UNDEFINED = new Object();\n/**\n * A ReflectiveDependency injection container used for instantiating objects
and resolving\n * dependencies.\n *\n * An `Injector` is a replacement for a `new` operator, which can automatically
resolve the\n * constructor dependencies.\n *\n * In typical use, application code asks for the dependencies in the
constructor and they are\n * resolved by the `Injector`.\n *\n *
 @usageNotes\n * ### Example\n *\n * The following example creates an `Injector` configured to create `Engine`
and `Car`.\n *\n * ```typescript\n * @Injectable()\n * class Engine {\n * }\n *\n * @Injectable()\n * class Car {\n *
constructor(public engine:Engine) {}\n * }\n *\n * var injector = ReflectiveInjector.resolveAndCreate([Car,
Engine]);\n * var car = injector.get(Car);\n * expect(car instanceof Car).toBe(true);\n * expect(car.engine instanceof
Engine).toBe(true);\n * ```\n *\n * Notice, we don't use the `new` operator because we explicitly want to have the
`Injector`\n * resolve all of the object's dependencies automatically.\n *\n * @deprecated from v5 - slow and brings
in a lot of code, Use `Injector.create` instead.\n * @publicApi\n */\nvar ReflectiveInjector = /** @class */ (function
() {\n    function ReflectiveInjector() {\n    }\n    /**\n     * Turns an array of provider definitions into an array of
resolved providers.\n     *\n     * A resolution is a process of flattening
 multiple nested arrays and converting individual\n     * providers into an array of `ResolvedReflectiveProvider`s.\n
 *\n     * @usageNotes\n     * ### Example\n     *\n     * ```typescript\n     * @Injectable()\n     * class Engine {\n     *
}\n     *\n     * @Injectable()\n     * class Car {\n     *   constructor(public engine:Engine) {}\n     * }\n     *\n     * var
providers = ReflectiveInjector.resolve([Car, [[Engine]]]);\n     *\n     * expect(providers.length).toEqual(2);\n     *\n
 * expect(providers[0] instanceof ResolvedReflectiveProvider).toBe(true);\n     *
expect(providers[0].key.displayName).toBe(\"Car\");\n     * expect(providers[0].dependencies.length).toEqual(1);\n
  * expect(providers[0].factory).toBeDefined();\n     *\n     *
expect(providers[1].key.displayName).toBe(\"Engine\");\n     * });\n     * ```\n     *\n     */\n

Unlike ngDoCheck, ngOnChanges and ngOnInit, which are\n// called during a pre-order traversal of the view tree (that is calling the\n// parent hooks before the child hooks) these events are sent in using a\n// post-order traversal of the tree (children before parents). This changes the\n// meaning of initIndex in the view state. For ngOnInit, initIndex tracks the\n// expected nodeIndex which a ngOnInit should be called. When sending\n// ngAfterContentInit and ngAfterViewInit it is the expected count of\n// ngAfterContentInit or ngAfterViewInit methods that have been called. This\n// ensure that despite being called recursively or after picking up after an\n// exception, the ngAfterContentInit or ngAfterViewInit will be called on the\n// correct nodes. Consider for example, the following (where E is an element\n// and D is a directive)\n// Tree: pre-order index post-order index\n// E1 0 6\n// E2 1 1\n// D3 2 0\n// E4 3 5\n// E5 4 4\n// E6 5 2\n// E7 6 3\n// As can be seen, the post-order index has an unclear relationship to the\n// pre-order index (postOrderIndex === preOrderIndex - parentCount +\n// childCount). Since number of calls to ngAfterContentInit and ngAfterViewInit\n// are stable (will be the same for the same view regardless of exceptions or\n// recursion) we just need to count them which will roughly correspond to the\n// post-order index (it skips elements and directives that do not have\n// lifecycle hooks).\n//\n// For example, if an exception is raised in the E6.onAfterViewInit() the\n// initIndex is left at 3 (by shouldCallLifecycleInitHook() which set it to\n// initIndex + 1). When

