[Solution](#)

Introduction

This document describes how to re-image Application Policy Infrastructure Controller (APIC) with the help of HTTP server.

Prerequisites

Requirements

1. Cisco Integrated Management Controller(CIMC) must be configured with OOB IP address.
2. Check APIC Release notes, and confirm to which APIC software image you need to re-image.
3. Obtain Software image from software.cisco.com.
4. Confirm that the MD5 Checksum of the image, matches the one published on Cisco.com.
5. Upload the APIC image on HTTP server.

Components Used

This document is not restricted to specific software and hardware versions.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Background Information

In the event of an APIC cluster breakdown or Hardware migration from L2/M2 to L4/M4, individual APIC devices can require re-imaging to restore functionality. This procedure outlines a streamlined approach to re-image APICs one by one using an HTTP server facilitating faster cluster recovery with minimal disruption.

Repeat the process sequentially for each APIC device requiring re-imaging. Once all APICs are re-imaged, restore cluster configuration as needed and conduct thorough testing to validate functionality.

This concise procedure enables efficient APIC recovery, allowing administrators to address cluster breakdowns promptly and restore network operations effectively.

Solution

To re-image the APIC using an HTTP server, Following steps are needed.

Step 1.Download the firmware from the Cisco Website.

Open software.cisco.com/download.

Step 2. Enter APIC and Select the Appropriate Version for ACI Here — in This Case, 4.2(7F) Is Selected.

For Example:

The screenshot shows the Cisco Software Download website. The URL is [Downloads Home / Cloud and Systems Management / Policy and Automation Controllers / Application Policy Infrastructure Controller \(APIC\) / APIC Software- 4.2\(7f\)](#). The main content area is titled "Application Policy Infrastructure Controller (APIC)". It shows a list of releases: 4.2(7u), 4.2(7t), 4.2(7s), 4.2(7r), 4.2(7q), 4.2(7i), and 4.2(7f). The "4.2(7f)" release is highlighted with a dark blue background. To the right, there is a "Related Links and Documentation" section with a link to "Release Notes for 4.2(7f)". Below the releases, there is a table with columns "File Information", "Release Date", and "Size". The first row in the table has a red box around its "File Information" column, which contains the text "APIC Image for 4.2(7f) Release aci-apic-dk9.4.2.7f.iso". The second row contains the text "Vapic Image for 4.2(7f) Release aci-apic-dk9.4.2.7f.ova". The "Release Date" column shows "16-Mar-2021" for both rows, and the "Size" column shows "5689.41 MB" and "5261.22 MB" respectively. To the right of each row are download icons.

File Information	Release Date	Size
APIC Image for 4.2(7f) Release aci-apic-dk9.4.2.7f.iso Advisories	16-Mar-2021	5689.41 MB
Vapic Image for 4.2(7f) Release aci-apic-dk9.4.2.7f.ova Advisories	16-Mar-2021	5261.22 MB

Step 3. Copy the APIC Software ISO Image to the HTTP Server.

Example: <http://x.x.x.x/iso/>

Index of /iso

	Name	Last modified	Size	Description
	Parent Directory		-	
	DCApps/	2024-03-28 11:06	-	
	NAB for ND_NDFC_NDL.pdf	2023-10-21 13:35	401K	
	aci-apic-dk9.2.2.3j.iso	2021-04-16 08:18	2.9G	
	aci-apic-dk9.2.2.3t.iso	2020-11-11 17:31	2.9G	
	aci-apic-dk9.2.2.4r.iso	2020-11-11 17:34	3.1G	
	aci-apic-dk9.3.0.2k.iso	2020-11-26 13:56	3.3G	
	aci-apic-dk9.3.2.3n.iso	2020-10-26 11:56	3.5G	
	aci-apic-dk9.3.2.4d.iso	2021-02-26 13:41	3.3G	
	aci-apic-dk9.3.2.7f.iso	2020-12-08 08:55	2.7G

	aci-apic-dk9.4.2.4k.iso	2020-09-18 14:21	5.6G	
	aci-apic-dk9.4.2.4o.iso	2020-07-29 13:21	5.6G	
	aci-apic-dk9.4.2.5k.iso	2020-09-24 16:08	5.6G	
	aci-apic-dk9.4.2.5l.iso	2024-03-15 10:08	5.6G	
	aci-apic-dk9.4.2.5n.iso	2020-11-02 17:20	5.6G	
	aci-apic-dk9.4.2.6d.iso	2020-12-03 19:30	0	
	aci-apic-dk9.4.2.6h.iso	2023-07-26 13:53	6.0G	
	aci-apic-dk9.4.2.7f.iso	2021-03-26 18:32	5.6G	

Step 4. SSH/Console to Cisco Integrated Management Controller.

- From a terminal window, log in to the CIMC console.

```
<#root>  
# ssh admin@cimc_ip
```

Where cimc_ip is the CIMC IP address. For example:

```
<#root>  
# ssh admin@x.x.x.x  
  
admin@x.x.x.x's password:  
  
system#
```

- Change the scope to virtual media:

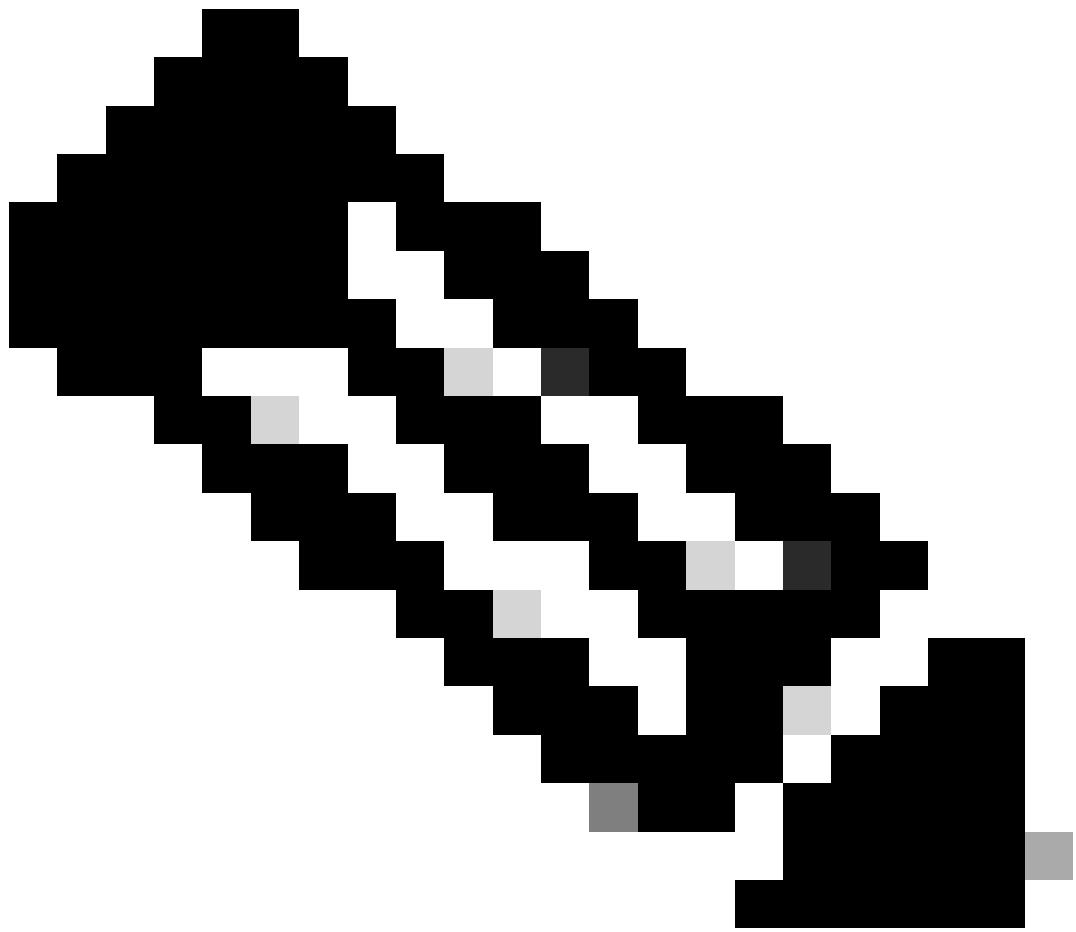

```
<#root>  
system# scope vmedia  
  
system /vmedia #
```

- Map the .iso image to the HTTP server.

```
<#root>  
system /vmedia # map-www volume_name http://http_server_ip_and_path iso_file_name
```

Where:

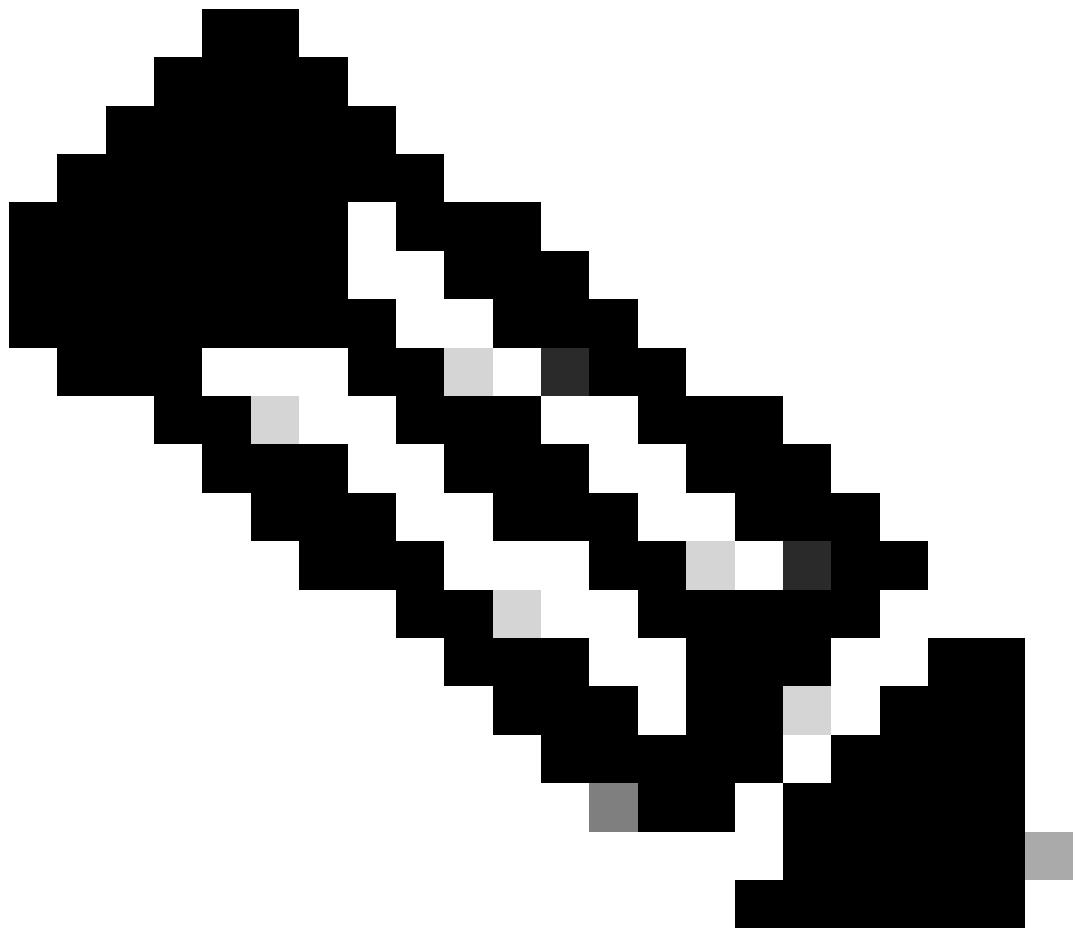

- volume_name is the name of the volume.
- http_server_ip_and_path is the IP address of the HTTP server and the path to the .iso file location.
- iso_filename is the name of the .iso file.

