 should contain year, long-month, day.\n *\n * For example, `MMMM d, y`, corresponding to a date like \"September 14, 1999\".\n *\n * - `medium` should contain year, abbreviated-month (MMM), day.\n *\n * For example, `MMM d, y`, corresponding to a date like \"Sep 14, 1999\".\n * For languages that do not use abbreviated months, use the numeric month (MM/M). For example,\n * `y/MM/dd`, corresponding to a date like \"1999/09/14\".\n *\n * - `short` should contain year, numeric-month (MM/M), and day.\n *\n * For example, `M/d/yy`, corresponding to a date like \"9/14/99\".\n *\n * @publicApi\n */\nfunction getLocaleDateFormat(locale, width) {\n   var data = findLocaleData(locale);\n   return getLastDefinedValue(data[10 /* DateFormat */], width);\n}\n/**\n * Time format that depends on the locale.\n *\n * The standard formats include four basic time formats:\n * - `full` should contain hour (h/H), minute (mm), second (ss), and zone (zzzz).\n * - `long` should contain hour, minute,
 second, and zone (z)\n * - `medium` should contain hour, minute, second.\n * - `short` should contain hour, minute.\n *\n * Note: The patterns depend on whether the main country using your language uses 12-hour time or\n * not:\n * - For 12-hour time, use a pattern like `hh:mm a` using h to mean a 12-hour clock cycle running\n * 1 through 12 (midnight plus 1 minute is 12:01), or using K to mean a 12-hour clock cycle\n * running 0 through 11 (midnight plus 1 minute is 0:01).\n * - For 24-hour time, use a pattern like `HH:mm` using H to mean a 24-hour clock cycle running 0\n * through 23 (midnight plus 1 minute is 0:01), or using k to mean a 24-hour clock cycle running\n * 1 through 24 (midnight plus 1 minute is 24:01).\n *\n * @publicApi\n */\nfunction getLocaleTimeFormat(locale, width) {\n   var data = findLocaleData(locale);\n   return getLastDefinedValue(data[11 /* TimeFormat */], width);\n}\n/**\n * Date-time format that depends on the locale.\n *\n * The date-time pattern shows
 how to combine separate patterns for date (represented by {1})\n * and time (represented by {0}) into a single pattern. It usually doesn't need to be changed.\n * What you want to pay attention to are:\n * - possibly removing a space for languages that don't use it, such as many East Asian languages\n * - possibly adding a comma, other punctuation, or a combining word\n *\n * For example:\n * - English uses `{1} 'at' {0}` or `{1}, {0}` (depending on date style), while Japanese uses\n * `{1}{0}`.\n * - An English formatted date-time using the combining pattern `{1}, {0}` could be\n * `Dec 10, 2010, 3:59:49 PM`. Notice the comma and space between the date portion and the time\n * portion.\n *\n * There are four formats (`full`, `long`, `medium`, `short`); the determination of which to use\n * is normally based on the date style. For example, if the date has a full month and weekday\n * name, the full combining pattern will be used to combine that with a time. If the date has\n * numeric
 month, the short version of the combining pattern will be used to combine that with a\n * time. English uses `{1} 'at' {0}` for full and long styles, and `{1}, {0}` for medium and short\n * styles.\n *\n * @publicApi\n */\nfunction getLocaleDateTimeFormat(locale, width) {\n   var data = findLocaleData(locale);\n   var dateTimeFormatData = data[12 /* DateTimeFormat */];\n   return getLastDefinedValue(dateTimeFormatData, width);\n}\n/**\n * Number symbol that can be used to replace placeholders in number formats.\n * See {@link NumberSymbol} for more information.\n *\n * @publicApi\n */\nfunction getLocaleNumberSymbol(locale, symbol) {\n   var data = findLocaleData(locale);\n   var res = data[13 /* NumberSymbols */][symbol];\n   if (typeof res === 'undefined') {\n   if (symbol === NumberSymbol.CurrencyDecimal) {\n   return data[13 /* NumberSymbols */][NumberSymbol.Decimal];\n   }\n   else if (symbol === NumberSymbol.CurrencyGroup) {\n   return data[13 /* NumberSymbols */][NumberSymbol.Group];\n   }\n   }\n   return res;\n}\n/**\n * Number format that depends on the locale.\n *\n * Numbers are formatted using patterns, like `#,###.00`. For example, the pattern `#,###.00`\n * when used to format the number 12345.678 could result in \"12'345,67\". That would happen if the\n * grouping separator for your language is an apostrophe, and the decimal separator is a comma.\n *\n * Important: The characters `.` `,` `0` `#` (and others below) are special placeholders;\n * they stand for the decimal separator, and so on, and are NOT real characters.\n * You must NOT \"translate\" the placeholders; for

example, don't change `.` to `,` even though in\n * your language the decimal point is written with a comma. The symbols should be replaced by the\n * local equivalents, using the Number Symbols for your language.\n *\n * Here are the special characters used in number patterns:\n *\n * | Symbol | Meaning |\n * |--------|---------|\n * | . | Replaced automatically by the character used for the decimal point. |\n * | , | Replaced by the \"grouping\" (thousands) separator. |\n * | 0 | Replaced by a digit (or zero if there aren't enough digits). |\n * | # | Replaced by a digit (or nothing if there aren't enough). |\n * | ¤ | This will be replaced by a currency symbol, such as $ or USD. |\n * | % | This marks a percent format. The % symbol may change position, but must be retained. |\n * | E | This marks a scientific format. The E symbol may change position, but must be retained. |\n * | ' | Special characters used as literal characters are quoted with ASCII single quotes. |\n *\n * You can find more information\n * [on the CLDR website](http://cldr.unicode.org/translation/number-patterns)\n *\n * @publicApi\n */\nfunction getLocaleNumberFormat(locale, type) {\n var data = findLocaleData(locale);\n return data[14 /* NumberFormats */][type];\n}\n/**\n * The symbol used to represent the currency for the main country using this locale (e.g. $ for\n * the locale en-US).\n * The symbol will be `null` if the main country cannot be determined.\n *\n * @publicApi\n */\nfunction getLocaleCurrencySymbol(locale) {\n var data = findLocaleData(locale);\n return data[15 /* CurrencySymbol */] || null;\n}\n/**\n * The name of the currency for the main country using this locale (e.g. USD for the locale\n * en-US).\n * The name will be `null` if the main country cannot be determined.\n *\n * @publicApi\n */\nfunction getLocaleCurrencyName(locale) {\n var data = findLocaleData(locale);\n return data[16 /* CurrencyName */] || null;\n}\n/**\n * Returns the currency values for the locale\n */\nfunction getLocaleCurrencies(locale) {\n var data = findLocaleData(locale);\n return data[17 /* Currencies */];\n}\n/**\n * The locale plural function used by ICU expressions to determine the plural case to use.\n * See {@link NgPlural} for more information.\n *\n * @publicApi\n */\nfunction getLocalePluralCase(locale) {\n var data = findLocaleData(locale);\n return data[18 /* PluralCase */];\n}\nfunction checkFullData(data) {\n if (!data[19 /* ExtraData */]) {\n throw new Error(\"Missing extra locale data for the locale \\\"\" + data[0 /* LocaleId */] + \"\\\". directive instantiates a template once per item from an iterable. The context\n * for each instantiated template
inherits from the outer context with the given loop variable\n * set to the current item from the iterable.\n *\n *
@usageNotes\n *\n * ### Local Variables\n *\n * `NgForOf` provides several exported values that can be aliased to
local variables:\n *\n * - `$implicit: T`: The value of the individual items in the iterable (`ngForOf`).\n * - `ngForOf:
NgIterable<T>`: The value of the iterable expression. Useful when the expression is\n * more complex then a
property access, for example when using the async pipe (`userStreams |\n * async`).\n * - `index: number`: The
index of the current item in the iterable.\n * - `first: boolean`: True when
```

```
 the item is the first item in the iterable.\n * - `last: boolean`: True when the item is the last item in the iterable.\n * - `even: boolean`: True when the item has an even index in the iterable.\n * - `odd: boolean`: True when the item has an odd index in the iterable.\n *\n * ```\n * <li *ngFor=\"let user of userObservable | async as users; index as i; first as isFirst\">\n *    {{i}}/{{users.length}}. {{user}} <span *ngIf=\"isFirst\">default</span>\n * </li>\n * ```\n *\n * ### Change Propagation\n *\n * When the contents of the iterator changes, `NgForOf` makes the corresponding changes to the DOM:\n *\n * * When an item is added, a new instance of the template is added to the DOM.\n * * When an item is removed, its template instance is removed from the DOM.\n * * When items are reordered, their respective templates are reordered in the DOM.\n * * Otherwise, the DOM element for that item will remain the same.\n *\n * Angular uses object identity to track insertions and deletions
