1. Einführung

In diesem Dokument wird beschrieben, dass das Zertifikatsmanagement in Cisco Unified Operating System eine sehr wichtige Komponente von CUCM und VOS selbst ist, da viele Anwendungen und Funktionen z. B. auf Zertifikate basieren: TVS, CAPF, Security by Default oder Unified Serviceability-Seiten. CertMgmt stellt ein einziges Repository von Zertifikaten und APIs für andere Komponenten bereit, um die Sicherheit und die sichere Datenübertragung (TLS) einfach einschließen zu können.

Der Service "Cisco Certificate Change Notification" (Benachrichtigung über Cisco Zertifikatsänderung) wurde vorwiegend eingeführt, um einige Zertifikate über die Knoten im Cluster zu synchronisieren. Er wird von ServM überwacht. Dadurch wird die Zertifikatsbereitstellung für Administratoren bei größeren Bereitstellungen einfacher und schneller.

Unterstützt von Mateusz Olszowy, Cisco TAC Engineer.

2. Wie werden Zertifikate gespeichert?

Zertifikate werden sowohl im Dateisystem als auch in der Datenbank gespeichert, und der CN-Dienst synchronisiert sie zwischen Knoten. Dateisystemzertifikate haben eine höhere Priorität als DB-Zertifikate.

DB-Tabellen:

- ZERTIFIKAT - speichert alle Zertifikatdetails wie Betreff, Aussteller, Seriennummer, Zertifikat im PEM-Format usw.
- CERTIFICATESERVICECERTIFICATEMAP - Zuordnung zwischen Zertifikat und Zertifikatstyp, z. B. CallManager-Trust, CAPF-Trust

- CERTIFICATEHASHMAP - Zuordnung zwischen Zertifikat und Hash des Zertifikats
- CERTIFICATEPROCESSNODEMAP - Zuordnung zwischen Zertifikat und Prozessknoten
- CERTIFICATESTRUSTROLEMAP - Zuordnung zwischen Zertifikat und Rolle_enum
- TYPECERTIFICATESERVICE - Karten der in CERTIFICATESERVICECERTIFICATEMAP enthaltenen enums den Zertifikatstypen (z. B. tomcat, tomcat-trust, callmanager usw.)

Speicherung im Dateisystem:

- certs: public key (X509Certificate - Own Certificate) (.der- und .pem-Format mit .description) sowie im pkcs-12 Keystore-Format.
- Schlüssel: private Schlüssel und Passphrasen sowie CSR.
- Trust-certs: alle vertrauenswürdigen Zertifikate (.der & .pem-Format) und auch im PKCS-12-Keystore-Format.

Beispielpfade:

`/usr/local/cm/.security/CallManager/`

`/usr/local/cm/.security/CAPF`

`/usr/local/platform/.security/tomcat`

Das Unterverzeichnis Trust-certs enthält symbolische Verknüpfungen, die auf .pem-Dateien mit speziellen Namen verweisen, die aus dem openssl-Hash und normalerweise der Erweiterung .0 bestehen, die als Iterator verwendet werden kann, wenn der gleiche Hash generiert wird.

Nachstehend finden Sie ein Beispiel:

```
[root@cucmpub trust-certs]# pwd
/usr/local/cm/.security/CallManager/trust-certs
```

```
[root@cucmpub trust-certs]# ls -l cucmpub.pem
-rwxr-xr-x 1 certbase ccmbase 993 Mar 15 2013 cucmpub.pem
```

```
[root@cucmpub trust-certs]# openssl x509 -noout -hash -in cucmpub.pem
5eb51e07
```

```
[root@cucmpub trust-certs]# ls -l 5eb51e07.0 lrwxrwxrwx 1 certbase ccmbase 11 May 13 17:16
5eb51e07.0 -> cucmpub.pem
```

3. CertMgmt- und Certificate CN-Designübersicht

Beim Hochladen des Zertifikats unter der Seite OS Administration (Betriebssystemverwaltung) wird die Datei im PEM- und IM-Format in das Dateisystem geschrieben, und die DB-Tabellen werden aktualisiert.

Diese Zertifikate werden als Nächstes über die DB-Replikation auf die anderen Knoten im Cluster repliziert.

Einige Arten von Zertifikaten werden vom Cisco Certificate Change Notification-Prozess auf den Remote-Knoten abgerufen und durch denselben Prozess auf das Dateisystem hochgeladen.

Der Cisco Certificate Change Notification-Prozess wird über Änderungen an den folgenden Tabellen benachrichtigt: ZERTIFIKAT- UND ZERTIFIKATESERVICEERTIFIZIERUNGSMAP.

Die von Cisco Certificate Change Notification abgerufenen Zertifikate werden in der folgenden Konfigurationsdatei konfiguriert: /usr/local/platform/conf/certM.conf:

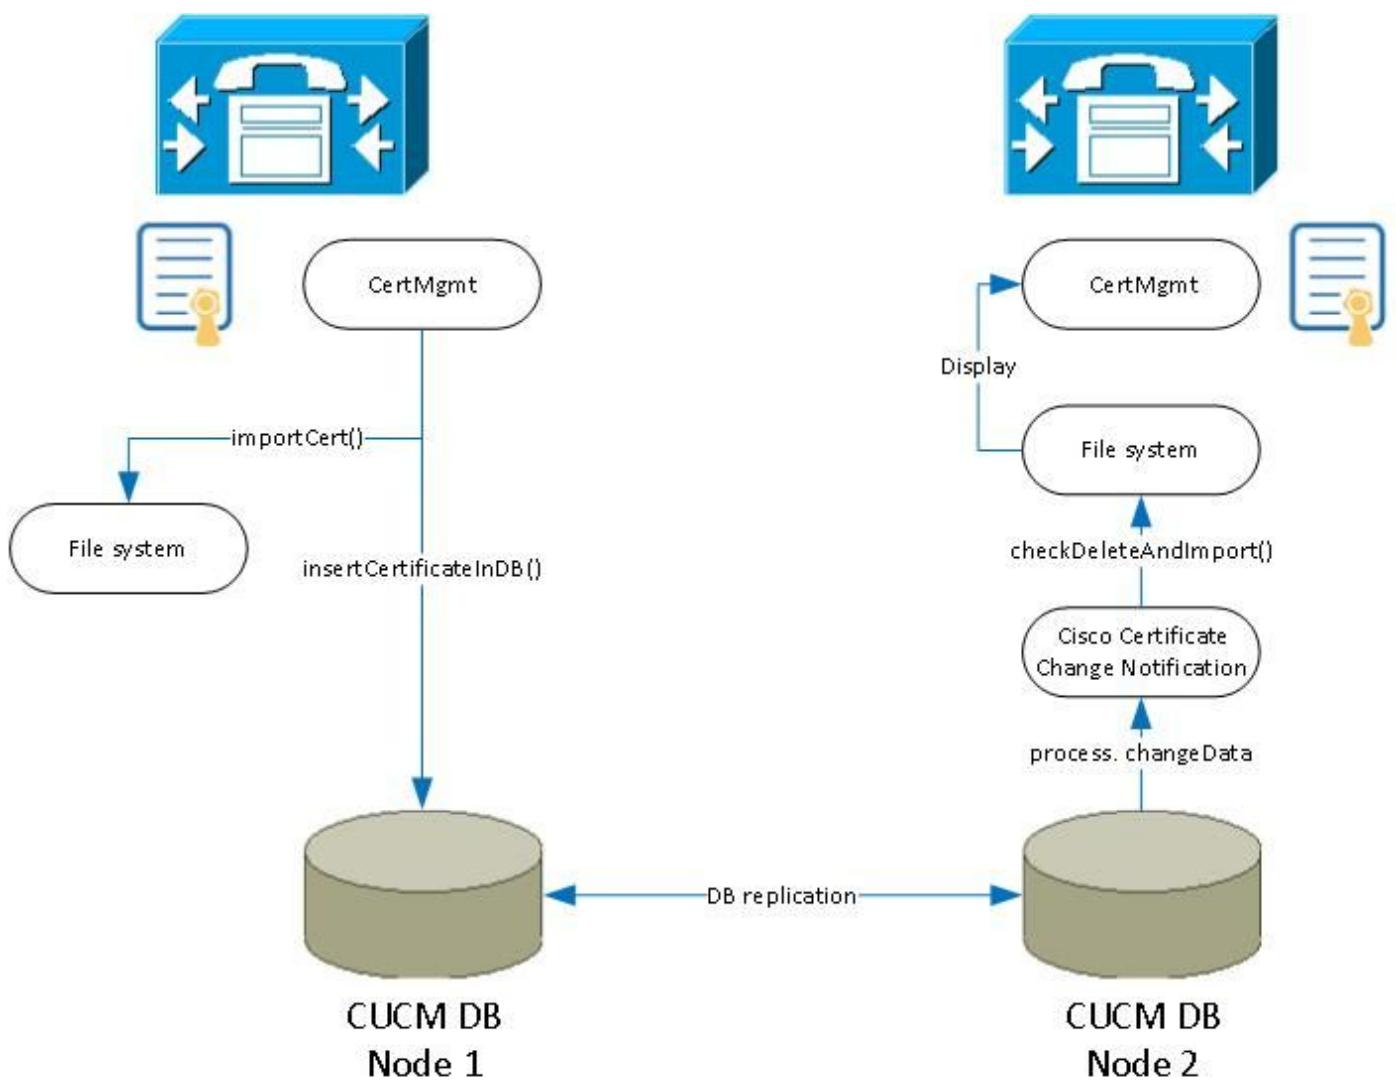

```
CHANGE_NOTIFICATION_UNIT=tomcat,tomcat-trust,directory-trust,CallManager,Phone-SAST-trust,CallManager-trust
```

Zusätzlich wird der Dienst standardmäßig alle 30 Min. (1.800 Sek.) ausgeführt, um alle Zertifikate synchronisiert zu halten. Dieser Timer ist auch in der obigen Datei konfiguriert:

```
CN_SYNC_TIMER=1800
```

Nach dem Hochladen werden die Zertifikate auf der OS-Admin-Seite auf Remote-Knoten repliziert und dort sowie auf das Dateisystem hochgeladen.

Beachten Sie, dass die Seite OS Admin und alle anderen Dienste die Zertifikate vom Dateisystem und nicht von der DB lesen.

4. Beispiele

In diesem Abschnitt werden drei verschiedene Szenarien der Zertifikatsverwaltung behandelt.

Für jedes Szenario folgen Sie dem Prozess im Detail und verwenden Screenshots und Protokolle.

In diesem Szenario verwenden Sie einen Cluster mit zwei Knoten und CUCM Version 9.1.2.1000-

28.

Legende:

CM - Certificate Management (Protokolle finden Sie unter 'file list active log platform/log/certMgmtXXXXX.log')

certCN - Certificate Change Notification Service (Protokolle finden Sie unter 'file list active log platform/log/certCNXXXXX.log')

Beispiele basierend auf CUCM-Cluster 9.1.2.1000-28, zwei Knoten:

PUB, IP:10.48.46.29, HOSTNAME:CUCM861

SUB, IP: 10.48.46.30, HOSTNAME:CUCM861s

Zertifikate werden auf der Seite OS Admin mit der Seriennummer im Dezimalformat angezeigt. DB speichert diese Nummer in HEX. Zur Konvertierung von Seriennummern zwischen HEX/DEC können Sie dieses Online-[Tool](#) verwenden.

Protokollausschnitte enthalten einige Kommentare (fett formatiert, beginnend mit '###').

4.A. Fügen Sie ein neues tomcat-trust-Zertifikat ein.

Im ersten Szenario laden Sie über die Seite OS Admin ein Zertifikat in die tomcat trust-Datei hoch. Die folgenden Schritte werden für beide Knoten im Cluster ausgeführt:

- a) Laden Sie das Zertifikat manuell hoch.
- b) Das Zertifikat wird vom CM im Dateisystem gespeichert.
- c) Das Zertifikat wird von CM in die DB eingefügt.
- d) Das Zertifikat wird über die DB-Replikation an den Subscriber repliziert. CertCN auf beiden Knoten (pub und sub) wird über die Änderung benachrichtigt. Es wird keine Aktion auf dem Pub-Knoten durchführen.
- e) CertCN auf Sub Node importiert Zertifikate in das Dateisystem und fügt sie dem Keystore hinzu.
- f. Nach diesen Schritten wird das Zertifikat auf der GUI unter OS Admin Seite angezeigt.
- a) Beim Hochladen von Zertifikaten aus PEM-Dateien Folgen Sie den folgenden Screenshots:

[root@CUCM861 tomcat]# md5sum trust-certs/CUCM9X.pem a0a2e12a42e4bbbf10655c9b299839d9 trust-
certs/CUCM9X.pem

```

Wie Sie sehen, wird das neue Zertifikat im Verzeichnis trust-certs gespeichert. Common Name (der dem Hostnamen des CUCM-Knotens entspricht) wurde als Dateiname verwendet. Sie wurde als .pem und .der gespeichert.

Der symbolische Link **25ffab9b.0 -> CUCM9X.pem** wurde ebenfalls erstellt und dem Text tomcat-trust.keystore ein Zertifikat hinzugefügt.

Schließlich vergleichen Sie md5 Prüfsumme der Zertifikatsdatei auf dem Unterknoten, um zu beweisen, dass es sich um dasselbe Zertifikat handelt.

b) Sehen wir uns nun genauer an, wie das Zertifikat im Dateisystem gespeichert wurde. Im CM-Protokoll (Kommentare im Ausschnitt, fett, beginnt mit **##**):

```

2014-08-04 15:21:21,116 INFO [main] - log4j configuration successful.

f. Wenn Sie jetzt das Zertifikat auf der Dateisystemebene betrachten, können Sie die md5 Prüfsumme (md5sum) überprüfen und sehen, dass es die gleiche ist wie auf dem Herausgeberknoten.

Auf der GUI können Sie dasselbe überprüfen, indem Sie die Seriennummer vergleichen.

4. B. tomcat-trust-Zertifikat löschen

Im zweiten Szenario entfernen Sie das im Abschnitt 4.A hochgeladene "tomcat-trust"-Zertifikat.

Bei der Analyse dieses Beispiels müssen Sie sich an die folgende Designanweisung erinnern:

"Der Änderungsbenachrichtigungsdienst gibt das Löschen eines Zertifikats aus dem tomcat trust store eines Knotens nicht an den anderen weiter. Dies bedeutet, dass das Löschen eines Zertifikats aus der tomcat trust-Klasse eines Knotens nicht automatisch dasselbe Zertifikat aus anderen Knoten löscht. Dieses Verhalten wird implementiert, um sicherzustellen, dass Administratoren aus Sicherheitsgründen bestimmte Knoten aus vertrauenswürdigen Anwendungen auf anderen Knoten entfernen können."

Oben ist nur für den Zertifikattyp tomcat trust gültig.

Der Löschvorgang besteht aus den folgenden Schritten:

- a) das Zertifikat von der CM-Seite löschen.
- b) Zertifikatsdateien werden aus dem Dateisystem gelöscht
- c) certCN tritt am Publisher und Subscriber ein. Beide erfordern keine Operation.
- d) Löschen desselben Zertifikats für "tomcat trust" vom Subscriber-Knoten

a) Vorgang löschen, der von der CM-Seite initiiert wurde

The screenshot shows the 'Certificate Configuration' page. At the top, there is a navigation bar with 'Show', 'Settings', 'Security', 'Software Upgrades', 'Services', and 'Help'. Below this, the 'Certificate Configuration' section has two buttons: 'Delete' (with a red 'X' icon) and 'Download' (with a download icon). The 'Delete' button is highlighted with a red rectangular box. Below the buttons is the 'Status' section, which shows an information icon and the text 'Status: Ready'. The 'Certificate Settings' section lists the following details: File Name: CUCM9X.pem, Certificate Name: tomcat-trust, Certificate Type: trust-certs, Certificate Group: product-cpi, and Description: Signed Certificate. The 'Certificate File Data' section shows a list of certificate details, with the 'Serial Number: 162503161730851213217569888696899890998' highlighted by a red rectangular box. Other details include Signature Algorithm: SHA256withRSA (1.2.840.113549.1.1.11), Issuer Name: L=Krakow, ST=Malopolska, CN=CUCM9X, OU=TAC, O=Cisco Systems, C=PL, Validity From: Mon Aug 04 15:19:07 CEST 2014, To: Sat Aug 03 15:19:06 CEST 2019, and Subject Name: L=Krakow, ST=Malopolska, CN=CUCM9X, OU=TAC, O=Cisco Systems, C=PL.

Das Zertifikat wird aus dem Dateisystem gelöscht und die entsprechenden Zeilen in der Datenbank werden ebenfalls gelöscht. Das Zertifikat selbst wird nicht aus der CERTIFICATE-Tabelle entfernt. Führen wir diese Schritte in den CM-Protokollen aus (Anmerkungen inline):

```

Wie Sie sehen, wurden drei Dateien entfernt (CUCM9X.pem, CUCM9X.der, CUCM9X.description) und der symbolische Link.

c) Der CertCN-Dienst am Publisher und Subscriber wird vom DB Änderungsbenachrichtigungsmechanismus über die Änderung der Tabelle CERTIFICATESERVICECERTIFICATEMAP benachrichtigt.

Über den Herausgeberknoten:

```

2014-08-19 23:25:13,811 INFO [Thread-5] - IN - process. changeData &colon;
2014-08-19 23:25:13,812 INFO [Thread-5] - Inside CERTIFICATESERVICECERTIFICATEMAP - I option..
2014-08-19 23:25:13,812 DEBUG [Thread-5] - Updated Data in CERTIFICATESERVICECERTIFICATEMAP
::<msg><type>DBL</type><table>certificateservicecertificatemap</table><tableid>44</tableid><acti
on>D</action><time>1408483513</time><old><cdrserver>2</cdrserver><cdftime>1407158487</cdftime><pk
kid>798ff6e1-e1d6-42e5-a4e6-30d9d7360d6d</pkid><fkcertificate>4152b36b-002e-68ac-711d-
c373fa940779</fkcertificate><tkcertificate>6</tkcertificate><ifx_replcheck>6043699
681953972226</ifx_replcheck></old></msg>
2014-08-19 23:25:18,818 INFO [Thread-5] - OUT - process.

```

Auf dem Herausgeberknoten muss nichts getan werden, da alles von der CM API durchgeführt wurde. Dasselbe können Sie in den certCN-Protokollen auf dem Teilnehmer beobachten.

d) Löschen Sie das gleiche tomcat-trust-Zertifikat auf dem Subscriber-Knoten, und führen Sie fast die gleiche Operation aus wie auf dem Publisher-Knoten. Der einzige Unterschied besteht darin, dass der Eintrag aus der CERTIFICATE-Tabelle entfernt wird. Aus den Protokollen von CM (nur das Teil, das die Änderung enthält):

```

2014-08-21 11:59:35,383 INFO [main] - OUT -- CertDBImpl.java - checkMultipleCertForProcessnode -
2014-08-21 11:59:35,383 DEBUG [main] - DELETE FLAG :: isSrvMap=false :: isRoleMap=false ::
isProcessnodeMap=false
2014-08-21 11:59:35,383 INFO [main] - IN -- CertDBImpl.java - deleteCertificateBySerialNo(con,
certInfo) -

```

certificate is removed from CERTIFICATE table

```

2014-08-21 11:59:35,383 DEBUG [main] - Delete query of CERTIFICATE :DELETE FROM CERTIFICATE
WHERE PKID = "4152b36b-002e-68ac-711d-c373fa940779"

Details:Connector(CONNECTED: Driver=com.informix.jdbc.IfxDriver;)

```

Auch hier wird certCN über die Änderung der CERTIFICATESERVICECERTIFICATEMAP-Tabelle auf beiden Knoten informiert. certCN übernimmt keine Aktion, da alle Arbeiten von CM durchgeführt wurden.

4 C Regeneriert das Tomcat-Zertifikat auf dem Herausgeberknoten.

Im dritten Szenario betrachten Sie den Prozess der Regeneration von tomcat.pem.

Sie können auf dem Herausgeberknoten neu generieren und anschließend sehen, wie diese Änderung auf den zweiten Knoten übertragen wird.

Dieser Vorgang besteht aus den folgenden Schritten:

- a) Aktion unter CM-Seite neu generieren.
 - b) oben auslösende Trigger generieren ein neues Tomcat-Zertifikat und legen es in das Dateisystem
 - c) Das neue Tomcat-Zertifikat wird von CM in die DB eingefügt (das alte wird überschrieben). Diese Informationen werden über die DB-Replikation repliziert.
 - d) Das alte "tomcat trust"-Zertifikat wird aus dem Dateisystem gelöscht (+vom Keystore entfernen).
 - e) tomcat-trust wird in das Dateisystem importiert (+ die entsprechenden DB-Einträge werden verifiziert).
 - f. certCN auf dem Sub-Knoten tritt ein und entfernt tomcat-trust aus dem Dateisystem und aus dem Keystore.
- B.** schließlich wird das neue in das Dateisystem importiert und in den Keystore geladen.
- a) Hitting regenerate show us under output (Timestamp 23:36):

_G3.description
-rwxr-xr-x 1 certbase ccmbase 2114 Apr  4 12:47 VeriSign_Class_3_Secure_Server_CA_-_G3.pem
[root@CUCM861 tomcat]# md5sum certs/tomcat.der
a0dd8031bcd3c269844df8a3fafd476c  certs/tomcat.der
[root@CUCM861 tomcat]# md5sum trust-certs/CUCM861.der
a0dd8031bcd3c269844df8a3fafd476c  trust-certs/CUCM861.der