Note: There is space between the http_server_ip_and_path and the iso_filename.

For example:

```
system /vmedia # map-www apic http://x.x.x.x/iso/ aci-apic-dk9.4.2.7f.iso
Server username: admin
Server password:
Confirm password:
```

Note: /* If no authentication required here, just press Enter.

- Check the mapping status:

```
<#root>  
system /vmedia #  
show mappings detail
```

The Map-Status must be shown as OK.

For Example:

```
<#root>  
system /vmedia #
```

```
show mappings detail
```

Volume apic:

```
Map-Status: OK  
Drive-Type: CD  
Remote-Share: http://x.x.x.x/iso/
```

```
Remote-File: aci-apic-dk9.4.2.7f.iso  
Mount-Type: www  
Mount-Options: noauto,username=admin,password=*****3  
system /vmmedia #
```

- Connect to SOL to monitor the installation process:

```
<#root>
```

```
system /vmmedia #  
connect host
```

CISCO Serial Over LAN:

Press Ctrl+x to Exit the session

Step 5. Power Cycle from the KVM Console of CIMC GUI.

Choose Power > Power Cycle System (cold boot) to power cycle the controller

From the SOL console: Watch the screen during the boot process and prepare to press F6 at the appropriate moment to enter the boot selection menu.

For example:

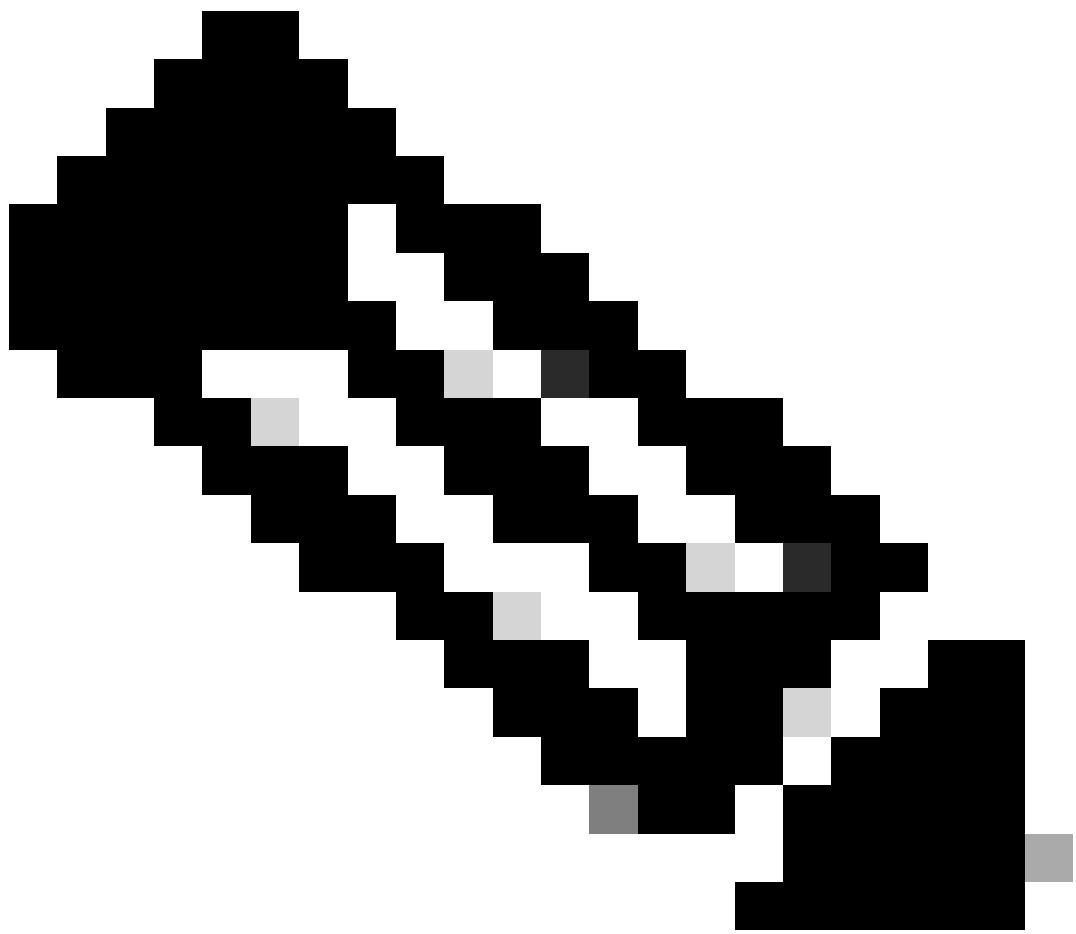

Press <F2> Setup, <F6> Boot Menu, <F7> Diagnostics, <F8>Cisco IMC Configuration, <F12> Network Boot

Bios Version : C220M4.4.0.1c.0.0711181559
Platform ID : C220M4

Cisco IMC IPv4 Address : 10.197.204.77
Cisco IMC MAC Address : D4:78:9B:C1:CF:22

Processor(s) Intel(R) Xeon(R) CPU E5-2609 v3 @ 1.90GHz
Total Memory = 64 GB Effective Memory = 64 GB
Memory Operating Speed 1600 Mhz

After Pressing the F6

Note: If you miss your opportunity and were not able to press F6 at the appropriate moment, go back to Step 5 to power cycle the controller and repeat the process until you are able to press F6 to enter the boot selection menu.

Copyright (c) 2018 Cisco Systems, Inc.

