

Cisco Unified Intelligent Contact Management Enterprise 7.5

Cisco® Unified Communications Solutions unify voice, video, data, and mobile applications on fixed and mobile networks, enabling easy collaboration every time from any workspace.

Product Overview

Through a combination of multichannel contact management, intelligent routing, and network-to-desktop computer telephony integration (CTI), Cisco Unified Intelligent Contact Management Enterprise segments your customers, monitors resource availability, and delivers each contact to the most appropriate resource anywhere in the enterprise. To complete this transaction, the software profiles each customer using contact-related data such as dialed number and calling line ID, caller-entered digits, data submitted on a web form, or information obtained from a customer-profile database. Simultaneously, the system monitors the resources available in the contact center to meet customer needs, including agent skills and availability, interactive-voice-response (IVR) status, queue lengths, and more.

Cisco Unified Intelligent Contact Management Enterprise gives your customers the choice to interact with your contact center by phone, web, text chat, or email message. Cisco Unified Intelligent Contact Management Enterprise provides centralized management control over customer contacts, allowing you to implement a single set of business rules that uniformly address customer needs independent of contact channel or resource location.

This combination of customer and contact center data is processed through user-defined routing scripts that graphically reflect your company's business rules, enabling Cisco Unified Intelligent Contact Management Enterprise to route each contact to the optimum resource anywhere in the enterprise. Wherever an agent is based, the system delivers a unique and rich set of call-event and customer-profile data to the targeted desktop as a contact arrives, personalizing service and maximizing efficiency. Throughout the process, carrier-class, distributed fault tolerance from the network to the desktop helps ensure uninterrupted operation in the contact center.

Features and Benefits

Cisco Pre-Routing and Post-Routing Functions

The Cisco Pre-Routing function makes routing decisions for each call while it is still in the carrier's network, helping enable the Cisco platform to effectively segment customers, balance calls across the enterprise, and deliver each contact to the best enterprise resource the first time.

The Cisco Post-Routing function provides the intelligent distribution of contacts already connected to a peripheral in your network, whether it is an automatic call distributor (ACD), private branch exchange (PBX), interactive voice response (IVR), or web or email server. When a contact requires redirection, Cisco Unified Intelligent Contact Management Enterprise applies business logic instructing the peripheral to send the contact to the best available enterprise resource. For contacts flowing between sites or among agents, skill groups, or IVRs, the Cisco Post-Routing

function optimizes each customer's interaction by applying the retained data collected by the Cisco Pre-Routing function, eliminating the need for your customer to restate any previously collected information.

Customer Profile Routing

Cisco Unified Intelligent Contact Management Enterprise extends the sources of data available for making contact routing decisions and for populating agent desktop applications. For instance, Cisco Unified Intelligent Contact Management Enterprise can perform a lookup in your customer-profile database during routing to more effectively segment customers and determine the best destination for each contact. Moreover, you can use information obtained from customer relationship management (CRM) packages to even more precisely match customers with agents and expand the data available to screen pop applications.

Computer Telephony Integration Option

Cisco Unified Intelligent Contact Management Enterprise allows companies to deploy a complete network-to-desktop CTI strategy, including comprehensive functions at the agent's workstation. Cisco Unified Intelligent Contact Management Enterprise delivers a rich set of data to business applications, providing enterprisewide call-event and customer-profile information to a targeted agent's desktop. Cisco Unified Intelligent Contact Management Enterprise sets a new standard for true enterprisewide, network-to-desktop CTI with minimal custom development or systems integration, helping enable your organization to implement CTI quickly and cost-effectively.

Customer Relationship Management (CRM) Integration

Your company can save costs, improve efficiency, and increase revenue by using Cisco Unified CRM Connector to integrate your third-party CRM applications with Cisco Unified Contact Center solutions. This integration allows the agent to use the third-party CRM user interface as the sole interface to manage customer interactions. The agent can log in, control agent state, and conduct calls through the CRM user interface. When a new call arrives, a screen pop of CRM information instantly appears on the agent's terminal and CRM information is retrieved by phone number, IVR information, or agent-entered information. Agents can route calls, connect them to a conference, or transfer them from within the CRM screen. Incoming and outgoing call activity is logged here as well.

Today's call centers need unified call flows, unified business processes, and unified desktops for both call management and business-transaction navigation. The Cisco Unified CRM Connector is a comprehensive tool that readily supports popular CRM packages, including Oracle PeopleSoft, Oracle Siebel, SAP, Microsoft CRM, and Salesforce.com. With Cisco Unified CRM Connector, agents can place, receive, and transfer customer interactions with full, real-time access to third-party CRM customer data — saving money, increasing revenue, improving monitoring, and facilitating excellent customer service.

Cisco Unified Web Interaction Manager

Cisco Unified Web Interaction Manager can help your contact center agents respond immediately to customer questions, using your website along with text chat or real-time Web collaboration. Agents can also use web collaboration in parallel with a voice conversation to provide simultaneous voice and visual interaction. Web collaboration allows contact center agents and customers to share webpages and collaboratively complete online forms. Cisco Unified Intelligent Contact Management Enterprise routes customer requests from your website using the same routing logic used for voice calls. Its reporting function also provides contact center statistics on all

interactions, regardless of the communication channel used. By facilitating effective, personalized customer assistance, Cisco Unified Web Interaction Manager is suitable for both sales- and service-oriented contact centers.