```

Wie Sie sehen können (abhängig von der Änderungszeit), wird unser neues Zertifikat im certs-Verzeichnis (als **tomcat.der**) und in trust-certs (als **CUCM861.der**) gespeichert. MD5-Prüfsumme (md5sum) zeigt, dass es sich um dasselbe Zertifikat handelt, das zweimal gespeichert wird. Symbolische Verknüpfung (**101f99a6.0 -> CUCM861.pem**) wird ebenfalls aktualisiert.

b) Die Regeneration selbst erfolgt durch CM. Sehen wir uns nun den Regenerationsprozess genauer an:

```

c) Derzeit ist ein neues Zertifikat auf der Dateisystemebene verfügbar (**tomcat.pem** in **certs**). **CUCM861.pem** in "trust-certs" ist ebenfalls vorhanden, wurde aber zum jetzigen Zeitpunkt nicht hinzugefügt. Dies wird später behandelt.
Jetzt ist die Zeit, unser Tomcat-Zertifikat in der DB zu aktualisieren, um die Änderung mit anderen Knoten gemeinsam zu nutzen.

Vor der Regeneration wurde Tomcat-Zertifikat in DB angezeigt:

```

admin:run sql select c.pkid, c.serialnumber from certificate c, certificateservicecertificatemap
m WHERE m.fkcertificate = c.pkid AND m.tkcertificate = '5'
pkid serialnumber =====
533dbbfc-78ce-b46f-7d64-cd2b7c536f6d 6cf5bc855b681f658f9e7506d3ec6ea5
a6b18f66-bf72-261d-8ecd-bfcea02add4e 68052e2e9cd6c979079e6449ff873031

```

Wie Sie sehen können, gibt es zwei Tomcat-Zertifikate in DB (für PUB und SUB), alte Tomcat-Zertifikate hatte die Seriennummer = '6cf5bc855b681f658f9e7506d3ec6ea5'. Die PKID unseres Tomcat Cert lautet "**533dbbfc-78ce-b46f-7d64-cd2b7c536f6d**" und ändert sich nicht, wenn die Zert-Regeneration erfolgt.

Weitere CM-Protokolldatei prüfen (Kommentare im Ausschnitt):

```

**## the same should be done on the DB level. CM consider deleting the the association
for this tomcat-trust cert from corresponding tables: CERTIFICATESERVICECERTIFICATEMAP,
CERTIFICATEPROCESSNODEMAP and CERTIFICATESTRUSTROLEMAP. As you see this does not
happen since the certificate itself has not been deleted so FKCERTIFICATE in those
tables become "null for this certificate" (cert still exists, has been
updated only)**

```

Schließlich können Sie das "tomcat-trust" Zertifikat des Pub unter GUI überprüfen. GUI zeigt uns das Zertifikat, das aus dem Dateisystem gelesen wird, nicht aus der Datenbank.

The screenshot shows the 'Certificate Configuration' window. The 'Certificate Settings' section is highlighted with a red box and contains the following information:

- File Name: CUCM861.pem
- Certificate Name: tomcat-trust
- Certificate Type: trust-certs
- Certificate Group: product-cpi
- Description: Trust Certificate

The 'Certificate File Data' section is also highlighted with a red box and shows the following details:

- Version: V3
- Serial Number: 88769680872451706773275250466208361017
- Signature Algorithm: SHA1withRSA (1.2.840.113549.1.1.5)
- Issuer Name: L=KRAKOW, ST=MALOPOLSKA, CN=CUCM861, OU=TAC, O=CISCO, C=PL
- Validity From: Sat Aug 02 23:36:44 CEST 2014
- To: Thu Aug 01 23:36:43 CEST 2019
- Subject Name: L=KRAKOW, ST=MALOPOLSKA, CN=CUCM861, OU=TAC, O=CISCO, C=PL
- Key: RSA (1.2.840.113549.1.1.1)

The 'Key value' section displays a long hexadecimal string representing the certificate's key. Below this, the 'Extensions' section lists two extensions: 'KeyUsage (OID.2.5.29.15)' and 'ExtKeyUsageSyntax (OID.2.5.29.37)', both with 'Critical: false'.

Damit wird der Prozess der Neugenerierung von Tomcat-Zertifikaten auf Herausgeberknoten beendet und diese Änderung im gesamten Cluster weitergegeben.

5. Fehlerbehebung

5.A. Bekannte Einwände - Kategorisierung

Im Folgenden finden Sie eine Liste häufiger Fehler, die sich auf Zertifikate und CM beziehen.

Antwort: Im Zusammenhang mit der falschen Vermehrung einer Änderung von Zertifikaten:

[CSCul78787](#) - Vertrauenswürdige Zertifikate von CM 9.1 können nicht gelöscht werden, selbst wenn der CertCN-Dienst beendet wurde.

[CSCto86463](#) - Gelöschte Zertifikate werden wieder angezeigt, Zertifikate können nicht aus dem CUCM entfernt werden.

[CSCth79451](#) - Zertifikats-DB-Einträge müssen bei der Änderung von Hostname/IP aktualisiert werden.

[CSCup28852](#) - Telefon-Zurücksetzen alle 7 Minuten aufgrund von aktenbasierten Aktualisierungen bei Verwendung von Multi-Server-Zertifikaten

B. Während des DRS-Betriebs gefunden:

[CSCtn50405](#) - CUCM DRF Backup sichert keine Zertifikate

[CSCtt95983](#) - CAPF-Zertifikat nicht gesichert/wiederhergestellt mit DRF

[CSCup71297](#) - Falsche Zertifikataktualisierung nach DRS-Wiederherstellung

C. Verschiedenes und Dok.

[CSCup54818](#) - [DOC] Zertifikate, signiert von CA (Schlüsselgröße >=4096), im gemischten Modus nicht unterstützt

[CSCud49047](#) - RTMT-Option zum Herunterladen von Zertifikatsänderungs-Benachrichtigungsdienstprotokollen

[CSCup88555](#) - Die Länge der Seriennummer muss beim Hochladen eines neuen Zertifikats validiert werden.

5.B. Tipps und Tricks

a) Es gibt eine Tabelle in der Datenbank, die Enumerationen mit dem entsprechenden Zertifikatstyp übereinstimmt. Sie können diese Enumerationen sehr häufig in den zertifizierten DB-Abfragen (CM/certCN-Protokolle, Tabelle CERTIFICATESSERVICECERTIFICATEMAP) sehen. Um diese Zuordnung zu erhalten, müssen Sie sich TYPECERTIFICATESSERVICE ansehen.

