[What is the Native Only option mode of a SQL script procedure?](#)

Introduction

This document describes the Native Only mode of a SQL script procedure.

What is the Native Only option mode of a SQL script procedure?

This checkbox seen at the top toolbar of a SQL script editor can serve as a hint to push this procedure down into an external datasource, if that SQL script procedure has been promoted to the role of a Custom Function.

In addition to the checkbox, you will also need to add an entry to the datasource adapter capabilities to recognize the name of the Custom Function, as if that function is supported by the datasource type.
