

# Framework Mapping: Cisco Secure Firewalls and Firewall Management Center + CIS Controls v8.1

## Background

Cisco Secure Firewalls and Firewall Management Center (FMC) give organizations a practical way to connect CIS Critical Security Controls v8.1 requirements to security controls they can deploy, operate, monitor, and document. Secure Firewalls provide the enforcement and inspection layer: boundary protection, segmentation, secure access, application control, URL filtering, intrusion prevention, malware and file inspection, encrypted traffic visibility, and detailed security-event telemetry. FMC adds centralized policy administration, monitoring, reporting, device health visibility, workflow evidence, and operational consistency across distributed firewall deployments.

For organizations using CIS as a security framework roadmap, the combined platform is particularly relevant where safeguards depend on network infrastructure management, network monitoring and defense, audit log management, malware defense, email and web protection, access control management, segmentation, and selected data-protection outcomes. In those areas, firewall enforcement, traffic inspection, policy control, logging, and event analysis can provide both operational protection and evidence that supports compliance discussions.

The mapping is intentionally scoped to what Cisco Firewalls and FMC can reasonably provide. Some CIS safeguards require enterprise governance, endpoint management, identity administration, user training, service-provider oversight, backup operations, or software development security programs. In those areas, Cisco Firewalls and FMC may still provide meaningful supporting evidence or compensating technical control value, but customers should pair that evidence with the appropriate process owner and adjacent security platforms.

## CIS Controls v8.1 Overview

The CIS Critical Security Controls v8.1 are a prioritized set of safeguards for defending systems and networks against prevalent cyber attacks. For Cisco customers, the framework is useful because it turns broad security outcomes into specific safeguards that can be mapped to technology capabilities, operational ownership, and evidence.

CIS Controls v8.1 updates v8 with current alignment to industry standards and frameworks, revised asset classes and safeguard wording, and the Govern security function introduced in NIST Cybersecurity Framework 2.0. CIS

publishes mapping resources and the CIS Controls Navigator so teams can see how CIS safeguards relate to other security standards and to the broader programs they already manage.

This crosswalk value matters in a multi-framework environment. CIS publishes individual mappings to frameworks such as [NIST CSF 2.0](#), [NIST SP 800-53 Rev. 5](#), [NIST SP 800-171](#), [ISO/IEC 27001](#), [PCI DSS](#), [SOC 2](#), and additional regulatory or industry frameworks. A CIS mapping can therefore help Cisco customers explain how firewall enforcement, monitoring, logging, segmentation, and policy-management evidence supports more than one compliance conversation.

## Implementation Groups

Implementation Groups (IGs) are CIS's recommended prioritization model. IG1 is essential cyber hygiene: the baseline set of safeguards every enterprise should consider first because they address common attacks with practical, foundational controls. IG2 builds on IG1 for organizations with more complex environments, greater regulatory exposure, or higher operational risk. IG3 includes the full CIS Controls safeguard set and is designed for organizations with mature security programs,

significant risk exposure, or a need for the most comprehensive coverage.

In the mapping tables, the IG1/IG2/IG3 columns show where each safeguard sits in that adoption path. This lets a customer use the same Cisco firewall and FMC mapping for a phased roadmap: start with IG1 priorities, expand into IG2 as the program matures, and use IG3 where the organization requires full CIS coverage.

### Major Controls at a Glance

The CIS Controls v8.1 provide a prioritized set of 18 cybersecurity best practices designed to help organizations strengthen their security posture, reduce cyber risk, and improve resilience against modern threats. The controls are organized around key areas of security governance, asset management, vulnerability management, access control, monitoring, and incident response. Together, they offer a practical, risk-based framework that helps organizations establish foundational security capabilities while aligning security resources to the most effective defensive measures. The following table summarizes the 18 CIS Controls at a high level. Detailed descriptions for each control are provided in subsequent sections of this document.

