## Introduction

This document describes Extranet mVPN and provides configuration examples in Cisco IOS®XR.

## Prerequisites

### Requirements

There are no specific requirements for this document.

### Components Used

This document is specific to Cisco IOS XR, but it is not restricted to a specific software release or hardware.

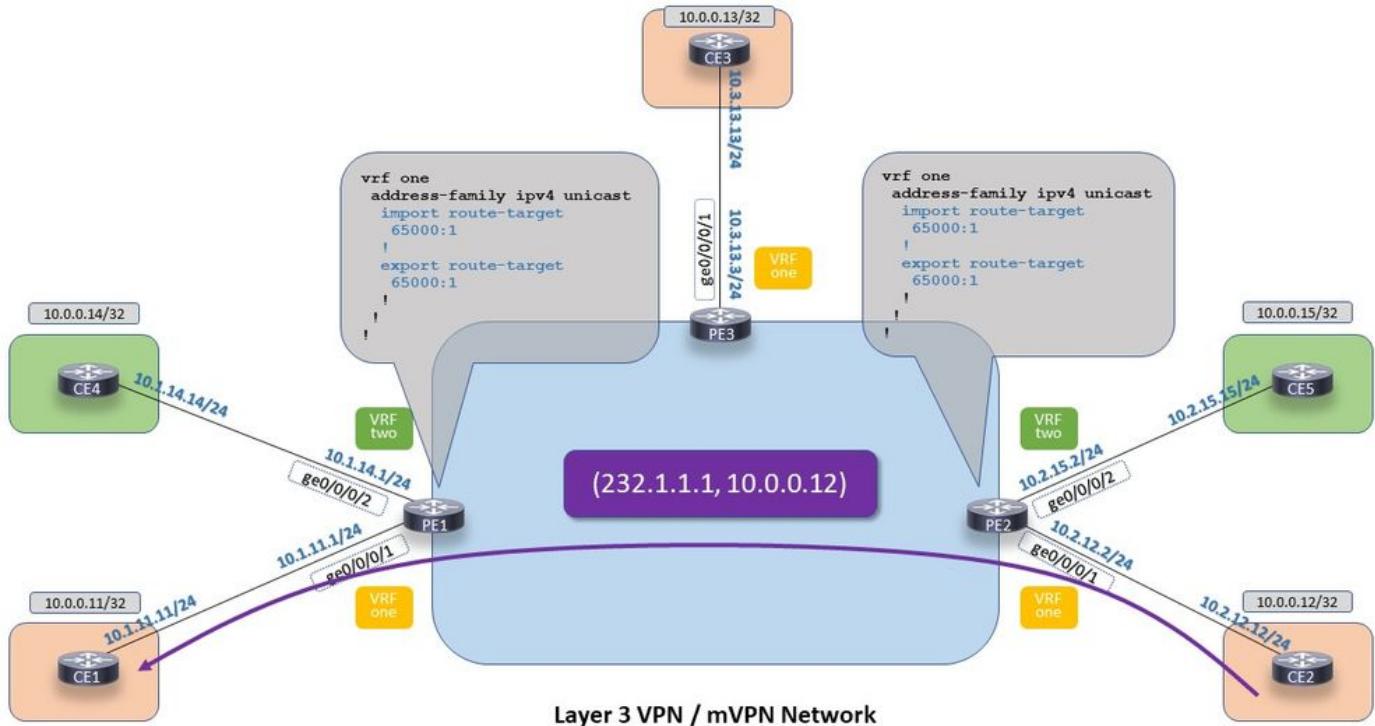

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is

live, ensure that you understand the potential impact of any command.

## Introduction to mVPN

Multicast is supported in multicast-enabled VPNs (mVPN). mVPN uses the same Virtual Routing and Forwarding (VRF) concepts that unicast Layer 3 VPN networks use.

This image shows intra-VRF multicast forwarding (using profile 0).

