

Create Better Digital Learning with Systems Manager for Schools

ENHANCE LEARNING BY TAKING CONTROL OF MOBILE DEVICES

Utilising technology in the classroom can significantly enhance the education process, but managing these devices and keeping students focused in lessons can hinder learning. Cisco Meraki Systems Manager Enterprise Mobility Management (EMM) provides simplicity in deploying, managing, and provisioning any number of school-owned or student-owned devices.

Time-based restrictions ensure that during school hours, student devices are used for learning purposes and have appropriate applications and content loaded. With the click of a button, update settings, adjust device restrictions, and provide troubleshooting from a centralised management platform.

GAIN A DIGITAL TEACHER'S ASSISTANT WITH TEACHER TOOLS

Systems Manager (SM) provides teachers with the automation, scalability, and simplicity needed to engage students and effectively use technology in the classroom. With role-based administration, network admins can provide teachers with access to devices in their classrooms, easily giving visibility and control over all or specific devices.

The SM Backpack feature automatically downloads files, documents, and lesson plans to devices, ready for class. In Single App Mode, teachers can force devices to only display a single application, great for focusing lessons or bringing eyes to the front of the classroom. To share content with the entire class, pre-provisioned AirPlay settings allow teachers to easily select the student's device they wish to display. To further guide, view, and track students' progress, the SM and Apple Classroom partnership gives teachers the ability to see and remotely control iPads.

SECURE STUDENT, FACULTY, AND STAFF DATA

Providing a safe and secure environment is a top priority. Implementing data loss prevention (DLP), as well as ensuring students are not accessing inappropriate content is critical. SM tools help to ensure device security and implement security requirements for access to sensitive information. Access to appropriate content for students in different classes or of various ages is easily achieved through integrating Student Information Systems via Apple School Manager or through identity access controls and Active Directory, LDAP, and OAuth integrations. With intuitive tools in place, students, faculty, and staff can securely use mobile devices without worry.