Table 1. CIS Controls v8.1

| Control Number | Control Title                                          |
|----------------|--------------------------------------------------------|
| Control 1      | Inventory and Control of Enterprise Assets             |
| Control 2      | Inventory and Control of Software Assets               |
| Control 3      | Data Protection                                        |
| Control 4      | Secure Configuration of Enterprise Assets and Software |
| Control 5      | Account Management                                     |
| Control 6      | Access Control Management                              |
| Control 7      | Continuous Vulnerability Management                    |
| Control 8      | Audit Log Management                                   |
| Control 9      | Email and Web Browser Protections                      |
| Control 10     | Malware Defenses                                       |
| Control 11     | Data Recovery                                          |
| Control 12     | Network Infrastructure Management                      |
| Control 13     | Network Monitoring and Defense                         |
| Control 14     | Security Awareness and Skills Training                 |
| Control 15     | Service Provider Management                            |
| Control 16     | Application Software Security                          |
| Control 17     | Incident Response Management                           |
| Control 18     | Penetration Testing                                    |

## Cisco Product Overview

### Cisco Secure Firewall

Cisco Secure Firewall helps organizations protect their users, applications, data, and critical infrastructure across on-premises, cloud, hybrid, branch, industrial, and IoT environments. By providing broad visibility and control over network traffic, Secure Firewall helps enable security teams to reduce risk, enforce security policies consistently, and strengthen their overall security posture.

Within the context of the CIS Controls v8.1, Cisco Secure Firewall plays a key role in helping organizations implement network security practices through capabilities such as network segmentation, access control enforcement, application visibility and control, intrusion prevention, malware and file inspection, URL filtering, encrypted traffic analysis, remote-access security, and security-event logging. These capabilities help organizations limit attack surfaces, detect and block malicious activity, and maintain greater visibility into network communications.

Powered by Cisco Talos threat intelligence and advanced Snort® detection technology, Cisco Secure Firewall helps customers identify

emerging threats and respond more effectively to security events. Its integration with identity, analytics, logging, security operations, and extended detection and response (XDR) platforms further enables organizations to support CIS Controls related to network management, threat detection, malware defense, access control, audit logging, and continuous monitoring.

### Firewall Management Center (FMC)

Cisco Firewall Management Center (FMC) provides a centralized platform for managing, monitoring, and optimizing Cisco Secure Firewall deployments across the enterprise. FMC helps organizations streamline security operations by enabling consistent policy administration, comprehensive visibility, and simplified management from a single interface.

For organizations with multiple firewalls deployed across campus, branch, data center, cloud, or hybrid environments, FMC provides the operational framework needed to maintain standardized security controls and support consistent policy enforcement. Security teams can centrally manage access control, intrusion prevention, malware protection, URL filtering, application control, and segmentation policies while maintaining visibility into security events

and network activity.

From a CIS Controls perspective, FMC enhances an organization's ability to implement and operationalize security controls by providing centralized policy management, network discovery, device health monitoring, event correlation, reporting, alerting, and investigation workflows. These capabilities support ongoing monitoring, audit readiness, threat detection, incident investigation, and security operations efficiency. Available in physical, virtual, and cloud-delivered deployment models, FMC enables organizations to extend consistent security management practices across diverse environments while scaling to meet evolving business and security requirements.

How to Interpret the Mapping

The CIS Controls mappings in this document evaluate the combined contributions of Cisco Secure Firewall and Firewall Management Center (FMC). While Secure Firewall provides security enforcement and threat-prevention capabilities at the network layer, FMC delivers the centralized management, visibility, reporting, and operational workflows needed to deploy, monitor, and maintain those controls consistently across the environment.

The following capability areas provide a useful framework for understanding how each solution contributes to CIS Controls implementation.

Table 2. CIS alignment value

| Capability Area                       | Cisco Secure Firewall Benefits                                                                                                            | Cisco Firewall Management Center (FMC) Benefits                                                                                                      |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network Security Enforcement          | Network segmentation, access control, VPN services, application visibility and control, and policy enforcement across network boundaries. | Centralized policy creation, deployment, validation, change management, and policy consistency across firewall deployments.                          |
| Threat Prevention and Detection       | Intrusion prevention, Snort-based threat detection, malware and file inspection, URL filtering, and encrypted traffic visibility.         | Centralized management of intrusion, malware, file, URL, and application policies, along with event aggregation and correlation.                     |
| Visibility, Monitoring, and Reporting | Collection of connection, intrusion, malware, URL, VPN, and policy events that provide operational security visibility.                   | Dashboards, reporting, event analysis, device health monitoring, audit data, and integrations with SIEM, logging, and security operations platforms. |
| Incident Response and Operations      | Supports containment and mitigation actions through policy enforcement, traffic blocking, and security integrations.                      | Provides investigation workflows, operational context, policy deployment capabilities, reporting, and integration-driven response support.           |

