

Application Portal: Change in Login Flow starting 31st March 2025

Contents

Introduction

This document provides details on the change in the login flow starting **31st March 2025** when accessing the **Cisco Application Portal**.

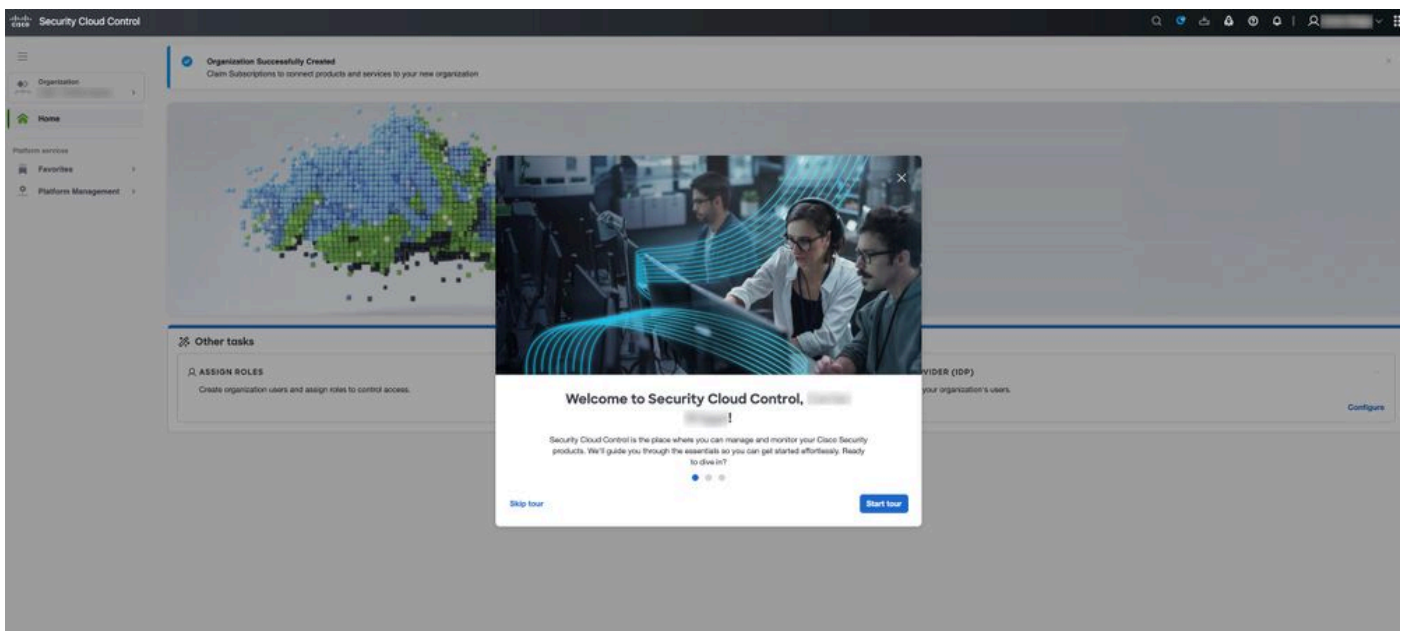

Application Portal offers you a combined view of all the Cisco Security Products and a seamless way to navigate to each product individually. Some of the Security Products which you can use to manage/access using the application portal:

- Security Provisioning and Administration (Will be integrated in to Security Cloud Control)
- Secure Client Management
- Secure Endpoint
- Secure Malware Analytics

and many more

Currently, security.cisco.com redirects to the **Application Portal** and some users may have bookmarked that URL to access the **Application Portal** instead of the final URL of apps.security.cisco.com

For those users starting on **31st March 2025**, when the **new Security Cloud Control** launches they will land on the **new Security Cloud Control** experience if they go to security.cisco.com instead of the **Application Portal** which is not appropriate for their use case.

These users should update their bookmarks to use apps.security.cisco.com going forward to access the **Application Portal**.