Press <F2> BIOS Setup : <F6> Boot Menu : <F7> Diagnostics

Press <F8> CIMC Setup : <F12> Network Boot

Bios Version : C220M5.4.0.1c.0.0627180916

Platform ID : C220M5

Processor(s) Intel(R) Xeon(R) Silver 4110 CPU @ 2.10GHz

Total Memory = 192 GB Effective Memory = 192 GB

Memory Operating Speed 2400 Mhz

M.2 SWRAID configuration is not detected. Switching to AHCI mode.

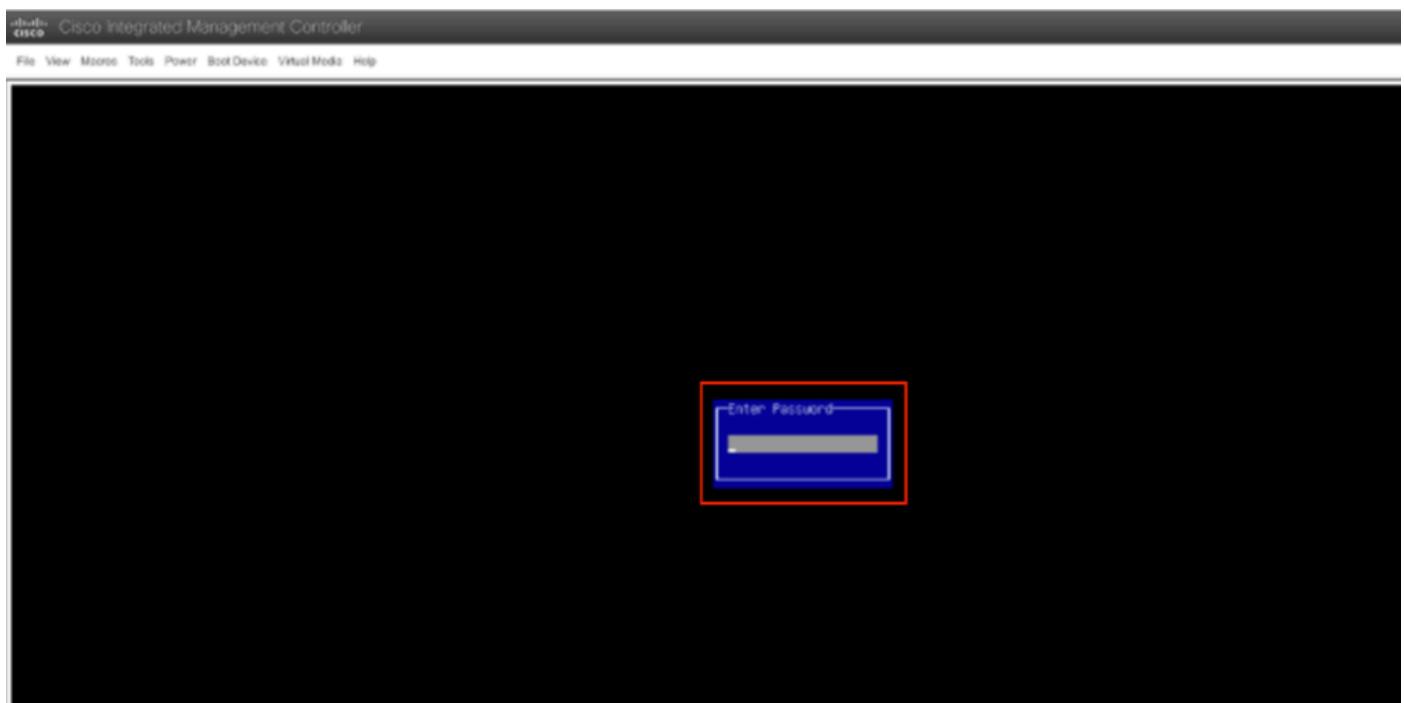

Cisco IMC IPv4 Address :

Cisco IMC MAC Address ::

Entering Boot Menu ...

You can also have to enter the BIOS password. The default password is password.

At the boot selection menu, select the Cisco CIMC-Mapped vDVD1.22 option as the one-time boot device.

Please select boot device:

(Bus 05 Dev 00)PCI RAID Adapter
UNIGEN PHF16H0CM1-ETG PMAP
IBA GE Slot 0100 v1585
IBA GE Slot 0101 v1585
UEFI: Built-in EFI Shell
Cisco vKVM-Mapped vDVD1.22
Cisco vKVM-Mapped vhdd1.22
Cisco vKVM-Mapped vfdd1.22
Cisco CIMC-Mapped vDVD1.22
Cisco CIMC-Mapped vhdd1.22
Enter Setup

↑ and ↓ to move selection
ENTER to select boot device
ESC to boot using defaults

Step 6. Go Back to CIMC CLI and Monitor the Output of Connect Host.

Monitor the CIMC cli , when get the message **To speed up the install, enter iso url in next ten minutes** then the enter http server URL with APIC image.

<#root>

```
++ grep /run/install/repo
++ cut -f 1 -d ' '
++ tr -d '[:digit:]'
+ usbdevice=/dev/sr
+ mkdir /mnt/usbdta
+ mount /dev/sr2 /mnt/usbdta
mount: special device /dev/sr2 does not exist
+ true
+ '[' -f /mnt/usbdta/ifabric.iso ']'
+ mountpoint -q /mnt/usbdta
+ true
+ echo 'INFO: found second partition on install media but did not find ifabric.iso. '
INFO: found second partition on install media but did not find ifabric.iso.
+ echo 'Continuing on to ISO URL prompt.'
Continuing on to ISO URL prompt.
+ '[' 0 -eq 0 ']'
+ read_iso_url
+ true,
+ echo

'To speed up the install, enter iso url in next ten minutes

:'

<< Enter the http server URL with apic image >>
```

```
To speed up the install, enter iso url in next ten minutes:
+ read -t 600 -p '? ' url
?
```

