Executive summary

Today the IT industry is going through a tremendous revolution. While evolving technologies such as IoT, image processing, AI/ML, autonomously driven vehicles, and intelligent manufacturing are growing rapidly, not only are customers transitioning their software and applications, they are also transforming the hardware layer for the underlying distributed infrastructure. Hyperconverged infrastructures are fast-to-deploy, simple-to-manage, and increasingly agile, thereby reducing the operational costs of daily IT operations, and are becoming a standardized choice for the enterprise and edge data centers.

Cisco HyperFlex™ and Cisco HyperFlex Edge systems are proven industry-leading hyperconverged solutions, optimized choices for many applications in a virtualized environment. Cisco HyperFlex systems combine converged computing and networking capabilities provided by the Cisco Unified Computing System™ (Cisco UCS®) with next-generation Cisco HyperFlex data platform storage software to deliver an innovative hyperconverged platform with all the computing resources, network connectivity, storage, and a hypervisor platform needed to run an entire virtual environment, all managed as a single, uniform system. The Cisco HyperFlex system delivers a cost-effective solution with simplified deployment, ease of day-to-day management, and many enterprise-class features. A HyperFlex™ powered data center can host many applications, services, and workloads, including virtual desktops that you can access from across the enterprise, in campus, WAN, and other remote locations. The large number of connected devices in enterprises today, accessing applications in the data center and exchanging content and data, also makes the workloads hosted in the data center more vulnerable to cyberattacks and other security threats. A robust security strategy to protect endpoints and data from advanced threats, therefore, becomes a critical factor in any IT architecture, including hyperconverged data center infrastructure.

The Cisco SecureX™ solution is an integrated and open security platform that integrates the Cisco® security portfolio with your IT infrastructure. It provides greater simplicity and visibility and maximizes operational efficiency with automated workflows. In addition, it unifies your entire security ecosystem in one location, including endpoint security to further enrich threat detection, investigation, and response. A core part of the Cisco SecureX platform, Cisco Advanced Malware Protection (AMP) for Endpoints, is deployed as a preventative and investigative tool supporting detection and/or response functions for Windows, MacOS, Linux, Android, and iOS devices. With the AMP Unity feature, you can make these functions available on other AMP-enabled devices such as firewalls, web gateways, and email proxies. The connectors installed in these end devices use metadata that it then sends to the Cisco AMP cloud for further analysis. For organizations with rigorous privacy requirements, a private cloud option is available for monitoring and protecting the AMP-enabled devices.

This document presents a validated solution for deploying a Cisco AMP Private Cloud virtual appliance (AMPv) on a Cisco HyperFlex system. It also provides guidance about the hardware and software requirements, procedures for installation and configuration of a Cisco HyperFlex Storage cluster, and instructions about how to deploy AMPv on Cisco HyperFlex hyperconverged infrastructure.

Solution overview

Security is an integrated part of the Cisco HyperFlex architecture. It comes from following the Cisco Security Development Lifecycle (Cisco SDL), which is a structured methodology for security development. It uses the Cisco security infrastructure to conduct regular security audits and to track exposure from common components and provide regular fixes. Cisco HyperFlex systems are built on highly secured Cisco UCS hardware, which has many security features such as Secure Boot, Hardware Root of Trust, Firmware Authenticity, and Secure Unique Device Identifier (SUDI) for anti-counterfeit, etc. It also has a set of features

that address the key requirements for certain security-conscious industries. For example, you can use data-at-rest encryption to achieve compliance for industry regulations, and Cisco HyperFlex uses a policy-based approach to ensure uniform and secure key management and deployment across the whole cluster. Refer to this [document](#) to learn more about the security advantages on Cisco HyperFlex systems.

In addition, by using the products from the Cisco industry-leading security portfolio, Cisco HyperFlex continues to deliver proven solutions for protecting the data and applications running in data centers. A core part of the Cisco security-integrated platform, Cisco AMP is a cloud-managed endpoint security solution that provides the visibility and control to prevent cyberattacks. It rapidly detects, contains, and remediates advanced threats before damage can be done, and without affecting operational efficiency. It allows you to investigate and identify multiple files with context from integrations across security products. It provides detailed information about affected endpoints and devices. Additionally, it allows you to block files at endpoints and AMP-capable edge devices and immediately quarantine affected endpoints with the AMP Host Isolation response feature. Cisco AMP cloud, hosted in the public cloud, usually provides all of these protection capabilities. However, if you require an on-premises solution, the Cisco AMP Private Cloud appliance provides an enterprise private cloud solution with the proximate features. The appliance addresses privacy requirements without compromising the ability to take advantage of the power of collective security intelligence and provides network and endpoint protection across edge and enterprises data centers. It delivers threat protection using file reputation, malware analysis, continuous monitoring of all file activity, and security intelligence stored locally.

You can deploy Cisco AMP Private Cloud on both the virtual and physical appliances. The virtual appliance deployment option lets you choose the underlying hardware. This choice is important because the efficiency of the infrastructure affects the efficiency of the application and the speed of data collection and processing, storage performance, and resource management. Cisco HyperFlex systems are an optimized choice for a Cisco AMP Private Cloud virtual deployment in a VMware ESXi virtual environment.

This document describes how to build a Cisco AMP Private Cloud on a Cisco HyperFlex cluster. It provides guidance about the requirements and instructions about how to deploy the Cisco AMP virtual appliance on Cisco HyperFlex hyperconverged infrastructure.

Figure 1 provides an overview of the solution.

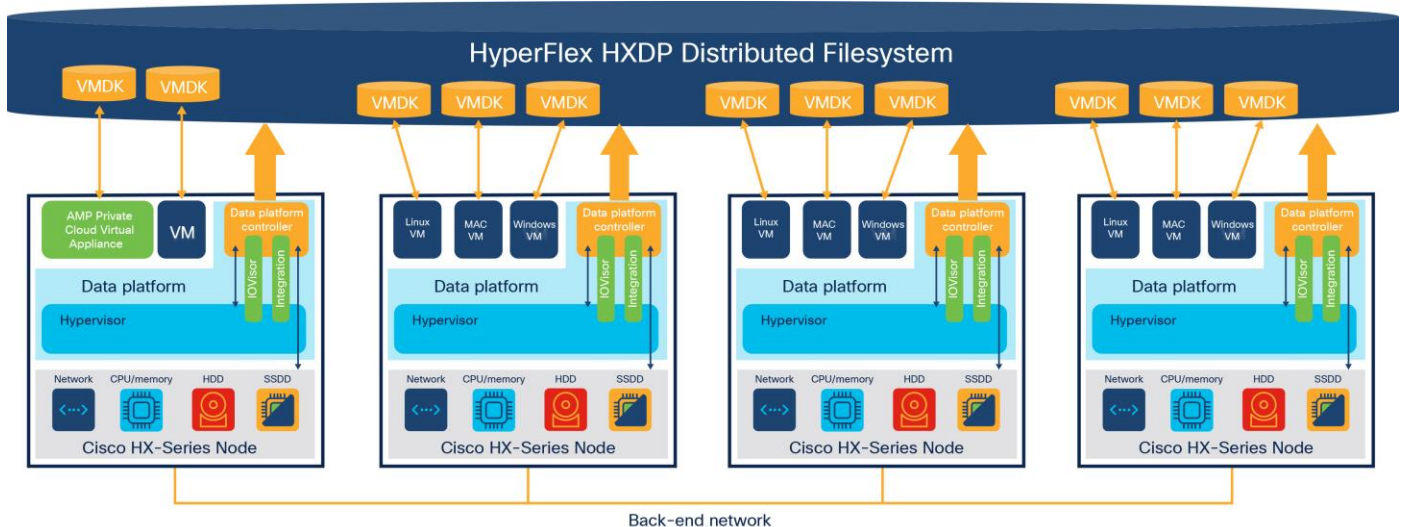

Figure 1.
High-level solution overview

Cisco HyperFlex and HyperFlex Edge systems

Cisco HyperFlex systems are built on the Cisco UCS platform. You can deploy these highly flexible and efficient systems quickly, reducing your risk. A main goal of the systems is simplicity of deployment and operation. They provide a hyperconverged platform that allows you to start small and grow in increments in the future and enable the support for any application of any scale. Many enterprise data centers have deployed these systems and adapted them for the small edge environments.

The Cisco HyperFlex system delivers a new generation of flexible, scalable, enterprise-class hyperconverged solutions with many enterprise-class features, such as:

- A fully distributed log-structured file system that supports thin provisioning
- High performance and low latency from the flash-friendly architecture
- Inline data optimization with deduplication and compression
- Fast and space-efficient clones through metadata operations
- The flexibility to scale out computing and storage resources separately
- Data-at-rest encryption using hardware-based self-encrypting disks (SEDs)
- Non-volatile memory express (NVMe)-based solid-state disk (SSD) support
- Native replication of virtual machine snapshots
- Cloud-based smart management

combines software-defined computing in the form of Cisco HyperFlex HX-Series nodes, software-defined storage with the powerful Cisco HX Data Platform, and software-defined networking with the Cisco UCS fabric that integrates seamlessly with Cisco Application Centric Infrastructure (Cisco ACI®). These technologies together offer a single point of connectivity and management and deliver a validated and adaptable cluster with a unified pool of resources that you can quickly deploy, scale, and manage to efficiently power your applications and your business. The system provides the following benefits:

- **Simplicity:** The solution is designed to be deployed and managed easily and quickly through familiar tools and methods. No separate management console is required for the Cisco HyperFlex solution.
- **Centralized hardware management:** The cluster hardware is managed consistently by service profiles in Cisco UCS Manager, which also provides a single console for solution management, including firmware management. A plug-in to VMware vCenter manages Cisco HyperFlex HX Data Platform clusters.
- **High availability:** Component redundancy is built into most levels at the node. Cluster-level tolerance of node, network, and fabric interconnect failures is implemented as well.
- **Enterprise-class storage features:** Complementing the other management efficiencies are features such as thin provisioning, data deduplication, compression, cloning, and snapshots to address concerns related to overprovisioning of storage.
- **Flexibility with a “pay-as-you-grow” model:** You can purchase the exact amount of computing and storage you need and expand one node at a time up to the supported cluster node limit.
- **Agility to support different workloads:** Support for both hybrid and all-flash models allows you to choose the right platform configuration for capacity-sensitive applications or performance-sensitive applications according to budget requirements.

A standard Cisco HyperFlex system is composed of the following components:

- One pair of Cisco UCS fabric interconnects
- Cisco HyperFlex HX-Series HX220c or HX240c rack-mount servers
- Cisco HyperFlex HX Data Platform software
- VMware vSphere ESXi hypervisor
- VMware vCenter Server (supplied by the end user)

A standard Cisco HyperFlex cluster requires a minimum of three HX-Series nodes. Data is replicated across at least two of these nodes, and a third node is required for continuous operation in case of a single-node failure. The HX-Series nodes combine the CPU and RAM resources for hosting guest virtual machines with a shared pool of the physical storage resources used by the HX Data Platform software. HX-Series hybrid nodes use a combination of SSDs for caching and hard-disk drives (HDDs) for the capacity layer. HX-Series all-flash nodes use SSD or NVMe storage for the caching layer and SSDs for the capacity layer.

The Cisco HyperFlex Edge system is a new type of Cisco HyperFlex system that is optimized for remote sites, branch offices, and edge environments. As a smaller form factor of the Cisco hyperconverged solution, the Cisco HyperFlex Edge system offers the same power as the Cisco HyperFlex system without the need for connecting to Cisco UCS fabric interconnects. It supports a configuration of two, three, or four HyperFlex converged nodes (Edge does not support compute-only nodes) and allows you to scale up capacity by hot-adding additional capacity drives to the nodes.

The Cisco HyperFlex HX Data platform is a high-performance, distributed file system with a wide range of enterprise-class data management services. Its innovations redefine distributed storage technology, exceeding the boundaries of first-generation hyperconverged infrastructures. The data platform simplifies operations and helps ensure data availability with many enterprise-class storage features.

An HX Data platform controller resides on each node and implements the Cisco HyperFlex HX Distributed File system. The storage controller runs in user space within a virtual machine, intercepting and handling all input/output (I/O) requests from guest virtual machines. The storage controller virtual machine uses the VMDirectPath I/O feature to provide Peripheral Component Interconnect (PCI) pass-through control of the serial-attached SCSI (SAS) disk controller of the physical server. This approach gives the controller virtual machine full control of the physical disk resources. The controller integrates the data platform into VMware software through three preinstalled VMware ESXi vSphere Installation Bundles (VIBs): the VMware API for Array Integration (VAAI), a customized IOvisor agent that acts as a stateless Network File System (NFS) proxy, and a customized stHypervisorSvc agent for Cisco HyperFlex data protection and virtual machine replication.

The HX Data platform controllers handle all read and write requests from the guest virtual machines to the virtual machine disks (VMDKs) stored in the distributed data stores in the cluster. The data platform distributes the data across multiple nodes of the cluster and across multiple capacity disks in each node according to the replication-level policy selected during cluster setup. The replication-level policy is defined by the Replication Factor (RF) parameter. When RF = 3, a total of three copies of the blocks are written and distributed to separate locations for every I/O write committed to the storage layer; when RF = 2, a total of two copies of the blocks are written and distributed.