 within the iterator and reproduce\n * those changes in the DOM. This has important implications for animations and any stateful\n * controls (such as `<input>` elements which accept user input) that are present. Inserted rows can\n * be animated in, deleted rows can be animated out, and unchanged rows retain any unsaved state\n * such as user input.\n *\n * It is possible for the identities of elements in the iterator to change while the data does not.\n * This can happen, for example, if the iterator produced from an RPC to the server, and that\n * RPC is re-run. Even if the data hasn't changed, the second response will produce objects with\n * different identities, and Angular will tear down the entire DOM and rebuild it (as if all old\n * elements were deleted and all new elements inserted). This is an expensive operation and should\n * be avoided if possible.\n *\n * To customize the default tracking algorithm, `NgForOf` supports `trackBy` option.\n * `trackBy` takes a function which
 has two arguments: `index` and `item`.\n * If `trackBy` is given, Angular tracks changes by the return value of the function.\n *\n * ### Syntax\n *\n * - `<li *ngFor=\"let item of items; index as i; trackBy: trackByFn\">...</li>`\n *\n * With `<ng-template>` element:\n *\n * ```\n * <ng-template ngFor let-item [ngForOf]=\"items\" let-i=\"index\" [ngForTrackBy]=\"trackByFn\">\n *   <li>...</li>\n * </ng-template>\n * ```\n *\n * ### Example\n *\n * See a [live demo](http://plnkr.co/edit/KVuXxDp0qinGDyo307QW?p=preview) for a more detailed\n * example.\n *\n * @ngModule CommonModule\n * @publicApi\n */\nvar NgForOf = /** @class */ (function () {\n    function NgForOf(_viewContainer, _template, _differs) {\n        this._viewContainer = _viewContainer;\n        this._template = _template;\n        this._differs = _differs;\n        this._ngForOfDirty = true;\n        this._differ = null;\n    }\n    Object.defineProperty(NgForOf.prototype, \"ngForOf\", {\n        set: function (ngForOf)

Typically the:\n * - `then` template is the inline template of `ngIf` unless bound to a different value.\n * - `else` template is blank unless it is bound.\n *\n *\n * @usageNotes\n *\n * ### Most common usage\n *\n * The most common usage of the `ngIf` directive is to conditionally show the inline template as\n * seen in this example:\n * {@example common/ngIf/ts/module.ts region='NgIfSimple'}\n *\n * ### Showing an alternative template using `else`\n *\n * If it is necessary to display a template when the `expression` is falsy use the `else` template\n * binding as shown. Note that the `else` binding points to a `<ng-template>` labeled `#elseBlock`.\n * The template can be defined anywhere in the component view but is typically placed right after\n * `ngIf` for readability.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfElse'}\n *\n * ### Using non-inlined `then` template\n *\n * Usually the `then` template is the inlined template of the `ngIf`, but it can be changed using\n * a binding (just like `else`). Because `then` and `else` are bindings, the template references can\n * change at runtime as shown in this example.\n *\n * {@example common/ngIf/ts/module.ts region='NgIfThenElse'}\n *\n * ### Storing conditional result in a variable\n *\n * A common pattern is that we need to show a set of properties from the same object. If the\n * object is undefined, then we have to use the safe-traversal-operator `?.` to guard against\n * dereferencing a `null` value. This is especially the case when waiting on async data such as\n * when using the `async` pipe as shown in following example:\n *\n * ```\n * Hello {{ (userStream|async)?.last }}, {{ (userStream|async)?.first }}!\n * ```\n *\n * There are several

inefficiencies in the above example:\n * - We create multiple subscriptions on `userStream`. One for each `async` pipe, or two in the\n *   example above.\n * - We cannot display an alternative screen while waiting for the data to arrive asynchronously.\n * - We have to use the safe-traversal-operator `?.` to
