## Contents

### Introduction

How do I determine if a TelePresence Server is used in a call?

## Introduction

This document describes how you can verify that a TelePresence Server is used in a call.

## How do I determine if a TelePresence Server is used in a call?

Some calls between telepresence endpoints do not require the TelePresence Server. However, if you have more than two Cisco TelePresence T3 systems and one single-screen system in a conference then the call will be placed on the TelePresence Server.

In order to check whether a call runs on the TelePresence Server, log in to the web interface and choose *Conferences*. Click on a conference in order to see additional information, such as the endpoints in the conference.