### mVPN Extranet on IOS-XR: Multicast Packet flow for Intranet MVRF

Image 1. Multicast Packet Flow for Intranet MVRF

Multicast relies on Reverse Path Forwarding (RPF). This applies to inter-VRF multicast traffic as well. This means that in order for multicast to flow from one VRF to another VRF, there is a need to have one VRF to RPF for the source of the multicast traffic to another VRF. So, the route for the multicast source needs to be available on the receiver VRF routing table on the PE router. There are two ways to ensure the RPF succeeds in the VRF context.

1. Routing Information Base (RIB) based. This means that the route from one VRF -the source VRF- needs to be leaked in the other VRF – the receiver VRF. This will be achieved by using the import and export function for Route-Targets (RT).
2. Route Policy Language (RPL) based. This means that the RPF succeeds thanks to a route policy forcing the RPF towards a VRF and/or interface (in another VRF).

A PE router does not re-advertise a VPN route. If a PE router received a VPN route from a remote PE router and imported it into VRF 1, it cannot export that VPN prefix from VRF 1 to VRF 2 locally. It does not matter if there is a route-target importing route from VRF 1 into VRF 2 locally on this PE router or not, the import into VRF 2 does not occur.

Multicast is all about RPF succeeding. Always keep an eye on RPF. For extranet multicast to work, the RPF must be from one VRF to another, from the receiver to the source VRF. Hence,

there must be a unicast route for the source in the receiver VRF back to the source VRF.

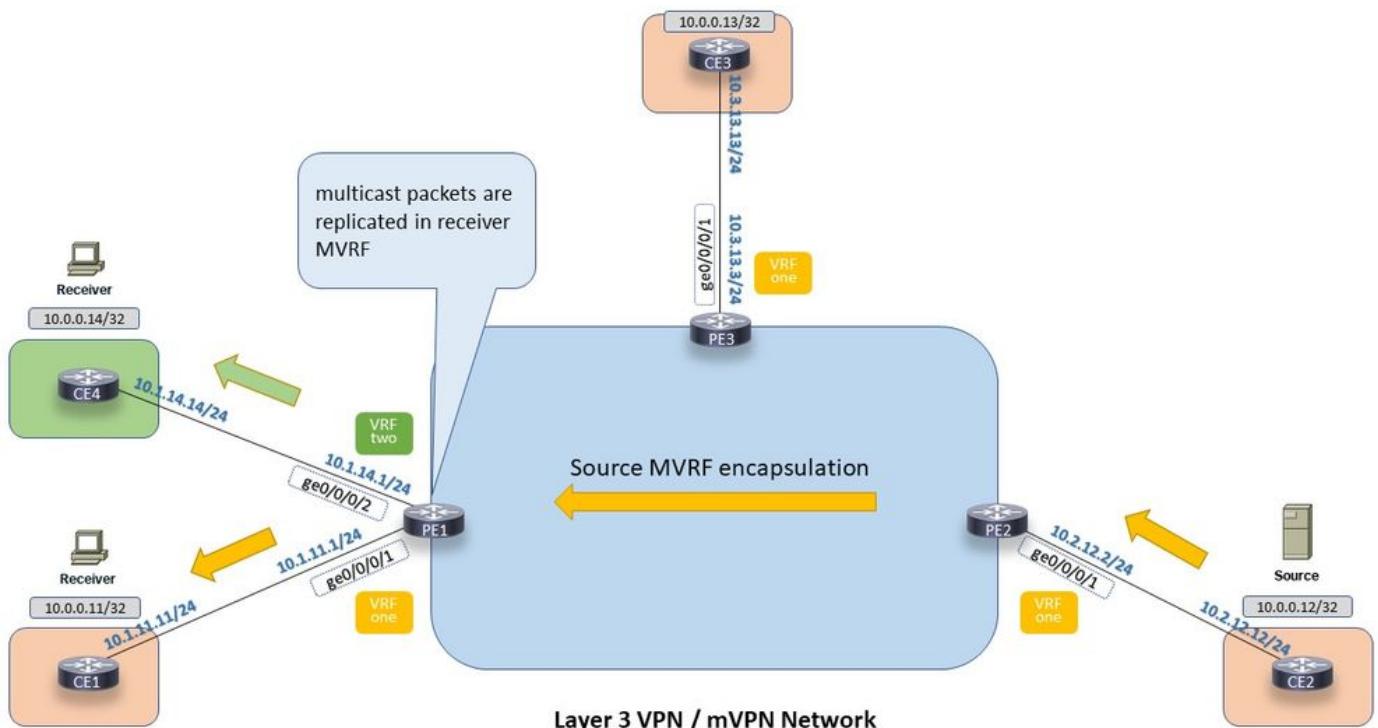

### Lmdt: Labelled Multicast Distribution Tree

## Schemes

Cisco IOS XE supports extranet mVPN as well. In the past, IOS (-XE) introduced two schemes to achieve extranet mVPN. They are referred to as option 1 and option 2. IOS-XR supports extranet with the same schemes.

Option 1: The source Multicast Virtual Routing and Forwarding (MVRF) is on the receiver MVRF. This means that the VRF (source VRF) on the ingress PE router for the multicast traffic is also configured on the egress PE router with the appropriate Route-targets.

Look at Image 2. It shows the multicast packet flow for Option 1.

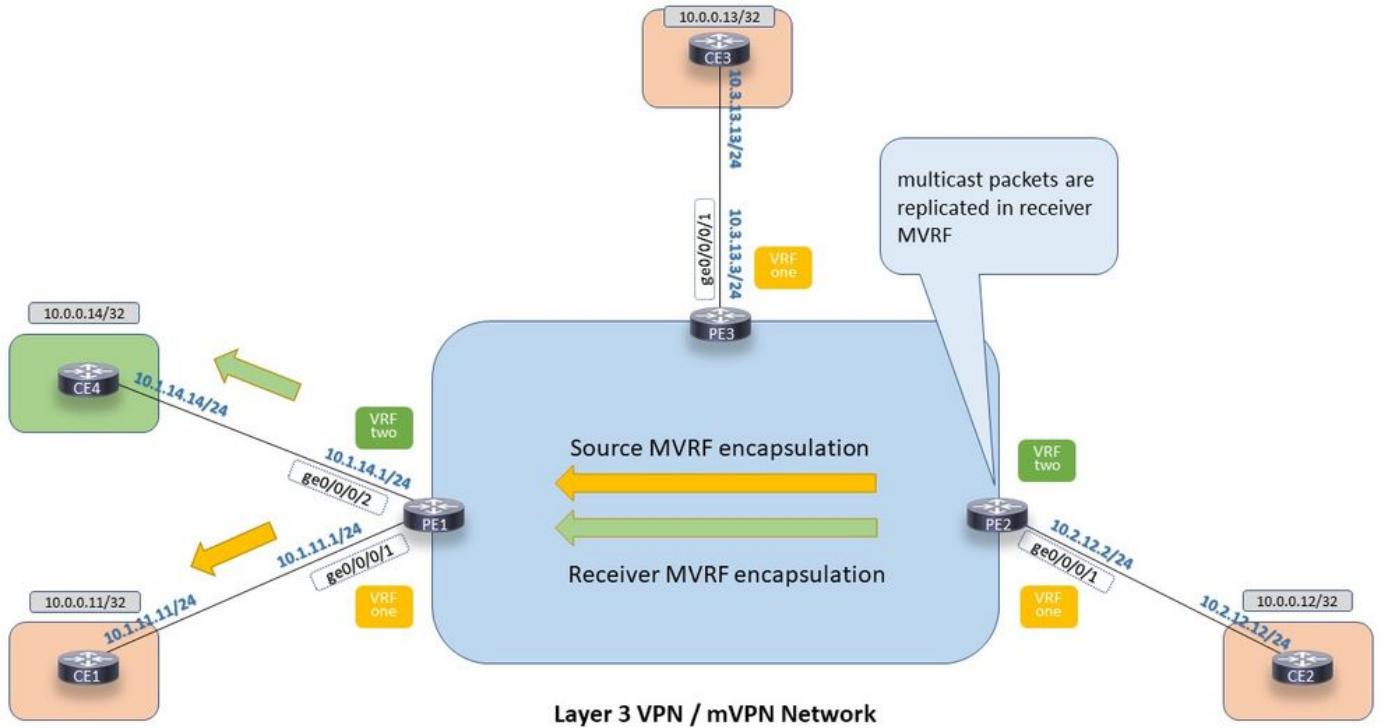

mVPN Extranet on IOS-XR: Multicast Packet flow for Extranet Option 1

Image 2. Multicast Packet flow for Extranet Option 1.

The multicast traffic traverses the core network and uses the encapsulation of the source MVRF.

Option 2: The receiver MVRF is on the source MVRF. This means that the VRF (receiver VRF) on the egress PE router for the multicast traffic is also configured on the ingress PE router with the appropriate Route-targets.

Look at Image 3. It shows the multicast packet flow for Option 2.

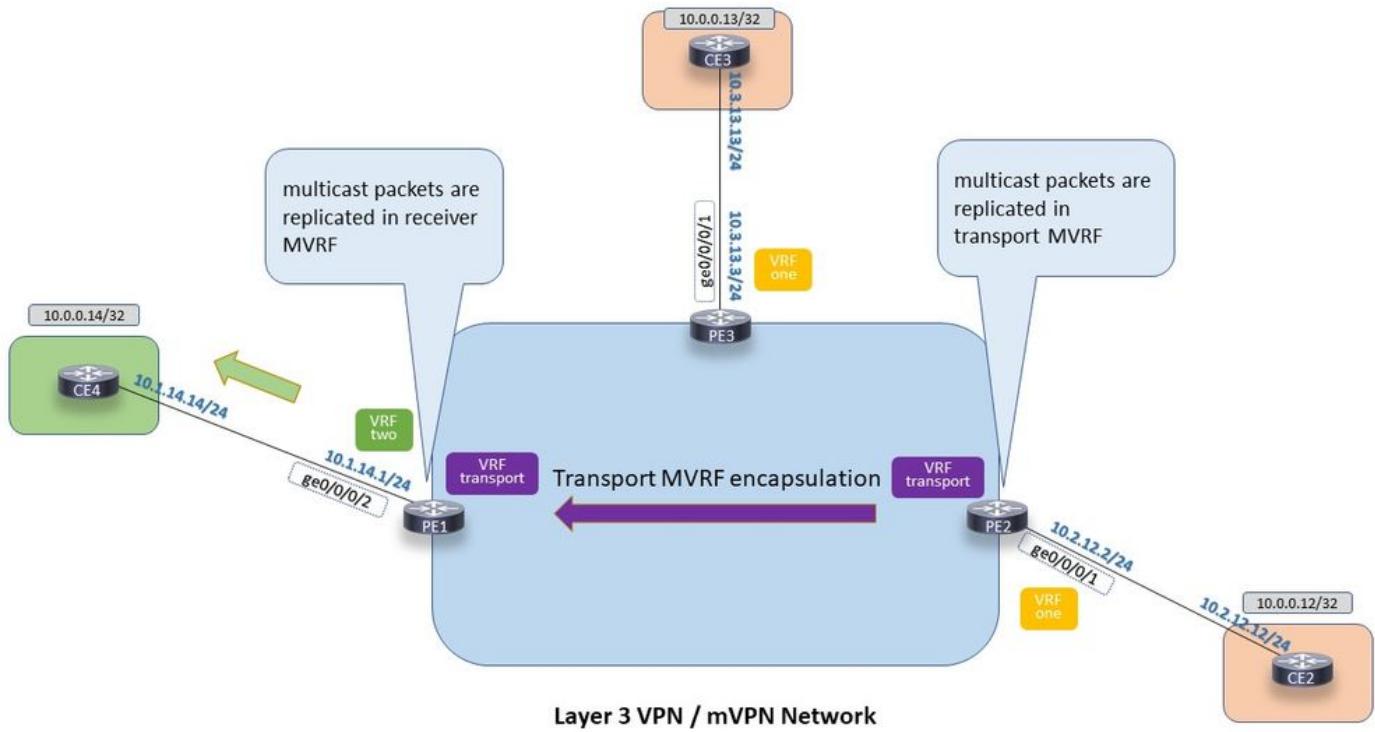

### mVPN Extranet on IOS-XR: Multicast Packet flow for Extranet Option 2

Image 3. Multicast Packet flow for Extranet Option 2.

The multicast traffic traverses the core network and uses the encapsulation of the source MVRF and the receiver MVRF. So, multicast traffic uses twice the amount of bandwidth in the core network.

There is a third option, a hybrid solution between Option 1 and Option 2.

Option 3: A transport MVRF is used. The ingress PE router extranets the multicast traffic from the source VRF to the transport VRF. The egress PE router extranets the multicast traffic from the transport VRF to the receiver VRF. This transport MVRF does not have customer-facing interfaces associated with it.

mVPN Extranet on IOS-XR: Multicast Packet flow for Extranet using a third VRF, the transport VRF

Image 4. Multicast Packet flow for Extranet using a third VRF, the transport VRF.

## Support Overview

### Option 1 Support

All profiles have RPL-based support.

Only the profiles that use the multicast core-tree protocol (profile 0, 3, and 11) support RIB-based extranet mVPN.

### Option 2 Support

All profiles support RPL-based and RIB-based support, except the profiles that use Customer-signalling with BGP (for example profiles 2, 11, ...). These last ones only support option 2 in a special way. Example 2.2 illustrates this.

Look here for an overview and configuration for the different profiles: [Configure mVPN Profiles within Cisco IOS-XR](#)

## Examples

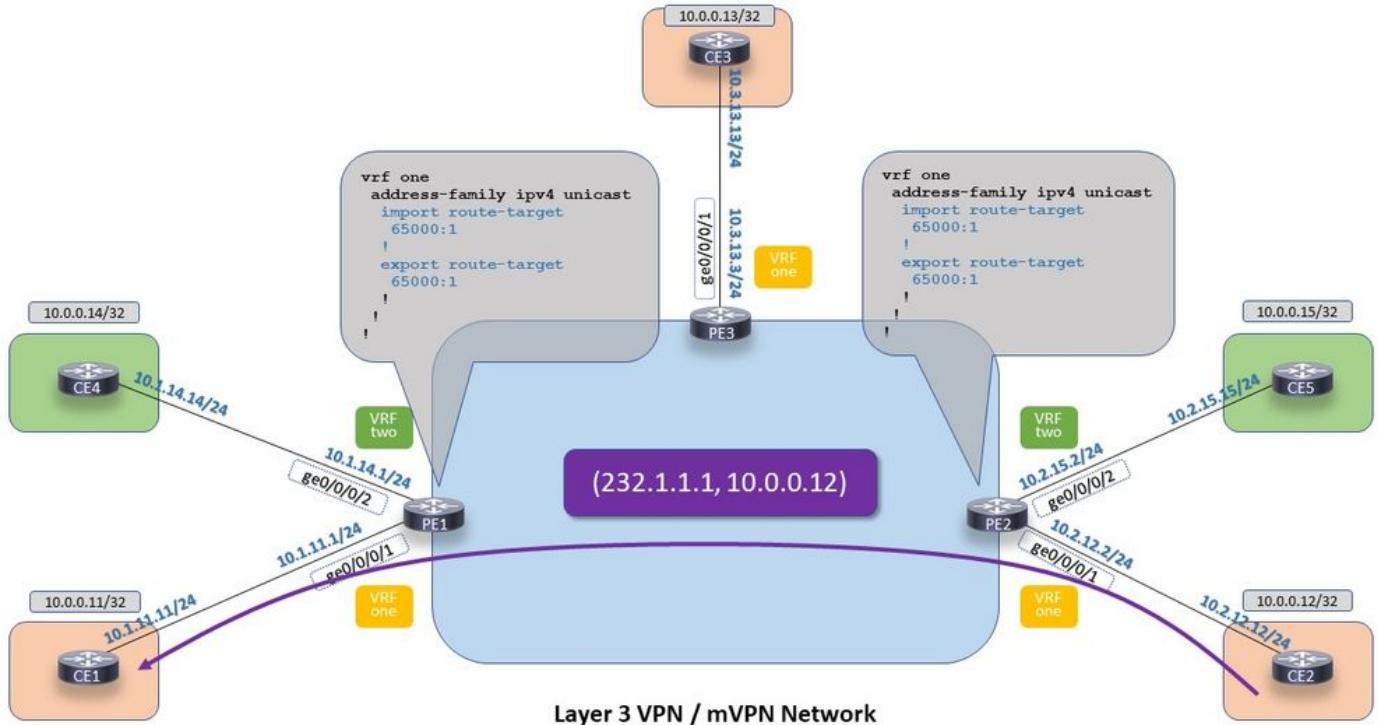

Notice the EX or Extranet flags on the Multicast RIB (MRIB) entries. They are present in the source and receiver VRF, on the multicast entries, and on interfaces.

### Profile 0

Profile 0 uses Default MDT, with PIM multicast signalling in the underlay and the overlay (VRF context).

This profile supports Option 1 and 2 (and hence 3).

Image 5 shows intra-VRF multicast traffic, VRF one to VRF one.

### mVPN Extranet on IOS-XR: Profile 0 - Multicast Packet flow for Intranet MVRF

#### Image 5 Profile 0 - Multicast Packet flow for Intranet MVRF

Configuration for profile 0.

```

multicast-routing
vrf one
address-family ipv4
interface GigabitEthernet0/0/0/1
enable
!
mdt source Loopback0
mdt default ipv4 239.1.1.1
!
!
!

router pim
vrf one
address-family ipv4
ssm range SSM-range-vrf-one
!
!
!
```

Notice that profile 0 is the only profile that does not mandate an RPF topology command.

Alternatively, you could configure the RPF topology command for profile 0.

```
router pim
vrf one
address-family ipv4
  rpf topology route-policy profile-0
  ssm range SSM-range-vrf-one
!
!
!

route-policy profile-0
  set core-tree pim-default
end-policy
!
```

The output of the MRIB entry on egress PE 1 looks like this:

```
RP/0/0/CPU0:PE1#show mrib vrf one route 232.1.1.1 10.0.0.12

IP Multicast Routing Information Base
Entry flags: L - Domain-Local Source, E - External Source to the Domain,

### Example 1.1. Option 1. The Source MVRF is on the Receiver MVRF

Profile 0 supports RIB-based option 1. The route back to the source needs to be present in the receiver VRF.

mVPN Extranet on IOS-XR: Profile 0 - Option 1 The source MVRF is on the receiver MVRF

Image 6. Profile 0 - Option 1. The source MVRF is on the receiver MVRF

Image 6 shows that the ingress PE router, PE2, advertises the source route from VRF two, the source VRF, with route-target 65000:5555. The egress PE router, PE1, imports the routes with this route target into VRF one, the receiver VRF.

VRF one and VRF two use profile 0.

```
multicast-routing
address-family ipv4
interface Loopback0
enable
!
interface GigabitEthernet0/0/0/0
enable
!
!
vrf one
address-family ipv4
interface GigabitEthernet0/0/0/1
enable

(10.0.0.15,232.1.1.3) RPF TID: 0xe0000011 Flags: RPF EX
Up: 01:36:16
Outgoing Interface List
  GigabitEthernet0/0/0/1 Flags: F NS, Up: 01:36:16
```

```
RP/0/0/CPU0:PE1#show pim vrf one rpf 10.0.0.15
Table: IPv4-Unicast-default
* 10.0.0.15/32 [200/0]
  via VRF:two with rpf neighbor 10.0.0.2
  Connector: 65000:2002:10.0.0.2, Nexthop: 10.0.0.2
```

How does the egress PE router, PE1, know that the RPF must occur in VRF two?

The BGP vpn4 unicast route in VRF one looks like this:

```
RP/0/0/CPU0:PE1#show bgp vpnv4 unicast vrf one 10.0.0.15/32
BGP routing table entry for 10.0.0.15/32, Route Distinguisher: 65000:1001
Versions:
  Process          bRIB/RIB  SendTblVer
  Speaker          65           65
Last Modified: Nov 21 19:09:22.469 for 00:14:33
Paths: (1 available, best #1)
  Not advertised to any peer
  Path #1: Received by speaker 0
  Not advertised to any peer
  65005
    10.0.0.2 (metric 3) from 10.0.0.4 (10.0.0.2)
      Received Label 24006
      Origin IGP, metric 0, localpref 100, valid, internal, best, group-best, import-candidate,
      imported
        Received Path ID 0, Local Path ID 1, version 65
        Extended community: RT:65000:2 RT:65000:5555
        Originator: 10.0.0.2, Cluster list: 10.0.0.4
        Connector: type: 1, Value:65000:2002:10.0.0.2
        Source AFI: VPNv4 Unicast, Source VRF: default, Source Route Distinguisher: 65000:2002
```

This route distinguisher is tied to a VRF. PE1 finds back the multicast group address used for this RD (Route Distinguisher) by a lookup of the RD in the BGP address-family ipv4 mdt table.

```
RP/0/0/CPU0:PE1#show bgp ipv4 mdt rd 65000:2002 10.0.0.2
BGP routing table entry for 10.0.0.2/96, Route Distinguisher: 65000:2002

```

```
Outgoing Interface List
mdttwo Flags: F MI, Up: 00:02:49
```

There is no state for (10.0.0.15, 232.1.1.3) on ingress PE, PE2, in VRF one, if VRF one is even present on the ingress PE router, PE2.

The alternative method to the RIB-based method is the RPL-based method. This means that a route-policy is used to change the RPF. See example 2.1 for an example of this RPF route-policy.

### Example 1.2. Option 2. The Receiver MVRF is on the Source MVRF

This is the RIB-based approach.

mVPN Extranet on IOS-XR: Profile 0 - Option 2 The receiver MVRF is on the source MVRF

Image 7 Profile 0 - Option 2 The receiver MVRF is on the source MVRF

A Route-Target is used to import VRF two routes into VRF one on the receiver PE, PE3.

The ingress PE, PE2, needs a static route in VRF one (receiver VRF) pointed to VRF two (source VRF) so that the RPF succeeds on the ingress PE router, PE2.

PE3:

```
vrf one
address-family ipv4 unicast
import route-target
65000:1
65000:3333
!
export route-target
65000:1
```

PE2:

```

vrf one
address-family ipv4 unicast
import route-target
65000:1
!
export route-target
65000:1
!

vrf two
address-family ipv4 unicast
import route-target
65000:2
!
export route-target
65000:2
65000:3333

router static
vrf one
address-family ipv4 unicast
10.0.0.15/32 vrf two GigabitEthernet0/0/0/2 10.2.15.15
!
```

There is no need to redistribute this static route into BGP. This route is advertised in VRF two, the source VRF. The egress PE router, PE3, receives this route because it is advertised by the ingress PE router, PE1, in VRF two with Route-Target 65000:3333 which gets imported into VRF one on PE3. The static route is needed to make the RPF succeed on VRF one on the ingress PE router, PE2.

The multicast traffic uses the MDT from VRF one to cross the core network.

