## Introduction

Cisco Tidal Enterprise Scheduler sets jobs that scan Output: Abnormal Strings to the Externally Defined status when there is no output.

## Prerequisites

## Requirements

Cisco recommends that you have knowledge of these topics:

- Tidal Enterprise Scheduler 5.3.0.132 or later

## Components Used

The information in this document is based on the Tidal Enterprise Scheduler 5.3.0.132 or later.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

## Problem

Jobs set to scan Output: Abnormal Strings have the Externally Defined status when there is no output.

## Solution

When no output is available, there is not a way to can the output to tell the status of a job, so therefore you mark it as externally defined in order to raise a flag when a user can go an determine what the status should be.

In order to resolve this issue add sysval 108 option. When this sysval is set to "Y", jobs described in this case would be set to Completed Normally instead of Externally Defined.
