Introduction

This document describes the solution to the problem that occurs when the Deployment Manager (DM) Target Owner is not changed.

Problem

When you migrate the resource with the use of DM and select the **Target Default Owner** as a different or new owner in the plan, then the resource owner is not updated or changed in the target environment after migration. It still shows the old owner for the resource as it did in the source environment, if the new owner is already present in target environment.

Root Cause

When sourceuser already exists in target, the owner of the resource is not modified after migration with the use of DM. It's intended behavior. Target default owner is used for when the source owner doesn't exist in the target site. If requirement is to change the owner, then use principal mapping for it.

Solution

Follow these steps as example:

1. Create a user called test in both source and target.
2. Create a user called test1 in target.
3. In source, user test creates a view.
4. In DM, add the view to resource bundle.
5. In principal mapping tab, do the mapping (in target value field) as: **/composite/user/test1** for source **principle /composite/user/test**.
6. Create a plan with target location as /shared, target default owner as test1.
7. Execute plan.
8. Check the resource privilege in target. Owner should have changed to test1.