You can administer the HX Data platform through a VMware vSphere web client plug-in or through the HTML5-based native Cisco HyperFlex Connect management tool. In addition, you can manage Cisco HyperFlex systems remotely with the Cisco Intersight™ cloud-based management platform. You can deploy and manage the Cisco Intersight platform from the cloud, providing a low-cost, easy-to-deploy, remote-management feature set for

Cisco HyperFlex systems for your IT environments without requiring experienced technicians at the deployment site.

You can install a Cisco HyperFlex system or Cisco HyperFlex Edge system using one of the following:

- The on-premises Cisco HyperFlex Installer appliance
- Cisco Intersight from the cloud

The on-premises Cisco HyperFlex Installer appliance is available as an OVA file that you can download from the Cisco website. After the HX Installer virtual machine is installed in your existing ESXi environment, you can access it through a web browser on the local computer by navigating to the IP address of the HX Installer virtual machine. It guides you through the process of setting up your cluster. Some specific workflows to support the installation for Standard clusters, Edge clusters, or Stretched clusters are available. The HyperFlex Installer assigns IP addresses to the HX-Series servers that come from the factory with ESXi hypervisor software preinstalled. The installer deploys the HyperFlex Controller virtual machine and software on the nodes, add the nodes to the vCenter cluster, and then finally creates the HyperFlex cluster and distributed filesystem. You can complete all of these processes with a single workflow from the HyperFlex Installer webpage.

You also can deploy HyperFlex clusters rapidly with the Cisco Intersight solution, where the HyperFlex installer sits in the cloud. It constructs a preconfiguration definition of your cluster, called a HyperFlex Cluster Profile. This definition is a logical representation of the HX nodes in your HyperFlex cluster. Each HyperFlex node provisioned in Cisco Intersight is specified in a HyperFlex Cluster Profile.

Cisco Intersight Cloud Management platform

Cloud-based management platforms provide unified access to applications and infrastructure monitoring, configuration, and orchestration, thereby reducing the complexity of IT management by simplifying and unifying the deployment and management of many devices. Cisco Intersight is Cisco's new system management platform for Cisco UCS servers and Cisco HyperFlex systems that delivers intuitive computing through cloud-powered intelligence. This cloud-based platform offers a centralized management that enables your IT organization to analyze, simplify, and automate your environment in ways that were not possible with traditional tools. It is designed to help your IT management and operations achieve a higher level of automation, simplicity, and operational efficiency, empowering your organization to achieve significant savings in Total Cost of Ownership (TCO) and to deliver applications faster, so they can support new business initiatives.

You can access the Cisco Intersight platform at <https://intersight.com/>. This cloud management platform simplifies the installation, monitoring, troubleshooting, upgrade, and support for your infrastructure with the following benefits:

- Cloud-based management: The ability to manage the Cisco UCS and HyperFlex platforms from the cloud offers you the speed, simplicity, and ease of scaling your company's infrastructure whether in the data centers or remote and branch-office locations.
- Automation: The unified application programming interface (API) in Cisco UCS and Cisco HyperFlex systems enables policy-driven configuration and management of the infrastructure, and it makes Cisco Intersight itself and the devices connected to it fully programmable and DevOps-friendly.
- Analytics and telemetry: Cisco Intersight monitors the health and relationships of all the physical and virtual infrastructure components. It also collects telemetry and configuration information for developing the intelligence of the platform in accordance with Cisco information security requirements.

- **Connected Cisco Technical Assistance Center (TAC):** Solid integration with Cisco TAC enables more efficient and proactive technical support. The Cisco Intersight platform expedites sending files to speed troubleshooting, thereby providing enhanced operations automation.
- **Recommendation engine:** Driven by analytics and machine learning, the Cisco Intersight Recommendation Engine provides actionable intelligence for IT operations management from the daily increasing knowledge base and practical insights learned in the entire system.
- **Management as a service:** Cisco Intersight provides management as a service and is designed to scale infinitely and implement easily. It relieves you of the burden of maintaining systems management software and hardware.

The Cisco Intersight solution supports monitoring and managing Cisco HyperFlex clusters. With the Cisco HX-Series rack-mount servers connected through the network, the platform provides comprehensive lifecycle management for the HyperFlex systems, including remote cloud-based installation through retirement. You can upgrade the Cisco Intersight website and framework with new and enhanced feature sets independently of the products that are managed, meaning that many new features and capabilities can come with no downtime or upgrades you have to perform. This innovative combination of embedded and online technologies will result in a complete cloud-based management solution that can care for the Cisco HyperFlex platform (Figure 2).

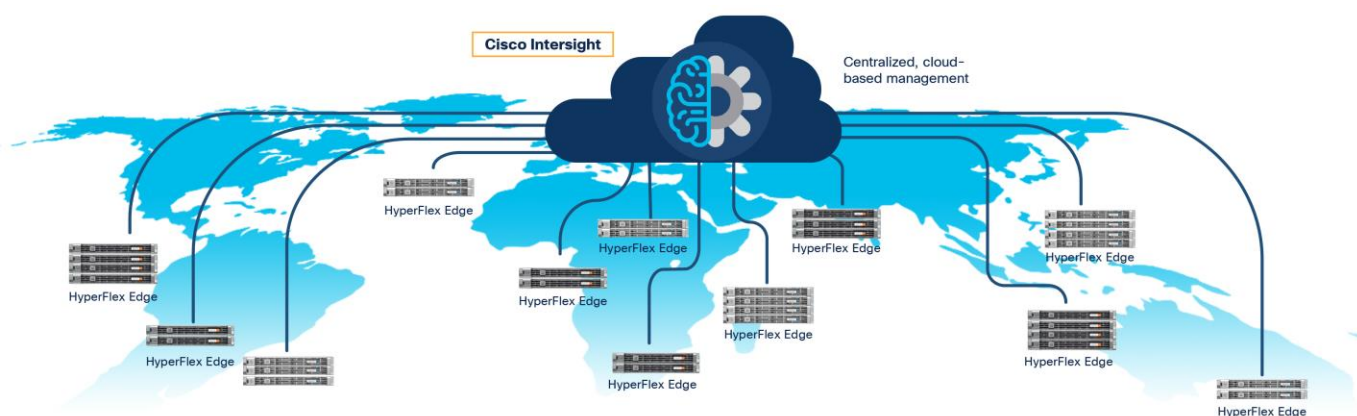

Figure 2.
Cisco Intersight Managed HyperFlex systems

The Cisco Intersight virtual appliance delivers the management features of the Cisco Intersight SaaS platform for Cisco UCS and HyperFlex in an on-premises IT environment with high security restrictions. The virtual appliance form factor satisfies additional data locality, security, or compliance requirements that are not completely met by connecting directly to intersight.com in the cloud. Deployment of the Cisco Intersight virtual appliance has two modes. Cisco Intersight Connected Virtual Appliance deployment requires a connection back to Cisco and Intersight services to get updates and access required services for all functions of intersight.com. You can redirect communication back to Cisco through a proxy server if direct connectivity is not available or allowed by policy. Cisco Intersight Private Virtual Appliance deployment is intended for an environment where you operate data centers in a disconnected (air gap) mode. You can deploy Cisco Intersight Virtual Appliance from a VMware OVA that you can download from Cisco.com. Then you can deploy the solution as a virtual machine in your existing environment. It uses a subscription-based license delivered through Cisco Smart Licensing.

Cisco Advanced Malware Protection Private Cloud

Cyber security threats are growing significantly in frequency and complexity in today's new world. With more and more devices connected and more sophisticated applications deployed, this growth also introduces new

exploitable weaknesses. The security solutions to protect your IT environment become more and more difficult to address, and the impact on the business might be very costly. The Cisco Security portfolio consists of a broad set of technologies that help ensure security across the network, cloud, email, applications, and endpoints. For example, Cisco Meraki™ integration safeguards your network with centrally cloud-managed security and Software-Defined WAN (SD-WAN), Cisco Tetration Analytics™ sensors provide advanced workload protection with application visibility and micro-segmentation, Cisco Duo verifies the identity of users and inspects the devices trying to access your applications, the Cisco Umbrella® security solution shields you from unsafe Internet destinations whether they are on or off the network, and more. All products function as a team under a single platform: Cisco SecureX, which provides seamless interoperability with your security infrastructure, including third-party technologies. The Cisco SecureX platform connects the breadth of the Cisco integrated security portfolio and your infrastructure for a consistent experience that unifies visibility, enables automation, and strengthens your security across your whole IT infrastructure. By connecting technologies in an integrated platform, the Cisco SecureX platform delivers measurable insights, desirable outcomes, and exceptional cross-team collaboration.

As a key integration in the Cisco SecureX platform, Cisco AMP consolidates prevention, detection, and response capabilities in a single solution, taking advantage of the power of cloud-based analytics. Cisco AMP for Endpoints can protect your Windows, Mac, Linux, Android, and iOS devices. With the AMP Unity feature, you can offer these functions on your other AMP-enabled devices such as firewalls, web gateways, and email proxies. AMP prevents attacks by providing the latest global threat intelligence to strengthen defenses, a built-in antivirus engine to detect and block attacks at the point of entry, built-in sandboxing technology (ThreatGRID® technology) to analyze unknown files, and proactive protection capabilities that close attack pathways and minimize vulnerabilities. But if malware evades these prevention measures and gets inside, AMP continuously monitors and records all file activity to quickly detect malicious behavior, retrospectively alert security teams, and then provide deep visibility and a detailed recorded history of the malware behavior over time—where it came from, where it's been, and what it's doing. It can then automatically contain and remediate the threat.

Cisco AMP is normally integrated with Cisco ThreatGRID technology to provide intelligent threat prevention. ThreatGRID technology is a unified malware analysis and threat intelligence platform (Figure 3). It performs automated static and dynamic analysis, producing human-readable behavioral indicators for each file submitted. The ThreatGRID global scalability promotes context-rich information that you can use directly or through content-rich threat intelligence feeds. The integration of the ThreatGRID sandboxing technology and advanced malware analysis capabilities into AMP provides more than 700 unique behavioral indicators analyzing the actions of a file, easy-to-understand threat scores, and billions of malware artifacts at your disposal for unmatched scale and coverage from global threats. You can deploy ThreatGRID technology as a cloud software as a service (SaaS) platform or on-premises physical appliance. The ThreatGRID appliance is equipped with a large amount of hardware and software resources and cannot be deployed as a virtual appliance. The integration option for Cisco AMP Private Cloud with Cisco ThreatGRID appliance is supported; you can achieve malicious marking for Cisco AMP Private Cloud only by integrating with the ThreatGRID appliance. The steps for deploying Cisco ThreatGRID appliance and integrating it on AMP are out of the scope and not described in this document. You can find more information at [Cisco On-Premises Threat Grid](#).

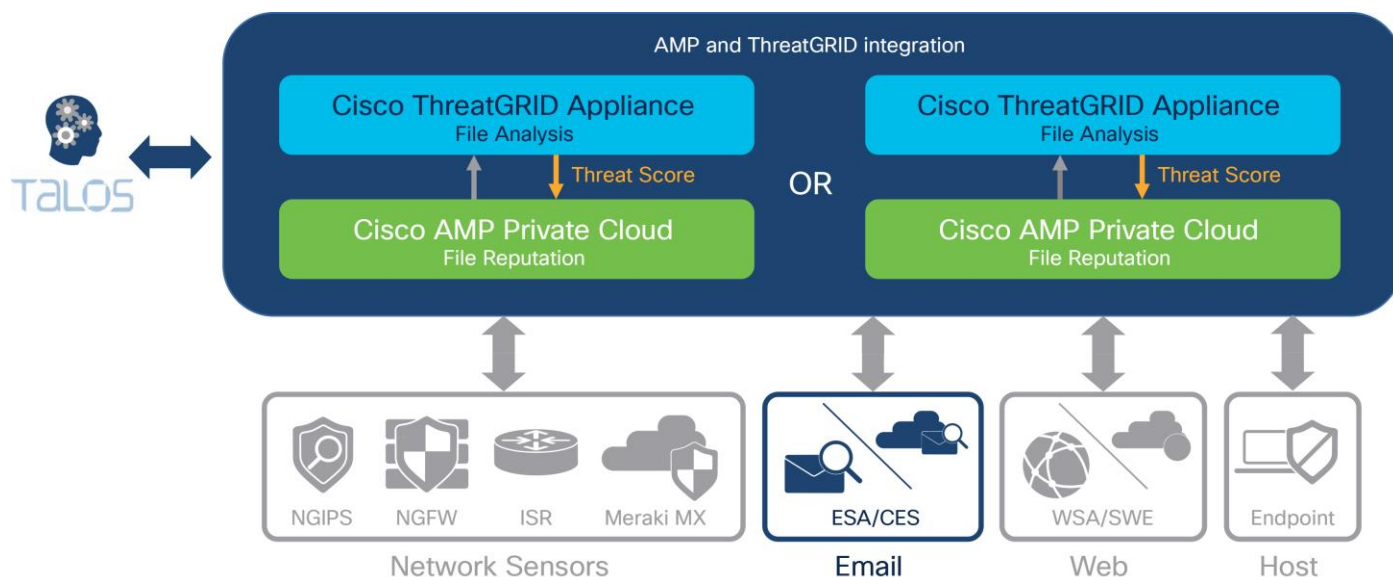

Figure 3.
Cisco AMP and ThreatGRID architecture

Cisco AMP provides many benefits, including:

- More effective, efficient, and pervasive protection that goes beyond prevention: It analyzes files and traffic continuously. This capability helps enable retrospective security. You can look back in time and trace processes, file activities, and communications to understand the full extent of an infection, establish root causes, and perform remediation.
- Monitoring that enables unmatched visibility: It introduces a new level of intelligence, linking and correlating various forms of retrospection into a lineage of activity available for analysis in real time. It can then look for patterns of malicious behavior from an individual endpoint or across the environment of endpoints.
- Advanced analysis that looks at behaviors over time: It provides automation through advanced behavioral detection capabilities that deliver a prioritized and collated view of top areas of compromise and risk.
- Investigation that turns the hunted into the hunter: It shifts activity from looking for facts and clues as part of an investigation to a focused hunt for breaches based on actual events such as malware detections and behavioral indications of compromise (IoCs).
- Containment that is truly simple: It provides visibility into the chain of events and context that complements its dashboards and trajectory views. AMP lets you target specific applications, files, malware, and other root causes. Breaking the attack chain is not only quick but also easy.
- Dashboards that are actionable and contextual: Reports are not limited to event enumeration and aggregation. Its actionable dashboards allow for streamlined management and faster response.
- Integrated platforms that work better together: You can fully integrate Cisco AMP for Endpoints, Cisco AMP for Networks, and other AMP deployments together.

Three options currently are available for deployment of Cisco AMP platform:

- Cisco AMP Public Cloud
- Cisco AMP Private Cloud physical appliance

- Cisco AMP Private Cloud virtual appliance (AMPv)

The AMP Private Cloud physical appliance supports both cloud proxy deployment mode and air-gap deployment mode, whereas the AMP Private Cloud virtual appliance supports only cloud proxy deployment mode. In the cloud proxy mode, all traffic from endpoint connectors goes to the private cloud, but an Internet connection is needed to complete disposition lookups. Also, you can retrieve content and software updates automatically from the AMP Public Cloud directly to the AMP Private Cloud virtual appliance. The communication between Cisco AMPv and the public cloud is conducted using a propriety protocol tunneled over Secure Sockets Layer (SSL), and only SHA-256 hashes are sent to the AMP Public Cloud. All the endpoint connectors use metadata for analysis. Before the deployment, consult with your IT administrator to determine which firewall ports need to be opened to allow the connectivity.

The deployment of Cisco AMP Private Cloud virtual appliance requires two network interfaces, one for the administration network and the other for the production network. You can align them with the network design in the HyperFlex system. The Cisco HyperFlex system has communication pathways that fall into four defined network zones:

- Management zone
- Storage zone
- VMotion zone
- Virtual Machine zone

For the network configuration for Cisco AMP Private Cloud virtual appliance, the production network sits in the virtual machine zone. You can place the administration network in the management zone.

Figure 4 provides a logical view of the network design of the solution.

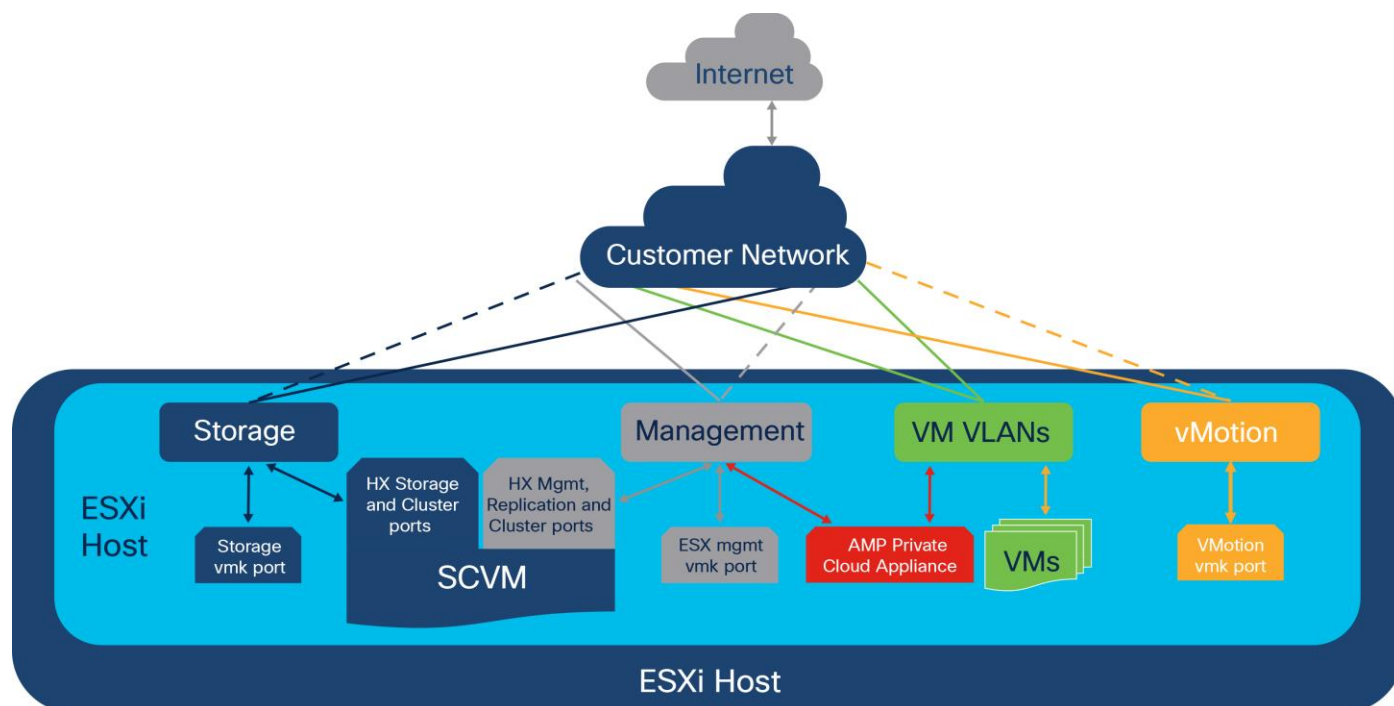

Figure 4.
Solution network design

Table 1 shows the mapping applied for this document between the AMP Private Cloud virtual appliance network and the Cisco HyperFlex network.

Table 1. Mapping between Cisco AMPv and Cisco HyperFlex networks

AMPV network	Cisco HyperFlex VLAN	Notes
Production	Cisco AMP private VLAN on the guest virtual machine network	Cisco HyperFlex guest virtual machine port group is created in the HyperFlex configuration.
Administration	Cisco HyperFlex Storage Controller management VLAN	The network can be the same as the Cisco HyperFlex management network, or it can be different, depending on the local environment. It must have access to the internet.

The AMP virtual appliance model provides the option to run the Cisco AMP solution in on-premises VMware ESXi virtualized environments. It allows you to deploy the Cisco AMP platform on your premises using the hardware of your choice. The AMPv version with VMware ESXi is well-suited for the environments that host fewer than 10,000 connectors (endpoint devices).

Table 2 lists the requirements for deploying the Cisco AMP Private Cloud virtual appliance in an ESXi environment.

Table 2. Prerequisites for running the Cisco AMP Private Cloud virtual appliance

Components	Prerequisites	
Software	<ul style="list-style-type: none"> VMware vSphere ESXi 5 or later Capability to access the VMware vSphere Flash Player GUI Cisco AMP Private Cloud software-only appliance .ova file 	
Hardware	CPU	Minimum 8 CPUs
	RAM	Minimum 64 GB
	Storage	<ul style="list-style-type: none"> Minimum 1 TB disk capacity on the VMware datastore SSD type of drive required Minimum Data Store Random Reads (4K): 60K IOPS Minimum Data Store Random Writes (4K): 30K IOPS
Network	<p>Two virtual networks are required for deployment:</p> <ul style="list-style-type: none"> Production network: This network is user-dedicated to the guest virtual machines and endpoints. Administration network: This network is the public network that you connect to for the configuration, setup, and installation of the appliance. It must be reachable from the user who is performing the deployment, and must have access to the internet. This network is used for Cisco AMPv administration portal access. 	

Setup and topology for validation testing

This section introduces the devices used in validating the solution described in this document (Figure 5):

- Cisco HyperFlex cluster (x 1) composed of:
 - Cisco HyperFlex HX220c M5SX All Flash converged node (x 4)
 - Cisco UCS 6454 Fabric Interconnect (x 2)
- Cisco Nexus® 93180YC-EX Switch (x 2)

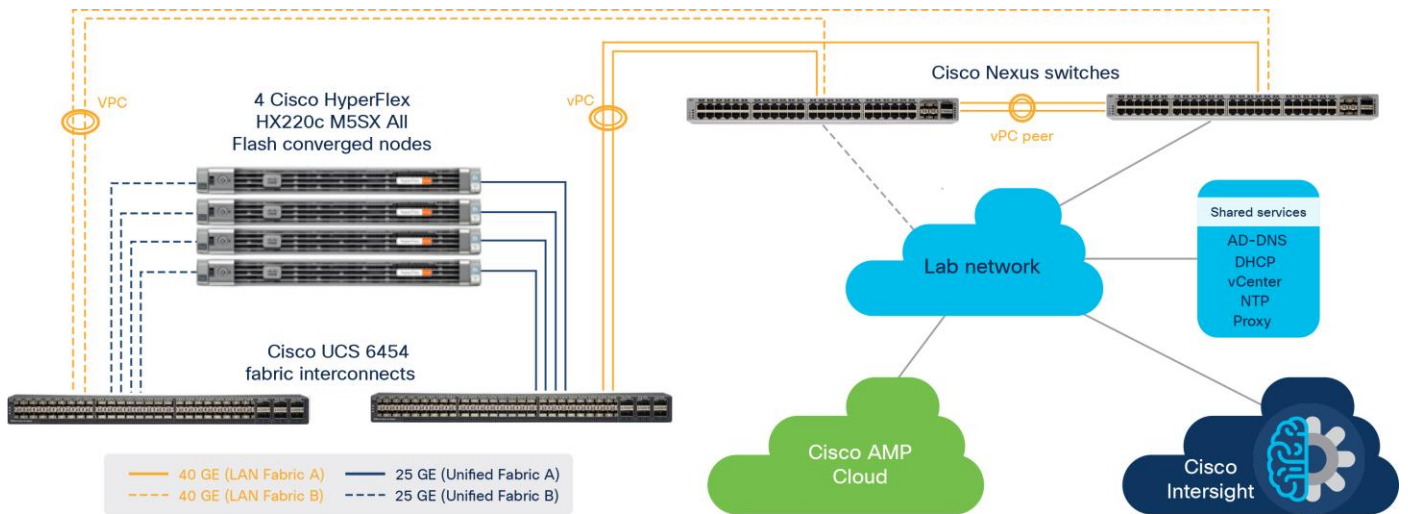

Figure 5.
Physical devices

Figure 6 provides a diagram of the virtual machines used in the testing environment.

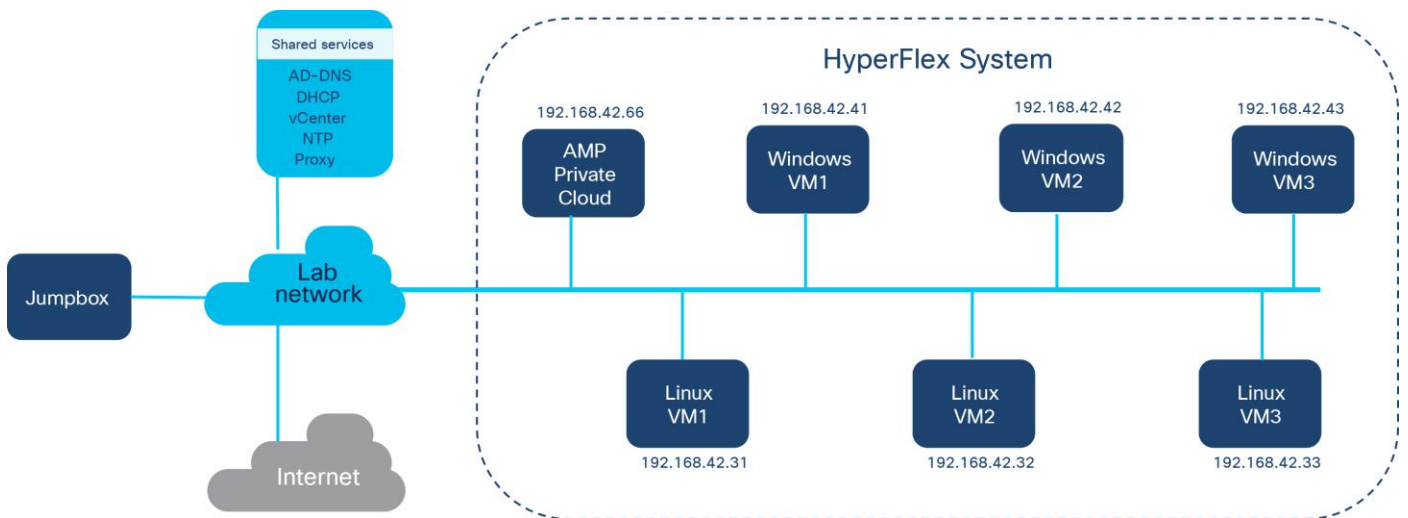

Figure 6.
Testing setup

Table 3 lists the converged node specifications.