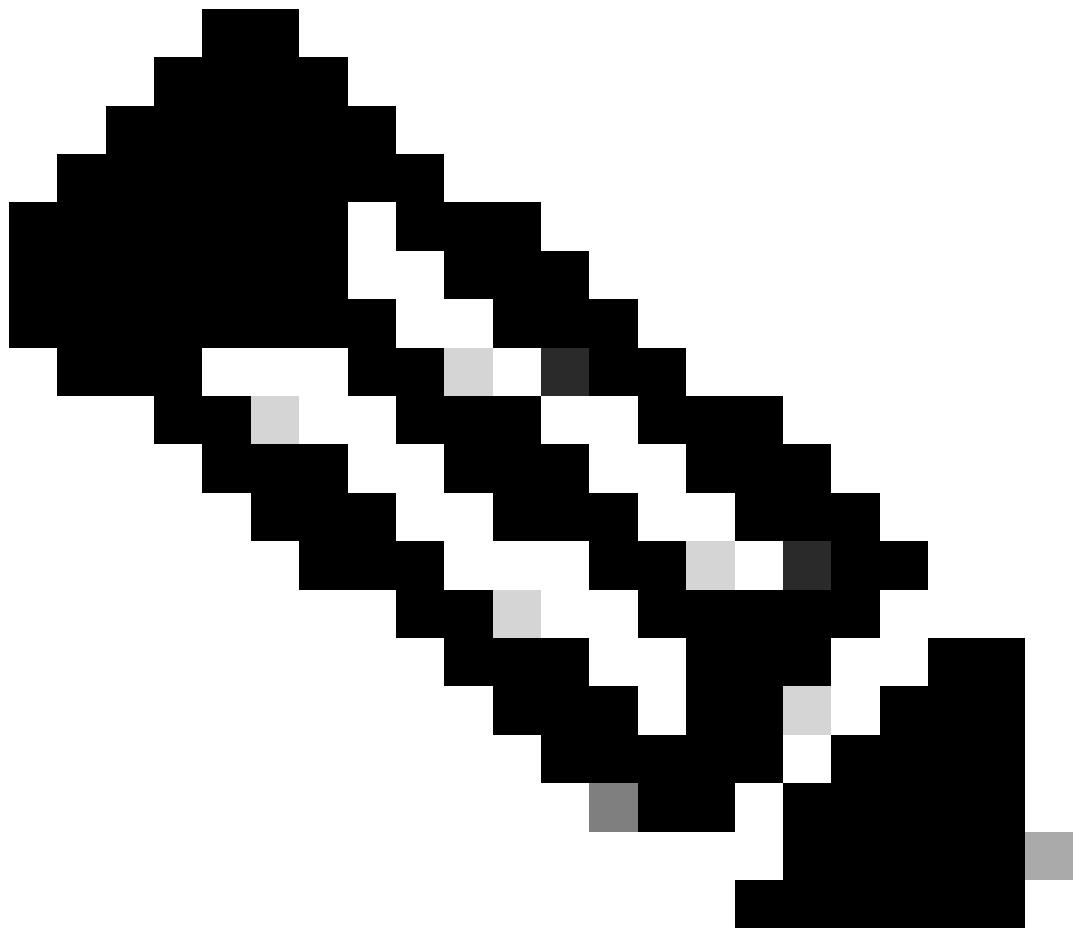

```
<#root>

http://x.x.x.x/iso/aci-apic-dk9.4.2.7f.iso

5:program-log

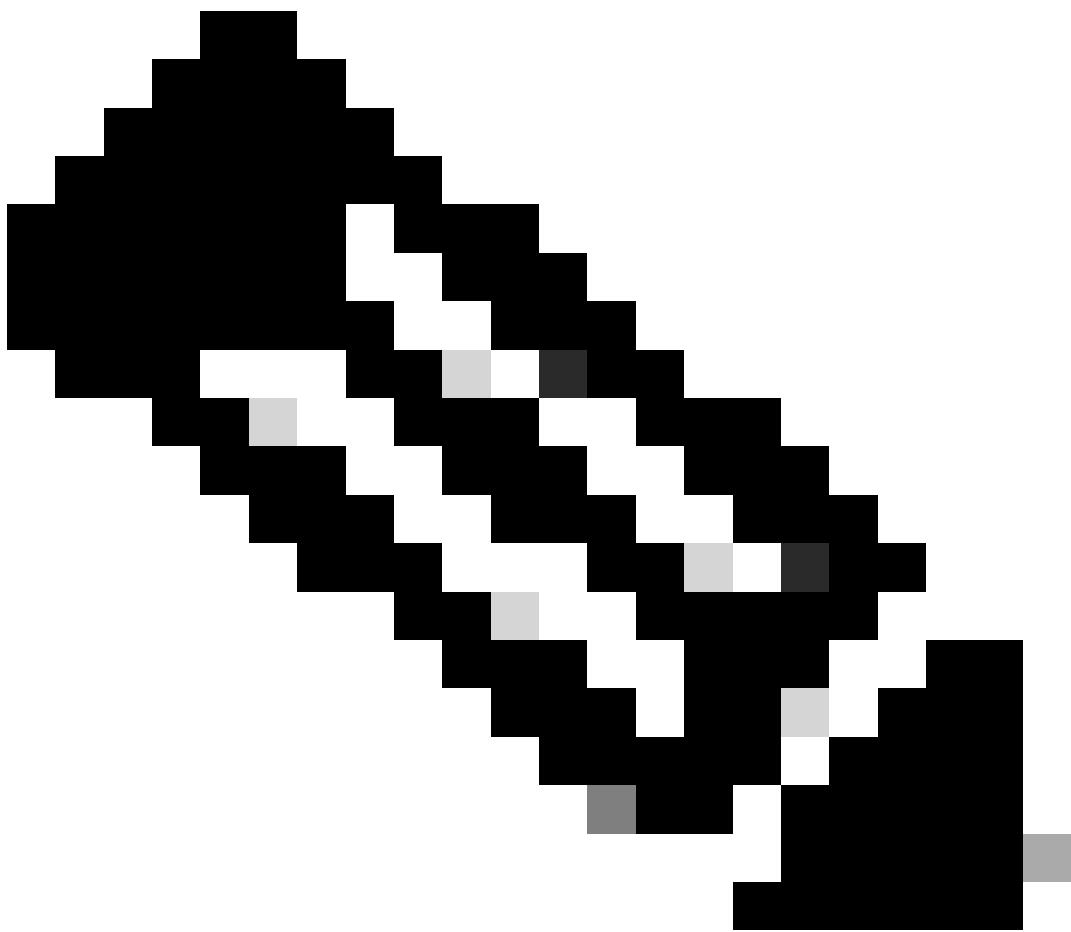

<< Enter the http server details >>
```

```
[anaconda] 1:main* 2:shell 3:log 4:storage-lo> Switch tab: Alt+Tab | Help: F1
```