checkAndUpdateView() is called again D3, E2 and E6 will\n// not have their ngAfterViewInit() called but, starting with E7, the rest of\n// the view will begin getting ngAfterViewInit() called until a check and\n// pass is complete.\n//\n// This algorthim also handles recursion. Consider if E4's ngAfterViewInit()\n// indirectly calls E1's ChangeDetectorRef.detectChanges(). The expected\n// initIndex is set to 6, the recusive checkAndUpdateView() starts walk again.\n// D3, E2, E6, E7, E5 and E4 are skipped, ngAfterViewInit() is called on E1.\n// When the recursion returns the initIndex will be 7 so E1 is skipped as it\n// has already been called in the recursively called checkAnUpdateView().\nfunction callLifecycleHooksChildrenFirst(view, lifecycles) {\n if (!(view.def.nodeFlags & lifecycles)) {\n return;\n }\n var nodes = view.def.nodes;\n var initIndex = 0;\n for (var i = 0; i < nodes.length; i++) {\n var nodeDef = nodes[i];\n var parent_1 = nodeDef.parent;\n if (!parent_1 && nodeDef.flags & lifecycles) {\n // matching root node (e.g. a pipe)\n callProviderLifecycles(view, i, nodeDef.flags & lifecycles, initIndex++);\n }\n if ((nodeDef.childFlags & lifecycles) === 0) {\n // no child matches one of the lifecycles\n i += nodeDef.childCount;\n }\n while (parent_1 && (parent_1.flags & 1 /* TypeElement */) &&\n i === parent_1.nodeIndex + parent_1.childCount) {\n // last child of an element\n if (parent_1.directChildFlags & lifecycles) {\n initIndex = callElementProvidersLifecycles(view, parent_1, lifecycles, initIndex);\n }\n parent_1 = parent_1.parent;\n }\n}\nfunction callElementProvidersLifecycles(view, elDef, lifecycles, initIndex) {\n for (var i = elDef.nodeIndex + 1; i <= elDef.nodeIndex + elDef.childCount; i++) {\n var nodeDef = view.def.nodes[i];\n if (nodeDef.flags & lifecycles) {\n callProviderLifecycles(view, i, nodeDef.flags & lifecycles, initIndex++);\n }\n // only visit direct children\n i += nodeDef.childCount;\n }\n return initIndex;\n}\nfunction callProviderLifecycles(view, index, lifecycles, initIndex) {\n var providerData = asProviderData(view, index);\n if (!providerData) {\n return;\n }\n var provider = providerData.instance;\n if (!provider) {\n return;\n }\n Services.setCurrentNode(view, index);\n if (lifecycles & 1048576 /* AfterContentInit */ &&\n shouldCallLifecycleInitHook(view, 512 /* InitState_CallingAfterContentInit */, initIndex)) {\n provider.ngAfterContentInit();\n }\n if (lifecycles & 2097152 /* AfterContentChecked */) {\n provider.ngAfterContentChecked();\n }\n if (lifecycles & 4194304 /* AfterViewInit */ &&\n shouldCallLifecycleInitHook(view, 768 /* InitState_CallingAfterViewInit */, initIndex)) {\n provider.ngAfterViewInit();\n }\n if (lifecycles & 8388608 /* AfterViewChecked */) {\n provider.ngAfterViewChecked();\n }\n if (lifecycles & 131072 /* OnDestroy */) {\n provider.ngOnDestroy();\n }\n}\n\n/**\n * @license\n * Copyright Google Inc. It's possible for the identities of items\n * to change while the data does not. This can happen, for example, if the items are produced\n * from an RPC to the server, and that RPC is re-run. Even if the data hasn't changed, the\n * second response will produce objects with different identities.\n *\n * To customize the default option comparison algorithm, `<select>` supports `compareWith` input.\n * `compareWith` takes a **function** which has two arguments: `option1` and `option2`.\n * If `compareWith` is given, Angular selects option by the return value of the function.\n *\n * ```ts\n * const selectedCountriesControl = new FormControl();\n * ```\n *\n * ```\n * <select [compareWith]=\"compareFn\" [formControl]=\"selectedCountriesControl\">\n * <option *ngFor=\"let country of countries\" [ngValue]=\"country\">\n * {{country.name}}\n * </option>\n * </select>\n *\n * compareFn(c1: Country, c2: Country): boolean {\n * return c1 && c2 ? c1.id === c2.id : c1 === c2;\n * }\n * ```\n *\n * **Note:** We listen to the 'change' event because 'input' events aren't fired\n * for selects in Firefox and IE:\n * https://bugzilla.mozilla.org/show_bug.cgi?id=1024350\n * https://developer.microsoft.com/en-us/microsoft-edge/platform/issues/4660045/\n *\n * @ngModule ReactiveFormsModule\n * @ngModule FormsModule\n * @publicApi\n */\nvar SelectControlValueAccessor = /** @class */ (function () {\n function SelectControlValueAccessor(_renderer, _elementRef) {\n this._renderer = _renderer;\n this._elementRef = _elementRef;\n /** @internal */\n this._optionMap = new Map();\n /** @internal */\n this._idCounter = 0;\n /**\n * @description\n * The registered callback function called when a change event occurs on the input element.\n */\n this.onChange = function (_) { };\n /**\n * @description\n * The registered callback function called when a blur event occurs on the input element.\n */\n this.onTouched = function () { };\n this._compareWith = looseIdentical;\n }\n Object.defineProperty(SelectControlValueAccessor.prototype, \"compareWith\", {\n /**\n * @description\n * Tracks the option comparison algorithm for tracking identities when\n * checking for changes.\n */\n set: function (fn) {\n if (typeof fn !== 'function') {\n throw new Error(\"compareWith must be a function, but received \" + JSON.stringify(fn));\n }\n this._compareWith = fn;\n },\n enumerable: true,\n configurable: true\n });\n /**\n * Sets the \"value\" property on the input element. You don't need to add a special selector.\n *\n * You can export
