

Your factory builds today. Your network should be building for tomorrow.

6 ways Cisco Digital Network Architecture builds a stronger, more connected factory

1 Security from A to Z

As you connect more devices, people, and processes across your factory, you can also inadvertently create new vulnerabilities. Cisco knows that security in manufacturing is not only about protecting data, but also about protecting your workers and machinery. You need a system that protects every asset across your business.

2 IT meets OT

It isn't easy to merge your factory network and your business network, but the benefits make it well worth it. Cisco® Digital Network Architecture (DNA) lets you get new virtual network services up in minutes, not months. And it delivers a flexible network architecture that securely connects the plant floor with the enterprise network.

3 Experts, united

An end-to-end network connects technicians to devices and technicians to other technicians across your factory. That means better visibility, faster issue resolution, better communication, and more collaboration.

4 Simplicity from complexity

The more devices you have connecting to your network, the more important it is to simplify network management. Top-of-the-line services and automation can make your network more secure and more scalable so you're ready for the future.

5 Works well with others

Sometimes networks can get in the way when you're trying to work with other businesses. Cisco has partnered with some of the most valuable manufacturing technology service providers across the globe to make sure your collaborations are seamless.
