

Cisco Meraki India Region

Overview

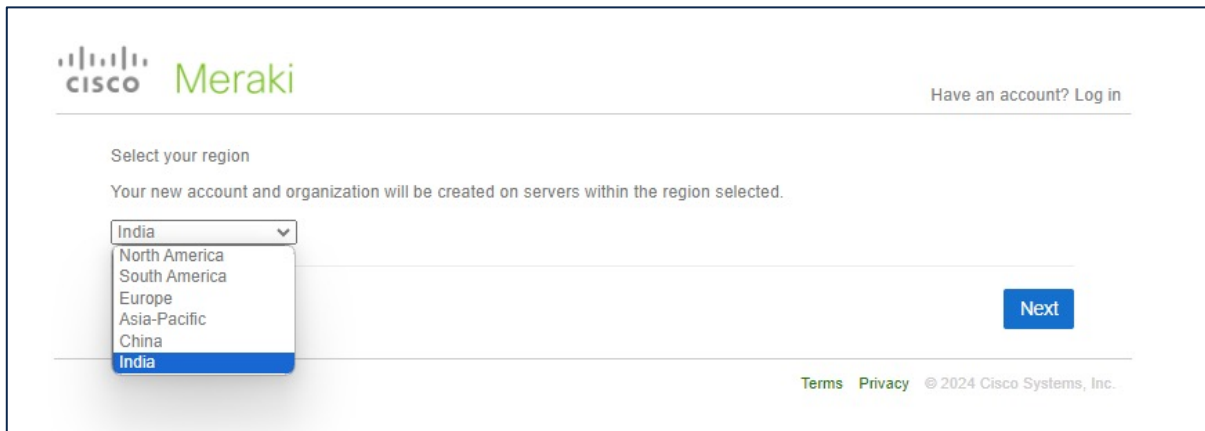

Cisco Meraki created the India Region to help our Indian customers who wish to store their data locally. Meraki built the India Region, hosted exclusively in MeitY empaneled CSP's data centers within India, to provide the security, reliability, and redundancy offered by our distributed cloud architecture.

Additionally, the India Region's out-of-band architecture ensures only management information, and not network traffic, passes through India Region data centers. The architecture also enables customers to realize all the advantages cloud management offers, including centralized visibility and control, unified management of wireless and wired networks, and reduced operational expenses.

The Cisco Meraki India Region is part of our commitment to data protection, privacy, and security while enabling customers to securely protect their data.

Security made simple

Creating a secure deployment hosted in the India Region is simple. Go to the India dashboard, <https://dashboard.meraki.in> and select "India" on the account creation page:

Created accounts can only be accessed through the India dashboard.

Product support

Products and license tiers supported for Cisco Meraki India Region are:
