Introduction

Border Gateway Protocol (BGP) is one of the key protocols to use to achieve Internet connection redundancy. When you connect your network to two different Internet service providers (ISPs), it is called multihoming. Multihoming provides redundancy and network optimization. It selects the ISP which offers the best path to a resource. When you run BGP with more than one service provider, you run the risk that your autonomous system (AS) will become a transit AS. This causes Internet traffic to pass through your AS and potentially consume all of the bandwidth and resources on the CPU of your router. This document addresses this issue and provides appropriate configuration examples.

Prerequisites

Requirements

Refer to this document before you proceed:

Sample Configuration for BGP with Two Different Service Providers (Multihoming)

Components Used

The information in this document is based on these software and hardware versions:

- Cisco 2800 Series Router with Cisco IOS® Software Release 12.4(13r)T
- Cisco 3800 Series Router with Cisco IOS Software Release 12.4(13r)T

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.
Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) to find more information on the commands used in this document.

Network Diagram

This document uses this network setup:

In this network Router A connects to two different Service Providers SP−A and SP−B forming Multihoming where 1010:1010::/64 and 2020:2020::/64 is advertised by AS 101 to the outside and network 1212:1212::/64 is received from two different AS, AS 202 and AS 303.

Note: Here is a link to a video (available on Cisco Support Community ) that provides overview of BGP Multihoming and gives advice on how to troubleshoot common BGP problems like peering and high CPU.

BGP Multi-homing: Design and Troubleshooting – Video from live Webcast

Configurations

This document uses these configurations:

- Router−A
- Service Provider A
- Service Provider B
Router-A

Router-A#
ipv6 unicast-routing

!---Enables the forwarding of IPv6 packets.

ipv6 cef
interface Serial3/0
description CONNECTED TO SP-A
ip address 192.168.10.1 255.255.255.0
ipv6 address 1202:ABCD::/64 eui-64
ipv6 enable
no fair-queue
clock rate 64000
!
interface Serial3/1
description CONNECTED TO SP-B
no ip address
ipv6 address 2303:ABCD::/64 eui-64
clock rate 64000
!
router bgp 101
bgp router-id 1.1.1.1
no bgp default ipv4-unicast
bgp log-neighbor-changes
neighbor 1202:ABCD::21B:54FF:FEA9:24B0 remote-as 202

!--- Configures SP-A as neighbor.

neighbor 1202:ABCD::21B:54FF:FEA9:24B0 ebgp-multihop 2
neighbor 2303:ABCD::21B:54FF:FE54:FB10 remote-as 303

!--- Configures SP-B as neighbor.

!
address-family ipv6
neighbor 1202:ABCD::21B:54FF:FEA9:24B0 activate
neighbor 2303:ABCD::21B:54FF:FE54:FB10 activate
network 1010:1010::/64
network 2020:2020::/64
exit-address-family
!

Service ProviderA

SP-A#
ipv6 unicast-routing
ipv6 cef
interface Serial1/0
no ip address
ipv6 address 1202:ABCD::/64 eui-64
ipv6 enable
no fair-queue
!
router bgp 202
bgp router-id 2.2.2.2
no bgp default ipv4-unicast
bgp log-neighbor-changes
neighbor 1202:ABCD::21C:58FF:FEED:3E90 remote-as 101

!--- Configures Router A as neighbor.

!
address-family ipv6
neighbor 1202:ABCD::21C:58FF:FEED:3E90 activate
network 1212:1212::/64
exit-address-family

Service ProviderB

SP-B#
ipv6 unicast-routing
ipv6 cef
interface Serial1/0
  no ip address
  ipv6 address 2303:ABCD::/64 eui-64
  no fair-queue
! router bgp 303
  no synchronization
  bgp router-id 3.3.3.3
  bgp log-neighbor-changes
  neighbor 2303:ABCD::21C:58FF:FEED:3E90 remote-as 101

!--- Configures as Router A as neighbor.

neighbor 2303:ABCD::21C:58FF:FEED:3E90 ebgp-multihop 5
no auto-summary
!
address-family ipv6
  neighbor 2303:ABCD::21C:58FF:FEED:3E90 activate
  network 1212:1212::/64
  exit-address-family
!

Verify

Use this section to confirm that your configuration works properly.

The Output Interpreter Tool (registered customers only) (OIT) supports certain show commands. Use the OIT to view an analysis of show command output.

• Router A peering with Two ISPs

  Router-A#
  show bgp ipv6 unicast summary

  BGP router identifier 1.1.1.1, local AS number 101
  BGP table version is 6, main routing table version 6
  3 network entries using 447 bytes of memory
  4 path entries using 304 bytes of memory
  4/2 BGP path/bestpath attribute entries using 496 bytes of memory
  2 BGP AS-PATH entries using 48 bytes of memory
  0 BGP route-map cache entries using 0 bytes of memory
  0 BGP filter-list cache entries using 0 bytes of memory
  BGP using 1295 total bytes of memory
  BGP activity 3/0 prefixes, 14/10 paths, scan interval 60 secs

  Neighbor     V AS  MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
  1202:ABCD::21B:54FF:FEA9:24B0  4  202  108  119  6  0  00:31:41  1
  2303:ABCD::21B:54FF:FE54:FB10  4  303  108  121  6  0  00:25:1  1

  !--- Indicates that Router A is peering with both the ISP SP-A and SP-B

• Router-A learned Routes from SP-A and SP-B
Router-A#show bgp ipv6 unicast
BGP table version is 6, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, 
r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

<td></td>
</tr>
</tbody>
</table>

TroubleShoot

Use the debug bgp ipv6 update command in order to display debugging information on the updates to help determine the state of the peering.