 the directive into a local template variable using `ngForm` as the key\n * (ex: `#myForm=\"ngForm\"`). This is optional, but useful.  Many properties from the underlying\n * `FormGroup` instance are duplicated on the directive itself, so a reference to it\n * will give you access to the aggregate value and validity status of the form, as well as\n * user interaction properties like `dirty` and `touched`.\n *\n * To register child controls with the form, you'll want to use `NgModel` with a\n * `name` attribute.  You can also use `NgModelGroup` if you'd like to create\n * sub-groups within the form.\n *\n * You can listen to the directive's `ngSubmit` event to be notified when the user has\n * triggered a form submission. The `ngSubmit` event will be emitted with the original form\n * submission event.\n *\n * In template driven forms, all `<form>` tags are automatically tagged as `NgForm`.\n * If you want to import the `FormsModule` but skip its usage in some forms,\n * for example, to
 use native HTML5 validation, you can add `ngNoForm` and the `<form>`\n * tags won't create an `NgForm` directive. In reactive forms, using `ngNoForm` is\n * unnecessary because the `<form>` tags are inert. In that case, you would\n * refrain from using the `formGroup` directive.\n *\n * Support for using `ngForm` element selector
```

If used\n * within a parent form, the directive will also register itself with the form as a child\n * control.\n *\n * This directive can be used by itself or as part of a larger form. All you need is the\n * `ngModel` selector to activate it.\n *\n * It accepts a domain model as an optional `Input`. If you have a one-way binding\n * to `ngModel` with `[]` syntax, changing the value of the domain model in the component\n * class will set the value in the view. If you have a two-way binding with `[()]` syntax\n * (also known as 'banana-box syntax'), the value in the UI will always be synced back to\n * the domain model in your class as well.\n *\n * If you wish to inspect the properties of the associated `FormControl` (like\n * validity state), you can also export the directive into a local template variable using\n * `ngModel` as the key (ex: `#myVar=\"ngModel\"`). You can then access the control using the\n * directive's `control` property, but most properties you'll need (like `valid` and `dirty`)\n * will fall through to the control anyway, so you can access them directly. You can see a\n * full list of properties directly available in `AbstractControlDirective`.\n *\n * The following is an example of a simple standalone control using `ngModel`:\n

*\n * {@example forms/ts/simpleNgModel/simple_ng_model_example.ts region='Component'}\n *\n * When using the `ngModel` within `<form>` tags, you'll also need to supply a `name` attribute\n * so that the control can be registered with the parent form under that name.\n *\n * It's worth noting that in the context of a parent form, you often can skip one-way or\n * two-way binding because the parent form will sync the value for you. You can access\n * its properties by exporting it into a local template variable using `ngForm` (ex:\n * `#f=\"ngForm\"`). Then you can pass it where it needs to go on submit.\n *\n * If you do need to populate initial values into your form, using a one-way binding for\n * `ngModel` tends to be sufficient as long as you use the exported form's value rather\n * than the domain model's value on submit.\n *\n * Take a look at an example of using `ngModel` within a form:\n *\n * {@example forms/ts/simpleForm/simple_form_example.ts region='Component'}\n *\n * To see `ngModel` examples with different form control types, see:\n *\n * * Radio buttons: `RadioControlValueAccessor`\n * * Selects: `SelectControlValueAccessor`\n *\n * @ngModule FormsModule\n * @publicApi\n */\nvar NgModel = /** @class */ (function (_super) {\n __extends(NgModel, _super);\n function NgModel(parent, validators, asyncValidators, valueAccessors) {\n var _this = _super.call(this) || this;\n _this.control = new FormControl();\n /** @internal */\n _this._registered = false;\n _this.update = new EventEmitter();\n _this._parent = parent;\n _this._rawValidators = validators || [];\n _this._rawAsyncValidators = asyncValidators || [];\n _this.valueAccessor = selectValueAccessor(_this, valueAccessors);\n return _this;\n }\n NgModel.prototype.ngOnChanges = function (changes) {\n this._checkForErrors();\n if (!this._registered)\n this._setUpControl();\n if ('isDisabled' in changes) {\n this._updateDisabled(changes);\n }\n if (isPropertyUpdated(changes, this.viewModel)) {\n this._updateValue(this.model);\n this.viewModel = this.model;\n }\n };\n NgModel.prototype.ngOnDestroy = function () { this.formDirective && this.formDirective.removeControl(this); };\n Object.defineProperty(NgModel.prototype, \"path\", {\n get: function () {\n return this._parent ? controlPath(this.name, this._parent) : [this.name];\n },\n enumerable: true,\n configurable: true\n });\n Object.defineProperty(NgModel.prototype, \"formDirective\", {\n get: function () { return this._parent ? this._parent.formDirective : null; },\n enumerable: true,\n configurable: true\n });\n Object.defineProperty(NgModel.prototype, \"validator\", {\n get: function () { return composeValidators(this._rawValidators); },\n enumerable: true,\n configurable: true\n });\n Object.defineProperty(NgModel.prototype, \"asyncValidator\", {\n get: function () {\n return composeAsyncValidators(this._rawAsyncValidators);\n },\n enumerable: true,\n configurable: true\n });\n NgModel.prototype.viewToModelUpdate = function (newValue) {\n this.viewModel = newValue;\n this.update.emit(newValue);\n };\n NgModel.prototype._setUpControl = function () {\n this._setUpdateStrategy();\n this._isStandalone() ? this._setUpStandalone() :\n this.formDirective.addControl(this);\n this._registered = true;\n };\n NgModel.prototype._setUpdateStrategy = function () {\n if (this.options && this.options.updateOn != null) {\n this.control._updateOn = this.options.updateOn;\n }\n };\n NgModel.prototype._isStandalone = function () {\n return !this._parent || !!(this.options && this.options.standalone);\n };\n NgModel.prototype._setUpStandalone = function () {\n setUpControl(this.control, this);\n this.control.updateValueAndValidity({ emitEvent: false });\n };\n NgModel.prototype._checkForErrors = function () {\n if (!this._isStandalone()) {\n this._checkParentType();\n }\n this._checkName();\n };\n NgModel.prototype._checkParentType = function () {\n if (!(this._parent instanceof NgModelGroup) &&\n this._parent instanceof AbstractFormGroupDirective) {\n TemplateDrivenErrors.formGroupNameException();\n }\n else if (!(this._parent instanceof NgModelGroup) &&\n !(this._parent instanceof NgForm)) {\n TemplateDrivenErrors.modelParentException();\n }\n };\n NgModel.prototype._checkName = function () {\n if (this.options && this.options.name)\n this.name = this.options.name;\n if (!this._isStandalone() && !this.name) {\n TemplateDrivenErrors.missingNameException();\n }\n };\n NgModel.prototype._updateValue = function

First, developers have
found this pattern\n * confusing. It seems like the actual `ngModel` directive is being used, but in fact it's\n * an input/output property named `ngModel` on the reactive form directive that simply\n * approximates (some of) its behavior. Specifically, it allows getting/setting the value\n * and intercepting value events. However, some of `ngModel`'s other features - like\n * delaying updates with`ngModelOptions` or exporting the directive - simply don't work,\n * which has understandably caused some confusion.\n *\n * In addition, this pattern mixes template-driven and reactive forms strategies, which\n * we generally don't recommend because it doesn't take advantage of the full benefits of\n * either strategy. Setting the value in the template violates the template-agnostic\n * principles behind reactive forms, whereas adding a `FormControl`/`FormGroup` layer in\n * the class removes the convenience of defining forms in the template.\n *\n * To update your code before v7, you'll want
to decide whether to stick with reactive form\n * directives (and get/set values using reactive forms patterns) or switch over to\n * template-driven directives.\n *\n * After (choice 1 - use reactive forms):\n *\n * ```html\n * <input [formControl]=\"control\">\n * ```\n *\n * ```ts\n * this.control.setValue('some value');\n * ```\n *\n * After (choice 2 - use template-driven forms):\n *\n * ```html\n * <input [(ngModel)]=\"value\">\n * ```\n *\n * ```ts\n * this.value = 'some value';\n * ```\n *\n * By default, when you use this pattern, you will see a deprecation warning