Table 3. Cisco HyperFlex HX220c M5SX All Flash Node specifications

Components	Specifications	Notes
CPU	2 x second-generation Intel Xeon Gold 6248 CPUs	2 x 20 cores
Memory	12 x 32-GB DDR4 2933-MHz RDIMMs	384 GB
Disk controller	1 x Cisco 12-Gbps modular SAS HBA	
SSD	1 x 240-GB 2.5-inch enterprise value 6-GB SATA SSD	Housekeeping

Components	Specifications	Notes
	1 x 1.6-TB 2.5-inch NVMe high-performance high-endurance SSD	Configured as cache
	6 x 960-GB 2.5-inch enterprise value 6-GB SATA SSDs	Capacity disks for each node
Network	1x Cisco UCS VIC1457 modular LAN on motherboard (mLOM)	25 Gigabit Ethernet
Boot device	1 x 240-GB M.2 6-GB SATA SSD	Local boot

Table 4 lists the software versions used in the test environment described in this document.

Table 4. Test environment software versions

Layer	Device	Version
Computing	Cisco UCS 6454 Fabric Interconnect pair	Release 4.0(4h)
	Cisco HyperFlex HX220c M5SX All Flash Node firmware	Release 4.0(4h)
Network	Cisco Nexus 93180YC-EX Switch pair	Release 7.0(3)I4(2)
Software	Cisco UCS Manager	Release 4.0(4h)
	Cisco HyperFlex HX Data Platform software	Release 4.0(2b)
	Cisco AMP Private Cloud (software-only virtual appliance)	Version 3.1.2_202005291954 (System)
	Cisco AMP for Endpoints connector (Windows)	Version 7.1.5.11523
	Cisco AMP for Endpoints connector (Linux)	Version 1.12.4.702
	VMware vSphere ESXi	Release 6.5.0, 15256549
	VMware vSphere vCenter	Release 6.5.0.32300
	Windows Server 2016 Standard (Desktop Experience)	Version 1607 (OS Build 14393.1884)
	Red Hat Enterprise Linux 7.5	Release 7.5-8.el7

Cisco AMP Private Cloud deployment in HyperFlex

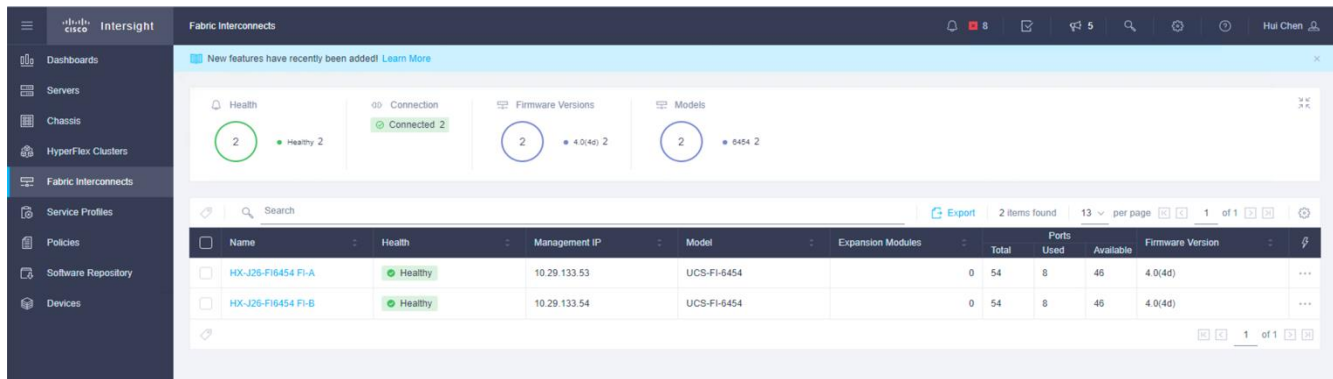

Use the following procedures to configure the Cisco HyperFlex system to run the Cisco AMP Private Cloud virtual appliance software (AMPv) to provide a solid malware protection solution for the endpoints in a virtualized environment. The procedures describe how to deploy and run a HyperFlex Data Platform configuration with an existing vCenter appliance. Although embedded VMware vSphere vCenter is supported, use of an existing vCenter appliance on an external ESXi host or cluster is recommended.

Installing Cisco HyperFlex systems

You can deploy a Cisco HyperFlex system by using an on-premises Cisco HyperFlex Installer appliance, or by using the Cisco Intersight platform from the cloud. In this solution, a Cisco HyperFlex cluster is created using the Cisco Intersight platform.

Prior to the installation, the managed devices must be claimed into the Cisco Intersight platform.

1. Enable the device connector on the Cisco UCS fabric interconnects.
2. In the Cisco Intersight platform <https://intersight.com> , claim the Cisco UCS fabric interconnects for cloud management.
3. In the Fabric Interconnects window of the Cisco Intersight platform, verify that both Cisco UCS FI-A and FI-B are connected.

4. In the Servers window of the Cisco Intersight platform, verify that four Cisco HyperFlex nodes are shown as connected devices.

Health	Management IP	S...	Name	Model	CPU Capac...	Memory Capaci...	UCS Domain
Healthy	10.29.133.25	org-root,	HX-J26-FI6454-2	HXAF220C-M5SX	100.0	384.0	HX-J26-FI6454
Healthy	10.29.133.27	org-root,	HX-J26-FI6454-4	HXAF220C-M5SX	100.0	384.0	HX-J26-FI6454
Healthy	10.29.133.24	org-root,	HX-J26-FI6454-1	HXAF220C-M5SX	100.0	384.0	HX-J26-FI6454
Healthy	10.29.133.26	org-root,	HX-J26-FI6454-3	HXAF220C-M5SX	100.0	384.0	HX-J26-FI6454

Now we can install and configure a Cisco HyperFlex cluster with the Cisco Intersight platform. Cisco Intersight provides an installation wizard to install, configure, and deploy Cisco HyperFlex clusters. The wizard constructs a preconfiguration definition of the cluster called a HyperFlex Cluster Profile. HyperFlex Cluster Profiles are built on policies in which administrators define sets of rules and operating characteristics, such as the node identity, interfaces, and network connectivity. Every active node in the HyperFlex cluster must be associated with a HyperFlex Cluster Profile. After gathering the node configuration settings to build the HyperFlex cluster profile, the installation wizard will validate and deploy this profile to your Cisco HX-Series nodes, thereby creating a Cisco HyperFlex cluster. HyperFlex Policies in Cisco Intersight provide different configurations, including auto support, security, network configuration, and more. You can assign a configured policy to any number of servers to provide a configuration baseline.

1. Log into the Cisco Intersight platform; in the left navigation pane choose Profiles. On the Profiles page, click the HyperFlex Cluster Profiles tab and then click Create HyperFlex Cluster Profile at the top right corner.

Name	Type	Nodes	Status	Last Update
HXStor	FI	4	OK	May 2, 2020 9:57 PM
HXStor2	FI	0	Not Complete	May 2, 2020 8:26 PM
HXStorb	FI	0	Not Complete	May 2, 2020 8:26 PM
HX-EM5	EDGE	0	Not Assigned	Jan 22, 2020 1:49 PM
HX-EM5a	EDGE	0	Not Assigned	Jul 26, 2019 1:52 PM
HX-EM5b	EDGE	0	Not Assigned	Jul 24, 2019 9:45 AM

- The Cisco HyperFlex Cluster Profile installation wizard is displayed. On the General page, enter a cluster name under Name. This cluster name must be unique; it will be used as the Cisco HyperFlex cluster name, VMware vCenter cluster name, and Cisco Intersight cluster name. Select the appropriate HX Data Platform version. Under Type, select Cisco HyperFlex with Fabric Interconnect. Choose 3 for Replication Factor. Select the appropriate Cisco UCS Server Firmware Version. Add a description and tags for this cluster for reference.

Prior to creating a HyperFlex Cluster profile, ensure that you go through the pre-installation checklist and the detailed HyperFlex installation instructions, [here](#).

- Click Next to move to the Cluster Configuration page.

- Click + to expand the Security configuration. Enter root as the hypervisor administrative user. Click the checkbox if the hypervisor on this node uses the factory default password. Enter a user-supplied new password for the hypervisor and a user-supplied password for the Cisco HyperFlex Controller virtual machine. Confirm that password in the second text field. The settings are saved automatically to a policy that you can reuse when you create a new Cisco HyperFlex cluster profile.

The screenshot shows the 'Security' configuration section. It includes a 'Hypervisor Admin' field with the value 'root'. Below it is a checkbox labeled 'The hypervisor on this node uses the factory default password' which is checked. There are two password fields: 'Hypervisor Password' and 'Hypervisor Password Confirmation', both currently empty. Below these are two more password fields: 'Controller VM Admin Password' and 'Controller VM Admin Password Confirmation', also currently empty. Each password field has an eye icon to toggle visibility.

- Click + to expand the DNS, NTP, and Timezone configuration. Choose a time zone from the drop-down list and enter the Domain Name System (DNS) server and Network Time Protocol (NTP) server information. Click + to enter secondary DNS or NTP servers if necessary.

The screenshot shows the 'DNS, NTP and Timezone' configuration section. It includes a 'Timezone' dropdown menu and a 'DNS Suffix' text field. Below these are two text fields for 'DNS Servers' and 'NTP Servers', each with a '+' icon to add more servers.

- Click + to expand the vCenter configuration. Enter the vCenter server fully qualified domain name (FQDN) or IP address, the administrative username, and the password. Enter the name of the vCenter data center that is hosting the Cisco HyperFlex cluster.

The screenshot shows the 'vCenter (optional)' configuration section. It includes a 'vCenter Server FQDN or IP' field with the value 'hx2vc65.hx.lab.cisco.com'. Below it are 'vCenter Username' (value: 'huich@hx') and 'vCenter Password' (masked with dots). There is also a 'vCenter Datacenter Name' field with the value 'HX2DC'. A 'Select Policy' button is visible in the top right corner.

- Click + to expand the Storage Configuration. Select Clean Up Disk Partitions if you are performing a reinstallation on top of an existing deployment. If you are deploying a Virtual Desktop Infrastructure (VDI) environment on a hybrid Cisco HyperFlex cluster, check the box to enable file system optimizations.

The screenshot shows the 'Storage Configuration (optional)' section. It includes a blue informational banner stating: 'Logical Availability Zones configuration is recommended for HyperFlex Clusters with 8 or more nodes connected to FI.' Below the banner are three checkboxes: 'VDI Optimization' (unchecked), 'Clean up Disk Partitions' (checked), and 'Logical Availability Zones' (unchecked).

- Click + to expand the Auto-Support configuration. Check the box to enable Auto-Support. Enter your email address for service ticket notification.

The screenshot shows the 'Auto Support (optional)' section. A checkbox labeled 'Auto-Support' is checked. To the right, there is a field 'Send Service Ticket Notification to' with the email address 'HXStor@hx.lab.cisco.com' entered. A 'Select Policy' button is visible in the top right corner.

- Click + to expand the IP & Hostname configuration. Enter a host name prefix. In a later step, you will assign host names sequentially to hosts using this prefix. Enter a starting IP address, an ending IP address, and the subnet mask and gateway for the management IP address pool. IP addresses from this range are automatically assigned to hosts during the node configuration step. If you enter only the management network IP addresses, the same range will be used for both VMware ESXi management and Cisco HyperFlex Controller virtual machine management IP addresses. If you want to use a second, noncontiguous range of IP addresses for the Cisco HyperFlex Controller virtual machines, you can optionally enter starting and ending IP addresses and the subnet mask and gateway for the Cisco HyperFlex Controller virtual machine management IP address pool. Note that these two IP address ranges must fall within the same IP subnet and VLAN.

The screenshot shows the 'IP & Hostname' section with a green checkmark icon. The 'Hostname Prefix' is set to 'HX1-C220'. Below this, there are two columns of fields for IP ranges. The first column is for the 'Management Network' and the second is for the 'Controller VM Management Network'. Each column has fields for 'Starting IP', 'Ending IP', 'Subnet Mask', and 'Gateway'. The values entered are: Management Network (10.29.133.32 to 10.29.133.35, 255.255.255.0, 10.29.133.1) and Controller VM Management Network (10.29.133.40 to 10.29.133.43, 255.255.255.0, 10.29.133.1). The policy 'hxstor-node-config-policy' is selected.

- Click + to expand the Network Configuration. Enter the VMotion VLAN name and VLAN ID. Enter the guest virtual machine network VLAN name and VLAN ID. Click + at the right to add input for multiple guest virtual machine networks if necessary. Enter a starting IP address, an ending IP address, and the subnet mask and gateway for the Kernel-based Virtual Machine (KVM) management IP address pool. IP addresses from this range are automatically assigned to hosts during the node configuration step. Enter MAC prefix starting and ending addresses. Enter the VLAN ID for the management network. Click the Jumbo Frames checkbox unless you want to do otherwise.

16. Click Next to proceed to the Nodes Assignment page.

17. Select the available Cisco HyperFlex nodes.

The screenshot shows the 'Nodes Assignment' step (Step 3/6) of the 'Edit HyperFlex Cluster Profile (HXStor)' wizard. The left sidebar shows the progress: 1 General, 2 Cluster Configuration, 3 Nodes Assignment (current), 4 Nodes Configuration, 5 Summary, and 6 Results. The main area has a title 'Nodes Assignment' with a sub-header 'Choose to assign nodes now or later. To deploy the nodes later, choose assign nodes later and then click Save & Close to save your profile details.' Below this, there are two radio buttons: 'Assign Nodes' (selected) and 'Assign Nodes Later'. A toggle switch for 'Show selected(4)' is also present. A table displays 4 items found, with 10 items per page. The table has columns: Name, Status, Assign Status, Model, and Serial. All four nodes are selected, and their 'Assign Status' is 'Not Assigned'. At the bottom, there are buttons for '< Back', 'Close', and 'Next >'.

19. Click Next to move to the Summary page. Review the Cluster Configuration and Nodes Configuration pages. Look for any errors.
20. Click Validate & Deploy to complete the validation and deployment processes together.
21. After deployment has completed successfully, click OK.
22. You can review more detailed status information for the new Cisco HyperFlex cluster in the Cisco HyperFlex Connect management GUI. You can launch Cisco HyperFlex Connect from the Cisco Intersight platform, or you can launch it directly with <https://<HX-Cluster-Management-IP-Address>>. At the Cisco HyperFlex Connect management console, click System Information and verify the status of the Cisco HyperFlex cluster and nodes.

For more details of the procedure to create a Cisco HyperFlex or Cisco HyperFlex Edge cluster, refer to these two documents:

- Cisco Validated Design: [Cisco HyperFlex Edge 4.0 with Cisco Intersight](#)
- Cisco Validated Design: [Cisco HyperFlex 4.0 for Virtual Server Infrastructure with VMware ESXi](#)

Before you put a new Cisco HyperFlex cluster into production, complete the necessary post-installation tasks as follows.

Performing Cisco HyperFlex post-installation configuration

Prior to putting a new HyperFlex cluster into production, you must complete a few post-install tasks. A `post_install` script is provided on the HyperFlex Controller virtual machines to automate the post-installation procedures and verify the HyperFlex cluster configuration. Use the following steps to run the **post_install** script to configure additional settings on the Cisco HyperFlex Storage cluster:

1. Execute Secure Shell Protocol (SSH) on the cluster management IP address and log in using `<root>` username and the controller virtual machine password provided during installation.
2. Run the following command in the shell and press Enter:
`/usr/share/springpath/storfs-misc/hx-scripts/post_install.py`
3. Select the first `post_install` workflow type – New/Existing Cluster.
4. Enter the HX Storage Controller virtual machine root password for the HX cluster (use the one entered during the HX Cluster installation).
5. Enter the vCenter username and password.
6. Enter the ESXi host root password (use the one entered during the HX Cluster installation).

```
root@springpathControllerM6TG8DAXPU:~# /usr/share/springpath/storfs-misc/hx-scripts/post_install.py
```

```
Select post_install workflow-
```

1. New/Existing Cluster
2. Expanded Cluster
3. Generate Certificate

Note: Workflow No.3 is mandatory to have unique SSL certificate in the cluster.
By Generating this certificate, it will replace your current certificate.
If you're performing cluster expansion, then this option is not required.

```
Selection: 1
```

```
Logging in to controller localhost
```

```
HX CVM admin password:
```

```
Getting ESX hosts from HX cluster...
```

```
vCenter URL: 10.29.145.207
```

```
Enter vCenter username (user@domain): uich@hx
```

```
vCenter Password:
```

```
Could not connect to vCenter - Cannot complete login due to an incorrect user name or password.
```

```
Could not login, try again.
```

```
vCenter URL: 10.29.145.207
```

```
Enter vCenter username (user@domain): huich@hx
```

```
vCenter Password:
```

```
Found datacenter HX2DC
```

```
Found cluster HXStor
```

```
post_install to be run for the following hosts:
```

```
hx1-c220-1.hx.lab.cisco.com
```

```
hx1-c220-2.hx.lab.cisco.com
```

```
hx1-c220-3.hx.lab.cisco.com
```

```
hx1-c220-4.hx.lab.cisco.com
```

```
Enter ESX root password:
```

```
Enter vSphere license key? (y/n) n
```

7. You must license the vSphere hosts through the script or complete this task in vCenter before continuing. Failure to apply a license will result in an error when enabling high availability (HA) or the Disaster Recovery System (DRS) in subsequent steps. Enter “n” if you have already registered the license information in vCenter.

```
Enter vSphere license key? (y/n) n
```

8. Enter “y” to enable HA/DRS.

```
Enable HA/DRS on cluster? (y/n) y
```

9. Enter “y” to disable the SSH warning of the ESXi hosts.

```
Disable SSH warning? (y/n) y
```

10. Add the vMotion VMkernel interfaces to each node by entering “y”. Input the netmask, the vMotion VLAN ID, and the vMotion IP addresses for each of the hosts as prompted.

```
Add vmotion interfaces? (y/n) y
Netmask for vMotion: 255.255.255.0
VLAN ID: (0-4096) 3043
vMotion MTU is set to use jumbo frames (9000 bytes). Do you want to change to 1500 bytes? (y/n) n
vMotion IP for hx1-c220-1.hx.lab.cisco.com: 192.168.133.32
Adding vmotion-3043 to hx1-c220-1.hx.lab.cisco.com
Adding vmkernel to hx1-c220-1.hx.lab.cisco.com
vMotion IP for hx1-c220-2.hx.lab.cisco.com: 192.168.133.33
Adding vmotion-3043 to hx1-c220-2.hx.lab.cisco.com
Adding vmkernel to hx1-c220-2.hx.lab.cisco.com
vMotion IP for hx1-c220-3.hx.lab.cisco.com: 192.168.133.34
Adding vmotion-3043 to hx1-c220-3.hx.lab.cisco.com
Adding vmkernel to hx1-c220-3.hx.lab.cisco.com
vMotion IP for hx1-c220-4.hx.lab.cisco.com: 192.168.133.35
Adding vmotion-3043 to hx1-c220-4.hx.lab.cisco.com
Adding vmkernel to hx1-c220-4.hx.lab.cisco.com
```

11. Add virtual machine network portgroups for guest virtual machine traffic. This step adds identical network configuration to all nodes in the cluster. Enter “n” to skip this step if you don't need additional virtual machine networks.

```
Add VM network VLANs? (y/n) n
```

12. Enter “y” to run the health check on the cluster.
13. A summary of the cluster will be displayed upon completion of the script. Make sure the cluster is healthy.

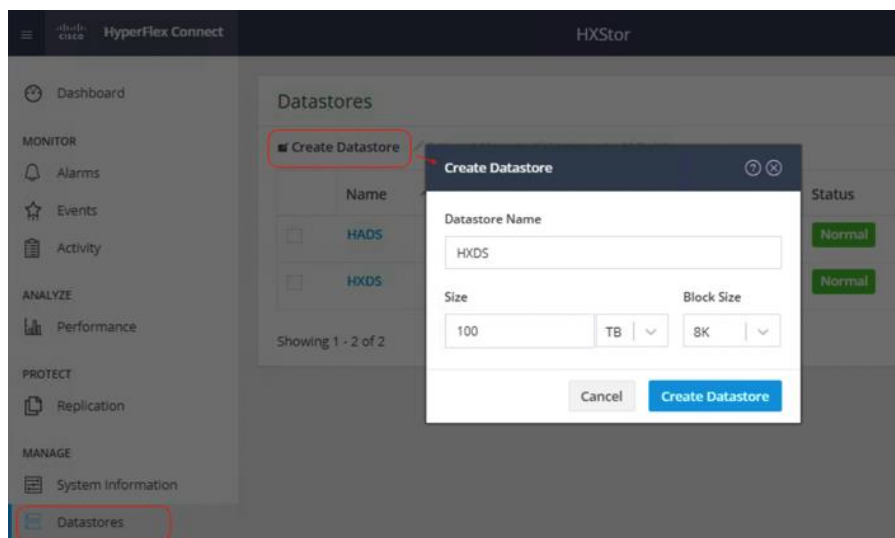

```
Run health check? (y/n) y
Validating cluster health and configuration...

Cluster Summary:
Version - 4.0.1b-33133
Model - HXAF220C-M5SX
Health - HEALTHY
ASUP enabled - False
```

Configuring the data stores

You have two options to configure the data stores for the Cisco HyperFlex Storage cluster. Use the following steps to configure it with the Cisco HyperFlex Connect management console:

1. Use a web browser to open the HX Connect webpage at the management IP address of the cluster; for example: <https://10.29.133.22/>.
2. Enter a local credential or a vCenter Role-Based Access Control (RBAC) credential for the username and the corresponding password.
3. Click Login.
4. Click Datastores from the left navigation pane, and then click Create Datastore.
5. In the popup screen, enter Datastore Name (for example, HXDS), Size, and Block Size, then click Create Datastore.

6. After you have successfully created the data store, check the Datastore status. Make sure that the data store shows as Normal and Mounted.

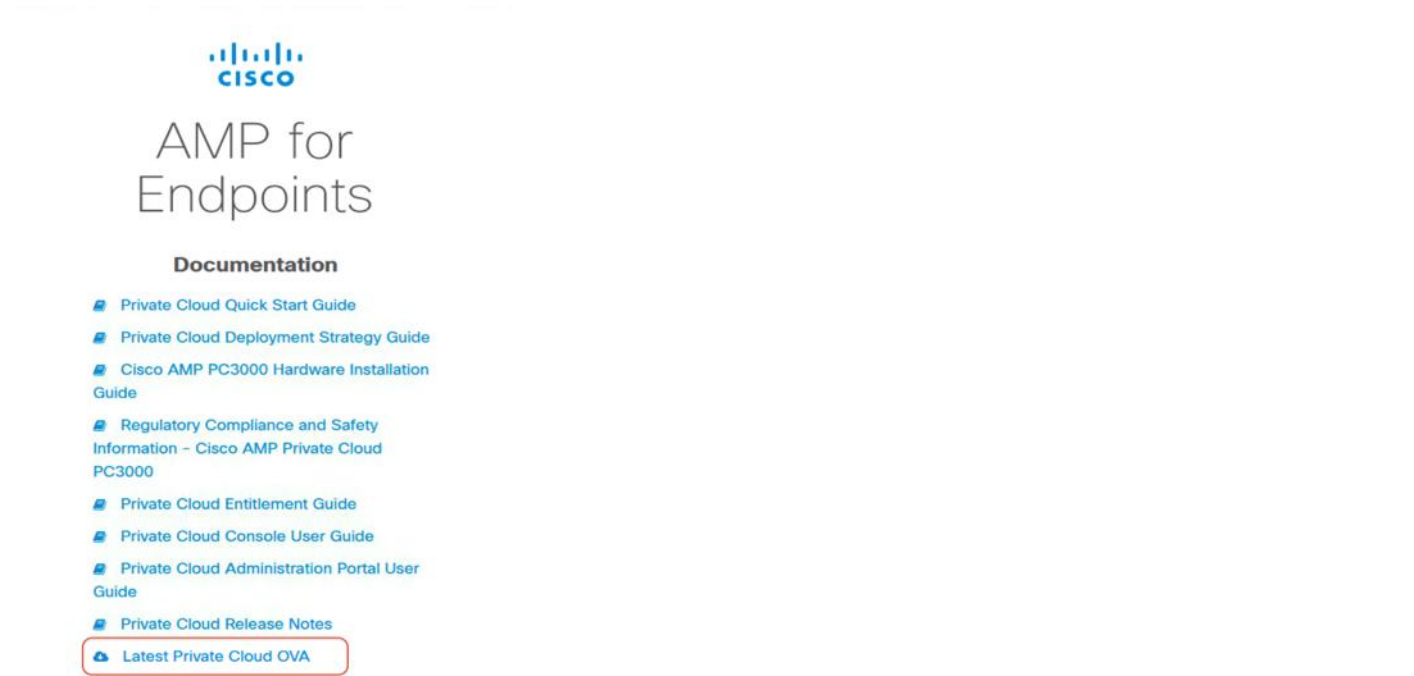

HXStor					
Datastores					
■ Create Datastore ✎ Edit ✓ Mount ⌂ Unmount ✕ Delete					
	Name	Mount Summary	Pairing Status	Status	Size
<input type="checkbox"/>	HADS	Mounted	Unpaired	Normal	2 TB
<input type="checkbox"/>	HXDS	Mounted	Unpaired	Normal	100 TB
Showing 1 - 2 of 2					

Installing Cisco AMP Private Cloud Virtual Appliance

Follow these steps to install the Cisco AMP Private Cloud Virtual Appliance. Before you start, make sure you obtain the appropriate license for the installation of the appliance.