```
admin:run sql select * from TYPECERTIFICATESSERVICE
enum name                moniker                                usestruststore
=====
1  Phone-trust            CERTIFICATE_SERVICE_PHONE_TRUST        t
2  Phone-VPN-trust        CERTIFICATE_SERVICE_PHONE_VPN_TRUST    t
3  CallManager            CERTIFICATE_SERVICE_CALLMANAGER        f
4  CallManager-trust      CERTIFICATE_SERVICE_CALLMANAGER_TRUST   t
5  tomcat                  CERTIFICATE_SERVICE_TOMCAT              f
6  tomcat-trust           CERTIFICATE_SERVICE_TOMCAT_TRUST        t
7  ipsec                   CERTIFICATE_SERVICE_IPSEC               f
8  ipsec-trust            CERTIFICATE_SERVICE_IPSEC_TRUST         t
9  CAPF                    CERTIFICATE_SERVICE_CAPF                f
10 CAPF-trust             CERTIFICATE_SERVICE_CAPF_TRUST          t
```

11	TVS	CERTIFICATE_SERVICE_TV	f
12	TVS-trust	CERTIFICATE_SERVICE_TV	t
13	directory-trust	CERTIFICATE_SERVICE_DIRECTORY	t
14	Phone-SAST-trust	CERTIFICATE_SERVICE_PHONE_SAST	t
15	Phone-CTL-trust	CERTIFICATE_SERVICE_PHONE_CTL	t
16	userlicensing-trust	CERTIFICATE_SERVICE_USERLICENSING	t

b) Denken Sie daran, dass Sie die DB abfragen und alle Zertifikate auflisten müssen. Die Abfrage muss Pid und Seriennummer des Zertifikats, IP und den Knotennamen, den Zertifikatstyp und den Subjektnamen zurückgeben. Bitte überprüfen Sie Folgendes:

führen Sie `sql select CERTIFICATE.pchild, CERTIFICATE.serialnumber, CERTIFICATEPROCESSNODEMAP.ipv4address, CERTIFICATEPROCESSNODEMAP.servername, TYPECERTIFICATESERVICE.name, Subjektname von CERTIFICATEPROCESSNODEMAP inner schließen CERTIFICATE ON CERTIFICATEPROCESSNODEMAP.fkcertificate=CERTIFICATE.pchild inner join CERTIFICATESERVICECERTIFICATEMAP.fkcertificate=CERTIFICATE.pchild JOIN TYPECERTIFICATESERVICE ON TYPECERTIFICATESERVICE.enum=CERTIFICATESERVICE FICATEMAP.tkcertificateservice order by CERTIFICATEPROCESSNODEMAP.servername`

Das Beispielergebnis, das Sie in folgendem Ausschnitt finden können.