once in dev\n * mode. You can choose to silence this warning by providing a config for\n * `ReactiveFormsModule` at import time:\n *\n * ```ts\n * imports: [\n * ReactiveFormsModule.withConfig({warnOnNgModelWithFormControl: 'never'});\n *]\n * ```\n *\n * Alternatively, you can choose to surface a separate warning for each instance of this\n * pattern with a config value of `\"always\"`. This may help to track
down where in the code\n * the pattern is being used as the code is being updated.\n *\n * @ngModule ReactiveFormsModule\n * @publicApi\n */\nvar FormControlDirective = /** @class */ (function (_super) {\n __extends(FormControlDirective, _super);\n function FormControlDirective(validators, asyncValidators, valueAccessors, _ngModelWarningConfig) {\n var _this = _super.call(this) || this;\n _this._ngModelWarningConfig = _ngModelWarningConfig;\n /** @deprecated as of v6 */\n _this.update = new EventEmitter();\n /**\n * @description\n * Instance property used to track whether an ngModel warning has been sent out for this\n * particular `FormControlDirective` instance. form control types, see:\n *\n * * Radio buttons: `RadioControlValueAccessor`\n * * Selects: `SelectControlValueAccessor`\n *\n * ### Use with ngModel\n *\n * Support for using the `ngModel` input property and `ngModelChange` event with reactive\n * form directives has been deprecated in Angular v6 and will be removed in Angular v7.\n *\n * Now deprecated:\n *\n * ```html\n * <form [formGroup]=\"form\">\n * <input formControlName=\"first\" [(ngModel)]=\"value\">\n * </form>\n * ```\n *\n * ```ts\n * this.value = 'some value';\n * ```\n *\n * This has been deprecated for a few reasons. First, developers have found this pattern\n * confusing. It seems like the actual `ngModel` directive is being used, but in fact it's\n * an input/output property named `ngModel` on the reactive form directive that simply\n * approximates (some of) its behavior. Specifically, it allows getting/setting the value\n * and intercepting value events. However, some of `ngModel`'s other features - like\n * delaying updates with`ngModelOptions` or exporting the directive - simply don't work,\n * which has understandably caused some confusion.\n *\n * In addition, this pattern mixes template-driven and reactive forms strategies, which\n * we generally don't recommend because it doesn't take advantage of the full benefits of\n * either strategy. Setting the value in the template violates the template-agnostic\n * principles behind reactive forms, whereas adding a `FormControl`/`FormGroup` layer in\n * the class removes the convenience of defining forms in the template.\n *\n * To update your code before v7, you'll want to decide whether to stick with reactive form\n * directives (and get/set values using reactive forms patterns) or switch over to\n * template-driven directives.\n *\n * After (choice 1 - use reactive forms):\n *\n * ```html\n * <form [formGroup]=\"form\">\n * <input formControlName=\"first\">\n * </form>\n * ```\n *\n * ```ts\n * this.form.get('first').setValue('some value');\n * ```\n *\n * After (choice 2 - use template-driven forms):\n *\n * ```html\n * <input [(ngModel)]=\"value\">\n * ```\n *\n * ```ts\n * this.value = 'some value';\n * ```\n *\n * By default, when you use this pattern, you will see a deprecation warning once in dev\n * mode. You can choose to silence this warning by providing a config for\n * `ReactiveFormsModule` at import time:\n *\n * ```ts\n * imports: [\n * ReactiveFormsModule.withConfig({warnOnNgModelWithFormControl: 'never'});\n *]\n * ```\n *\n * Alternatively, you can choose to surface a separate warning for each instance of this\n * pattern with a config value of `\"always\"`. This may help to track down where in the code\n * the pattern is being used as the code is being updated.\n *\n * @ngModule ReactiveFormsModule\n * @publicApi\n */\nvar FormControlName = /** @class */ (function (_super) {\n __extends(FormControlName, _super);\n function FormControlName(parent, validators, asyncValidators, valueAccessors,
 _ngModelWarningConfig) {\n var _this = _super.call(this) || this;\n _this._ngModelWarningConfig = _ngModelWarningConfig;\n _this._added = false;\n /** @deprecated as of v6 */\n _this.update = new EventEmitter();\n /**\n * @description\n * Instance property used to track whether an ngModel warning has been sent out for this\n * particular FormControlName instance.
