practice for these objects. These objects

are:
ControlString
protocolDirID
protocolDirParameters
addressMapNetworkAddress
nlHostAddress
nlMatrixSDSourceAddress
nlMatrixSDDestAddress
nlMatrixDSSourceAddress
nlMatrixDSDestAddress
nlMatrixTopNSourceAddress
nlMatrixTopNDestAddress
alHostEntry
alMatrixSDEntry
alMatrixDSEntry
alMatrixTopNSourceAddress
alMatrixTopNDestAddress

Finally, the TimeFilter TC has been updated to encourage agent implementations that allow a MIB walk to behave well even when performed by an application that is not aware of the special TimeFilter semantics."

REVISION "200207080000Z" -- 08 July, 2002
DESCRIPTION
"Added new enumerations to support the High-Capacity RMON MIB as defined in RFC 3273. Also fixed some typos and added clarifications."

```

-- Textual Conventions

ZeroBasedCounter32 ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
     "This TC describes an object that counts events with the
     following semantics: objects of this type will be set to
     zero(0) on creation and will thereafter count appropriate
     events, wrapping back to zero(0) when the value 2^32 is
     reached.

     Provided that an application discovers the new object within
     the minimum time to wrap, it can use the initial value as a
     delta since it last polled the table of which this object is
     part.  It is important for a management station to be aware of
     this minimum time and the actual time between polls, and to
     discard data if the actual time is too long or there is no
     defined minimum time.

      Typically, this TC is used in tables where the INDEX space is
     constantly changing and/or the TimeFilter mechanism is in use."
  SYNTAX Gauge32

LastCreateTime ::= TEXTUAL-CONVENTION
```

```
  STATUS current
  DESCRIPTION
      "This TC describes an object that stores the value of the
      sysUpTime object at the last time its entry was created.

      This can be used for polling applications to determine that an
      entry has been deleted and re-created between polls, causing
      an otherwise undetectable discontinuity in the data.

      If sysUpTime is reset to zero as a result of a re-
      initialization of the network management (sub)system, then
      the values of all LastCreateTime objects are also reset.
      However, after approximately 497 days without a re-
      initialization, the sysUpTime object will reach 2^^32-1 and
      then increment to zero; in this case, existing values
      of TimeStamp objects do not change.
  This can lead to
      ambiguities in the value of TimeStamp objects."
  SYNTAX TimeTicks

TimeFilter ::= TEXTUAL-CONVENTION
 STATUS       current
 DESCRIPTION
     "To be used for the index to a table.  Allows an application
     to download only those rows changed since a particular time.

     Note that this is not a history mechanism.  Only current values
     of underlying objects are returned; saved instance values
     associated with particular values of sysUpTime are not.

     An entry is considered changed if the value of any object in the
     entry changes, if the row is created, or if any object in the
     entry is created or deleted.  Note that deleted entries cannot
     be detected or downloaded.

     A time-filtered conceptual table is created by inserting a
     single object of SYNTAX TimeFilter as the first INDEX component
     in a copy of an existing basic conceptual table (i.e., any
     SEQUENCE without a TimeFilter INDEX component).  Thus,
  for
     each conceptual entry 'I' in the basic table, there exists N
     conceptual entries in the time-filtered version, indexed N.I,
     where 'N' is equal to the value of sysUpTime.

     When an application retrieves conceptual instances from a
     time-filtered table, and an INDEX value is provided for the
```

TimeFilter INDEX component 'N', the agent will only consider returning basic conceptual entries (e.g., 'fooColumn.N.I') if any column within the basic conceptual entry has changed since sysUpTime 'N'. If not, the basic conceptual entry will be ignored for the particular retrieval operation.

When sysUpTime is equal to zero, this table shall be empty.

One conceptual entry exists for each past value of sysUpTime, except that the whole table is purged should sysUpTime wrap.

As an entry in a time-filtered table is updated (i.e., one of the columns in the basic conceptual table is changed), new conceptual
entries are also created in the time-filtered version (which still shares the now updated object values with all other instances). The number of unique time-filtered instances that are created is determined by the value of sysUpTime at which the basic entry was last updated. One unique instance will exist for each value of sysUpTime at the last update time for the row. However, a new TimeFilter index instance is created for each new sysUpTime value. The TimeFilter index values not associated with entry updates are called duplicate time-filtered instances.

After some deployment experience, it has been determined that a time-filtered table is more efficient if the agent stops a MIB walk operation by skipping over rows with a TimeFilter index value higher than the value in the received GetNext/GetBulk request. That is, instead of incrementing a TimeFilter index value, the agent will continue to the
next

object or table. As a consequence, GetNext or GetBulk operations will provide only one pass through a time-filtered table.

It is suggested that an agent implement a time-filtered table in this manner to improve performance and avoid a MIB walk getting stuck in time-filtered tables. It is, however, still acceptable for an agent to implement a time-filtered table in the traditional manner (i.e., every conceptual time-filtered instance is returned in GetNext and GetBulk PDU responses), and management applications must be able to deal with such traditional implementations.

See the appendix for further discussion of this textual

convention.

The following example is provided to demonstrate TimeFilter behavior:

Consider the following basic conceptual table, basicFooTable. (Note that the basic version of a time-filtered table may not actually be defined.)

```
basicFooTable:

 basicFooTable ...
INDEX { fooIndex }

BasicFooEntry {
  fooIndex     Integer32,
  fooCounts    Counter32
}
```

For this example, the basicFooTable contains two static conceptual entries (fooIndex equals '1' and '2'), created at time zero. It also contains one dynamic conceptual entry (fooIndex equals '3'), which is created at time '3' and deleted at time '7'.

The time-filtered version of the basicFooTable could be defined as follows:

```
FooTable:

fooTable ...
INDEX { fooTimeMark, fooIndex }

FooEntry {

  fooTimeMark  TimeFilter,
  fooIndex     Integer32,
  fooCounts    Counter32
}
```

Note that entries exist in the time-filtered conceptual table only if they actually exist in the underlying (basic) table.

For this example, the fooTable will have three underlying basic

entries (fooIndex == 1, 2, and 3), with the following
activity (for sysUpTime equal 0 to 9):

- fooEntry.N.1 is created at time '0' and most recently updated at time '6' to the value '5'.
- fooEntry.N.2 is created at time '0' and most recently updated at time '8' to the value '9'.
- fooEntry.N.3 is created at time '3', updated at time '5' to the value '17', and deleted at time '7'.

The following tables show the values that would be returned for MIB walk operations with various TimeFilter values, done at different times. An application issues a retrieval request at time 'T', with a TimeFilter value, 'N' (typically set to a lower value, such as the value of sysUpTime at the last polling cycle).

The following values would be returned in a MIB walk of fooCounts.N if T equals '0' and N equals '0':

fooCounts.N.I	Value
fooCounts.0.1	0
fooCounts.0.2	0

Note that nothing is returned for fooCounts.0.3, since that entry does not exist at sysUpTime equals '0'.

The following values would be returned in a full (traditional) MIB walk of fooCounts.N if T equals '3' and N equals '0':

fooCounts.N.I	Value
fooCounts.0.1	0
fooCounts.0.2	0
fooCounts.0.3	0
fooCounts.1.3	0
fooCounts.2.3	0
fooCounts.3.3	0

Note that there are no instances for T equals 1 or 2 for the first two values of N, as these entries did not change since they were created at time '0'.

Note that the current value for 'fooCounts.N.3' is returned here, even for values of N less than '3' (when the entry was

created). The agent only considers the current existence of an entry in the TimeFilter algorithm, not the time when the entry

was created.

Note that the instances 'fooCounts.0.3', 'fooCounts.1.3', and 'fooCounts.2.3' are duplicates and can be suppressed by the agent in a MIB walk.

The following values would be returned in a full (traditional) MIB walk of fooCounts.N if T equals '6' and N equals '3':

fooCounts.N.I	Value
fooCounts.3.1	5
fooCounts.3.3	17
fooCounts.4.1	5
fooCounts.4.3	17
fooCounts.5.1	5
fooCounts.5.3	17
fooCounts.6.1	5

Note that no instances for entry 'fooCounts.N.2' are returned, since it has not changed since time '3'.

Note that all instances except 'fooCounts.5.3' and 'fooCounts.6.1' are duplicates and can be suppressed by the agent in a MIB walk.