# Detailed CIS Controls Mapping Tables

The following sections map Cisco Secure Firewall and Firewall Management Center (FMC) capabilities to CIS Controls v8.1. Each control and its safeguards are evaluated to show how Secure Firewall and FMC meet or support control requirements, helping organizations understand their role in supporting CIS Control objectives within a defense-in-depth security strategy. Mapping tables identify the applicable Implementation Group (IG1, IG2, and IG3),

asset types, and security functions (Identify, Protect, Detect, Respond, and Recover). Safeguards are categorized as either:

- **Meets** – Cisco Secure Firewall or FMC directly provides capabilities that satisfy the intent of the safeguard.
- **Supports** – Cisco Secure Firewall or FMC contributes to the implementation of the safeguard but may require complementary technologies, processes, or organizational controls to fully address the requirement.

Not all CIS Controls and safeguards are directly addressed by network security technologies. Where a control focuses primarily on areas such as governance, policy, risk management, or workforce training, a mapping table may not be included. These controls remain important components of a comprehensive cybersecurity program and are therefore included for completeness, along with a description of their purpose and relevance within the CIS Controls framework.

## Control 1: Inventory and Control of Enterprise Assets

Actively manage (inventory, track, and correct) all enterprise assets (end-user devices, including portable and mobile; network devices; non-computing/Internet of Things (IoT) devices; and servers) connected to the infrastructure physically, virtually, remotely, and

those within cloud environments, to accurately know the totality of assets that need to be monitored and protected within the enterprise. This will also support identifying unauthorized and unmanaged assets to remove or remediate.

| Sub-Control | Title                                                                                       | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|---------------------------------------------------------------------------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 1.1         | Establish and Maintain Detailed Enterprise Asset Inventory                                  | Devices    | Identify          | X   | X   | X   |                | Supports           |          | Supports     |
| 1.2         | Address Unauthorized Assets                                                                 | Devices    | Respond           | X   | X   | X   |                | Supports           |          | Supports     |
| 1.3         | Utilize an Active Discovery Tool                                                            | Devices    | Detect            |     | X   | X   |                | Supports           |          | Supports     |
| 1.4         | Use Dynamic Host Configuration Protocol (DHCP) Logging to Update Enterprise Asset Inventory | Devices    | Identify          |     | X   | X   |                | Supports           |          | Supports     |
| 1.5         | Use a Passive Asset Discovery Tool                                                          | Devices    | Detect            |     |     | X   |                | Supports           | Meets    |              |

## Control 2: Inventory and Control of Software Assets

Actively manage (inventory, track, and correct) all software (operating systems and applications) on the network so that only authorized software is installed and can execute, and that unauthorized and unmanaged software is found and prevented from installation or execution.

| Sub-Control | Title                                             | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|---------------------------------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 2.1         | Establish and Maintain a Software Inventory       | Software   | Identify          | X   | X   | X   |                | Supports           |          | Supports     |
| 2.2         | Ensure Authorized Software is Currently Supported | Software   | Identify          | X   | X   | X   |                | Supports           |          | Supports     |
| 2.3         | Address Unauthorized Software                     | Software   | Respond           | X   | X   | X   |                | Supports           |          | Supports     |
| 2.4         | Utilize Automated Software Inventory Tools        | Software   | Detect            |     | X   | X   |                | Supports           |          | Supports     |
| 2.5         | Allowlist Authorized Software                     | Software   | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 2.6         | Allowlist Authorized Libraries                    | Software   | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 2.7         | Allowlist Authorized Scripts                      | Software   | Protect           |     |     | X   |                | Supports           |          | Supports     |

## Control 3: Data Protection

Develop processes and technical controls to identify, classify, securely handle, retain, and dispose of data.