Cisco Unified E-Mail Interaction Manager

Cisco Unified E-Mail Interaction Manager is a comprehensive solution for managing large volumes of customer email inquiries submitted to your company mailboxes or website. Based on customizable business rules, Cisco Unified E-Mail Interaction Manager accelerates the response process by automatically directing messages to the right agent or support team, categorizing and prioritizing messages, suggesting relevant response templates, and, if desired, sending automated replies. Quick, accurate turnaround of inquiries helps build stronger customer relationships, added value, and greater efficiency in the contact center.

IVR Integration

IVR integration supports customer identification and segmentation, skills-based routing, and IVR load balancing while extending the value of IVR investments. The open IVR interface of Cisco Unified Intelligent Contact Management Enterprise allows any IVR application to communicate with the Cisco platform, enabling the IVR to act as a routing client, as a managed resource, and as a queue point. A service control interface allows Cisco Unified Intelligent Contact Management Enterprise to control IVR scripting, providing a single, unified scripting environment to which business rules can be applied. This Cisco solution also supports call queuing at a premises- or network-based IVR and directs the IVR to connect the call when an appropriate agent becomes available anywhere in the enterprise.

Enterprise Reporting

Cisco Unified Intelligent Contact Management Enterprise provides a collection of real-time and historical data necessary for mission-critical contact center reporting. Cisco Unified Intelligent Contact Management Enterprise provides accurate and timely reports on contact center activity, allowing managers to make informed decisions regarding staffing levels, contact handling procedures, and technology investments. Standard reporting templates provide ready-to-use functions for common reporting needs. Custom reports extend this package to meet more specific reporting needs. Furthermore, the open software architecture of Cisco Unified Intelligent Contact Management Enterprise allows for the consolidation of timely and accurate information from the Internet, carrier networks, ACDs, IVRs, web servers, databases, business applications, and other resources, creating a more complete view of the contact center enterprise.

Distributed Fault Tolerance

From the network to the desktop, all Cisco Unified Intelligent Contact Management Enterprise components and external application links provide carrier-class, distributed fault tolerance at both the hardware and software levels, with real-time application failover capabilities. Self-diagnosing and self-healing, the system automatically takes advantage of redundant components when required and is resilient to hardware component failures, communications network failures, and asynchronous software errors. Cisco Unified Intelligent Contact Management Enterprise also includes a Simple Network Management Protocol (SNMP) feed for integration into a broader corporate fault-management system.

Multicarrier, Multivendor Capabilities

The Cisco solution helps you meet business objectives without the limitations of proprietary or custom solutions. The open architecture of Cisco Unified Intelligent Contact Management Enterprise supports a heterogeneous environment of carrier networks, ACDs, PBXs, and IVRs, and complementary software applications — enhancing the value of existing investments. The solution allows your company to include multiple toll-free carrier networks in a single contact center enterprise while supplying advanced functions beyond those of traditional offerings.

Cisco also offers platform independence, while extending the value of premises-based equipment, by supporting a mixed environment of ACDs and IVRs. And integration with common applications for CRM, agent scheduling, workflow management, voice recording, and other activities allows your company to address unique business requirements while maintaining an enterprise view of contact center performance.

Scalability

Cisco Unified Intelligent Contact Management Enterprise supports both enterprise and single-site architectures and can scale to accommodate thousands of agents at multiple sites. If your company's use of Cisco Unified Intelligent Contact Management Enterprise grows to span many locations, the system is designed to accommodate your changing environment while protecting your initial investment.

Security

Cisco Unified Intelligent Contact Management Enterprise supports the latest in security and data integrity features and solutions. When deployed, the application servers are hardened, Secure Sockets Layer (SSL) is available on all web-based applications, and Transport Layer Security (TLS) and IP Security (IPsec) support is available for sockets-based communications to secure data in transit across trusted and untrusted networks.

In addition to supporting the latest antivirus applications from the major vendors, Cisco offers, as part of its unified communications solutions, the Cisco Security Agent, a host-based intrusion detection and prevention application that provides added protection. By analyzing behavior rather than relying on signature matching, Cisco Security Agent complements the capabilities of antivirus software to provide a robust solution to protect your network and reduce operational costs. Cisco Unified Communications Services

Cisco Unified Communications Services allows you to accelerate cost savings and productivity gains associated with deploying a secure, resilient Cisco Unified Communications Solution. Delivered by Cisco and our certified partners, our portfolio of services is based on proven methodologies for unifying voice, video, data, and mobile applications on fixed and mobile

networks. Our unique lifecycle approach to services can enhance your technology experience to accelerate true business advantage.

Summary

Cisco Unified Intelligent Contact Management Enterprise allows your company to integrate traditional inbound and outbound voice applications with today's Internet applications such as real-time chat, web collaboration, and email messaging. This integration allows for unified capabilities, allowing a single agent to support multiple interactions simultaneously, regardless of the communications channel the customer has chosen. Each interaction is unique and, therefore, may require individualized service. Cisco provides contact center solutions to manage each interaction based on virtually any contact attribute.

Within these capabilities, Cisco can bridge the gap between traditional ACDs and IP infrastructures, integrating voice, chat, email, and web collaboration applications over both technologies, allowing your company to maintain current investments in call center products such as ACDs, IVRs, and PBXs and take advantage of the wide range of Cisco solutions to support the same contact center requirements in a converged network environment — continuing your evolution toward a true Customer Interaction Network.