```
admin:run sql select CERTIFICATE.pkid, CERTIFICATE.serialnumber,
CERTIFICATEPROCESSNODEMAP.ipv4address, CERTIFICATEPROCESSNODEMAP.servername,
TYPECERTIFICATESERVICE.name, subjectname from CERTIFICATEPROCESSNODEMAP inner join CERTIFICATE
ON CERTIFICATEPROCESSNODEMAP.fkcertificate=CERTIFICATE.pkid inner join
CERTIFICATESERVICECERTIFICATEMAP ON
CERTIFICATESERVICECERTIFICATEMAP.fkcertificate=CERTIFICATE.pkid JOIN TYPECERTIFICATESERVICE ON
TYPECERTIFICATESERVICE.enum=CERTIFICATESERVICECERTIFICATEMAP.tkcertificateservice order by
CERTIFICATEPROCESSNODEMAP.servername
pkid                serialnumber                ipv4address servername
name                subjectname

CAPF-trust CN=Cisco Manufacturing CA,O=Cisco Systems
```

Oben kann sehr nützlich sein, wenn Sie Probleme mit dem Synchronisierungszertifikat zwischen DB und dem Dateisystem beheben.

c) Um das Ablaufdatum des Zertifikats zu überprüfen, können Sie den OpenSSL-Befehl (Root erforderlich) verwenden:

Beispielausgabe:

```
[root@CUCM861 certs]# openssl x509 -noout -dates -in tomcat.pem
notBefore=Aug  2 21:36:44 2014 GMT
notAfter=Aug  1 21:36:43 2019 GMT
[root@CUCM861 certs]#
```

d) Um dasselbe wie oben zu überprüfen, aber das Zertifikat, das in der Datenbank gespeichert ist, muss die Seriennummer oder PKID des Zertifikats bekannt sein, das Sie überprüfen möchten. Für die Aufgabe müssen zwei Bash-Befehle ausgeführt werden (vorher müssen Sie "su - informix" ausführen).

```
echo "Entladen zu 'cert_gedumpte_to_file'-Trennzeichen " wählen Sie ein Zertifikat aus dem
Zertifikat aus, wobei Seriennummer = '6a6967b3000000000003'"|dbaccess -e ccm9_1_2_1000_28
```

Oben wird eine Datei **cert_gedumpte_to_file** erstellt, in der die SQL-Befehlsausgabe gespeichert wird. Wichtig ist, den richtigen Namen der Datenbank zu verwenden. Sie finden es im dbaccess-Tool (während Sie DB-Verbindung auswählen).

Der zweite Befehl wird zur Anzeige des Datums verwendet:

```
sed 's/\\/g' cert_gedumpte_to_file | openssl x509 -noout -dates
```

Beispielausgabe:

```
[root@CUCM861 certs]# su - informix
-bash-3.2$ echo "unload to 'cert_dumped_to_file' delimiter " " select certificate from
certificate where serialnumber = '6a6967b3000000000003'"|dbaccess -e ccm9_1_2_1000_28
```

Database selected.

```
unload to 'cert_dumped_to_file' delimiter select certificate from certificate where
serialnumber = '6a6967b3000000000003'
```

1 row(s) unloaded.

Database closed.

```
-bash-3.2$ sed 's/\\/g' cert_dumped_to_file | openssl x509 -noout -dates
```

notBefore=Jun 10 22:16:01 2005 GMT
notAfter=May 14 20:25:42 2029 GMT

5 C CCM-Zertifikat-Verifizierung

CallManager als Service muss das Client-Zertifikat für den erfolgreichen TLS/SSL-Handshake mit dem Telefon oder Gateway überprüfen.

Die Fehler finden Sie in SDL/SDI Traces zusammen mit Fehlercode, der sich auf die OpenSSL-Bibliothek bezieht:

```
00370874,000 |09:50:27,713 |AppInfo |SdISSTCPLListener::verify_cb pre-verify=0,cert verify  
errno=20,deep=0
```

```
00370875,000 |09:50:27,713 |AppInfo |HandleSSLERror - Fehler bei der  
Zertifikatsüberprüfung:(Verifizierungsfehler:20)- Lokales Ausstellungszertifikat für  
192.168.255.95:52089 kann nicht abgerufen werden
```

Liste der OpenSSL-Fehlercodes:

<https://www.openssl.org/docs/apps/verify.html#DIAGNOSTICS>

Wenn Sie Zertifikate mit CA-Signatur generieren, stellen Sie sicher, dass diese mit der richtigen Schlüsselverwendung generiert werden, wie im CSR gefordert, andernfalls werden sie möglicherweise nicht ordnungsgemäß verifiziert:

http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/cucm/cucos/8_6_1/cucos/osg_861_cm/iptpc_h6.html#wp1055278

Der CUCM verwendet für die Zertifikatsvorgänge die OpenSSL-Bibliothek, sodass Sie das Zertifikat unter dem Root manuell überprüfen können. Das von einer externen Zertifizierungsstelle signierte Tomcat-Zertifikat ist im Folgenden dargestellt:

```
[root@cucmpub trust-certs]# ls -l e87b20d3.0  
lrwxrwxrwx 1 certbase ccmbase 31 Jul 8 00:01  
e87b20d3.0 -> moliszowy-WIN-V8HGEMMBHOU-CA.pem
```