| Sub-Control | Title                                                    | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|----------------------------------------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 3.1         | Establish and Maintain a Data Management Process         | Data       | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 3.2         | Establish and Maintain a Data Inventory                  | Data       | Identify          | X   | X   | X   |                | Supports           |          | Supports     |
| 3.3         | Configure Data Access Control Lists                      | Data       | Protect           | X   | X   | X   | Meets          |                    |          | Supports     |
| 3.4         | Enforce Data Retention                                   | Data       | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 3.7         | Establish and Maintain a Data Classification Scheme      | Devices    | Identify          |     | X   | X   |                | Supports           |          | Supports     |
| 3.8         | Document Data Flows                                      | Data       | Identify          |     | X   | X   |                | Supports           |          | Supports     |
| 3.10        | Encrypt Sensitive Data in Transit                        | Data       | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 3.12        | Segment Data Processing and Storage-Based on Sensitivity | Data       | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 3.13        | Deploy a Data Loss Prevention Solution                   | Data       | Protect           |     |     | X   |                | Supports           |          | Supports     |
| 3.13        | Deploy a Data Loss Prevention Solution                   | Data       | Protect           |     |     | X   |                | Supports           |          | Supports     |
| 3.14        | Log Sensitive Data Access                                | Data       | Detect            |     |     | X   |                | Supports           |          | Supports     |

#### Control 4: Secure Configuration of Enterprise Assets and Software

Establish and maintain the secure configuration of enterprise assets (end-user devices, including portable and mobile; network devices; non-computing/IoT devices; and servers) and software (operating systems and applications).

| Sub-Control | Title                                                                            | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|----------------------------------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 4.1         | Establish and Maintain a Secure Configuration Process                            | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 4.2         | Establish and Maintain a Secure Configuration Process for Network Infrastructure | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 4.3         | Configure Automatic Session Locking on Enterprise Assets                         | Devices       | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 4.6         | Securely Manage Enterprise Assets and Software                                   | Devices       | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 4.7         | Manage Default Accounts on Enterprise Assets and Software                        | Users         | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 4.8         | Uninstall or Disable Unnecessary Services on Enterprise Assets and Software      | Devices       | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 4.9         | Configure Trusted DNS Servers on Enterprise Assets                               | Devices       | Protect           |     | X   | X   |                | Supports           |          | Supports     |

#### Control 5: Account Management

Use processes and tools to assign and manage authorization to credentials for user accounts, including administrator accounts, as well as service accounts, to enterprise assets and software.

| Sub-Control | Title                                                                 | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|-----------------------------------------------------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 5.1         | Establish and Maintain an Inventory of Accounts                       | Users      | Identify          | X   | X   | X   |                | Supports           |          | Supports     |
| 5.2         | Use Unique Passwords                                                  | Users      | Protect           | X   | X   | X   |                | Supports           |          | Supports     |

| 5.6         | Centralize Account Management                                         | Users      | Protect           |     | X   | X   |                | Supports           | Meets    |              |

## Control 6: Access Control Management

Use processes and tools to create, assign, manage, and revoke access credentials and privileges for user, administrator, and service accounts for enterprise assets and software.

| Sub-Control | Title                                                                           | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|---------------------------------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 6.1         | Establish an Access Granting Process                                            | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 6.2         | Establish an Access Revoking Process                                            | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 6.3         | Require MFA for Externally-Exposed Applications                                 | Users         | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 6.4         | Require MFA for Remote Network Access                                           | Users         | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 6.5         | Require MFA for Administrative Access                                           | Users         | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 6.6         | Establish and Maintain an Inventory of Authentication and Authorization Systems | Software      | Identify          |     | X   | X   |                | Supports           |          | Supports     |
| 6.7         | Centralize Access Control                                                       | Users         | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 6.8         | Define and Maintain Role-Based Access Control                                   | Users         | Govern            |     |     | X   |                | Supports           | Meets    |              |

## Control 7: Continuous Vulnerability Management

Develop a plan to continuously assess and track vulnerabilities on all enterprise assets within the enterprise's infrastructure, in order to remediate, and minimize, the window of opportunity for attackers. Monitor public and private industry sources for new threat and vulnerability information.

