

NHS Wi-Fi

Scalable solutions for better patient and staff experiences

The timescales for the NHS Wi-Fi rollout are tight, so you need to act now. But how do you choose the right supplier for your NHS trust?

Wi-Fi in 3 easy steps

Whether you have already installed a Wi-Fi solution and want to roll out services, or you're just getting started, our three-point guide outlines the key considerations for helping to ensure that your service is reliable. We also offer pointers for implementing a Wi-Fi solution that benefits your NHS organisation, your staff, and your patients.

Step 1

Build a medical-grade wireless network

We can help you design and build a highly secure shared multipurpose network that provides:

- Business value for multiple use cases
- Resiliency and robustness to cope with patient, clinical, business, and staff usage with little downtime
- Ubiquitous coverage with built-in intelligence to perform in a dynamic environment
- Application recognition to help ensure that critical medical applications are prioritised and delivered seamlessly

Step 2

Achieve regulatory compliance and protect against threats

Our experts can help you:

- Control network access, and enable segmentation throughout, to protect clinical and business assets
- Protect against known external threats and evolving malicious activity by assessing vulnerabilities and apply threat intelligence to support immediate remediation
- Deliver instant fingerprinting of more than 250 leading medical devices and thousands of nonclinical devices, so you know exactly what's on your network
- Simplify patient onboarding without losing visibility or control over what is being accessed
- Support compliance with regulations

Step 3

Improve patient and staff experiences

Our services will help you:

- Get more value from your wireless network. With location services, you can track expensive medical equipment, improve bed management, and better understand resource availability
- Use location analytics to get round-the-clock information about space utilisation, average waiting room times, and congested areas within the hospital
- Build wayfinding apps to help patients locate the correct clinic or consultation room, improving the patient experience and reducing late arrivals

Trust the experts

With 80 per cent of the health and care industry in the UK connected to our Wi-Fi, we understand NHS requirements and have an experienced team ready to help you deliver a medical grade network that will support your organisation for years to come.