access properties, which is cumbersome.\n * - We have to place the `async` pipe in parenthesis.\n *\n * A better way to do this is to use `ngIf` and store the result of the condition in a local\n * variable as shown in the the example below:\n *\n * {@example common/ngIf/ts/module.ts region='NgIfAs'}\n *\n * Notice that:\n * - We use only one `async` pipe and hence only one subscription gets created.\n * - `ngIf` stores the result of the `userStream|async` in the local variable `user`.\n * - The local `user` can then be bound repeatedly in a more efficient way.\n * - No need to use the safe-traversal-operator `?.` to access properties as `ngIf` will only\n *   display the data if `userStream` returns a value.\n * - We can display an alternative template while waiting for the data.\n *\n * ### Syntax\n *\n * Simple form:\n * - `<div *ngIf=\"condition\">...</div>`\n * - `<ng-template [ngIf]=\"condition\"><div>...</div></ng-template>`\n *\n * Form with an else block:\n * ```\n * <div *ngIf=\"condition; else elseBlock\">...</div>\n * <ng-template #elseBlock>...</ng-template>\n * ```\n *\n * Form with a `then` and `else` block:\n * ```\n * <div *ngIf=\"condition; then thenBlock else elseBlock\"></div>\n * <ng-template #thenBlock>...</ng-template>\n * <ng-template #elseBlock>...</ng-template>\n * ```\n *\n * Form with storing the value locally:\n * ```\n * <div *ngIf=\"condition as value; else elseBlock\">{{value}}</div>\n * <ng-template #elseBlock>...</ng-template>\n * ```\n *\n * @ngModule CommonModule\n * @publicApi\n */\nvar NgIf = /** @class */ (function () {\n   function NgIf(_viewContainer, templateRef) {\n   this._viewContainer = _viewContainer;\n   this._context = new NgIfContext();\n   this._thenTemplateRef = null;\n   this._elseTemplateRef = null;\n   this._thenViewRef = null;\n   this._elseViewRef = null;\n   this._thenTemplateRef = templateRef;\n   }\n   Object.defineProperty(NgIf.prototype, \"ngIf\", {\n   set: function (condition) {\n   this._context.$implicit = this._context.ngIf = condition;\n   this._updateView();\n   },\n   enumerable: true,\n   configurable: true\n   });\n   Object.defineProperty(NgIf.prototype, \"ngIfThen\", {\n   set: function (templateRef) {\n   assertTemplate('ngIfThen', templateRef);\n   this._thenTemplateRef = templateRef;\n   this._thenViewRef = null; // clear previous view if any.\n   this._updateView();\n   },\n   enumerable: true,\n   configurable: true\n   });\n   Object.defineProperty(NgIf.prototype, \"ngIfElse\", {\n   set: function (templateRef) {\n   assertTemplate('ngIfElse', templateRef);\n   this._elseTemplateRef = templateRef;\n   this._elseViewRef = null; // clear previous view if any.\n   this._updateView();\n   },\n   enumerable: true,\n   configurable: true\n   });\n   NgIf.prototype._updateView = function () {\n   if (this._context.$implicit) {\n   if (!this._thenViewRef) {\n   this._viewContainer.clear();\n   this._elseViewRef = null;\n   if (this._thenTemplateRef) {\n   this._thenViewRef =\n   this._viewContainer.createEmbeddedView(this._thenTemplateRef, this._context);\n   }\n   }\n   }\n   else {\n   if (!this._elseViewRef) {\n   this._viewContainer.clear();\n   this._thenViewRef = null;\n   if (this._elseTemplateRef) {\n   this._elseViewRef =\n   this._viewContainer.createEmbeddedView(this._elseTemplateRef, this._context);\n   }\n   }\n   }\n   };\n   /**\n   * Assert the correct type of the expression bound to the `ngIf` input within the template.\n   *\n   * The presence of this method is a signal to the Ivy template type check compiler

To localize dates\n * in another language, you must import the corresponding locale data.\n * See the [I18n guide](guide/i18n#i18n-pipes) for more information.\n *\n * @see `formatDate()`\n *\n *\n * @usageNotes\n *\n * The result of this pipe is not reevaluated when the input is mutated. To avoid the need to\n * reformat the date on every change-detection cycle, treat the date as an immutable object\n * and change the reference when the pipe needs to run again.\n *\n * ### Pre-defined format options\n *\n * Examples are given in `en-US` locale.\n *\n * - `'short'`: equivalent to `'M/d/yy, h:mm a'` (`6/15/15, 9:03 AM`).\n * - `'medium'`: equivalent to `'MMM d, y, h:mm:ss a'` (`Jun 15, 2015, 9:03:01 AM`).\n * - `'long'`: equivalent to `'MMMM d, y, h:mm:ss a z'` (`June 15, 2015 at 9:03:01 AM\n * GMT+1`).\n * - `'full'`: equivalent to `'EEEE, MMMM d, y, h:mm:ss a zzzz'` (`Monday, June 15, 2015 at\n * 9:03:01 AM GMT+01:00`).\n * - `'shortDate'`: equivalent to `'M/d/yy'` (`6/15/15`).\n * - `'mediumDate'`: equivalent to `'MMM d, y'` (`Jun 15, 2015`).\n * - `'longDate'`: equivalent to `'MMMM d, y'` (`June 15, 2015`).\n * - `'fullDate'`: equivalent to `'EEEE, MMMM d, y'` (`Monday, June 15, 2015`).\n * - `'shortTime'`: equivalent to `'h:mm a'` (`9:03 AM`).\n * - `'mediumTime'`: equivalent to `'h:mm:ss a'` (`9:03:01 AM`).\n * - `'longTime'`: equivalent to `'h:mm:ss a z'` (`9:03:01 AM GMT+1`).\n * - `'fullTime'`: equivalent to `'h:mm:ss a zzzz'` (`9:03:01 AM GMT+01:00`).\n *\n * ### Custom format options\n *\n * You can construct a format string using symbols to specify the components\n * of a date-time value, as described in the following table.