| Sub-Control | Title                                                                         | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|-------------------------------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 7.1         | Establish and Maintain a Vulnerability Management Process                     | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 7.2         | Establish and Maintain a Remediation Process                                  | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 7.5         | Perform Automated Vulnerability Scans of Internal Enterprise Assets           | Software      | Identify          |     | X   | X   |                | Supports           |          | Supports     |
| 7.6         | Perform Automated Vulnerability Scans of Externally-Exposed Enterprise Assets | Software      | Identify          |     | X   | X   |                | Supports           |          | Supports     |
| 7.7         | Remediate Detected Vulnerabilities                                            | Software      | Respond           |     | X   | X   |                | Supports           |          | Supports     |

## Control 8: Audit Log Management

Collect, alert, review, and retain audit logs of events that could help detect, understand, or recover from an attack.

| Sub-Control | Title                                                  | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|--------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 8.1         | Establish and Maintain an Audit Log Management Process | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 8.2         | Collect Audit Logs                                     | Data          | Detect            | X   | X   | X   |                | Supports           | Meets    |              |
| 8.3         | Ensure Adequate Audit Log Storage                      | Data          | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 8.4         | Standardize Time Synchronization                       | Network       | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 8.5         | Collect Detailed Audit Logs                            | Data          | Detect            |     | X   | X   |                | Supports           | Meets    |              |
| 8.6         | Collect DNS Query Audit Logs                           | Data          | Detect            |     | X   | X   |                | Supports           |          | Supports     |
| 8.7         | Collect URL Request Audit Logs                         | Data          | Detect            |     | X   | X   | Meets          |                    |          | Supports     |
| 8.8         | Collect Command-Line Audit Logs                        | Data          | Detect            |     | X   | X   |                | Supports           |          | Supports     |
| 8.9         | Centralize Audit Logs                                  | Data          | Detect            |     | X   | X   |                | Supports           | Meets    |              |
| 8.10        | Retain Audit Logs                                      | Data          | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 8.11        | Conduct Audit Log Reviews                              | Data          | Detect            |     | X   | X   |                | Supports           |          | Supports     |
| 8.12        | Collect Service Provider Logs                          | Data          | Detect            |     |     | X   |                | Supports           |          | Supports     |

## Control 9: Email and Web Browser Protections

Improve protections and detections of threats from email and web vectors, as these are opportunities for attackers to manipulate human behavior through direct engagement.

| Sub-Control | Title                                          | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|------------------------------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 9.2         | Use DNS Filtering Services                     | Devices    | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 9.3         | Maintain and Enforce Network-Based URL Filters | Network    | Protect           |     | X   | X   | Meets          |                    |          | Supports     |
| 9.6         | Block Unnecessary File Types                   | Network    | Protect           |     | X   | X   |                | Supports           |          | Supports     |

## Control 10: Malware Defenses

Prevent or control the installation, spread, and execution of malicious applications, code, or scripts on enterprise assets.

| Sub-Control | Title                                              | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|----------------------------------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 10.1        | Deploy and Maintain Anti-Malware Software          | Devices    | Detect            | X   | X   | X   |                | Supports           |          | Supports     |
| 10.2        | Configure Automatic Anti-Malware Signature Updates | Devices    | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 10.5        | Enable Anti-Exploitation Features                  | Devices    | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 10.6        | Centrally Manage Anti-Malware Software             | Devices    | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 10.7        | Use Behavior-Based Anti-Malware Software           | Devices    | Detect            |     | X   | X   |                | Supports           |          | Supports     |

## Control 11: Data Recovery

Establish and maintain data recovery practices sufficient to restore in-scope enterprise assets to a pre-incident and trusted state.

| Sub-Control | Title                     | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|---------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 11.2        | Perform Automated Backups | Data       | Recover           | X   | X   | X   |                |                    |          | Supports     |
| 11.3        | Protect Recovery Data     | Data       | Protect           | X   | X   | X   |                |                    |          | Supports     |
| 11.5        | Test Data Recovery        | Data       | Recover           |     | X   | X   |                |                    |          | Supports     |

## Control 12: Network Infrastructure Management

Establish, implement, and actively manage (track, report, correct) network devices, in order to prevent attackers from exploiting vulnerable network services and access points.