The following values would be returned in a full (traditional) MIB walk of fooCounts.N if T equals '9' and N equals '6':

fooCounts.N.I	Value
fooCounts.6.1	5
fooCounts.6.2	9
fooCounts.7.2	9
fooCounts.8.2	9

Note that no instances for entry 'fooCounts.N.3' are returned, since it was deleted at time '7'.

Note that instances 'fooCounts.6.2' and 'fooCounts.7.2'

are duplicates and can be suppressed by the agent in a MIB

walk."

SYNTAX TimeTicks

DataSource ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
"Identifies the source of the data that the associated
function is configured to analyze. This source can be any
interface on this device.

In order to identify a particular interface, this
object shall identify the instance of the ifIndex
object, defined in [RFC2863], for the desired interface.

For example, if an entry were to receive data from
interface #1, this object
would be set to ifIndex.1."

}

protocolDirID OBJECT-TYPE
```

```
  SYNTAX      OCTET STRING  (SIZE (4..128))
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
      "A unique identifier for a particular protocol.  Standard
      identifiers will be defined in such a manner that they

      can often be used as specifications for new protocols - i.e.,
      a tree-structured assignment mechanism that matches the
      protocol encapsulation 'tree' and that has algorithmic
      assignment mechanisms for certain subtrees.  See RFC 2074 for
      more details.

      Despite the algorithmic mechanism, the probe will only place
      entries in here for those protocols it chooses to collect.  In
      other words, it need not populate this table with all
      possible ethernet protocol types, nor need it create them on
      the fly when it sees them.  Whether it does these
      things is a matter of product definition (cost/benefit,
      usability) and is up to the designer of the product.

      If an entry is written to this table with a protocolDirID that
      the agent doesn't understand, either
 directly or
      algorithmically, the SET request will be rejected with an
      inconsistentName or badValue (for SNMPv1) error."

protocolDirLocalIndex OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION

"The locally arbitrary but unique identifier associated
with this protocolDir entry.

The value for each supported protocol must remain constant at
least from one re-initialization of the entity's network
management system to the next re-initialization, except that
if a protocol is deleted and re-created, it must be re-created
with a new value that has not been used since the last
re-initialization.

The specific value is meaningful only within a given SNMP
entity. A protocolDirLocalIndex must not
be re-used until the
next agent restart in the event that the protocol directory
entry is deleted."
::= { protocolDirEntry 3 }

protocolDirDescr OBJECT-TYPE
SYNTAX DisplayString (SIZE (1..64))
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"A textual description of the protocol encapsulation.
A probe may choose to describe only a subset of the
entire encapsulation (e.g., only the highest layer).

This object is intended for human consumption only.

This object may not be modified if the associated
protocolDirStatus object is equal to active(1)."
::= { protocolDirEntry 4 }

protocolDirType OBJECT-TYPE

```
  SYNTAX      BITS {
                extensible(0),
                addressRecognitionCapable(1)
              }
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
     "This object describes 2 attributes of this protocol
      directory entry.

The presence or absence of the 'extensible' bit describes
      whether this protocol directory entry can be extended
      by the user by creating protocol directory entries that are
      children of this protocol.

      An example of an entry that will often allow extensibility is

      'ip.udp'.  The probe may automatically populate some children
      of this node, such as 'ip.udp.snmp' and 'ip.udp.dns'.
      A probe administrator or user may also populate additional
      children via remote SNMP requests that create entries in this
      table.  When a child node is added for a protocol for which the
      probe has no built-in support extending a parent node (for
      which the probe does have built-in support),
      that child node is not extendable.  This is termed 'limited
      extensibility'.

      When a child node is added through this extensibility
      mechanism, the values of protocolDirLocalIndex and
      protocolDirType
shall be assigned by the agent.

      The other objects in the entry will be assigned by the
      manager who is creating the new entry.

      This object also describes whether this agent can
      recognize addresses for this protocol, should it be a
      network-level protocol.  That is, while a probe may be able
      to recognize packets of a particular network-layer protocol
      and count them, it takes additional logic to be able to
      recognize the addresses in this protocol and to populate
      network-layer or application-layer tables with the addresses
      in this protocol.  If this bit is set, the agent will
      recognize network-layer addresses for this protocol and
      populate the network- and application-layer host and matrix
```

tables with these protocols.

Note that when an entry is created, the agent will supply values for the bits that match the capabilities of the agent

with respect to this protocol. Note that since row creations usually exercise the limited extensibility feature, these bits will usually be set to zero."

::= { protocolDirEntry 5 }

protocolDirAddressMapConfig OBJECT-TYPE
SYNTAX INTEGER {
notSupported(1),
supportedOff(2),
supportedOn(3)
}
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object describes and configures the probe's support for address mapping for this protocol. When the probe creates entries in this table for all protocols that it understands,

it will set the entry to notSupported(1) if it doesn't have the capability to perform address mapping for the protocol or if this protocol is not a network-layer protocol. When an entry is created in this table by a management operation as part of the limited extensibility feature,

the probe must set this value to notSupported(1), because limited extensibility of the protocolDirTable does not extend to interpreting addresses of the extended protocols.

If the value of this object is notSupported(1), the probe will not perform address mapping for this protocol and shall not allow this object to be changed to any other value.
If the value of this object is supportedOn(3), the probe supports address mapping for this protocol and is configured to perform address mapping for this protocol for all addressMappingControlEntries and all interfaces.
If the value of this object is supportedOff(2), the probe supports address mapping for this protocol but is configured to not perform address mapping for this protocol for any addressMappingControlEntries and all interfaces.
Whenever this value changes from supportedOn(3) to supportedOff(2), the probe

```
shall delete all related entries in
    the addressMappingTable."
  ::= { protocolDirEntry 6 }

                supportedOn(3)
              }
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
    "This object describes and configures the probe's support for
    the network-layer and application-layer host tables for this
    protocol.  When the probe creates entries in this table for
    all protocols that it understands, it will set the entry to
    notSupported(1) if it doesn't have the capability to track the
    nlHostTable for this protocol or if the alHostTable is
    implemented but doesn't have the capability to track this
    protocol.  Note that if the alHostTable is implemented, the
    probe may only support a protocol if it is supported in both
    the nlHostTable and the
alHostTable.

    If the associated protocolDirType object has the
    addressRecognitionCapable bit set, then this is a network-
    layer protocol for which the probe recognizes addresses, and

    thus the probe will populate the nlHostTable and alHostTable
    with addresses it discovers for this protocol.

    If the value of this object is notSupported(1), the probe
    will not track the nlHostTable or alHostTable for this
    protocol and shall not allow this object to be changed to any
    other value.  If the value of this object is supportedOn(3),
    the probe supports tracking of the nlHostTable and alHostTable
    for this protocol and is configured to track both tables
    for this protocol for all control entries and all interfaces.
    If the value of this object is supportedOff(2), the probe
    supports tracking of the nlHostTable and alHostTable for this
    protocol but is configured to not track these
tables
    for any control entries or interfaces.
    Whenever this value changes from supportedOn(3) to
    supportedOff(2), the probe shall delete all related entries in
```

the nlHostTable and alHostTable.

Note that since each alHostEntry references 2 protocol directory entries, one for the network address and one for the type of the highest protocol recognized, an entry will only be created in that table if this value is supportedOn(3) for both protocols."
::= { protocolDirEntry 7 }

protocolDirMatrixConfig OBJECT-TYPE
SYNTAX INTEGER {
notSupported(1),
supportedOff(2),
supportedOn(3)
}
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object describes and configures the probe's support for the network-layer and application-layer matrix tables for this protocol. When the probe creates entries
in this table for
all protocols that it understands, it will set the entry to notSupported(1) if it doesn't have the capability to track the nlMatrixTables for this protocol or if the alMatrixTables are implemented but don't have the capability to track this protocol. Note that if the alMatrix tables are implemented, the probe may only support a protocol if it is supported in both of the nlMatrixTables and both of the alMatrixTables.

If the associated protocolDirType object has the addressRecognitionCapable bit set, then this is a network-

layer protocol for which the probe recognizes addresses, and thus the probe will populate both of the nlMatrixTables and both of the alMatrixTables with addresses it discovers for this protocol.