\n * Format details depend on the locale.\n * Fields marked with (*) are only available in the extra data set for the given locale.\n *\n * | Field type | Format | Description | Example Value |\n * |--------------------|-------------|--|--|\n * | Era | G, GG & GGG | Abbreviated | AD |\n * | | GGGG | Wide | Anno Domini |\n * | | GGGGG | Narrow | A |\n * | Year | y | Numeric: minimum digits | 2, 20, 201, 2017, 20173 |\n * | | yy | Numeric: 2 digits + zero padded | 02, 20, 01, 17, 73 |\n * | | yyy | Numeric: 3 digits + zero padded | 002, 020, 201, 2017, 20173 |\n * | | yyyy | Numeric: 4 digits or more + zero padded | 0002, 0020, 0201, 2017, 20173 |\n * | Month | M | Numeric: 1 digit | 9, 12 |\n * | | MM | Numeric: 2 digits + zero padded | 09, 12 |\n * | | MMM | Abbreviated | Sep |\n * | | MMMM | Wide | September |\n * | | MMMMM | Narrow | S |\n * | Month standalone | L | Numeric: 1 digit | 9, 12 |\n * | | LL | Numeric: 2 digits + zero padded | 09, 12 |\n * | | LLL | Abbreviated | Sep |\n * | | LLLL | Wide | September |\n * | | LLLLL | Narrow | S |\n * | Week of year | w | Numeric: minimum digits

| 1... 53 |\n * | | ww | Numeric: 2 digits + zero padded | 01... 53 |\n * | Week of month | W | Numeric: 1 digit | 1... 5 |\n * | Day of month | d | Numeric: minimum digits | 1 |\n * | | dd | Numeric: 2 digits + zero padded | 01 |\n * | Week day | E, EE & EEE | Abbreviated | Tue |\n * | | EEEE | Wide | Tuesday |\n * | | EEEEE | Narrow | T |\n * | | EEEEEE | Short | Tu |\n * | Period | a, aa & aaa | Abbreviated | am/pm or AM/PM |\n * | | aaaa | Wide (fallback to `a` when missing) | ante meridiem/post meridiem |\n * | | aaaaa | Narrow | a/p |\n * | Period* | B, BB & BBB | Abbreviated | mid. |\n * | | BBBB | Wide | am, pm, midnight, noon, morning, afternoon, evening, night |\n * | | BBBBB | Narrow | md |\n * | Period standalone* | b, bb & bbb | Abbreviated | mid. |\n * | | bbbb | Wide | am, pm, midnight, noon, morning, afternoon, evening, night |\n * | | bbbbb | Narrow | md |\n * | Hour 1-12 | h | Numeric: minimum digits | 1, 12 |\n * | | hh | Numeric: 2 digits + zero padded | 01, 12 |\n * | Hour 0-23 | H | Numeric: minimum digits | 0, 23 |\n * | | HH | Numeric: 2 digits + zero padded | 00, 23 |\n * | Minute | m | Numeric: minimum digits | 8, 59 |\n * | | mm | Numeric: 2 digits + zero padded | 08, 59 |\n * | Second | s | Numeric: minimum digits | 0... 59 |\n * | | ss | Numeric: 2 digits + zero padded | 00... 59 |\n * | Fractional seconds | S | Numeric: 1 digit | 0... 9 |\n * | | SS | Numeric: 2 digits + zero padded | 00... 99 |\n * | | SSS | Numeric: 3 digits + zero padded (= milliseconds) | 000... 999 |\n * | Zone | z, zz & zzz | Short specific non location format (fallback to O) | GMT-8 |\n * | | zzzz | Long specific non location format (fallback to OOOO) | GMT-08:00 |\n * | | Z, ZZ & ZZZ | ISO8601 basic format | -0800 |\n * | | ZZZZ | Long localized GMT format | GMT-8:00 |\n * | | ZZZZZ | ISO8601 extended format + Z indicator for offset 0 (= XXXXX) | -08:00 |\n * | | O, OO & OOO | Short localized GMT format | GMT-8 |\n * | | OOOO | Long localized GMT format | GMT-08:00 |\n *\n * Note that timezone correction is not applied to an ISO string that has no time component, such as \"2016-09-19\"\n *\n * ### Format examples\n *\n * These examples transform a date into various formats,\n * assuming that `dateObj` is a JavaScript `Date` object for\n * year: 2015, month: 6, day: 15, hour: 21, minute: 43, second: 11,\n * given in the local time for the `en-US` locale.\n *\n * ```\n * {{ dateObj | date }} // output is 'Jun 15, 2015'\n * {{ dateObj | date:'medium' }} // output is 'Jun 15, 2015, 9:43:11 PM'\n * {{ dateObj | date:'shortTime' }} // output is '9:43 PM'\n * {{ dateObj | date:'mmss' }} // output is '43:11'\n * ```\n *\n * ### Usage example\n *\n * The following component uses a date pipe to display the

current date in different formats.\n *\n * ```\n * @Component({\n * selector: 'date-pipe',\n * template: `<div>\n * <p>Today is {{today | date}}</p>\n *    <p>Or if you prefer, {{today | date:'fullDate'}}</p>\n *    <p>The time is {{today | date:'h:mm a z'}}</p>\n *  </div>`\n * })\n * // Get