| Sub-Control | Title                                                                | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|----------------------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 12.1        | Ensure Network Infrastructure is Up-to-Date                          | Network       | Protect           | X   | X   | X   |                | Supports           |          | Supports     |
| 12.2        | Establish and Maintain a Secure Network Architecture                 | Network       | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 12.3        | Securely Manage Network Infrastructure                               | Network       | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 12.4        | Establish and Maintain Architecture Diagram(s)                       | Documentation | Govern            |     | X   | X   |                | Supports           |          | Supports     |
| 12.5        | Centralize Network Authentication, Authorization, and Auditing (AAA) | Network       | Protect           |     | X   | X   |                | Supports           |          | Supports     |

| Sub-Control | Title                                                                                        | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |

### Control 14: Security Awareness and Skills Training

Establish and maintain a security awareness program to influence behavior among the workforce to be security conscious and properly skilled to reduce cybersecurity risks to the enterprise.

This control is primarily addressed through organizational policies, processes, and employee education programs. While Cisco Secure Firewall and Firewall Management Center (FMC) are not designed to directly implement security awareness and training activities, they serve as important components of a defense-in-depth security strategy by helping organizations enforce security policies, monitor network activity, and reduce exposure to cyber threats addressed through workforce awareness initiatives.

### Control 15: Service Provider Management

Develop a process to evaluate service providers who hold sensitive data, or are responsible for an enterprise's critical IT platforms or processes, to ensure these providers are protecting those platforms and data appropriately.

| Sub-Control | Title                                                           | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|-----------------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 15.4        | Ensure Service Provider Contracts Include Security Requirements | Documentation | Govern            |     | X   | X   |                | Supports           |          | Supports     |
| 15.5        | Assess Service Providers                                        | Users         | Govern            |     |     | X   |                | Supports           |          | Supports     |
| 15.6        | Monitor Service Providers                                       | Data          | Govern            |     |     | X   |                | Supports           |          | Supports     |

### Control 16: Application Software Security

Manage the security life cycle of in-house developed, hosted, or acquired software to prevent, detect, and remediate security weaknesses before they can impact the enterprise.

| Sub-Control | Title                                                                         | Asset Type | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|-------------------------------------------------------------------------------|------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 16.7        | Use Standard Hardening Configuration Templates for Application Infrastructure | Software   | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 16.8        | Separate Production and Non-Production Systems                                | Network    | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 16.10       | Apply Secure Design Principles in Application Architectures                   | Software   | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 16.13       | Conduct Application Penetration Testing                                       | Software   | Govern            |     |     | X   |                | Supports           |          | Supports     |
| 16.14       | Conduct Threat Modeling                                                       | Software   | Protect           |     |     | X   |                | Supports           |          | Supports     |

### Control 17: Incident Response Management

Establish a program to develop and maintain an incident response capability (e.g., policies, plans, procedures, defined roles, training, and communications) to prepare, detect, and quickly respond to an attack.

| Sub-Control | Title                                                                       | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|-----------------------------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 17.1        | Designate Personnel to Manage Incident Handling                             | Users         | Respond           | X   | X   | X   |                | Supports           |          | Supports     |
| 17.2        | Establish and Maintain Contact Information for Reporting Security Incidents | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 17.3        | Establish and Maintain an Enterprise Process for Reporting Incidents        | Documentation | Govern            | X   | X   | X   |                | Supports           |          | Supports     |
| 17.3        | Establish and Maintain an Enterprise Process for Reporting Incidents        | Documentation | Govern            |     | X   | X   |                | Supports           |          | Supports     |
| 17.3        | Establish and Maintain an Enterprise Process for Reporting Incidents        | Documentation | Govern            |     | X   | X   |                | Supports           |          | Supports     |
| 17.4        | Establish and Maintain an Incident Response Process                         | Documentation | Govern            |     | X   | X   |                | Supports           |          | Supports     |
| 17.5        | Assign Key Roles and Responsibilities                                       | Users         | Respond           |     | X   | X   |                | Supports           |          | Supports     |
| 17.6        | Define Mechanisms for Communicating During Incident Response                | Users         | Respond           |     | X   | X   |                | Supports           |          | Supports     |
| 17.7        | Conduct Routine Incident Response Exercises                                 | Users         | Recover           |     | X   | X   |                | Supports           |          | Supports     |
| 17.8        | Conduct Post-Incident Reviews                                               | Users         | Recover           |     | X   | X   |                | Supports           |          | Supports     |
| 17.9        | Establish and Maintain Security Incident Thresholds                         | Documentation | Recover           |     |     | X   |                | Supports           |          | Supports     |