If the value of this object is notSupported(1), the probe will not track either of the nlMatrixTables or the alMatrixTables
for this protocol and shall not allow this
object to be changed to any other value. If the value of this object is supportedOn(3), the probe supports tracking of both of the nlMatrixTables and (if implemented) both of the

```
      alMatrixTables for this protocol and is configured to track
      these tables for this protocol for all control entries and all
      interfaces.  If the value of this object is supportedOff(2),
      the probe supports tracking of both of the nlMatrixTables and
      (if implemented) both of the alMatrixTables for this protocol
      but is configured to not track these tables for this
      protocol for any control entries or interfaces.
      Whenever this value changes from supportedOn(3) to
      supportedOff(2), the probe shall delete all related entries in
      the nlMatrixTables and the alMatrixTables.

      Note that since each alMatrixEntry references 2 protocol
      directory entries, one for
 the network address and one for the
      type of the highest protocol recognized, an entry will
      only be created in that table if this value is supportedOn(3)
      for both protocols."

  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "A list of higher-layer (i.e., non-MAC) host table control
     entries.

     These entries will enable the collection of the network- and
     application-level host tables indexed by network addresses.
     Both the network- and application-level host tables are
     controlled by this table so that they will both be created
     and deleted at the same time, further increasing the ease with
     which they can be implemented as a single datastore.  (Note that
     if an implementation stores application-layer host records
in
     memory, it can derive network-layer host records from them.)

     Entries in the nlHostTable will be created on behalf of each
     entry in this table.  Additionally, if this probe implements
     the alHostTable, entries in the alHostTable will be created on
     behalf of each entry in this table.

     Implementations are encouraged to add an entry per monitored
     interface upon initialization so that a default collection

-- control optional alMatrixTables, implementation of the
-- alMatrixTables is not required to fully implement this group.

hlMatrixControlTable OBJECT-TYPE
  SYNTAX      SEQUENCE OF HlMatrixControlEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
     "A list of higher-layer (i.e., non-MAC) matrix control entries.

     These entries will enable the collection of the network- and
     application-level matrix tables containing conversation
     statistics indexed by pairs of network addresses.
     Both the network- and application-level matrix tables are
     controlled by this table so that they will both be created
     and deleted at the same time, further increasing the ease with
     which they can be implemented as a single datastore.  (Note that
      if an implementation stores application-layer matrix records

     in memory, it can derive network-layer matrix records from
     them.)

     Entries in the nlMatrixSDTable and nlMatrixDSTable will be
     created on behalf of each entry in this table.  Additionally,
     if this probe implements the alMatrix tables, entries in the
     alMatrix tables will be created on behalf of each entry in
     this table."

    SYNTAX     Integer32 (0..2147483647)
    MAX-ACCESS read-create
    STATUS     current
    DESCRIPTION
      "The number of seconds left
   in the report currently
      being collected.  When this object is modified by
      the management station, a new collection is started,
      possibly aborting a currently running report.  The
      new value is used as the requested duration of this
```

report and is immediately loaded into the associated
nlMatrixTopNControlDuration object.

When the report finishes, the probe will automatically
start another collection with the same initial value
of nlMatrixTopNControlTimeRemaining. Thus, the management
station may simply read the resulting reports repeatedly,
checking the startTime and duration each time to ensure that a
report was not missed or that the report parameters were not
changed.

While the value of this object is non-zero, it decrements
by one per second until it reaches zero. At the time
that this object decrements to zero, the report is made
accessible
in the nlMatrixTopNTable, overwriting any report
that may be there.

When this object is modified by the management station, any
associated entries in the nlMatrixTopNTable shall be deleted.

(Note that this is a different algorithm than the one used
in the hostTopNTable)."

alMatrixTopNControlTimeRemaining OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The number of seconds left in the report currently
being collected. When this object is modified by
the management station, a new collection is started,
possibly aborting a currently running report. The
new value is used as the requested duration of this
report and is immediately loaded into the associated
alMatrixTopNControlDuration object.

When the report finishes, the probe will automatically
start another collection with the same initial value
of alMatrixTopNControlTimeRemaining. Thus, the management
station may simply read the resulting reports repeatedly,
checking the startTime and duration each time to ensure that a
report was not missed or that the report parameters were not
changed.

While the value
of this object is non-zero, it decrements
by one per second until it reaches zero. At the time

that this object decrements to zero, the report is made
accessible in the alMatrixTopNTable, overwriting any report
that may be there.

When this object is modified by the management station, any
associated entries in the alMatrixTopNTable shall be deleted.

(Note that this is a different algorithm than the one used
in the hostTopNTable)."

  MAX-ACCESS read-only
  STATUS     current
  DESCRIPTION
     "The maximum number of matrix entries in this report.
```

When the associated alMatrixTopNControlRequestedSize object
is created or modified, the probe should set this
object as closely to the requested value as
possible for the particular implementation and
available resources. The probe must not lower this
value except as a side-effect of a set to the associated
alMatrixTopNControlRequestedSize object.

If the value of alMatrixTopNControlRateBase is equal to
alMatrixTopNTerminalsPkts or alMatrixTopNAllPkts, when the
next topN report is generated, matrix entries with the highest
value of alMatrixTopNPktRate shall be placed in this table in
decreasing order of this rate until there is no more room or
until there are no more matrix entries.

If the value of alMatrixTopNControlRateBase
is equal to
alMatrixTopNTerminalsOctets or alMatrixTopNAllOctets, when the
next topN report is generated, matrix entries with the highest
value of alMatrixTopNOctetRate shall be placed in this table
in decreasing order of this rate until there is no more room
or until there are no more matrix entries.

It is an implementation-specific matter how entries with the
same value of alMatrixTopNPktRate or alMatrixTopNOctetRate are
sorted. It is also an implementation-specific matter as to
whether zero-valued entries are available."

::= { alMatrixTopNEntry 9 }

--
-- User History Collection Group (usrHistory)
--
-- The usrHistory group combines mechanisms seen in the alarm and
-- history groups to provide user-specified history collection,
-- utilizing two additional control tables and one additional data
-- table. This function has traditionally been done by NMS
-- applications, via periodic polling. The usrHistory group allows
-- this task to be offloaded to an RMON probe.
--
-- Data (an ASN.1 INTEGER based object) is collected in the same
-- manner as any history data table (e.g., etherHistoryTable) except
-- that the user specifies the MIB instances to be collected. Objects
-- are collected in bucket-groups, with the intent that all MIB
-- instances in the same bucket-group are collected as atomically as

-- possible by the RMON probe.
--
-- The usrHistoryControlTable is a one-dimensional read-create table.
-- Each row configures
 a collection of user history buckets, much
-- the same as a historyControlEntry, except that the creation of a
-- row in this table will cause one or more associated instances in
-- the usrHistoryObjectTable to be created. The user specifies the
-- number of bucket elements (rows in the usrHistoryObjectTable)
-- requested, as well as the number of buckets requested.
--
-- The usrHistoryObjectTable is a 2-d read-write table.
-- Each row configures a single MIB instance to be collected.
-- All rows with the same major index constitute a bucket-group.
--
-- The usrHistoryTable is a 3-d read-only table containing

-- the data of associated usrHistoryControlEntries. Each
-- entry represents the value of a single MIB instance
-- during a specific sampling interval (or the rate of
-- change during the interval).
--
-- A sample value is stored in two objects - an absolute value and
-- a status object. This allows numbers from -(2G-1) to +4G to be
-- stored. The status object also indicates
 whether a sample is
-- valid. This allows data collection to continue if periodic
-- retrieval of a particular instance fails for any reason.
--
-- Row Creation Order Relationships
--
-- The static nature of the usrHistoryObjectTable creates
-- some row creation/modification issues. The rows in this
-- table need to be set before the associated
-- usrHistoryControlEntry can be activated.
--
-- Note that the usrHistoryObject entries associated with a
-- particular usrHistoryControlEntry are not required to
-- be active before the control entry is activated. However,
-- the usrHistory data entries associated with an inactive
-- usrHistoryObject entry will be inactive (i.e.,
-- usrHistoryValStatus == valueNotAvailable).

    DESCRIPTION
        "The number of discrete sampling intervals
        over which data shall be saved in the part of
        the usrHistoryTable associated with this
        usrHistoryControlEntry.

        When the associated usrHistoryControlBucketsRequested
        object is created or modified, the probe should set
        this object as closely to the requested value as
        possible for the particular probe implementation and
        available resources.  The probe must not lower this
        value except as a result of a modification to the associated
         usrHistoryControlBucketsRequested object.

        The associated usrHistoryControlBucketsRequested object
```

should be set before or at the same time as this object
to allow the probe to accurately estimate the resources
required for this usrHistoryControlEntry.