the current date and time as a date-time value.\n * export class DatePipeComponent {\n *   today: number = Date.now();\n * }\n * ```\n *\n * @publicApi\n */\n// clang-format on\nvar DatePipe = /** @class */ (function () {\n function DatePipe(locale) {\n   this.locale = locale;\n   }\n   DatePipe_1 = DatePipe;\n   /**\n   * @param value The date expression: a `Date` object, a number\n   * (milliseconds since UTC epoch), or an ISO string (https://www.w3.org/TR/NOTE-datetime).\n   * @param format The date/time components to include, using predefined options or a\n   * custom format string.\n   * @param timezone A timezone offset (such as `'+0430'`), or a standard\n   * UTC/GMT or continental US timezone abbreviation. Default is\n   * the local system timezone of the end-user's machine.\n   * @param locale A locale code for the locale format rules to use.\n   * When not supplied, uses the value of `LOCALE_ID`, which is `en-US` by default.\n   * See [Setting
your app locale](guide/i18n#setting-up-the-locale-of-your-app).\n   * @returns A date string in the desired format.\n   */\n   DatePipe.prototype.transform = function (value, format, timezone, locale) {\n   if (format === void 0) { format = 'mediumDate'; }\n   if (value == null || value === '' || value !== value)\n   return null;\n   try {\n   return formatDate(value, format, locale || this.locale, timezone);\n   }\n   catch (error) {\n   throw invalidPipeArgumentError(DatePipe_1, error.message);\n   }\n   };\n   var DatePipe_1;\n   DatePipe = DatePipe_1 = __decorate([\n   Pipe({ name: 'date', pure: true }),\n   __param(0, Inject(LOCALE_ID)),\n   __metadata(\"design:paramtypes\", [String])\n   ], DatePipe);\n   return DatePipe;\n}());\n\n/**\n * @license\n * Copyright Google Inc. original file level comment is reproduced below\n */\n/*\n This is a limited shim for ShadowDOM css styling.\n https://dvcs.w3.org/hg/webcomponents/raw-file/tip/spec/shadow/index.html#styles\n\n The intention here is to support only the styling features which can be\n relatively simply implemented. The goal is to allow users to avoid the\n most obvious pitfalls and do so without compromising performance significantly.\n For ShadowDOM styling that's not covered here, a set of best practices\n can be provided that should allow users to accomplish more complex styling.\n\n The following is a list of specific ShadowDOM styling features and a brief\n discussion of the approach used to shim.\n\n Shimmed features:\n\n * :host, :host-context: ShadowDOM allows styling of the shadowRoot's
 host\n element using the :host rule. To shim this feature, the :host styles are\n reformatted and prefixed with a given scope name and promoted to a\n document level stylesheet.\n For example, given a scope name of .foo, a rule like this:\n\n   :host {\n   background: red;\n   }\n }\n\n becomes:\n\n   .foo {\n   background: red;\n }\n\n * encapsulation: Styles defined within ShadowDOM, apply only to\n dom inside the ShadowDOM. Polymer uses one of two techniques to implement\n this feature.\n\n By default, rules are prefixed with the host element tag name\n as a descendant selector. This ensures styling does not leak out of the 'top'\n of the element's ShadowDOM. For example,\n\n div {\n   font-weight: bold;\n   }\n\n becomes:\n\n x-foo div {\n   font-weight: bold;\n   }\n\n becomes:\n\n\n Alternatively, if WebComponents.ShadowCSS.strictStyling is set to true then\n selectors are scoped by adding an attribute selector suffix to each\n
  simple selector that contains the host element tag name. Each element\n in the element's ShadowDOM template is also given the scope attribute.\n Thus, these rules match only elements that have the scope attribute.\n For example, given a scope name of x-foo, a rule like this:\n\n   div {\n   font-weight: bold;\n   }\n\n becomes:\n\n   div[x-foo] {\n   font-weight: bold;\n   }\n\n Note that elements that are dynamically added to a scope must have the scope\n selector added to them manually.\n\n * upper/lower bound encapsulation: Styles which are defined outside a\n shadowRoot should not cross the ShadowDOM boundary and should not apply\n inside a shadowRoot.\n\n This styling behavior is not emulated. Some possible ways to do this that\n were rejected due to complexity and/or performance concerns include: (1) reset\n every possible property for every possible selector for a given scope name;\n (2) re-implement css in javascript.\n\n As an alternative, users should
 make sure to use selectors\n specific to the scope in which they are working.\n\n * ::distributed: This behavior is not emulated. It's often not necessary\n to style the contents of a specific insertion point and instead, descendants\n of the host element can be styled selectively. Users can also create an\n extra node around an insertion point and style that node's contents\n via descendent selectors. For example, with a shadowRoot like this:\n\n   <style>\n   ::content(div) {\n   background: red;\n   }\n   </style>\n   <content></content>\n\n could become:\n\n   <style>\n   / *@polyfill .content-container div * /\n   ::content(div) {\n   background: red;\n   }\n   </style>\n   <div class=\"content-container\">\n   <content></content>\n   \n\n Note the use of @polyfill in the comment above a ShadowDOM specific style\n declaration. This is a directive to the styling shim to use the selector\n in comments in lieu of the next selector
 when running under polyfill.\n*/\nvar ShadowCss = /** @class */ (function () {\n   function ShadowCss() {\n   this.strictStyling = true;\n   }\n   /*\n   * Shim some cssText with the given selector. Returns cssText that can\n   * be included in the document via WebComponents.ShadowCSS.addCssToDocument(css).\n   *\n   * When strictStyling is true:\n   * - selector is the attribute added to all elements inside the host,\n   * - hostSelector is the attribute added to the host itself.\n   */\n   ShadowCss.prototype.shimCssText = function (cssText, selector, hostSelector) {\n   if (hostSelector === void 0) { hostSelector = ''; }\n   var commentsWithHash = extractCommentsWithHash(cssText);\n   cssText = stripComments(cssText);\n   cssText = this._insertDirectives(cssText);\n   var scopedCssText = this._scopeCssText(cssText, selector, hostSelector);\n   return __spread([scopedCssText], commentsWithHash).join('\\n');\n   };\n   ShadowCss.prototype._insertDirectives

= 'number';\nvar STRING = 'string';\nvar OBJECT = 'object';\n/**\n * This array represents the DOM schema. It
encodes inheritance, properties, and events.\n *\n * ## Overview\n *\n * Each line represents one kind of element.
The `element_inheritance` and properties are joined\n * using `element_inheritance|properties` syntax.\n *\n * ##
Element Inheritance\n *\n * The `element_inheritance` can be further subdivided as
`element1,element2,...^parentElement`.\n * Here the individual elements are separated by `,` (commas). Every
element in the list\n * has identical properties.\n *\n * An `element` may inherit additional properties from
`parentElement` If
 no `^parentElement` is\n * specified then `\"\"` (blank) element is assumed.\n *\n * NOTE: The blank element
inherits from root `[Element]` element, the super element of all\n * elements.\n *\n * NOTE an element prefix such
as `:svg:` has no special meaning to the schema.\n *\n * ## Properties\n *\n * Each element has a set of properties
separated by `,` (commas). Each property can be prefixed\n * by a special character designating its type:\n *\n * -
(no prefix): property is a string.\n * - `*`: property represents an event.\n * - `!`: property is a boolean.\n * - `#`:
property is a number.\n * - `%`: property is an object.\n *\n * ## Query\n *\n * The class creates an internal squas
representation which allows to easily answer the query of\n * if a given property exist on a given element.\n *\n *
NOTE: We don't yet support querying for types or events.\n * NOTE: This schema is auto extracted from
`schema_extractor.ts` located in the test folder,\n * see dom_element_schema_registry_spec.ts\n

says\n * As the \"first-match-wins\" algorithm is identical to the \"greedy\"\n * disambiguation method used by POSIX regular expressions, it is natural and\n * commonplace to use a regular expression for parsing the potential five\n * components of a URI reference.\n *\n * The following line is the regular expression for breaking-down a\n

```
* well-formed URI reference into its components.\n *\n * <pre>\n *
^(([^:/?#]+):)?(//([^/?#]*))?([^?#]*)(\\?([^#]*))?(#(.*))?\n *  12            3  4          5       6  7        8 9\n * </pre>\n *\n *
The numbers in the second line above are only to assist readability; they\n * indicate the reference points for each
subexpression (i.e., each paired\n * parenthesis). We refer to the value matched for subexpression <n> as $<n>.\n *
For example, matching the above expression to\n * <pre>\n *     http://www.ics.uci.edu/pub/ietf/uri/#Related\n *
</pre>\n * results in the following subexpression matches:\n * <pre>\n *
  $1 = http:\n *    $2 = http\n *    $3 = //www.ics.uci.edu\n *    $4 = www.ics.uci.edu\n *    $5 = /pub/ietf/uri/\n *
$6 = <undefined>\n *    $7 = <undefined>\n *    $8 = #Related\n *    $9 = Related\n * </pre>\n * where <undefined>
indicates that the component is not present, as is the\n * case for the query component in the above example.