Note: There is no space between the http_server_ip_and_path and the iso_filename.

Step 7. After Entering the HTTP URL, Boot Process Will Continue.

Note: If you choose static option, you will be asked to enter the interface name, management IP address and gateway.

```
<#root>

+ '[' 0 -eq 0 ']'
+ read_iso_url
+ true
+ echo 'To speed up the install, enter iso url in next ten minutes: '
To speed up the install, enter iso url in next ten minutes:
+ read -t 600 -p '?' url
?
[ahhttp://x.x.x.x/iso/aci-apic-dk9.4.2.7f.iso 5:program-log
++ awk -F '/|:' '{print $4}'
+ urlip=x.x.x.x
+ '[' -z http://x.x.x.x/iso/aci-apic-dk9.4.2.7f.iso ']'
+ '[' -z x.x.x.x ']'
+ break
+ '[' -n http://x.x.x.x/iso/aci-apic-dk9.4.2.7f.iso ']'
+ set +e
+ configured=0
+ '[' 0 -eq 0 '']
```

```
+ echo 'Configuring network interface'
Configuring network interface
+ echo

'type static, dhcp, bash for a shell to configure networking,
or url to re-enter the url: '
>>

<< Type static and configure the APIC OOB IP address with it's gateway>>

type static, dhcp, bash for a shell to configure networking, or url to re-enter the url:
+ read -p '? ' ntype

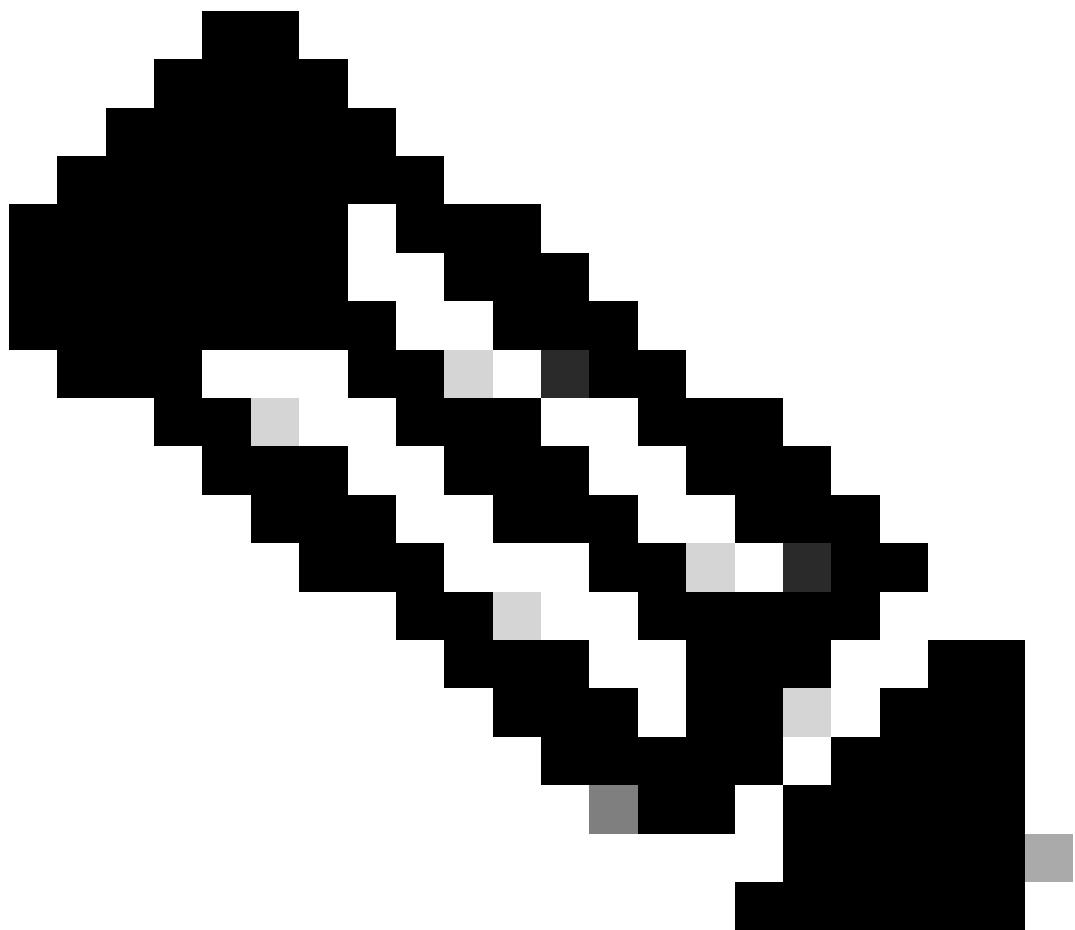

<#root>
?

static

.

<< Enter the static  to configure the networking >>

[anaconda] 1:main* 2:shell  3:log  4:storage-lo> Switch tab: Alt+Tab | Help: F1
```

Note: After typing the static it will list down the CIMC interface, select the correct interface. if you selected the wrong interface then the packet loss will be 100% then after three fail attempts of ping , it will again ask to select the correct interface until packet loss is 0 if you are not aware about interface select the all interface one by one.

