Modernize your hybrid cloud, innovate at the speed of apps

Hybrid cloud is changing fast. It has become the de-facto operating model for most IT organizations, but it can introduce challenges and increase complexity in managing distributed environments.

We invite you to join our Tech Days event focused on Infrastructure Modernization to learn how Cisco can help your organization build cloud-ready, operate cloud-smart and accelerate cloud-native. We'll discuss strategies for a successful platform approach that delivers a unified experience for IT teams, better application experiences and better business results.

Join Cisco experts to learn how to:

- Take control of your hybrid cloud world with cloud as an operational model
- Optimize operations across environments and break down silos with continuous workload optimization
- Accelerate innovation and agility with infrastructure as code

Session 1 - Cloud Operated Infrastructure

Customers require flexibility and choice in where they are deploying their applications. At the same time, a unified IT experience from the data center to the public cloud is essential to allow customers to streamline their operations. Cisco understands that these requirements must be met to allow customers to choose to deploy applications based on cost and performance and not based on the underlying infrastructure.

This talk will focus on how Cisco can help customers effectively manage their infrastructure including operations, observability and solution automation across compute, storage, and networking both on premises and in the cloud.

Session 2 - Accelerate innovation and agility with Infrastructure as Code

Applications are critical to the competitiveness of the company and are evolving faster than ever. Organizations want to release new changes at an increasing pace, with applications changes requiring changes to the infrastructure on a weekly basis not uncommon and when changes are needed to restore service change execution needs to be measured in hours or minutes.

This talk will focus on how Cisco can help bring that Cloud agility to your compute and network infrastructure.

Session 3 - Optimize operations across environments and break down silos with Continuous Workload Optimization

IT orgs have one challenging job: to deliver high performing applications at the lowest possible cost. It is a tough job when there is one application. It is a difficult job when there are many applications. It is an impossible job as those hundreds of applications increasingly move to a cloud native architecture with microservices running on prem, in hosted environments, or in the public cloud.

This talk will highlight how Cisco can help automate and orchestrate the environment, allowing a real-time decision engine to optimize the resources available to every application component and ensure cost-effective delivery of the application for an optimal user experience.