```
[root@cucmpub trust-certs]# cd /usr/local/platform/.security/tomcat/certs  
[root@cucmpub certs]# openssl verify -CApath /usr/local/platform/.security/tomcat/trust-certs  
tomcat.pem
```

tomcat.pem: OK

5.D. Tomcat Trust-Store- und Keystore-Verifizierung

Tomcat kann zwei verschiedene SSL-Implementierungen verwenden:

- die JSSE-Implementierung als Teil der Java-Laufzeit (seit 1.4)
- die APR-Implementierung, die die OpenSSL-Engine standardmäßig verwendet.

Welche SSL-Implementierung von Tomcat verwendet wird, kann in der *Konfigurationsdatei server.xml* (in */usr/local/third_party/jakarta-tomcat/conf*) unter HTTPS-Connector-Konfiguration überprüft werden - Keystores werden von der JSSE-Implementierung verwendet, Zertifikate in pem/der Form werden von der APR-Implementierung verwendet:

```
<Connector SSLEnabled="true" URIEncoding="UTF-8" acceptCount="100"
ciphers="TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA_256,TLS_RSA_WITH_AES_256_CBC_SHA,TLS_DHE_DSS_WITH_AES_256_CBC_SHA,TLS_RSA_WITH_AES_128_CBC_SHA,TLS_DHE_RSA_WITH_AES_128_CBC_SHA,SSL_RSA_WITH_3DES_EDE_CBC_SHA,SSL_DHE_RSA_WITH_3DES_EDE_CBC_SHA" clientAuth="false" disableUploadTimeout="true" enableLookups="false"
keystoreFile="/usr/local/platform/.security/tomcat/certs/tomcat.keystore"
keystorePass="pPSTJpLa8QLuEpVp" keystoreType="PKCS12" maxHttpHeaderSize="8192"
maxSpareThreads="150" maxThreads="150" minSpareThreads="25" port="443"
protocol="HTTP/1.1" scheme="https" secure="true" server="" sessionTimeout="3600"
sslProtocol="TLSv1.2" sessionCacheSize="10000"/>
```

Das Zertifikat, das angezeigt wird, wenn Sie versuchen, eine Verbindung zu einer von Tomcat gehosteten Webanwendung herzustellen, befindet sich in einem kennwortgeschützten Schlüsselbereich:

```
/usr/local/platform/.security/tomcat/certs/tomcat.keystore
```

Auf diesen Keystore kann mit dem OpenSSL-Dienstprogramm zugegriffen werden, um dessen Inhalt zu überprüfen:

```
openssl pkcs12 -in /usr/local/platform/.security/tomcat/certs/tomcat.keystore -info -password
file:/usr/local/platform/.security/tomcat/keys/tomcat.passphrase
```

Die Ausgabe des oben angegebenen Befehls zeigt ein gepuffertes Zertifikat des Tomcat-Dienstes an, sowie einen privaten Schlüssel, nachdem keystorePass in einer Eingabeaufforderung eingegeben wird.

Tomcat-gehostete Dienste, für die eine Zertifikatsüberprüfung für ausgehende SSL-Verbindungen erforderlich ist (z. B. sichere Verbindung mit LDAP durch IMS), verwenden tomcat-trust.keystore als Vertrauensspeicher zur Überprüfung von Zertifikaten, die vom Server während des SSL-Handshake angezeigt werden.

Speicherort des Truststore:

```
/usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore
```

Abrufen einer Liste von Zertifikaten aus TrustStore:

```
openssl pkcs12 -in /usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore -info -
password file:/usr/local/platform/.security/tomcat/keys/tomcat-trust.passphrase
```

Entladen von Zertifikaten aus dem TrustStore in eine temporäre Datei und gleichzeitiges Anzeigen aller Zertifikate:

```
openssl pkcs12 -in /usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore -info -
password file:/usr/local/platform/.security/tomcat/keys/tomcat-trust.passphrase 2>dev/null
1>/root/tomcat-trust.pem
```

```
openssl crl2pkcs7 -nocrl -certfile /root/tomcat-trust.pem | openssl pkcs7 -print_certs -noout-text
```

Wenn ein Zertifikat, das sich im Truststore befinden muss, fehlt, kann es in den Keystore importiert werden:

```
keytool -importcert -file somecert.pem -storetype pkcs12 -keystore
/usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore -storepass $(cat
/usr/local/platform/.security/tomcat/keys/tomcat-trust.passphrase)
```

Wenn der ganze TrustStore beschädigt ist, kann er mit folgendem Skript wiederhergestellt werden:

```
#!/bin/bash
```

```
mv /usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore{,.bak}
```

```
Passphrase=$(cat /usr/local/platform/.security/tomcat/keys/tomcat-trust.passphrase)
```

```
für f in /usr/local/platform/.security/tomcat/trust certs/*.pem
```

```
do
```

```
echo "Processing $f"
```

```
/usr/local/third party/java/j2sdk/bin/keytool -importcert -keystore
```

```
/usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore -alias "$(basename
```

```
`${f%.pem}`)" -noprompt -storepass $passphrase -storetype pkcs12 -providername JsafeJCE -
```

```
providerclass com.rsa.jsafe.provider.JsafeJCE -providerpath
```

```
/usr/local/thirdparty/java/cryptojFIPS.jar -file "$f"
```

```
fertig
```

```
chown certbase:ccmbase /usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore
```

```
chmod 755 /usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore
```

```
chcon —reference='/usr/local/platform/.security/tomcat/trust-certs/tomcat-trust.keystore.bak'
```

```
/usr/local/platform/security/tomcat/trust-certs/tomcat-trust.keystore
```

Der Text eines Skripts kann in einer Datei gespeichert und wie folgt ausgeführt werden:

```
bash /root/truststore_repair.sh
```