For Example:

```
<#root>
```

```
+ case $ntype in
+ configure_static
+ echo 'Available interfaces'
Available interfaces
+ ls -l /sys/class/net
total 0
```

```
1rwxrwxrwx. 1 root root 0 May 3 07:08
```

```
enp11s0
```

```
-> ../../devices/pci0000:00/0000:00:03.0/0000:06:00.0/0000:07:01.0/0000:09:00.0/0000:0a:00.0/0000:0b:00.0
1rwxrwxrwx. 1 root root 0 May 3 07:08
```

```
enp1s0
```

```
-> ../../devices/pci0000:00/0000:00:03.0/0000:06:00.0/0000:07:01.0/0000:09:00.0/0000:0a:01.0/0000:0c:0  
1rwxrwxrwx. 1 root root 0 May 3 07:08
```

```
enp1s0f0
```

```
-> ../../devices/pci0000:00/0000:00:01.0/0000:01:00.0/net/enp1s0f0  
1rwxrwxrwx. 1 root root 0 May 3 07:08
```

```
enp1s0f1
```

```
-> ../../devices/pci0000:00/0000:00:01.0/0000:01:00.1/net/enp1s0f1  
1rwxrwxrwx. 1 root root 0 May 3 07:08 lo -> ../../devices/virtual/net/lo  
+ read -p 'Interface to configure: ' interface
```

```
<#root>
```

```
Interface to configure:
```

```
enp1s0f0
```

```
<< select the correct interface >>
```

```
[anaconda] 1:main* 2:shell 3:log 4:storage-lo>
```

Step 8. Correct Interface Check.

After Entering the interface it will try to ping http server and if selected interface is correct then packet loss must be 0% and start fetching the image from http server.

For Example: After Entering the correct interface with 0% Packet loss.

```
<#root>
```

```
+ read -p 'Interface to configure: ' interface  
Interface to configure:
```

```
enp1s0f0
```

```
+ read -p 'address: ' addr  
address: x.x.x.x/24  
+ read -p 'gateway: ' gw  
gateway: x.x.x.x  
+ ip addr add x.x.x.x/24 dev enp1s0f0  
+ ip link set enp1s0f0 up  
+ ip route add default via x.x.x.x  
++ seq 1 2  
+ for count in '$(seq 1 2)'  
+ ping -c 1 x.x.x.x  
PING x.x.x.x (x.x.x.x) 56(84) bytes of data.  
64 bytes from x.x.x.x: icmp_seq=1 ttl=64 time=55.0 ms  
--- x.x.x.x ping statistics ---  
1 packets transmitted, 1 received, 0% packet loss, time 0ms  
rtt min/avg/max/mdev = 55.056/55.056/55.056/0.000 ms
```

```

+ configured=1
+ break
+ '[' 1 -eq 0 ']'
+ echo 'Fetching http://x.x.x.x/iso/aci-apic-dk9.4.2.7f.iso'

Fetching http://x.x.x.x/iso/aci-apic-dk9.4.2.7f.iso
>> started fetching the apic image from HTTP server

+ wget -o /dev/null -O /tmp/cdrom.iso http://x.x.x.x/iso/aci-apic-dk9.4.2.7f.iso

```

If you selected the wrong interface then the packet loss will be 100% then after three fail attempts of ping it will again ask to select the correct interface.

For Example: After Entering the wrong interface with 100% Packet loss.

```

<#root>

+ read -p 'Interface to configure: ' interface
Interface to configure:

enp11s0

+ read -p 'address: ' addr
address: x.x.x.x/24
+ read -p 'gateway: ' gw
gateway: x.x.x.x
+ ip addr add x.x.x.x/24 dev enp11s0
+ ip link set enp11s0 up
+ ip route add default via x.x.x.x
++ seq 1 2
+ for count in '$(seq 1 2)'
+ ping -c 1 x.x.x.x
PING x.x.x.x (x.x.x.x) 56(84) bytes of data.
From x.x.x.x icmp_seq=1 Destination Host Unreachable

--- x.x.x.x ping statistics ---
1 packets transmitted, 0 received, +1 errors, 100% packet loss, time 0ms

+ sleep 20
+ for count in '$(seq 1 2)'
+ ping -c 1 x.x.x.x
PING x.x.x.x (x.x.x.x) 56(84) bytes of data.
From x.x.x.x icmp_seq=1 Destination Host Unreachable

--- x.x.x.x ping statistics ---
1 packets transmitted, 0 received, +1 errors, 100% packet loss, time 0ms

+ sleep 20
+ '[' 0 -eq 0 ']'
+ echo 'Configuring network interface'
Configuring network interface
+
echo 'type static, dhcp, bash for a shell to configure networking, or url to re-enter the url: '
<<Asking again to select the interface after selecting the type i,e static >>

```

```
type static, dhcp, bash for a shell to configure networking, or url to re-enter the url:  
+ read -p '?' ntype  
?
```

Keep Monitor the CIMC CLI and wait for approx. 40-50 Min , you will get following output on cli.

```
[anaconda] 1:main* 2:shell 3:log 4:storage-1o> Switch tab: Alt+Tab | Help: F1  
[ OK ] Started Show Plymouth Power Off Screen.  
[ OK ] Stopped Availability of block devices.  
      Stopping Logout off all iSCSI sessions on shutdown...  
      Stopping LVM2 metadata daemon...  
[ OK ] Stopped LVM2 metadata daemon.  
[ OK ] Stopped Logout off all iSCSI sessions on shutdown.  
[ OK ] Stopped target Network.  
[ OK ] Stopped Remount Root and Kernel File Systems.  
      Stopping Remount Root and Kernel File Systems...  
[ OK ] Started Restore /run/initramfs.  
[ OK ] Reached target Shutdown.  
dracut Warning: Killing all remaining processes  
Powering off.  
reboot: Power down
```

Step 9. Exit SOL After Power Off

Wait until you see the message poweroff in the SOL console, then exit from SOL by pressing Ctrl and x (Ctrl+x) and login to CIMC again and change the scope again.