There will be times when the actual number of buckets
associated with this entry is less than the value of
this object. In this case, at the end of each sampling
interval, a new bucket will be added to the usrHistoryTable.

When the number of buckets reaches the value of this object
and a new bucket is to be added to the usrHistoryTable,
the oldest bucket associated with this usrHistoryControlEntry
shall be deleted by the agent so that the new bucket can be
added.

When the value of this object changes to a value less than
the current value, entries are deleted from the
usrHistoryTable associated with
this usrHistoryControlEntry.
Enough of the oldest of these entries shall be deleted by the
agent so that their number remains less than or equal to the
new value of this object.

When the value of this object changes to a value greater
than the current value, the number of associated usrHistory
entries may be allowed to grow."

"A list of MIB instances to be sampled periodically.

Entries in this table are created when an associated
usrHistoryControlObjects object is created.

The usrHistoryControlIndex value in the index is
that of the associated usrHistoryControlEntry.

For example, an instance of usrHistoryObjectVariable might be
usrHistoryObjectVariable.1.3"
INDEX { usrHistoryControlIndex, usrHistoryObjectIndex }
::= { usrHistoryObjectTable 1 }

UsrHistoryObjectEntry ::= SEQUENCE {

usrHistoryObjectIndex Integer32,
usrHistoryObjectVariable OBJECT IDENTIFIER,
usrHistoryObjectSampleType INTEGER
}

usrHistoryObjectIndex OBJECT-TYPE
SYNTAX Integer32 (1..65535)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"An index used to uniquely identify an entry in the
usrHistoryObject table. Each such entry defines a
MIB instance to be collected periodically."
::= { usrHistoryObjectEntry 1 }

usrHistoryObjectVariable OBJECT-TYPE
SYNTAX OBJECT IDENTIFIER
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The object identifier of the particular variable to be

sampled.

Only variables that resolve to an ASN.1 primitive type of
Integer32 (Integer32, Counter, Gauge, or TimeTicks) may be
sampled.

Because SNMP access control is articulated entirely in terms
of the contents of MIB views, no access control mechanism

```
 exists that can restrict the value of this object to identify
      only those objects that exist in a particular MIB view.
      Because there is thus no acceptable means of restricting the
      read access that could be obtained through the user history
      mechanism, the probe must only grant write access to this
      object in those views that have read access to all objects on
      the probe.  See USM [RFC3414] and VACM [RFC3415] for more
      information.

      During a set operation, if the supplied variable name is not
      available in the selected MIB view, a badValue error must be
      returned.

      This object may not be modified if the associated
      usrHistoryControlStatus object is equal to active(1)."
  ::= { usrHistoryObjectEntry 2 }

usrHistoryObjectSampleType OBJECT-TYPE
  SYNTAX INTEGER {
           absoluteValue(1),
           deltaValue(2)
         }
  MAX-ACCESS read-create
  STATUS current
  DESCRIPTION
      "The method of sampling the selected variable for storage in
      the usrHistoryTable.

      If the value of this object is absoluteValue(1), the value of
      the selected variable will be copied directly into the history
      bucket.

      If the value of this object is deltaValue(2), the value of the
      selected variable at the last sample will be subtracted from
      the current value, and the difference will be stored in the
      history bucket.  If the associated usrHistoryObjectVariable
      instance could not be obtained at the previous sample
      interval, then a delta sample is not possible, and the value
      of the associated usrHistoryValStatus object for this interval
      will be valueNotAvailable(1).

      This object may not be modified if the associated
      usrHistoryControlStatus object is equal to active(1)."

DESCRIPTION
"The value of sysUpTime at the end of the interval over which this sample was measured."
::= { usrHistoryEntry 3 }

usrHistoryAbsValue OBJECT-TYPE
SYNTAX Gauge32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The absolute value (i.e., unsigned value) of the

user-specified statistic during the last sampling period. The value during the current sampling period is not made available until the period is completed.

To obtain the true value for this sampling interval, the associated instance of usrHistoryValStatus must be checked, and usrHistoryAbsValue adjusted as necessary.

```
      If the MIB instance could not be accessed during the sampling
      interval, then this object will have a value of zero, and the
      associated instance of usrHistoryValStatus will be set to
      'valueNotAvailable(1)'.

      The access control check prescribed in the definition of
      usrHistoryObjectVariable SHOULD be checked for each sampling
      interval.  If this check determines that access should not be
      allowed, then this object will have a value of zero, and the
      associated instance of usrHistoryValStatus will be set to
      'valueNotAvailable(1)'."
  ::= { usrHistoryEntry

usrHistoryValStatus OBJECT-TYPE
  SYNTAX INTEGER {
      valueNotAvailable(1),
      valuePositive(2),
      valueNegative(3)
  }
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
      "This object indicates the validity and sign of the data in
      the associated instance of usrHistoryAbsValue.

      If the MIB instance could not be accessed during the sampling
      interval, then 'valueNotAvailable(1)' will be returned.

      If the sample is valid and the actual value of the sample is
      greater than or equal to zero, then 'valuePositive(2)' is
      returned.

      If the sample is valid and the actual value of the sample is
      less than zero, 'valueNegative(3)' will be returned.  The
      associated instance of usrHistoryAbsValue should be multiplied
      by -1 to obtain the true sample value."
  ::= { usrHistoryEntry 5 }

-- The Probe Configuration Group
--
-- This group controls the configuration of various operating
--
```

parameters of the probe.

```
ControlString ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
    "This data type is used to communicate with a modem or a

    serial data switch.  A ControlString contains embedded
    commands to control how the device will interact with the
    remote device through the serial interface.  Commands are
    represented as two-character sequences beginning with
    the '^' character.

    The following commands are recognized by the device (note
    that command characters are case sensitive):

      ^s  Send string that follows, which is terminated by the
          next command or the end of string.
      ^c  Delay for the number of seconds that follows.  Toss
          out any data received rather than store it in a
          buffer for parsing.
      ^t  Set timeout to the value represented by the decimal
          digits that follow.  The default timeout is 20

    seconds.  Note that this timeout may be overridden
          by a smaller serialTimeout configured for the
          associated serial interface (see serialConfigTable).
      ^w  Wait for the reply string that follows, which is
          terminated by the next command or the end of string.
          Partial and case-insensitive matching is applied, i.e.,
          if the reply string (any case combination) is found
          anywhere in the received string, then the a match is
          found.  If the current timeout elapses without a match,
          then the remaining control string is ignored.
      ^!  The ^ character.
      ^d  Delay the number of seconds specified by the decimal
          digits that follow.
      ^b  Send break for the number of milliseconds specified by
          the decimal digits that follow.  If no digits follow,
          break will be enforced for 250 milliseconds by default.

     The following ASCII control characters may be inserted into
    the '^s' send string or the '^w' reply string:

      ^@    0x00
      ^A    0x01
```

..
^M 0x0D
..
^Z 0x1A
^[0x1B
^ 0x1C
^] 0x1D
^^ 0x1E
^_ 0x1F

Binary data may also be inserted into the data stream. The control sequence for each byte of binary data is ^0x##, where ## is the hexadecimal representation of the data byte. Two ASCII characters (0-9, a-f, A-F) must follow the '^0x' control prefix. For example, '^0x0D^0x0A' is interpreted as a carriage return followed by a line feed."

-- This MIB module contains objects necessary
-- for management of the following SNA devices: PU types 1.0, 2.0, 2.1
-- and LU types 0, 1, 2, 3, 4, 7.  It also contains generic objects
-- which can be used to manage LU 6.2.

-- Naming conventions in this document:
-- The following names are used in object descriptors according to
-- SNA conventions.
-- The name 'PU' or 'Node' is used to describe Node type 1.0, 2.0 or
-- 2.1.
-- The name 'LU' is used to describe Logical Unit of type 0,1,2,3,
-- 4,7 or 6.2.

-- ****************************************************************
-- snaNode group
--
-- It contains Managed Objects related to any type of Node and
-- some specific objects for Node Type 2.0.
-- ****************************************************************

-- ****************************************************************
-- The following table contains generic Node configuration
-- parameters.
-- ****************************************************************

snaNodeAdminTable OBJECT-TYPE
    SYNTAX  SEQUENCE OF SnaNodeAdminEntry
     MAX-ACCESS  not-accessible
    STATUS  current
    DESCRIPTION
```

"This table contains objects which describe the
configuration parameters for an SNA Node. Link
specific configuration objects are contained in
a separate MIB module (e.g., SNA DLC MIB)
corresponding to the link type.
The table snaNodeAdminLinkTable contains objects
which identify the relationship between node instances
and link instances.