```

### Example 1.3. Option 3. A Transport MVRF is Used

mVPN Extranet on IOS-XR: Profile 0 - Option 3 A transport MVRF is used

### Image 8. Profile 0 - Option 3 A transport MVRF is used

The transport MVRF does not need any interfaces. However, everything else needs to be there: the VRF configuration, the BGP configuration, the multicast-routing configuration, and the router PIM configuration.

The configuration of option 1 is on egress PE, PE1 and the configuration of option 2 are on ingress PE, PE2.

## Example 1.4. Local Extranet

There is only one PE router involved. Having a route back in the receiver VRF to the source VRF is the only requirement here for the RIB-based solution.

One solution is to have VRF one (source VRF) import the routes from VRF two (receiver VRF) by use of the appropriate Route-Target.

## Profile 14

Profile 14 uses Partitioned MDT, with mLDP multicast signalling in the underlay and BGP (customer) signalling in the overlay (VRF context).

This profile supports option 1.

Option 2 and 3 can be made to work with a routing trick.

Image 10 shows intra-VRF multicast traffic, VRF one to VRF one.

mVPN Extranet on IOS-XR: Profile 14 - Intra-VRF Multicast Traffic

Image 10 Profile 14 - Intra-VRF Multicast Traffic

The output of the MRIB entry on egress PE 1 looks like this:

```

## Example 2.2. Option 2. The Receiver MVRF is on the Source MVRF

This solution cannot work by manipulating the import and export statements for the route targets or by a change of the route policy used by the RPF only.

A trick helps to fix the RPF on the ingress PE router. The trick is to add a static route in the receiver VRF and point it to the source VRF on the ingress PE router.

The static route announces the source address in the receiver VRF. This static route is tagged with a new unique Route-Target in BGP so that this route can be distinguished from the same route advertised in the source VRF. This avoids the importing of the static route from the receiver VRF on the ingress PE into the receiver VRF of the other PE routers which causes a routing issue.

mVPN Extranet on IOS-XR: Profile 14 - Option 2 The receiver MVRF is on the source MVRF

## Example 2.4. Local Extranet

mVPN Extranet on IOS-XR: Profile 14 - Local Extranet

Image 14 Profile 14 - Local Extranet

The source route from the source VRF must be imported into the receiver VRF.

```
vrf one
address-family ipv4 unicast
import route-target
65000:1
65000:2
!
export route-target
65000:1
!

vrf two
address-family ipv4 unicast
import route-target
65000:2
!
export route-target
65000:2
```

!

```
RP/0/0/CPU0:PE1#show route vrf one 10.0.0.14/32
Routing entry for 10.0.0.14/32
Known via "bgp 65000", distance 20, metric 0
Tag 65004, type external
Installed Nov 22 10:52:10.451 for 00:01:22
Routing Descriptor Blocks
 10.1.14.14, from 10.1.14.14, BGP external
   Nexthop in Vrf: "two", Table: "default", IPv4 Unicast, Table Id: 0xe0000011
   Route metric is 0
No advertising protos.
```

```
RP/0/0/CPU0:PE1#show mrib vrf one route 232.1.1.2 10.0.0.14
```

```
IP Multicast Routing Information Base
Entry flags: L - Domain-Local Source, E - External Source to the Domain,
C - Directly-Connected Check, S - Signal, IA - Inherit Accept,
IF - Inherit From, D - Drop, ME - MDT Encap, EID - Encap ID,
MD - MDT Decap, MT - MDT Threshold Crossed, MH - MDT interface handle
CD - Conditional Decap, MPLS - MPLS Decap, EX - Extranet
MoFE - MoFRR Enabled, MoFS - MoFRR State, MoFP - MoFRR Primary
MoFB - MoFRR Backup, RPFID - RPF ID Set, X - VXLAN
Interface flags: F - Forward, A - Accept, IC - Internal Copy,
NS - Negate Signal, DP - Don't Preserve, SP - Signal Present,
II - Internal Interest, ID - Internal Disinterest, LI - Local Interest,
LD - Local Disinterest, DI - Decapsulation Interface