Therefore, we can\n * determine the value of the five components as\n * <pre>\n *    scheme    = $2\n *    authority
= $4\n *    path      = $5\n *    query     = $7\n *    fragment  = $9\n * </pre>\n *\n * The regular expression has been
modified slightly to expose the\n * userInfo, domain, and port separately from the authority.\n * The modified
version yields\n * <pre>\n *    $1 = http              scheme\n *    $2 = <undefined>       userInfo -\\\n *    $3 =
www.ics.uci.edu   domain     | authority\n *    $4 = <undefined>       port     -/\n *    $5 = /pub/ietf/uri/    path\n *    $6
= <undefined>       query without ?\n *    $7 = Related
      fragment without #\n * </pre>\n * @internal\n */\nvar _splitRe = new RegExp('^' +\n    '(?:' +\n    '([^:/?#.]+)' +

If that factory function needs to inject arguments, it can\n *   use the `inject` function.\n * * `providers`: an optional array of providers to add to the injector. Each provider must\n *   either have a factory or point to a type which has an `ngInjectableDef` static property (the\n *   type must be an `InjectableType`).\n * * `imports`: an optional array of imports of other `InjectorType`s or `InjectorTypeWithModule`s\n *   whose providers will also be added to the injector. Locally provided types will override\n *   providers from imports.\n *\n * @publicApi\n */\nfunction defineInjector(options) {\n   return {\n   factory: options.factory, providers: options.providers || [], imports: options.imports || [],\n   };\n}\n/**\n * Read the `ngInjectableDef` type in a way which is immune to accidentally reading inherited value.\n *\n * @param type type which may have `ngInjectableDef`\n */\nfunction getInjectableDef(type) {\n   return type.hasOwnProperty(NG_INJECTABLE_DEF) ? type[NG_INJECTABLE_DEF] : null;\n}\n/**\n * Read the `ngInjectorDef` type in a way which is immune to accidentally reading inherited value.\n *\n * @param type type which may have `ngInjectorDef`\n */\nfunction getInjectorDef(type) {\n   return type.hasOwnProperty(NG_INJECTOR_DEF) ? type[NG_INJECTOR_DEF] : null;\n}\n\n/**\n * @license\n * Copyright Google Inc. All Rights Reserved.\n *\n * Use of this source code is governed by an MIT-style license that can be\n * found in the LICENSE file at https://angular.io/license\n */\n/**\n * Creates a token that can be used in a DI Provider.\n *\n * Use an `InjectionToken` whenever the type you are injecting is not reified (does not have a\n * runtime representation) such as when injecting an interface, callable type, array or\n * parametrized type.\n *\n * `InjectionToken` is parameterized on `T` which is the type of object which will be returned by\n * the `Injector`. This provides additional level of type safety.\n *\n * ```\n * interface MyInterface {...}\n * var myInterface = injector.get(new InjectionToken<MyInterface>('SomeToken'));\n * // myInterface is inferred to be MyInterface.\n * ```\n *\n * When creating an `InjectionToken`, you can optionally specify a factory function which returns\n * (possibly by creating) a default value of the parameterized type `T`. This sets up the\n * `InjectionToken` using this factory as a provider as if it was defined explicitly in the\n * application's root injector. If the factory function, which takes zero arguments, needs to inject\n * dependencies, it can do so using the `inject` function. See below for an example.\n *\n *

Additionally, if a `factory` is specified you can also specify the `providedIn` option, which\n * overrides the above behavior and marks the token as belonging to a particular `@NgModule`. As\n * mentioned above, `'root'` is the default value for `providedIn`.\n *\n * @usageNotes\n * ### Basic Example\n *\n * ### Plain InjectionToken\n *\n * {@example core/di/ts/injector_spec.ts region='InjectionToken'}\n *\n * ### Tree-shakable InjectionToken\n *\n * {@example core/di/ts/injector_spec.ts region='ShakableInjectionToken'}\n *\n *\n * @publicApi\n */\nvar InjectionToken = /** @class */ (function () {\n function InjectionToken(_desc, options) {\n this._desc = _desc;\n /** @internal */\n this.ngMetadataName = 'InjectionToken';\n if (options !== undefined) {\n this.ngInjectableDef = defineInjectable({\n providedIn: options.providedIn || 'root',\n factory: options.factory,\n });\n }\n else {\n this.ngInjectableDef = undefined;\n }\n }\n InjectionToken.prototype.toString = function () { return \"InjectionToken \" + this._desc; };\n return InjectionToken;\n}());\n\n/**\n * @license\n * Copyright Google Inc.