### Control 18: Penetration Testing

Test the effectiveness and resiliency of enterprise assets through identifying and exploiting weaknesses in controls (people, processes, and technology), and simulating the objectives and actions of an attacker.

| Sub-Control | Title                                                | Asset Type    | Security Function | IG1 | IG2 | IG3 | Firewalls Meet | Firewalls Supports | FMC Meet | FMC Supports |
|-------------|------------------------------------------------------|---------------|-------------------|-----|-----|-----|----------------|--------------------|----------|--------------|
| 18.1        | Establish and Maintain a Penetration Testing Program | Documentation | Govern            |     | X   | X   |                | Supports           |          | Supports     |
| 18.2        | Perform Periodic External Penetration Tests          | Network       | Detect            |     | X   | X   |                | Supports           |          | Supports     |
| 18.3        | Remediate Penetration Test Findings                  | Network       | Protect           |     | X   | X   |                | Supports           |          | Supports     |
| 18.4        | Validate Security Measures                           | Network       | Protect           |     |     | X   |                | Supports           |          | Supports     |
| 18.5        | Perform Periodic Internal Penetration Tests          | Network       | Detect            |     |     | X   |                | Supports           |          | Supports     |

## Key Observations

### 1. Strong Alignment to Network Security and Defense:

- Cisco Secure Firewall and Firewall Management Center align strongly with CIS safeguards focused on network infrastructure management, network monitoring, access control enforcement, intrusion prevention, and threat detection.
- Together, the platform helps customers strengthen control areas such as secure network architecture, traffic inspection, segmentation, policy enforcement, and response to suspicious or unauthorized activity.

### 2. Centralized Policy Management and Operational Consistency:

- FMC provides centralized management for firewall policy, events, configuration, reporting, and operational oversight, helping customers apply security controls consistently across distributed environments.
- 
- This is especially valuable for CIS safeguards that require repeatable processes, documented control operation, audit visibility,

and ongoing management of network security controls.

### 3. Meaningful Support for Visibility, Logging, and Audit Evidence:

- Cisco Secure Firewall and FMC support CIS compliance by generating and centralizing security events, connection data, intrusion events, malware events, and policy activity that can be used for audit, investigation, and reporting.
- These capabilities are particularly relevant to CIS controls related to audit log management, network monitoring and defense, malware defenses, incident response, and continuous security operations.

### 4. Threat Prevention and Response Value:

- Cisco Secure Firewall supports proactive defense through capabilities such as intrusion prevention, malware protection, URL filtering, application visibility and control, encrypted traffic handling, and threat intelligence from Cisco Talos.
- FMC strengthens response workflows by helping customers correlate events, review security activity, tune policies, and document

actions taken during investigation or remediation.

### 5. Complementary Role in Broader CIS Compliance:

- Cisco Secure Firewall and FMC provide technical support for network-centered CIS safeguards, but some controls require complementary tools, processes, or ownership outside the firewall platform.

Areas such as workforce training, identity lifecycle management, endpoint configuration, backup and recovery, software development, and service-provider governance should be addressed through the broader security program, with firewall and FMC evidence used where it supports those outcomes.

## Summary

Cisco Secure Firewalls and FMC support customers' efforts to map selected Cisco capabilities to CIS Controls v8.1 by combining enforcement, telemetry, centralized policy, and operational evidence. Secure Firewalls provide the network security enforcement layer: they enforce access controls, segment traffic, inspect applications, filter URLs, analyze files and malware, detect intrusions, support secure remote access, and generate high-value

security events. FMC provides the management and visibility plane: it helps deploy consistent controls, tune policies, monitor device health, analyze events, and preserve evidence for compliance and response workflows.

The combined value is strongest where CIS safeguards depend on network visibility, boundary defense, traffic inspection, centralized logging, monitoring, policy

consistency, and response support. For safeguards that require enterprise-wide governance, endpoint configuration, user training, service-provider management, software development lifecycle control, or data lifecycle ownership, Cisco Firewalls and FMC are positioned as supporting technical controls that should be paired with the appropriate process owner and adjacent security platforms.