The entries (i.e., rows) in this table can be created
by either an Agent or a Management Station.
The Management Station can do this through setting
the appropriate value in the snaNodeAdminRowStatus.

The snaNodeAdminRowStatus object describes the
status of an entry and is used to change the status
of an entry. The entry is deleted
by an Agent based
on the value of the snaNodeAdminRowStatus.

The snaNodeAdminState object describes the desired
operational state of a Node and is used to change the
operational state of a Node. For example, such
information may be obtained from a configuration file.

How an Agent or a Management Station obtains the
initial value of each object at creation time is an
implementation specific issue.

For each entry in this table, there is a corresponding
entry in the snaNodeOperTable.
While the objects in this table describe the desired
or configured operational values of the SNA Node, the
actual runtime values are contained in
snaNodeOperTable."
::= { snaNode 1 }

snaNodeAdminEntry OBJECT-TYPE
SYNTAX SnaNodeAdminEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"An entry contains the configuration parameters for
one SNA Node instance. The objects in the entry
have read-create access.
An entry can be created, modified or deleted. The
object snaNodeAdminRowStatus is used (i.e., set) to
create or delete a row entry."

                "The value indicates the type of XID format used for
```

```
            this Node.  Note that there is no format type 2.

            A write operation to this object will
            not change the operational value reflected
            in snaNodeOperAdminXidFormat until the Node has
            been re-activated (e.g., after the next initialization
            of the SNA services)."
        ::= { snaNodeAdminEntry 4 }

snaNodeAdminBlockNum OBJECT-TYPE
        SYNTAX  DisplayString (SIZE(3))
        MAX-ACCESS  read-create
        STATUS
    current
        DESCRIPTION
            "The value indicates the block number for this Node
            instance.  It is the first 3 hexadecimal digits of the
            SNA Node id.

            A write operation to this object will
            not change the operational value reflected
            in snaNodeOperBlockNum until the Node has
            been re-activated (e.g., after the next initialization
            of the SNA services)."
        ::= { snaNodeAdminEntry 5 }

snaNodeAdminIdNum OBJECT-TYPE
        SYNTAX  DisplayString (SIZE(5))
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "The value indicates the ID number for this Node
            instance.  This is the last 5 hexadecimal digits of
            the SNA Node id.

            A write operation to this object will
            not change the operational value reflected
            in snaNodeOperIdNum until the Node has
             been re-activated (e.g., after the next initialization
            of the SNA services)."
        ::= { snaNodeAdminEntry 6 }

snaNodeAdminEnablingMethod OBJECT-TYPE
        SYNTAX  INTEGER {
            other (1),
            startup (2),
            demand (3),
            onlyMS (4)
```

```
            }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "The value indicates how the Node should be
            activated for the first time.
            The values have the following meanings:

            other (1)  - may be used for proprietary methods
              not listed in this enumeration,
            startup (2) - at SNA services' initialization time
              (this is the default),
            demand (3) - only when LU is requested by application,
                    or
            onlyMS (4) - by a Management Station only.

            A  write operation
    to this object may immediately
            change the operational value reflected
            in snaNodeOperEnablingMethod depending
            on the Agent implementation.  If the Agent
            implementation accepts immediate changes, then the
            behavior of the Node changes immediately and not only
            after the next system startup of the SNA services.
            An immediate change may only apply when the
            current value 'demand (3)' is changed to 'onlyMS (4)'
            and vice versa."
        ::= { snaNodeAdminEntry 7 }

    snaNodeAdminLuTermDefault OBJECT-TYPE
        SYNTAX  INTEGER {
            unbind (1),
            termself (2),
            rshutd (3),
            poweroff(4)
            }
         MAX-ACCESS  read-create
         STATUS  current
         DESCRIPTION
            "The value indicates the desired default method
            used to deactivate LUs for this Node
             For LU6.2s, 'unbind(1)' is the only valid value.

            unbind(1) -   terminate the LU-LU session by sending
                  an SNA UNBIND request.
            termself(2) - terminate the LU-LU session by sending
                  an SNA TERM-SELF (Terminate Self) request on
                  the SSCP-LU session. The SSCP will inform the
```

remote session LU partner to send an UNBIND
request to terminate the session.

rshutd(3) - terminate the LU-LU session by sending
an SNA RSHUTD (Request ShutDown) request to
the remote session LU partner. The remote LU
will then send an UNBIND request to terminate
the session.

poweroff(4) - terminate the LU-LU session by sending
either an SNA LUSTAT (LU Status) request on
the LU-LU
session or an SNA NOTIFY request on
the SSCP-LU session indicating that the LU has
been powered off. Sending both is also
acceptable. The result should be that the
remote session LU partner will send an UNBIND
to terminate the session.

The default behavior indicated by the value of this
object may be overridden for an LU instance. The
override is performed by setting the snaLuAdminTerm
object instance in the snaLuAdminTable to the desired
value.

A write operation to this object may immediately
change the operational value reflected
in snaNodeOperLuTermDefault depending
on the Agent implementation."
::= { snaNodeAdminEntry 8 }

snaNodeAdminMaxLu OBJECT-TYPE
SYNTAX Integer32
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"The maximum number of LUs that may be
activated for this Node. For PU2.1, this object
refers to the number of dependent LUs.

A write operation to this object will
not change the operational value reflected
in snaNodeOperMaxLu until the Node has
been re-activated (e.g., after the next initialization
of the SNA services)."
::= { snaNodeAdminEntry 9 }

snaNodeAdminHostDescription OBJECT-TYPE
SYNTAX DisplayString (SIZE(0..128))
MAX-ACCESS read-create

```
        STATUS  current
        DESCRIPTION
                "The value identifies the remote host associated
                with this Node.
                Since SSCP Id's may not be unique
                across hosts, the host description
                is required to uniquely identify the SSCP.
                This object
 is only applicable to PU2.0 type
                Nodes. If the remote host is unknown, then the
                value is the null string.

                A write operation to this object may immediately
                change the operational value reflected
                in snaNodeOperHostDescription depending
                on the Agent implementation."
        ::= { snaNodeAdminEntry 10 }

                force (4)
                }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
                "The value indicates the desired method to be used
                by the Agent to stop a Node (i.e., change the Node's
                operational state to inactive(1) ).

                The values have the following meaning:

                other (1) - used for proprietary
                     methods not listed in this enumeration.
                normal(2) - deactivate only when there is no more
                    activity on this Node (i.e., all data flows
                    have been completed and all sessions
                    have been terminated).
                immed(3)  - deactivate immediately regardless of
                    current activities on this Node. Wait for
                    deactivation responses (from remote Node)
                    before changing the Node state to inactive.
                force(4)  - deactivate immediately regardless of
                    current activities on this Node. Do not wait
                    for deactivation responses (from remote Node)
                    before changing the Node state to inactive.
```

```
            A write operation to this object may immediately
            change the operational value reflected
            in snaNodeOperStopMethod
 depending
            on the Agent implementation."
        ::= { snaNodeAdminEntry 11 }

snaNodeAdminState OBJECT-TYPE
        SYNTAX  INTEGER {
            inactive (1),
            active (2)
            }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "The value indicates the desired operational
             state of the SNA Node. This object is used
             by the Management Station to
             activate or deactivate the Node.

            If the current value in snaNodeOperState is
            'active (2)', then setting this object to
            'inactive (1)' will initiate the Node shutdown
            process using the method indicated
            by snaNodeOperStopMethod.

            If the current value in snaNodeOperState is
            'inactive (1)', then setting this object to
            'active (2)'
 will initiate the
            Node's activation.