(i) Change the scope to virtual media again:

```
system# scope vmedia  
system /vmedia #
```

(ii) Unmap the .iso image that you mapped in 2.c:

```
system /vmedia # unmap volume_name  
At the Save mapping prompt, enter yes if you want to save the mapping or no if you do not want to save  
system /vmedia # unmap apic  
Save mapping? Enter 'yes' or 'no' to confirm (CTRL-C to cancel) → yes  
system /vmedia #
```

(iii) Connect back to SOL again:

```
system /vmedia # connect host
```

Step 10. Initial Config

From the KVM console: Choose Power > Power on System to power on the controller and Lunch KVM , it will ask for APIC Initial configuration.

```
Starting Wait for Plymouth Boot Screen to Quit...
```

```
Press any key to continue...
```

```
Starting Setup Utility
```

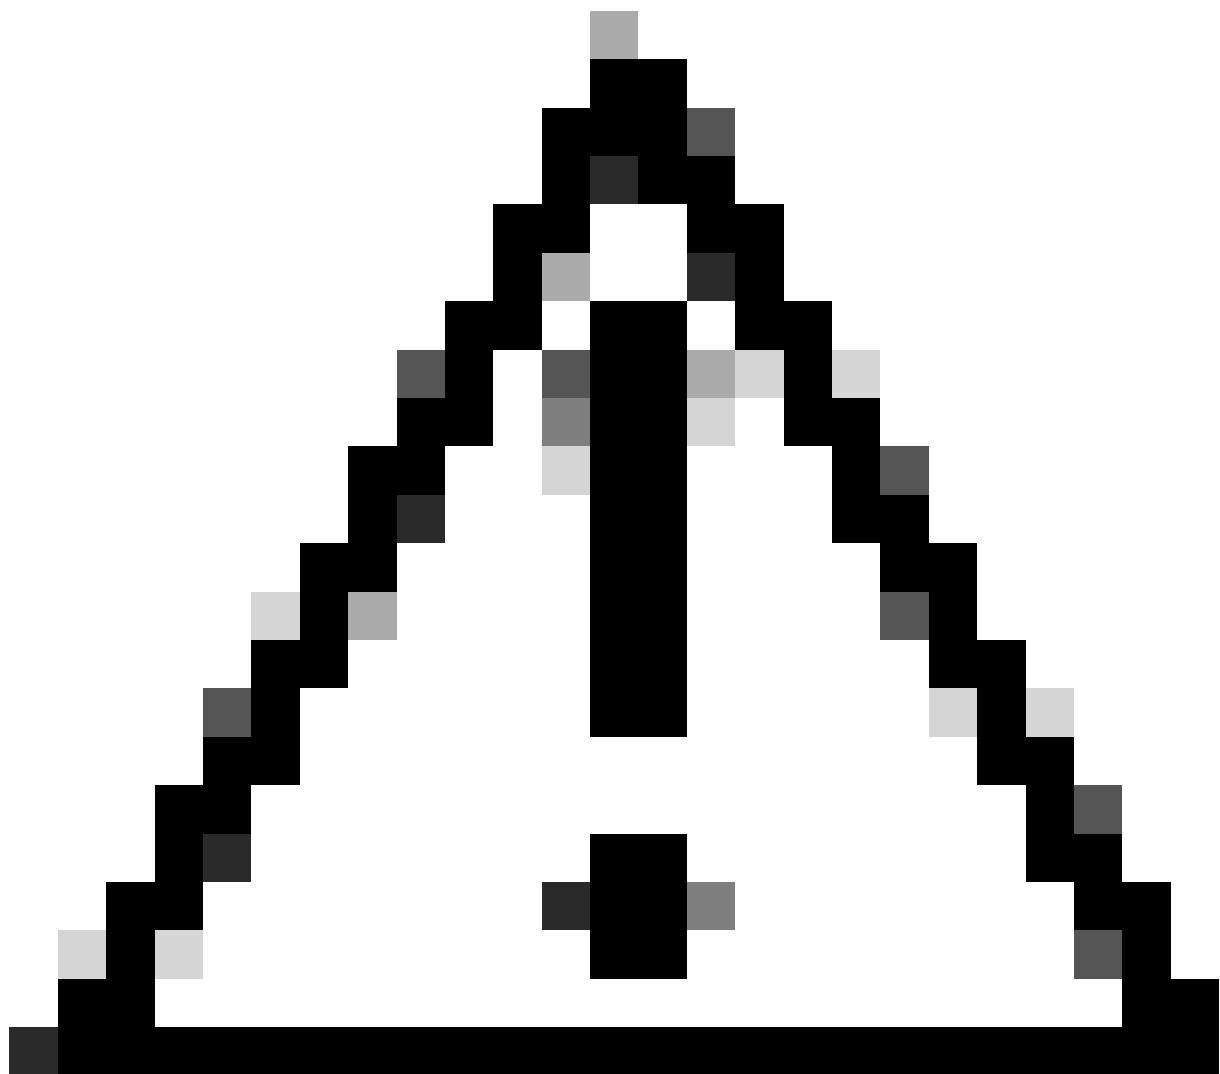

```
bootstrap: setup: False clean: False init: False reboot: True
```

This setup utility will guide you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.

*Note: setup is mainly used for configuring the system initially, when no configuration is present. So setup always assumes system defaults and not the current system configuration values.

Press Enter at anytime to assume the default values. Use ctrl-d at anytime to restart from the beginning.

```
Cluster configuration ...  
Enter the fabric name [ACI Fabric1]:
```

Caution: This method is applicable exclusively to IPv4 APIC (HTTP server) Out-of-Band (OOB) addressing. Please note that IPv6 support is not available at this time.