1. Go to the Cisco AMP Private Cloud document website:
https://console.amp.cisco.com/docs/private_cloud. Click Latest Private Cloud OVA at the bottom to download the latest software-only virtual appliance OVA file for deploying AMP Private Cloud in a VMware ESXi environment; for example, PrivateCloud-Latest.ova.

2. Log in to the vSphere vCenter web interface for the HyperFlex cluster.
3. Right-click the Cisco HyperFlex cluster and choose Deploy OVF Template.
4. Enter the location of the downloaded OVF template file. Click Next.
5. Enter the name for the AMP Private Cloud virtual machine and choose the data center in which the virtual machine is deployed. Click Next.

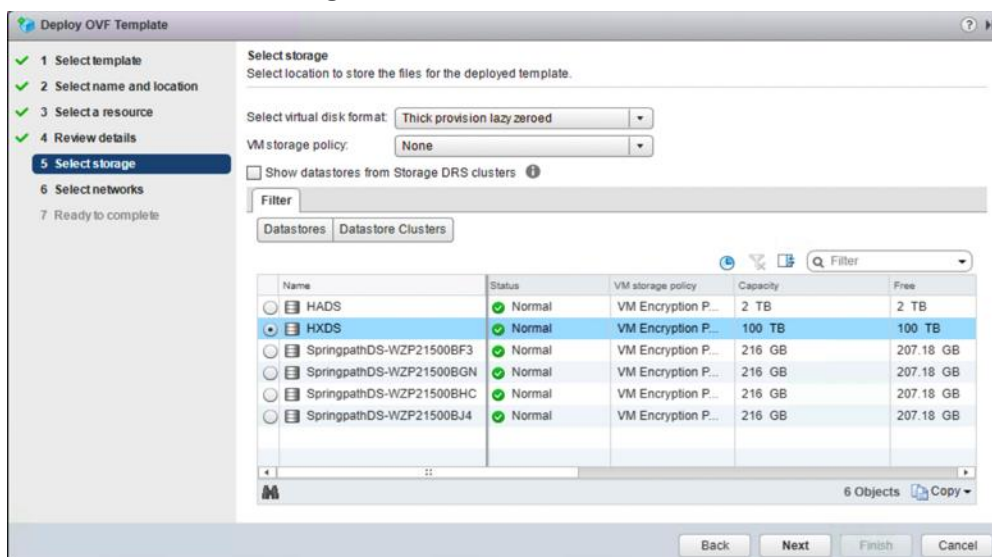

6. Choose the Cisco HyperFlex cluster that is the intended target. Click Next.

7. Review the required resources. Click Next.

8. Choose the Cisco HyperFlex data store that you should use for the deployment. Leave other options at the default settings. Click Next.

9. Choose the appropriate network settings on the Cisco HyperFlex cluster for AMP administrative network. Click Next.

Deploy OVF Template

1 Select template
2 Select name and location
3 Select a resource
4 Review details
5 Select storage
6 Select networks
7 Ready to complete

10. Review and confirm all your configuration parameters. Click Finish.

Deploy OVF Template

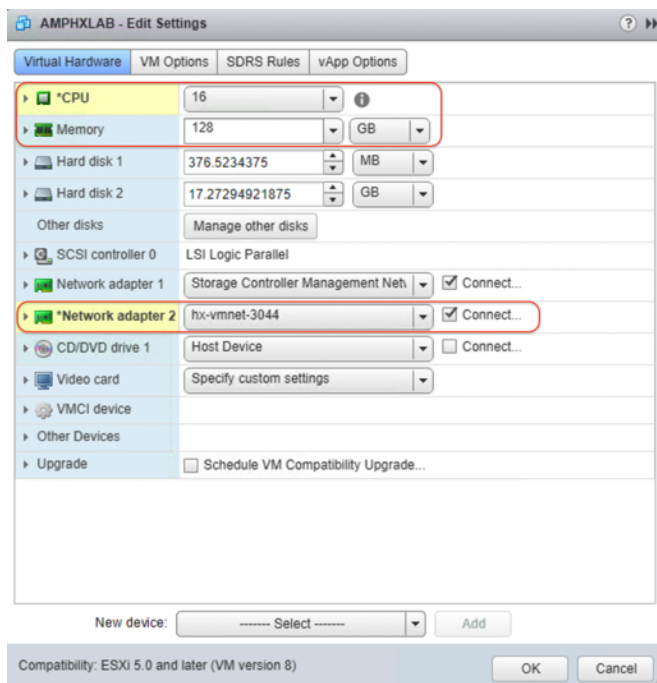

1 Select template
2 Select name and location
3 Select a resource
4 Review details
5 Select storage
6 Select networks
7 Ready to complete

Ready to complete
Review configuration data.

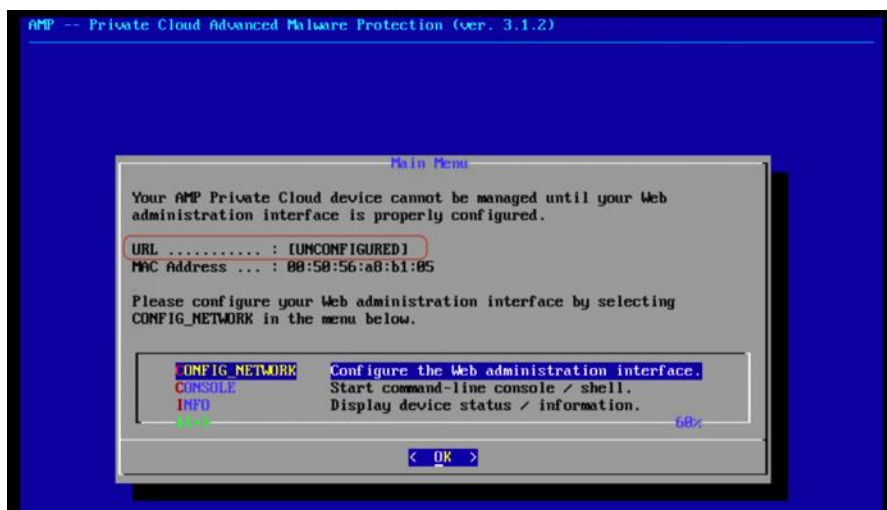

Name	AMPHXLAB
Source VM name	PrivateCloud-Latest
Download size	7.2 GB
Size on disk	1.7 TB
Datacenter	HX2DC
Resource	HXStor
Storage mapping	1
Network mapping	1
IP allocation settings	IPv4, Static - Manual

Back Next Finish Cancel

11. Wait a few minutes for the OVF deployment to be completed.
12. Go back to the vSphere web client, and edit the settings of the newly created virtual machine.
13. Increase the vCPU number and the memory capacity to meet the minimum requirements.
14. Add a second network adapter for the Cisco AMP Private Cloud. Place it in the appropriate production virtual machine network on the Cisco HyperFlex cluster.

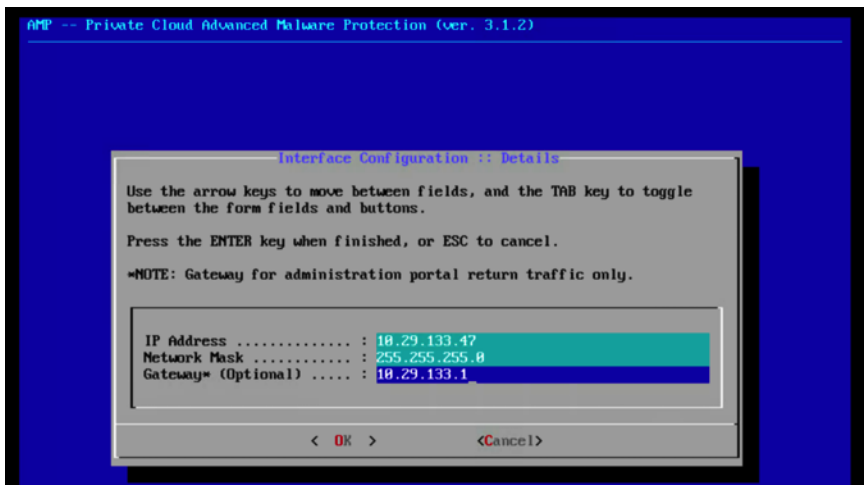

15. Power on the AMP Private Cloud virtual machine.
16. Then power on the AMP Private Cloud virtual machine. The initial startup process of the AMPv will start.
17. After the startup is completed, the Main Menu window appears on the console. The URL shows [UNCONFIGURED] if the administration interface did not receive an IP address from the DHCP server.

18. Navigate to CONFIG_NETWORK and click OK to begin the configuration of the administration IP address for the AMP Private Cloud. You can choose to use Dynamic Host Configuration Protocol (DHCP) or not. If you do not want to use DHCP, select No and click Enter.

19. Enter the IP address, Network Mask, and Default Gateway. Navigate to OK and Click Enter.

20. Choose Yes to continue with a static configuration for the administration interface.

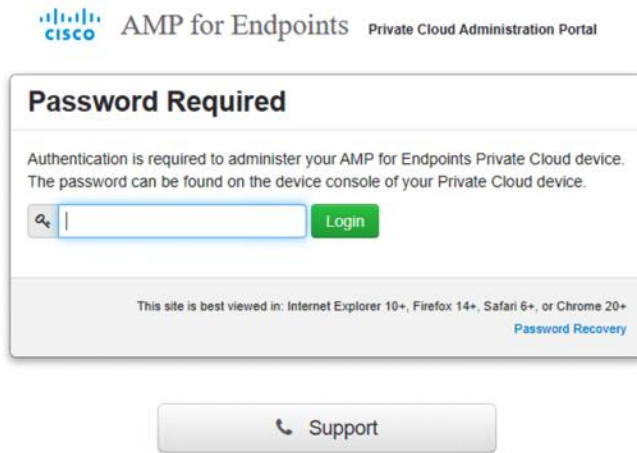

21. Wait until the main console menu appears again. This time you will see an IP address on the URL line. Write down the password that is displayed on the screen. This is a one-time password that is used on the web-based setup.

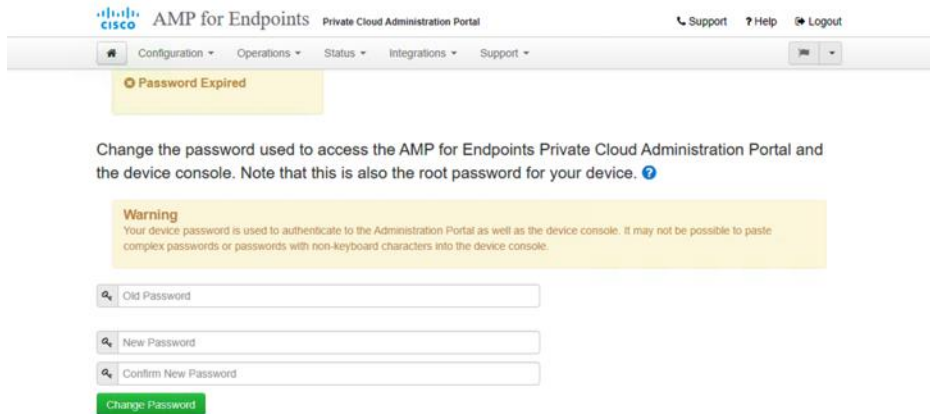

Configuring and deploying Cisco AMP Private Cloud

Now the system is ready to deploy the full set of Cisco AMP Private Cloud configurations.

1. Open a web browser and navigate to the administration IP address of the AMPv appliance. Let the browser trust the self-signed Secure HTTP (HTTPS) certificate of the AMP Private Cloud.
2. Enter the password (use the initial password from the console recorded previously). Click Login.

3. After you log in to the administration portal, change the password.

4. On the next page, scroll down to the bottom of the license agreement, click I HAVE READ AND AGREE to accept the agreement.
5. Continue to the installation page, as shown in the image. You have the options to do a Clean Installation or Restore the configuration from a backup file. In this document, the guidance is for the clean installation. Click Start.

Install or Restore

Either perform a clean installation or select a location to restore your device from. When restoring you will have the option to edit your configuration before restore proceeds.

Clean Installation

Next

8. Now the Welcome to Private Cloud page displays. This page shows you the information you must have before beginning the configuration of the AMP Private Cloud. Read the requirements carefully and collect all the required information.
9. Click Next to start the pre-installation configuration.

Welcome to Private Cloud

Before you begin
AMP for Endpoints Private Cloud needs certain network and infrastructure resources in place. You will be asked to provide this information as you proceed through the installation. For more information and examples, please refer to the Private Cloud Deployment Strategy guide.

- Two Static IP Addresses**
One for administrative use, and the other for enterprise-facing services.
- DNS Server**
Provides hostname resolution to the Private Cloud device.
- Hostnames and Trusted Certificates**
One hostname and trusted certificate for each of the following services:
 - Authentication.
 - AMP for Endpoints Console.
 - Disposition Server.
 - Disposition Server - Extended Protocol.
 - Disposition Update Service.
 - Firepower Management Center Link.
 Note: Hostnames can not be changed once the device has finished installation.
- SMTP Server**
Used for emails, alerts, and notifications.
- NTP Server**
Provides time synchronization across your Private Cloud device and endpoints.
- External Internet connection**
Proxy Mode devices perform anonymized disposition queries against the Cisco Cloud.

12. On the Network Configuration page, perform the network configuration for the Production interface, which connects to your endpoints in your HyperFlex systems. You have two options for the IP address assignment: DHCP or Static. For the Static configuration, enter the IP address, subnet mask, gateway, and DNS servers in the appropriate fields. Click Next (applies configuration).

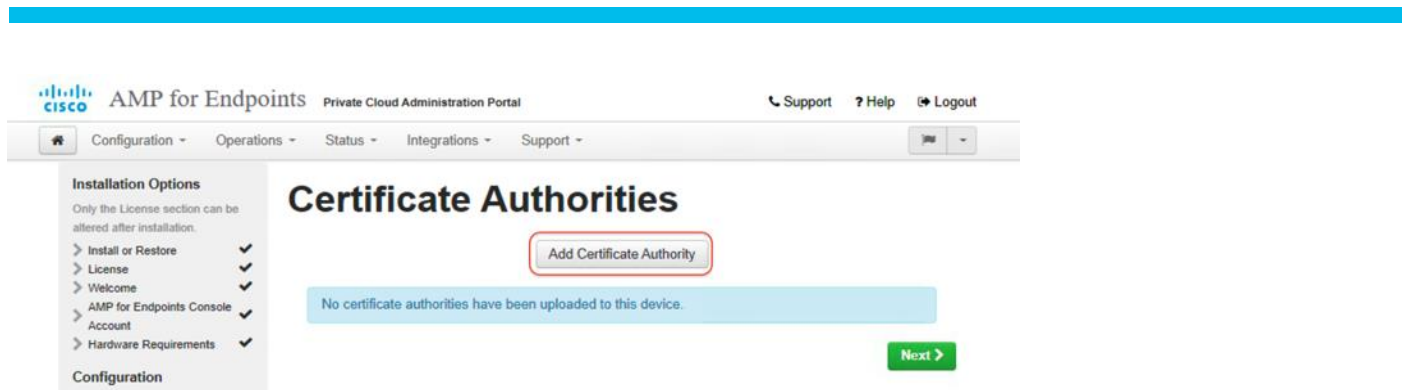

The screenshot shows the Cisco AMP for Endpoints Private Cloud Administration Portal. The left sidebar contains a navigation menu with sections: Installation Options, Configuration, Services, and Other. The main content area is titled "Network Configuration". It includes a warning box about applying configuration, and three main sections: Administration Portal, Interface Configuration, and DNS. The Administration Portal section shows the interface eth0 / 00:50:56:A8:B1:05 with an IP Assignment of 10.29.133.47. The Interface Configuration section shows the interface eth1 / 00:50:56:A8:69:EA with an IP Assignment of (Not Configured). The DNS section shows a Primary DNS Server of 192.168.42.61 and a Secondary DNS Server field. At the bottom, there are buttons for "Start Installation" and "Next (Applies Configuration)".

13. On the Date and Time page, enter the addresses of one or more NTP servers you want to use for Date and Time synchronization. You can specify more than one through a comma or space delimited list. Click Next.

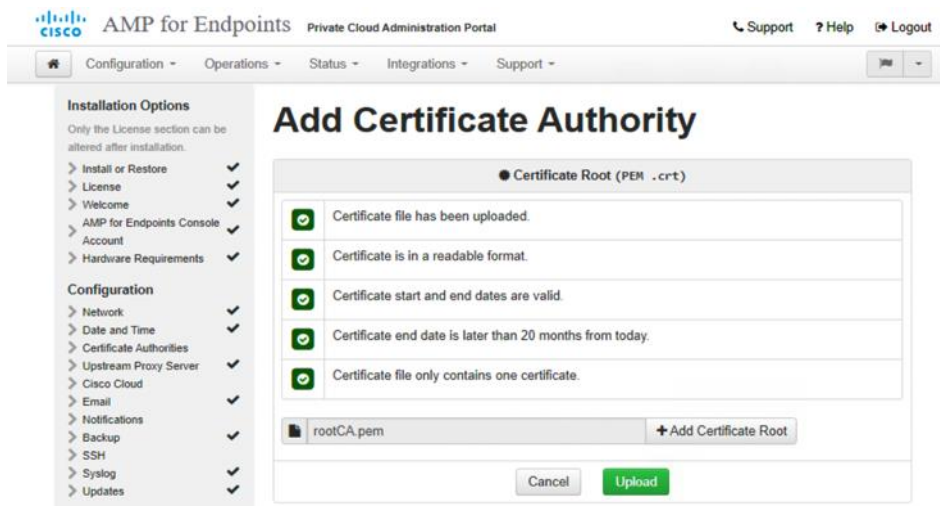

The screenshot shows the Cisco AMP for Endpoints Private Cloud Administration Portal. The left sidebar contains a navigation menu with sections: Installation Options, Configuration, Services, and Other. The main content area is titled "Date and Time". It includes a section for NTP Servers with a text input field containing "192.168.42.62" and a checkbox for "Verify hostname resolution". Below this is a section for Current System Time with a date picker showing "2020 / 7 / 29", a time picker showing "18 : 5 : 26 UTC", and a radio button for "Set by NTP". At the bottom, there is a "Next" button.

14. On the Certificate Authorities page, click Add Certificate Authority to add your root certificate.

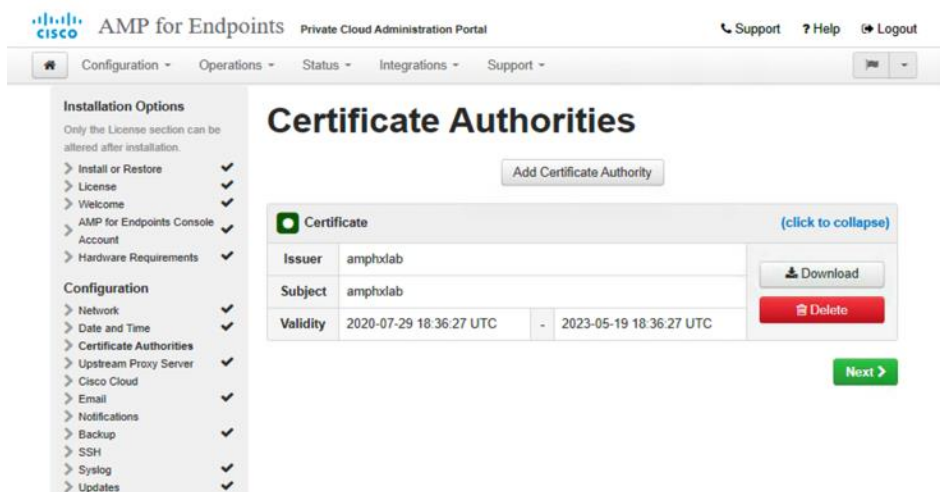

Note: Refer to the Cisco Technote [How to Generate and Add Certificates that are Required for Installation of AMP VPC 3.x Onwards](#) for instructions on Root Certificate generation.

15. On the Add Certificate Authority page, click +Add Certificate Root and select your root certificate file; then Click Upload to continue.

16. On the Certificate Authorities page, click Next after the certificate authority file is uploaded successfully.

17. On the Cisco Cloud page, select the appropriate Cisco Cloud Region. Expand View Hostnames if your lab administrators need to create firewall exceptions for your AMP Private Cloud device to communicate with the Cisco Cloud for file lookups and device updates. Click Next.

The screenshot shows the Cisco AMP for Endpoints Private Cloud Administration Portal. The left sidebar contains a navigation menu with sections: Installation Options, Configuration, and Services. The main content area is titled 'Cisco Cloud' and includes a 'Cisco Cloud Configuration' section. Under this section, there is a 'Region' dropdown menu set to 'Cisco Cloud, North America'. Below the region, there is a 'View Hostnames (click to collapse)' section showing three hostnames: 'cloud-pc-est.amp.cisco.com:443', 'cloud-pc-asn.amp.cisco.com:443', and 'cloud-pc.amp.cisco.com:443'. Further down, there is a 'Cisco Cloud Identity' section with a 'Client Identity' field containing the value '9524b77b'. A green 'Next >' button is located at the bottom right of the configuration area.

18. On the Notifications page, select the frequency for critical and regular Notifications. Enter the email addresses you want to receive alert notifications for the AMP device. You can use email aliases or specify multiple addresses through a comma-separated list. You can specify the sender name and email address the device uses. You can also specify a unique Device Name if you have multiple AMP Private Cloud devices. Click Next.

The screenshot shows the Cisco AMP for Endpoints Private Cloud Administration Portal, specifically the 'Notifications' configuration page. The left sidebar is the same as in the previous screenshot. The main content area is titled 'Notifications' and includes a 'Notification Frequency' section with two dropdown menus: 'Critical Notification Frequency' set to 'Every 5 Minutes' and 'Notification Frequency' set to 'Every Day'. Below this is a 'Notification Addresses' section with three fields: 'Notification Recipients' (containing 'huich@cisco.com'), 'Notification Sender Address' (containing 'donotreply@cisco.com'), and 'Notification Sender Name' (containing 'AMP for Endpoints Device'). At the bottom, there is a 'Device Name' section with a field containing 'AMPHCLAB'. A green 'Next >' button is located at the bottom right of the configuration area.

19. On the SSH Keys page, click Add SSH Key to enter the public keys you want to add (you can generate the key by using the **ssh-keygen** command). SSH keys allow you to access the device through a remote shell with root privileges. The Private Cloud appliance requires an OpenSSH-formatted RSA key. Click Save to save the key on the device.

The screenshot shows the 'Add SSH Key' page in the Cisco AMP for Endpoints Private Cloud Administration Portal. The left sidebar contains 'Installation Options' and 'Configuration' sections. The main content area has a form with the following fields:

- Name:** ampprivate
- Enabled:** ☒
- SSH Key:** ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQDeegwqEx48rEA44lwVXXSKJww7Y+ectDXPKL5T/acj+nhQT/Du5ShxpPuaTizECdtB3EBEEihD329Tc5UIMmaF77j6671KvAZ+U+1DX2TQrUjBCx2WVT3o/emZJPJohaqQ7gX3

At the bottom of the form are 'Cancel' and 'Save' buttons.

20. The SSH Keys page reappears when the key is added successfully. Click Next.

The screenshot shows the 'SSH Keys' page in the Cisco AMP for Endpoints Private Cloud Administration Portal. The left sidebar is the same as in the previous screenshot. The main content area displays the 'ampprivate' key with the following details:

- Key Name:** ampprivate
- Created:** 2020-07-29 18:51:33 +0000 (created less than a minute ago)
- Last Updated:** 2020-07-29 18:51:33 +0000 (less than a minute since last update)
- SSH Key:** ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQDeegwqEx48rEA44lwVXXSKJww7Y+ectDXPKL5T/acj+nhQT/Du5ShxpPuaTizECdtB3EBEEihD329Tc5UIMmaF77j6671KvAZ+U+1DX2TQrUjBCx2WVT3o/emZJPJohaqQ7gX3x85CTC

At the top right of the main content area is an 'Add SSH Key' button. At the bottom right is a green 'Next >' button.

21. Now you can configure the Services section. For each service, you need to assign a hostname and upload the appropriate certificate and key pairs on the Cisco AMP Private Cloud:

- Authentication
- AMP Console
- Disposition Server
- Disposition Server - Extended Protocol
- Disposition Update Service
- Firepower Management Center

Note: You need to create six unique DNS A records for the AMP Private Cloud. Each record points to the same IP Address but represents the different host name for each of the services listed. The host names must be resolved by both the AMP Private Cloud and the AMP endpoints. You cannot change the host names after the device has finished the installation. Here is an example:

192.168.42.66	Pointer (PTR)	mgmt.amp.hx.com.	static
192.168.42.66	Pointer (PTR)	console.amp.hx.com.	static
192.168.42.66	Pointer (PTR)	auth.amp.hx.com.	static
192.168.42.66	Pointer (PTR)	disp.amp.hx.com.	static
192.168.42.66	Pointer (PTR)	dispX.amp.hx.com.	static
192.168.42.66	Pointer (PTR)	disp-update.amp.hx.com.	static

Note: Refer to the Cisco Technote [How to Generate and Add Certificates that are Required for Installation of AMP VPC 3.x Onwards](#) for the instruction on the Certificate generation for each service.

22. On the page for each service, enter the FQDN of the host; then click Replace Certificate to upload the certificate files.