            A Management Station can always set this object to
            'active (2)' irrespective of the value in the
            snaOperEnablingMethod."
        ::= { snaNodeAdminEntry 12 }

snaNodeAdminRowStatus OBJECT-TYPE
        SYNTAX  RowStatus
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "This object is used by a Management Station to
            create or delete the row entry in the
            snaNodeAdminTable following
            the RowStatus textual convention.
```

```
                Upon successful creation of
                the row, an Agent automatically creates a
                corresponding entry in the snaNodeOperTable with
                snaNodeOperState equal to 'inactive (1)'.

                Row deletion can be Management Station or Agent
                initiated:
                (a) The Management
 Station can set the value to
                'destroy (6)' only when the value of
                snaNodeOperState of this Node instance is
                'inactive (1)'. The Agent will then delete the rows
                corresponding to this Node instance from the
                snaNodeAdminTable and the snaNodeOperTable.
                (b) The Agent detects that a row is in the
                'notReady (3)' state for greater than a
                default period of 5 minutes.
                (c) All rows with the snaNodeAdminRowStatus object's
                value of 'notReady (3)' will be removed upon the
                next initialization of the SNA services."
        ::= { snaNodeAdminEntry 13 }

-- ****************************************************************
-- The following object is updated when there is a change to
-- the value of any object in the snaNodeAdminTable.
-- ****************************************************************

snaNodeAdminTableLastChange
 OBJECT-TYPE
        SYNTAX  TimeStamp
        MAX-ACCESS  read-only
        STATUS  current
        DESCRIPTION
                "The value indicates the timestamp
                (e.g., the Agent's sysUpTime value) of the last
                change made to any object in the snaNodeAdminTable,
                including row deletions/additions (e.g., changes to
                snaNodeAdminRowStatus values).

                This object can be used to reduce frequent
                retrievals of the snaNodeAdminTable by a Management
                Station. It is expected that a Management Station
                will periodically poll this object and compare its
                current value with the previous one. A difference
                indicates that some Node configuration information
                has been changed. Only then will the Management
                Station retrieve the entire table."

                the first time.
                The values have the following meanings:
                  other (1)   - not at boot time, LU activation
                     or by a Management Station;
```

```
                startup (2) - at SNA services' initialization
                  time (this is the default),

    demand (3)  - only when LU is requested by
                  application,
                onlyMS (4) - by a network Management Station
                  only."
      ::= { snaNodeOperEntry 6 }

snaNodeOperLuTermDefault OBJECT-TYPE
      SYNTAX  INTEGER {
            unbind (1),
            termself (2),
            rshutd (3),
            poweroff (4)
            }
      MAX-ACCESS  read-only
      STATUS  current
      DESCRIPTION
          "The value identifies the default method used to
          deactivate LUs for this Node.
          For LU6.2s, 'unbind(1)' is the only valid value.

          unbind(1) -   terminate the LU-LU session by sending
                an SNA UNBIND request.
          termself(2) - terminate the LU-LU session by sending
                an SNA TERM-SELF (Terminate Self) request on
                the SSCP-LU session. The SSCP will inform
the
                remote session LU partner to send an UNBIND
                request to terminate the session.
          rshutd(3) -   terminate the LU-LU session by sending
                an SNA RSHUTD (Request ShutDown) request to
                the remote session LU partner. The remote LU
                will then send an UNBIND request to terminate
                the session.
          poweroff(4) - terminate the LU-LU session by sending
                either an SNA LUSTAT (LU Status) request on
                the LU-LU session or an SNA NOTIFY request on
                the SSCP-LU session indicating that the LU has
                been powered off. Sending both is also
                acceptable. The result should be that the
                remote session LU partner will send an UNBIND
                to terminate the session.

          This object
describes the default behavior for this
          Node; however, it is possible that for a specific LU
```

```
            the behavior indicated by the snaLuOperTerm object is
            different."

            force (4)
            }
        MAX-ACCESS  read-only
        STATUS  current
        DESCRIPTION
            "This value identifies the current Node shutdown
            method to be used by the Agent to stop the Node.
            When the Agent changes the Node's state to 'inactive
            (1)', the Agent must use the shutdown method
            indicated by this object.

            The values have the following meaning:

            other (1) - proprietary method not listed in this
                    enumeration
            normal(2) - deactivate only when there is no more
```

```
                activity on this Node (i.e., all
data flows
                have been completed and all sessions have
                been terminated).
            immed(3)  - deactivate immediately regardless of
                current activities on this Node. Wait for
                deactivation responses (from remote Node)
                before changing the Node state to inactive.
            force(4)  - deactivate immediately regardless of
                current activities on this Node. Do not wait
                for deactivation responses (from remote Node)
                before changing the Node state to inactive.

            Note that a write operation to
            snaNodeAdminOperStopMethod may immediately change
            the value of snaNodeOperStopMethod depending on
            the Agent implementation."

        MAX-ACCESS  not-accessible
        STATUS  current
        DESCRIPTION
                "This table contains the references to link
                specific tables. If a Node is configured for
                multiple links, then the Node will have
```

```
            multiple entries in this table.
            The entries in this table can be generated
            initially, after initialization of SNA service,
            by the Agent which uses information from
            Node configuration file.

          Subsequent modifications of parameters,
            creation of new Nodes link entries and deletion
            of entries is possible.
            The modification to this table can be
            saved in the Node configuration file for the
            next initialization of SNA service, but the mechanism
            for this function is not defined here."

        STATUS  current
        DESCRIPTION
            "This value identifies the maximum number of octets
            that can be exchanged by this Node in one
            Path Information Unit (PIU)."
        ::= { snaNodeLinkAdminEntry 3 }

snaNodeLinkAdminRowStatus OBJECT-TYPE
        SYNTAX  RowStatus
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "This object is used by a
 Management Station to
            create or delete the row entry in the
            snaNodeLinkAdminTable.
            To activate a row, a Management Station sets the value
            to 'active (1)' or 'notReady (3)'.  Upon successful
            creation of the row, the Agent automatically creates
            a corresponding entry in the snaNodeLinkOperTable.

            Row deletion can be Management Station or Agent
            initiated:
            (a) The Management Station can set the value to
            'destroy (6)' only when the value of
```

```
            snaNodeLinkOperState of this Link
            instance is 'inactive (1)'. The Agent will then
            delete the row corresponding to this Link
            instance from snaNodeLinkOperTable and
            from snaNodeLinkAdminTable.
            (b) The Agent detects that a row is in the
            'notReady (3)' state for greater than a

  default period of 5 minutes.
            (c) The Agent will not include a row with RowStatus=
            'notReady (3)', after SNA system re-initialization
             (e.g., reboot)."

            model4B(7) - Model 4 (43 rows x 80 cols) with extended
                                attributes
            model5A(8) - Model 5 (27 rows x 132 cols) with base
                attributes
            model5B(9) - Model 5 (27 rows x 132 cols) with
                extended attributes
            dynamic(10) - Screen size determine with
 BIND and Read
                                Partition Query.

            In case this LU is not Type 2, then this object
            should contain the invalid(1) value."
        ::= { snaLuAdminEntry 7 }

snaLuAdminTerm OBJECT-TYPE
        SYNTAX  INTEGER {
            unbind (1),
            termself (2),
            rshutd (3),
            poweroff (4)
            }
        MAX-ACCESS  read-create
        STATUS  current
        DESCRIPTION
            "This value identifies the desired method for
            deactivation of this LU. This value overrides the
            default method (snaNodeOperLuTermDefault) for this
            Node.  For LU 6.2, only the value 'unbind (1)'
            applies.

