

3.3.1 Foster a risk-centric mindset around cybersecurity for the corporate sector

The lack of a holistic approach around strategy, governance, organization, and culture often results in organizations being highly vulnerable despite relying on the best vendors and products. A four-step approach can help companies define their cybersecurity strategy (see figure 24).

The first step is to align on business objectives and raise the profile of cybersecurity as a business risk imperative. Second, high-value assets should be identified and prioritized. Third, a cyber threat impact risk assessment should be conducted. Finally, it is imperative to identify cyber capabilities needed to defend high-value assets.

“We are in the process of setting up the CISO function with an independent mandate to report to the board, distinct from the CIO. We have conducted cybersecurity posture assessments across our major operating companies. This has helped to build awareness, but there is a lot of work to do to build a solid governance framework.”

In defining their strategy to enhance cyber resilience, businesses need to consider the value-at-risk. To assess the value-at-risk, businesses could take either an asset- or liability-based view. An asset-based view involves valuing critical assets and the potential reputational damage from an attack. Alternatively, businesses could consider a liability-based approach, building scenarios and quantifying the financial and reputational loss. Building potential scenarios with a combination of historical data and judgment about the probability of a threat can create a better understanding of the value-at-risk and help allocate resources in a more judicious manner.

Businesses should leverage industry best practices and standards such as the NIST Cybersecurity Framework, ISO 27001, and an architecture framework based on risk-centric security (see figure 25).

As digitalization grows, security must also mature (see figure 26). An organization’s evolution across the various stages of cyber excellence could be measured and tracked, providing a useful measure of cyber readiness. A security maturity model can help map an organization’s digital transformation journey against its security profile (see Appendix A on page 50). For smaller organizations looking to partner with large multinationals or CII owners, performance on the security maturity model should be a threshold requirement for doing business. This will raise the profile of cybersecurity among all business partners and promote resilience across the supply chain. Singapore’s Cybersecurity Bill calls for regular system audits by an approved third party. For CII owners, a maturity model can help identify cybersafe business partners.

Cyber insurance companies are increasingly looking at an organization’s strategy, policy, and governance while pricing cyber insurance. Depending on the sector, a vulnerability scan or a penetration test may also be carried out in addition to reviewing the size of the security budget in relation to the total IT budget. Putting in place a comprehensive, layered cybersecurity strategy can help businesses reduce their insurance spend.
