

Scaling for the mobility and IoT explosion

A network that can be simply managed will scale to meet the needs of mobility and IoT for your critical digital initiatives.

In 2020, there will be **63 million new devices** attaching to enterprise networks per second.*

Simplify your network management and evolve to an intent-based network in four easy steps:

Step 1: Scale wireless

Is your wireless network ready to scale?

[See more](#)

Step 2: Automate networking

Is complexity under control?

[See more](#)

Step 3: Segment users and devices

Is security a headache?

[See more](#)

Step 4: Extend to IoT environments

Can your network support OT?

Step 1: Scale wireless

Ask yourself

Will your wireless network scale to give all your users, customers, and devices the service they need?

Something to consider

Only a wireless infrastructure that is optimized for high performance and density can cope with the influx of users, devices, and demanding applications.

Recommended solutions

- [Wi-Fi 6 \(802.11ax\) Cisco Catalyst access points](#)
- [Multigigabit-enabled Catalyst switches](#)
- [WLAN Advise and Implement Service](#)

Benefits: By upgrading your wireless network to Wi-Fi 6 (802.11ax), you significantly boost performance, provide a better user experience, and effectively support more applications and devices including IoT.

Step 2: Automate networking

Ask yourself

Is your team challenged with managing the growing complexity and scale of your wired and wireless network?

Something to consider

You can start your journey to intent-based networking by automating repetitive administration tasks like provisioning and configuration to reduce the management burden.

Recommended solutions

- [Cisco DNA Center](#)
- [Cisco DNA Advantage software](#)
- [Cisco DNA Center Advise and Implement Service](#)

Benefits: With Cisco DNA Center automation capabilities, you can reduce operating expenses by 61%**. These capabilities include zero-touch provisioning, end-to-end QoS policy deployment, and simplified software image management. Our Services team can get you on the fast track to automating your network.

Step 3: Segment users and devices

Ask yourself

Is the growth in mobile users and IoT devices and guest Wi-Fi causing security headaches?

Something to consider

By automating policy-based network segmentation, you can easily protect groups of users and devices while radically reducing your risk of spreading attacks – even zero-day attacks.

Recommended solutions

- [Software-Defined Access \(SD-Access\)](#)
- [Identity Services Engine \(ISE\)](#)
- [Security Segmentation Advisory Service](#)

Benefits: SD-Access easily secures all users, devices, and applications with centralized, identity-based policy and segmentation across your network.

Step 4: Extend to IoT environments

Ask yourself

Do you need to take control and streamline management of your extended enterprise networks (warehouses, outdoor spaces, and more)?

Something to consider

Imagine the cost savings and operational efficiency you can achieve with a single network for IT and OT that can apply consistent policy across the extended enterprise.

Recommended solution

- [SD-Access Extension for IoT](#)
- [Extended Enterprise products and solutions](#)

Benefits: SD-Access Extension for IoT allows you to extend policy and segmentation to your OT environments. Get expanded control and security in industrial, outdoor, and IoT environments.