            unbind(1) -   terminate the LU-LU session by sending
                an SNA UNBIND request.
            termself(2) - terminate the LU-LU session by sending
```

an SNA TERM-SELF
(Terminate Self) request on
the SSCP-LU session. The SSCP will inform the
remote session LU partner to send an UNBIND
request to terminate the session.
rshutd(3) - terminate the LU-LU session by sending
an SNA RSHUTD (Request ShutDown) request to
the remote session LU partner. The remote LU
will then send an UNBIND request to terminate
the session.
poweroff(4) - terminate the LU-LU session by sending
either an SNA LUSTAT (LU Status) request on
the LU-LU session or an SNA NOTIFY request on
the SSCP-LU session indicating that the LU has
been powered off. Sending both is also
acceptable. The result should be that the
remote session LU partner
will send an UNBIND
to terminate the session.

A write operation to this object may immediately
change the operational value reflected
in snaLuOperTerm depending
on the Agent implementation."
::= { snaLuAdminEntry 8 }

snaLuAdminRowStatus OBJECT-TYPE
SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
DESCRIPTION
"This object is used by a Management Station to
create or delete the row entry in the
snaLuAdminTable.
To activate a row, the Management Station sets the
value to 'active (1)' or 'notReady (3)'.
Upon successful creation of the row, the Agent
automatically creates a corresponding entry in the
snaLuOperTable with snaLuOperState equal to
'inactive (1)'.
Row deletion can be Management Station
or Agent
initiated:
(a) The Management Station can set the value to
'destroy (6)' only when the value of snaLuOperState
of this LU instance is 'inactive (1)'. The Agent will
then delete the row corresponding to this LU
instance from snaLuAdminTable and

```
            from snaLuOperTable.
            (b) The Agent detects that a row is in the
            'notReady (3)' state for greater than a
            default period of 5 minutes.
            (c) The Agent will not create a row with RowStatus
            equal to 'notReady (3)', after SNA system
            re-initialization (e.g., reboot)."

            poweroff (4)
            }
        MAX-ACCESS  read-only
        STATUS  current
        DESCRIPTION
            "The value identifies the current method for
            deactivation of this LU. This value overrides the
            default method (snaNodeOperLuTermDefault) for this
            Node.  For LU 6.2, only the value 'unbind (1)'
            applies.

            unbind(1) -   terminate the LU-LU session by sending
                an SNA UNBIND request.
             termself(2) - terminate the LU-LU session by sending
                an SNA TERM-SELF (Terminate Self) request on
                the SSCP-LU session. The SSCP will inform the
                remote session LU partner to send an UNBIND
                request to terminate the session.
            rshutd(3) -   terminate the LU-LU session by sending
                an SNA RSHUTD (Request ShutDown) request to
                the remote session LU partner. The remote LU
                will then send an UNBIND request to terminate
                the session.
            poweroff(4) - terminate the LU-LU session by sending
                either an SNA LUSTAT (LU Status) request on
                the LU-LU session or an SNA NOTIFY request on
                the SSCP-LU session indicating that the LU has
                been powered off. Sending both is also

               acceptable. The result should be that the
                remote session LU partner will send an UNBIND
                to terminate the session."

    STATUS  current
    DESCRIPTION
        "The value identifies the current operational state of
        this LU.
        It has different meanings for dependent and independent
        LUs.
        For dependent LUs the values indicate the following:
          inactive (1) - LU didn't receive ACTLU, or
              it received DACTLU, or received ACTLU and sent
              negative response.
          active (2) - LU received ACTLU and acknowledged
              positively.

        For independent LUs the values
 indicate the following:
          active (2) - the LU is defined and is able to send
              and receive BIND.
          inactive (1) - the LU has a session count equal
              to 0."

-- ****************************************************************
```

```
-- ****************************************************************
-- The following table contains Response Time Monitoring (RTM)
-- configuration information and statistics for LU Type 2s.
-- RTM supports the capability to measure and report end-user
-- response times for dependent LUs. When the RTM state of an LU
-- is 'on', response times for each LU transaction are monitored.
-- A set of ranges is defined (e.g., Range 1 includes the number of
-- transactions with response times less than 1 second) using the
-- "boundary" definitions (e.g., boundary #2 is defined as 3 seconds).
-- A set of counters (one per range) identifies
-- the number of transactions within each response time range.
-- ****************************************************************

              }
  MAX-ACCESS  read-write
  STATUS      current
  DESCRIPTION
        "The requested configuration of this capability.  If this
        value is 'disabled(1)', this is a request to disable this
        protocol.  If this value is 'preferred(3)', this is a
        request to enable this protocol, and to prefer it in any
        negotiation over other appropriate protocols
 that have a
        value of 'optional(2)'."
  DEFVAL      { preferred }
  ::= { mdmLineCapabilitiesEntry 3 }

mdmLineCapabilitiesEnableGranted OBJECT-TYPE
  SYNTAX      INTEGER {
                disabled(1),
                optional(2),
                preferred(3)
              }
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
        "The actual configuration of this capability.  The agent
        shall attempt to set this as close as possible to the
        associated mdmLineCapabilitiesEnableRequested value.  The
        agent shall make this determination in an implementation-
        specific manner that may take into account the configuration
        of other capabilities or other considerations.  The modem
```

```
            will choose in an implementation-specific manner between
            multiple mutually-exclusive capabilities that each have the
            same (non-disabled) value.  However, the modem must prefer
             all capabilities with a value of 'preferred(3)' over all
            capabilities with a value of 'optional(2)'.

            In other words, if there are one or more mutually-exclusive
            capabilities (e.g. V.32 and V.32bis) that are set to
            `preferred', the agent must choose one in an
            implementation-specific manner.  Otherwise, if there are one
            or more mutually-exclusive capabilities that are set to
            `optional', the agent must choose one in an implementation-
            specific manner."

  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION

        "Indicates the reason that the last connection or attempt
        failed. The meaning of each reason code is explained below.

          unknown:
        This code means the failure reason is unknown or
        there has been no previous call.
```

other:
This code used when no other code is applicable.
Additional vendor information may be available
elsewhere.

managementCommand:
A management command terminated the call. These
commands include escaping to command mode, initiating
dialing, restoring lines, and disconnecting.

inactivityTimeout:
The call was terminated because it was inactive for
at the minimum duration specified.

mnpIncompatibility:
The modems are unable to resolve MNP protocol
differences.

protocolError:
An error occured in one of protocol in use. Further
information is required to determine in which
protocol the error occurred, and the exact nature of
the error.

powerLoss:
The modem lost power and disconnected the call.

equipmentFailure:
The modem equipment failed.

dtrDrop:

DTR has been turned off while the modem is to
disconnect on DTR drop. (Ref: V.58 cct108TurnedOff)

noDialTone:
If the modem is to monitor for call progress tones,
but the modem has failed to detect dial tone while
attempting to dial a number.

lineBusy:
Busy signal is detected while busy signal detection
is enabled, or while the 'W' or '@' dial modifier is
used. (Ref: V.58 engagedTone)

noAnswer:
The call was not answered.

```
            voiceDetected:
          A voice was detected on the call.

            carrierLost:
          Indicates that the modem has disconnected due to
          detection of loss of carrier.  In TIA-602, the S10
          register determines the time that loss of carrier
          must be detected before the modem disconnects.

            trainingFailed:
          Indicates that the modems did
 not successfully train
          and reach data mode on the previous connection.

            faxDetected:
          A fax was detected on the call."

 IANAItuProbableCause ::= TEXTUAL-CONVENTION
    STATUS current
    DESCRIPTION
```

"ITU-T probable cause values. Duplicate values defined in
X.733 are appended with X733 to ensure syntactic uniqueness.
Probable cause value 0 is reserved for special purposes.

The Internet Assigned Number Authority (IANA) is responsible
for the assignment of the enumerations in this TC.
IANAItuProbableCause value of 0 is reserved for special
purposes and MUST NOT be assigned.

Values of IANAItuProbableCause in the range 1 to 1023 are
reserved
for causes that correspond to ITU-T probable cause.

All other requests for new causes will be handled on a
first-come, first served basis and will be assigned
enumeration values starting with 1025.

Request should come in the form of well-formed
SMI [RFC2578] for enumeration names that are unique and
sufficiently descriptive.

While some effort will be taken to ensure that new probable
causes do not conceptually duplicate existing probable
causes it is acknowledged that the existence of conceptual
duplicates in the starting probable cause list is an known
industry reality.

To aid IANA in the administration of probable cause names
and values, the OPS Area Director will appoint one or more
experts to help review requests.

See http://www.iana.org"

  DESCRIPTION
        "The time (in hundredths of a second) since the
        network management portion of the system was last
```

re-initialized."
::= { system 3 }

sysContact OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"The textual identification of the contact person for this managed node, together with information on how to contact this person. If no contact information is known, the value is the zero-length string."
::= { system 4 }

sysName OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string."
::= { system 5 }

sysLocation OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"The physical location of this node (e.g., 'telephone closet,
3rd floor'). If the location is unknown, the
value is the zero-length string."
::= { system 6 }

sysServices OBJECT-TYPE
SYNTAX INTEGER (0..127)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"A value which indicates the set of services that this entity may potentially offer. The value is a sum.