23. For example, on the Authentication Configuration page, enter the FQDN for the authentication service. Click Replace Certificate. Then click +Choose Certificate and +Choose Key to upload your matching certificate and key pair. Make sure the check marks for all the listed items become green. Click Next to continue.

24. Repeat step 23 to complete AMP for Endpoints Console Configuration.
25. Repeat step 23 to complete Disposition Server Configuration.
26. Repeat step 23 to complete Disposition Server – Extended Protocol Configuration.
27. Repeat step 23 to complete Disposition Update Service Configuration.
28. Repeat step 23 to complete Firepower Management Center Configuration.
29. On the Recovery page, download and verify a recovery file of your configuration before the installation starts. The recovery file contains all of the configuration as well as the server keys. Click Download to save the backup to your local computer. After the file is downloaded, click Choose File to upload the backup file and verify that it is not corrupt. Click Next to proceed.

Page 39 of 46

30. On the Review and Install page, review your AMP settings. You can go back to previous steps to change settings through the navigation bar on the left. If you edit any settings, you have to download a new recovery file with the new settings and verify it. When you are satisfied with your configuration settings, click Start Installation.

31. During the installation process, you can see an output of the commands that have been performed. This process may take some time. You can download the output log or error log if you need to contact support about an installation problem. To do so, click Download Output.

The device is installing...
Please wait for this page to redirect you. Refreshing manually might cause problems. Installation time is typically under 20 minutes.

State	Started	Finished	Duration
Successful	Wed Jul 29 2020 12:25:10 GMT-0700 (Pacific Daylight Time) 0 day, 0 hour, 17 minutes, 14 seconds ago	Wed Jul 29 2020 12:40:40 GMT-0700 (Pacific Daylight Time) 0 day, 0 hour, 1 minute, 43 seconds ago	0 day, 0 hour, 15 minutes, 30 seconds

Your device will need to be rebooted after this operation.

[Reboot](#)

Verifying the installation

Now validate the installation. You can use all of the features of your AMP Private Cloud. You can visit the production IP address or FQDN of the AMP Private Cloud virtual appliance through a web browser to access the AMPv Console for policy, connector, and detection management.

1. When the installation is completed, you will receive an email to activate the initial account you created. Click the link in the email to activate the account.

[ACTION REQUIRED] Activate your Cisco Security account

2. Open a web browser and navigate to the AMP Console FQDN; for example, console.amp.hx.com. Enter the email address and password for your activated account. Click Log In.

3. On the fresh Dashboard page are links to some Getting Started documents, wizards to deploy connectors, and a description and option to enable Demo Data.

- Download Cisco AMP for Endpoints User Guide
- Download Cisco AMP for Endpoints Deployment Strategy

Deploy AMP for Endpoints Connectors

- Set Up Windows Connector
- Set Up Mac Connector
- Set Up Linux Connector

Demo Data

Demo Data allows you to see how Cisco AMP for Endpoints works by populating your Console with replayed data from actual malware infections. Enabling Demo Data will add computers and events to your Cisco AMP for Endpoints Console so you can see how the Dashboard, File Trajectory, Device Trajectory, Threat Root Cause, and Detections and Events displays behave when malware is detected. Demo Data can coexist with live data from your Cisco AMP for Endpoints deployment, however, because of the severity of some of the Demo Data

Demo Computers

WannaCry [Click here to view PDF](#)
The WannaCry attack involves a remote compromise through the Windows SMB (Server Message Block) service using the ETERNALBLUE exploit. Upon system compromise, the attacker drops the WannaCry ransomware variant that is initially identified by AMP for Endpoints using ransomware indicators of compromise, and later by AMP Cloud signatures.

SFEIcar [Click here to view PDF](#)
Learn how Indicators of Compromise can alert you to potential malware problems and how to determine their effects in Device Trajectory.

ZAccess [Click here to view PDF](#)
Use Device Trajectory to watch a rootkit exploit privilege escalation on a computer, and use File Trajectory to discover which other endpoints have been compromised.

ZBot [Click here to view PDF](#)
See how a vulnerable version of Internet Explorer can expose you to malware. Use Device Trajectory to learn what happened and use application blocking lists to stop the future execution of vulnerable programs.

CozyDuke [Click here to view PDF](#)
Trace a detection back to an abused DLL search path, block any communications to its upstream CnC, and deploy an Endpoint IOC to contain further attacks.

- (Optional) Demo Data allows you to see how Cisco AMP for Endpoints works by populating your console with replayed data from actual malware infections. To enable Demo Data, click Enable Demo Data on the Dashboard page. Or from the menu bar at the top, click Accounts → Demo Data → Enable Demo Data. Enabling Demo Data will add computers and events to your Cisco AMP for Endpoints console so you can see how the Dashboard, File Trajectory, Device Trajectory, Threat Root Cause, and Detections and Events displays behave when malware is detected. You can disable this option later. To disable Demo Data, from the menu bar at the top, click Accounts → Demo Data → Disable Demo Data.

- From the menu bar at the top, click Management → Download Connector.

- Quick Start
- Computers
- Groups
- Policies
- Exclusions
- Download Connector**
- Deployment Summary
- AV Definition Summary

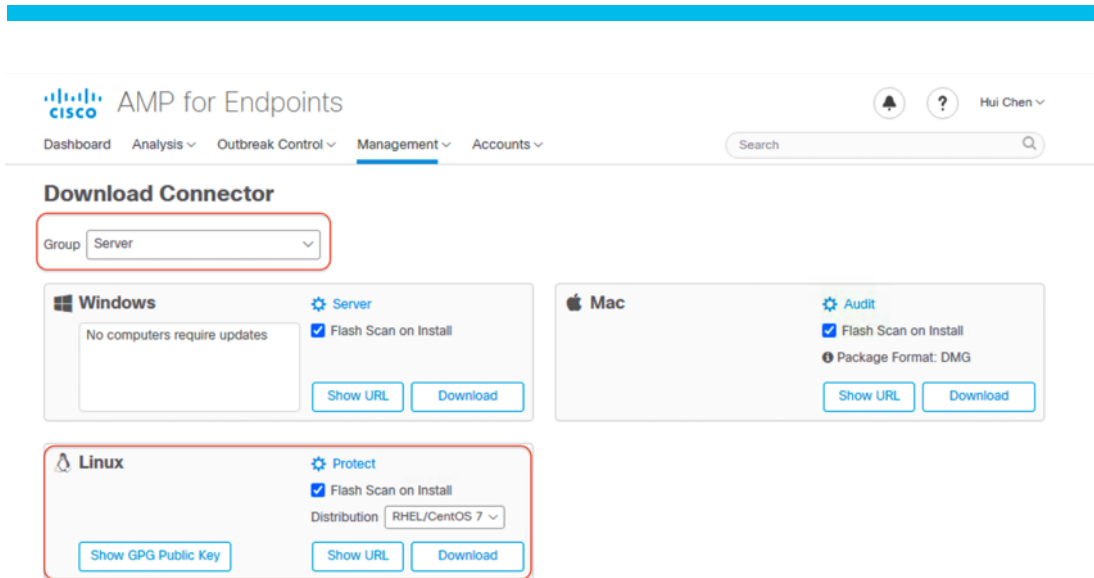

- On the Download Connector page, select Server Group. Click Download under the Windows category to save the amp_Server.exe file to your local machine. Then transfer this file to your Windows client virtual machines.

- Go to one of your Windows clients, and open amp_Server.exe to install the AMP for Endpoints connector. A green Pass sign with Connected status indicates a successful installation, and the client is under the protection. You can click Scan Now for an immediate scanning of the viruses on this virtual machine if needed.

- Repeat step 7 to install the connector for all the Windows client virtual machines.
- Go to the console of the AMP Private Cloud; on the Download Connector page, select Server Group. Under the Linux category, select RHEL/CentOS 7 Distribution, and click Download to save the amp_Server_rhel-centos-7.rpm file to your local machine. Then transfer this file to your Linux client virtual machines.

10. Log in to one of your Linux clients, and install the AMP for Endpoints connector using the command:

```
Sudo yum localinstall amp_Server_rhel-centos-7.rpm -y.
```

11. To check the connector status, run the following command:

```
/opt/cisco/amp/bin/ampcli status.
```

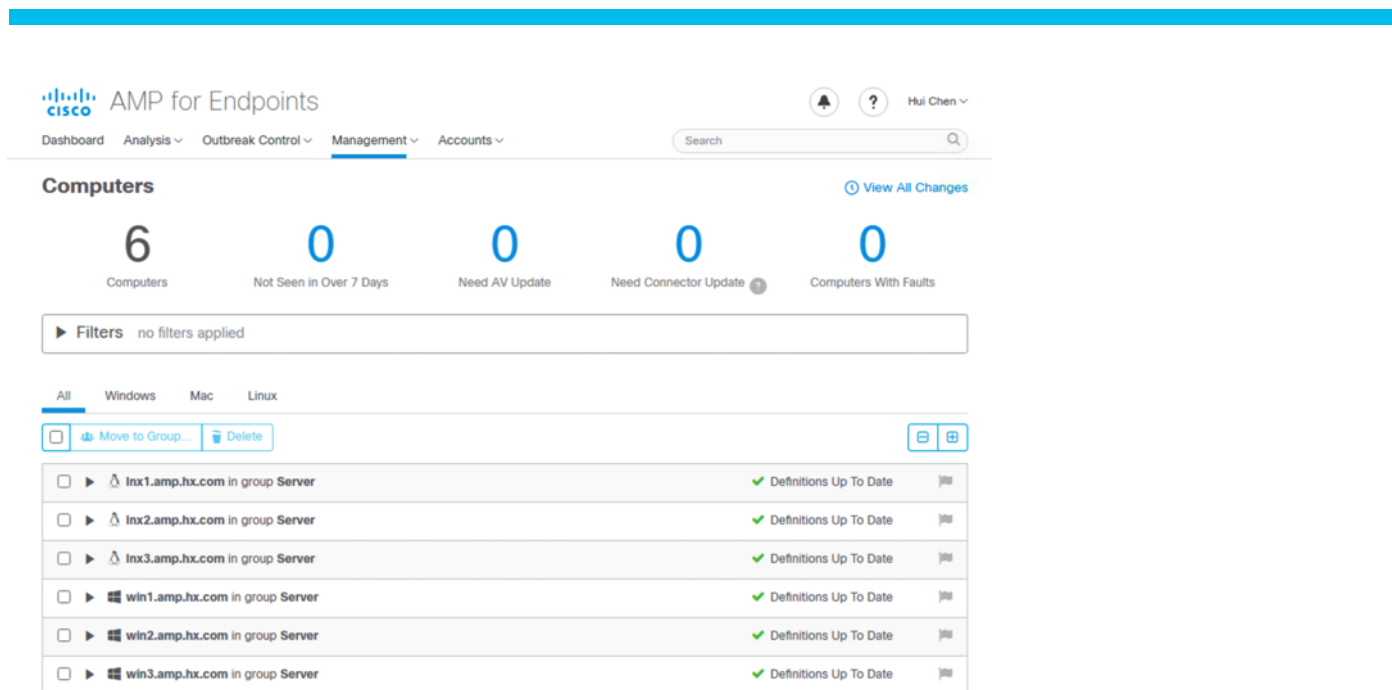

```
[root@lnx1 ~]# /opt/cisco/amp/bin/ampcli status
[logger] Set minimum reported log level to notice
Trying to connect...
Connected.
Status:      Connected
Mode:        Normal
Scan:        Ready for scan
Last Scan:   2020-08-20 11:49 AM
Policy:      Protect (#53)
Command-line: Enabled
Faults:      None
```

12. You can start scanning for viruses on this virtual machine if needed with the following command:

```
/opt/cisco/amp/bin/ampcli scan [options].
```

```
[root@lnx1 ~]# /opt/cisco/amp/bin/ampcli scan
[logger] Set minimum reported log level to notice
Trying to connect...
Connected.
Supported scan parameters:
flash      Perform a flash scan
full       Perform a full scan
custom     Perform a custom scan on a file or directory (recursive)
           e.g. '> scan custom file_or_directory_to_scan'
pause      Pause a running scan
resume     Resume a paused scan
cancel     Cancel a running scan
list       List scheduled scans
```

13. Repeat steps 10–12 to install the connector for all the Linux client virtual machines.
14. Go to the console of the AMP Private Cloud; from the menu bar at the top, click Management → Computers to check the protected servers.

Note: The client computers must trust the Root Certificate Authority for the AMP Private Cloud to be connected.

Conclusion

Cisco AMP provides next-generation endpoint protection, scanning files using a variety of anti-malware technologies including the Cisco antivirus engine. The Cisco AMP Private Cloud virtual appliance offers you the benefits of advanced malware protection in a VMware ESXi-based virtualized environment. Cisco HyperFlex systems provide optimized hyperconverged infrastructure for any workload at any scale. This solution simplifies the AMPv deployment process and provides an excellent choice of hardware and storage for the high-performing virtual infrastructure required for a Cisco AMPv deployment. Meanwhile the embedded AMP Private Cloud establishes a solid solution to protect the endpoints in the HyperFlex cluster from the malware attacks.