This sum initially takes the value zero. Then, for each layer, L, in the range 1 through 7, that this node

```
        performs transactions for, 2 raised to (L - 1) is added
        to the sum.  For example, a node which performs only
        routing functions would have a value of 4 (2^(3-1)).
        In contrast, a node which is a host offering application
        services would have a value of 72 (2^(4-1) + 2^(7-1)).
        Note that in the context of the Internet suite of
        protocols, values should be calculated accordingly:

            layer     functionality
              1       physical (e.g., repeaters)
              2       datalink/subnetwork (e.g., bridges)
              3       internet (e.g., supports the IP)
              4       end-to-end  (e.g., supports the TCP)
              7       applications (e.g., supports the SMTP)

        For systems including OSI protocols, layers 5 and 6
        may also be counted."

-- Textual conventions

DHKeyChange ::=         TEXTUAL-CONVENTION
  STATUS             current
  DESCRIPTION
     "Upon initialization, or upon creation of a row containing an
  object of this type, and after any successful SET of this value, a
  GET of this value returns 'y' where y = g^xa MOD p, and where g is
  the base from usmDHParameters, p is the prime from
  usmDHParameters, and xa is a new random integer selected by the
  agent in the interval 2^(l-1) <= xa < 2^l < p-1.  'l' is the
```

```
  optional privateValueLength from usmDHParameters in bits.  If 'l'
  is omitted,
 then xa (and xr below) is selected in the interval 0
  <= xa < p-1.  y is expressed as an OCTET STRING 'PV' of length 'k'
  which satisfies

          k
      y =  SUM   2^(8(k-i)) PV'i
          i=1

      where PV1,...,PVk are the octets of PV from first to last, and
      where PV1 <> 0.

  A successful SET consists of the value 'y' expressed as an OCTET
  STRING as above concatenated with the value 'z'(expressed as an
  OCTET STRING in the same manner as y) where z = g^xr MOD p, where
  g, p and l are as above, and where xr is a new random integer
  selected by the manager in the interval 2^(l-1) <= xr < 2^l <
  p-1. A SET to an object of this type will fail with the error
  wrongValue if the current 'y' does not match the 'y' portion of
  the value of the varbind for the object. (E.g. GET yout, SET
  concat(yin, z), yout <> yin).

  Note that the private values xa and xr are never transmitted from
  manager to device or vice versa, only the values
 y and z.
  Obviously, these values must be retained until a successful SET on
  the associated object.

  The shared secret 'sk' is calculated at the agent as sk = z^xa MOD
  p, and at the manager as sk = y^xr MOD p.

  Each object definition of this type MUST describe how to map from
  the shared secret 'sk' to the operational key value used by the
  protocols and operations related to the object.  In general, if n
  bits of key are required, the author suggests using the n
  right-most bits of the shared secret as the operational key value."

  DESCRIPTION
     "The public Diffie-Hellman parameters for doing
 a Diffie-Hellman
  key agreement for this device.  This is encoded as an ASN.1
  DHParameter per PKCS #3, section 9.  E.g.

     DHParameter ::= SEQUENCE {
       prime   INTEGER,   -- p
       base    INTEGER,   -- g
       privateValueLength  INTEGER OPTIONAL }

  Implementors are encouraged to use either the values from
  Oakley Group 1  or the values of from Oakley Group 2 as specified
  in RFC-2409, The Internet Key Exchange, Section 6.1, 6.2 as the
  default for this object.  Other values may be used, but the
  security properties of those values MUST be well understood and
  MUST meet the requirements of PKCS #3 for the selection of
  Diffie-Hellman primes.

     In addition, any time usmDHParameters changes, all values of
  type DHKeyChange will change and new random numbers MUST be
  generated by the agent for each DHKeyChange object."

usmDHKickstartTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF UsmDHKickstartEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
        "A table of mappings between zero or more Diffie-Helman key
    agreement values and entries in the usmUserTable.  Entries in this
    table are created by providing the associated device with a
    Diffie-Helman public value and a usmUserName/usmUserSecurityName
    pair during initialization. How these values are provided is
    outside the scope of this MIB, but could be provided manually, or
    through a configuration file.  Valid public value/name pairs
    result
   in the creation of a row in this table as well as the
    creation of an associated row (with keys derived as indicated) in
    the usmUserTable.  The actual access the related usmSecurityName
    has is dependent on the entries in the VACM tables.  In general,
    an implementor will specify one or more standard security names
    and will provide entries in the VACM tables granting various
    levels of access to those names.  The actual content of the VACM
    table is beyond the scope of this MIB.
```

Note: This table is expected to be readable without authentication
using the usmUserSecurityName 'dhKickstart'. See the conformance
statements for details."

this row."
::= { usmDHKickstartEntry 1 }

usmDHKickstartMyPublic OBJECT-TYPE
SYNTAX OCTET STRING
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The agent's Diffie-Hellman public value for this row. At
initialization, the agent generates a random number and derives

its public value from that number. This public value is published here. This public value 'y' equals g^r MOD p where g is the from the set of Diffie-Hellman parameters, p is the prime from those parameters, and r is a random integer selected by the agent in the interval 2^(l-1) <= r < p-1 < 2^l. If l is unspecified, then r is a random integer selected in the interval 0 <= r < p-1

The public value is expressed as an OCTET STRING 'PV' of length 'k' which satisfies

$$y = \sum_{i=1}^{k} 2^{(8(k-i))} PV'i$$

where PV1,...,PVk are the octets of PV from first to last, and where PV1 != 0.

The following DH parameters (Oakley group #2, RFC 2409, sec 6.1, 6.2) are used for this object:

g = 2
p = FFFFFFFF FFFFFFFF C90FDAA2 2168C234 C4C6628B 80DC1CD1

::= { usmDHKickstartEntry 2 }

usmDHKickstartMgrPublic OBJECT-TYPE
  SYNTAX      OCTET STRING
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION

    "The manager's Diffie-Hellman public value for this row.  Note
  that this value is not set via the SNMP agent, but may be set via
  some out of band
```

method, such as the device's configuration file.
The manager calculates this value in the same manner and using the same parameter set as the agent does. E.g. it selects a random number 'r', calculates y = g^r mod p and provides 'y' as the public number expressed as an OCTET STRING. See usmDHKickstartMyPublic for details.

When this object is set with a valid value during initialization, a row is created in the usmUserTable with the following values:

usmUserEngineID localEngineID
usmUserName [value of usmDHKickstartSecurityName]
usmUserSecurityName [value of usmDHKickstartSecurityName]
usmUserCloneFrom ZeroDotZero
usmUserAuthProtocol usmHMACMD5AuthProtocol
usmUserAuthKeyChange -- derived from set value
usmUserOwnAuthKeyChange -- derived from set value
usmUserPrivProtocol usmDESPrivProtocol
usmUserPrivKeyChange -- derived from set value
usmUserOwnPrivKeyChange -- derived from set value
usmUserPublic "
usmUserStorageType permanent
usmUserStatus active

A shared secret 'sk' is calculated at the agent as sk = mgrPublic^r mod p where r is the agents random number and p is the DH prime from the common parameters. The underlying privacy key for this row is derived from sk by applying the key derivation function PBKDF2 defined in PKCS#5v2.0 with a salt of 0xd1310ba6, and iterationCount of 500, a keyLength of 16 (for usmDESPrivProtocol), and a prf (pseudo random function) of 'id-hmacWithSHA1'. The underlying authentication key for this row is derived from sk by applying the key derivation function PBKDF2 with a salt of 0x98dfb5ac , an interation count of 500, a keyLength of 16 (for usmHMAC5AuthProtocol), and a prf of 'id-hmacWithSHA1'. Note: The salts are the first two words in the ks0 [key schedule 0] of the BLOWFISH
cipher from 'Applied
Cryptography' by Bruce Schnier - they could be any relatively random string of bits.

The manager can use its knowledge of its own random number and the agent's public value to kickstart its access to the agent in a secure manner. Note that the security of this approach is directly related to the strength of the authorization security of the out of band provisioning of the managers public value (e.g. the configuration file), but is not dependent at all on the strength of the confidentiality of the out of band provisioning

```
  data."
