Introduction

This document explains how to implement Static NAT-PT that uses a configuration example where IPv6 network nodes communicate with IPv4 network nodes that use an IPv6 mapping of the IPv4 address configured on the NAT-PT router.

The Network Address Translation - Protocol Translation (NAT-PT) is an IPv6 to IPv4 translation mechanism, which allows IPv6-only devices to communicate with IPv4-only devices and vice versa. NAT-PT is designed to be deployed to allow direct communication between IPv6-only networks and IPv4-only networks transparently that use a single V4 address.

Prerequisites

Requirements

Ensure that you meet these requirements before you attempt this configuration:

- Basic knowledge of NAT concepts and operations.
- Basic knowledge of IPv6 Addressing Scheme
- Basic knowledge of IPv6 Static Routing

Note: NAT-PT has been deemed deprecated by IETF because of its tight coupling with Domain Name System (DNS) and its general limitations in translation, and it has proven as technology to be too complex to maintain scalable translational services. With the deprecation of NAT-PT and the increasing IPv6 transition among users has led to the introduction of NAT64. Refer to these documents for more information on NAT64:

- NAT64 Technology: Connecting IPv6 and IPv4 Networks
- NAT64-Stateless versus Stateful
- IPv6 Stateful NAT64 Configuration Example

Components Used
The configurations in this document are based on the Cisco 3700 series router on Cisco IOS® Software Release 12.4 (15)T 13.

**Configure**

In this example, three routers R1, R2 and R3 are connected through a serial interface where R1 acts as NAT-PT router, which connects to the router R2 using IPv4 address and to R3 using IPv6 address.

*Note:* NAT-PT is not supported in Cisco Express Forwarding (CEF) and has to be disabled.

**Network Diagram**

This example uses this network setup:

![Network Diagram](image)

**Configurations**

This example uses these configuration:

- [Router R1 Configuration](#)
- [Router R2 Configuration](#)
- [Router R3 Configuration](#)

**R1 Configuration**

**R2 Configuration**

**R3 Configuration**

**Verify**
Use this section in order to confirm that your configuration works properly.

**In Router R3**

Now any packet from IPv6 address of Loopback0 of R3 should be able to reach fa0/0 IPv4 address of R2 using the IPv6 address 2000::960B:202 as shown here:

**Ping**

```plaintext
R3#ping 2000::960B:202 sou lo 0
```

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 2000::960B:202, timeout is 2 seconds:
Packet sent with a source address of 3001:11:0:1::1
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 8/60/124 ms
--- This shows that the router R3 is able to reach
--- the router R2 through lo address 3001:11:0:1::1.

**In Router R2**

**Ping**

```plaintext
R2#ping 150.11.3.1
```

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 150.11.3.1, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 24/68/120 ms
--- The successful ping response shows that the router R2
--- is able to reach the IPv6 network.

**In Router R1**

**show ipv6 nat translations**

```plaintext
R1#show ipv6 nat translations
```

<table>
<thead>
<tr>
<th>Prot</th>
<th>IPv4 source</th>
<th>IPv6 source</th>
</tr>
</thead>
<tbody>
<tr>
<td>---</td>
<td>192.168.30.9</td>
<td>2000::960B:202</td>
</tr>
<tr>
<td>---</td>
<td>150.11.3.1</td>
<td>3001:11:0:1::1</td>
</tr>
</tbody>
</table>

**debug ipv6 nat detailed**

```plaintext
R1#debug ipv6 nat detailed
```

*Mar  1 09:12:41.881: IPv6 NAT: IPv4->IPv6:
    src (192.168.30.9 -> 2000::960B:202)
    dst (0.0.0.0 -> ::)
    ref_count = 1, usecount = 0, flags = 513,
    rt_flags = 0, more_flags = 0

*Mar  1 09:12:41.881: IPv6 NAT: IPv4->IPv6:
    src (0.0.0.0 -> ::)
    dst (150.11.3.1 -> 3001:11:0:1::1)
    ref_count = 1, usecount = 0, flags = 257,
    rt_flags = 0, more_flags = 0

*Mar  1 09:12:41.925: IPv6 NAT: IPv6->IPv4:
    src (3001:11:0:1::1 -> 150.11.3.1)
    dst (2000::960B:202 -> 192.168.30.9)
    ref_count = 1, usecount = 0, flags = 2,
    rt_flags = 0, more_flags = 0

*Mar  1 09:12:41.925: IPv6 NAT: icmp src (3001:11:0:1::1) -> (150.11.3.1),
    dst (2000::960B:202) -> (192.168.30.9)

*Mar  1 09:12:41.965: IPv6 NAT: IPv4->IPv6:
    src (192.168.30.9 -> 2000::960B:202)
    dst (150.11.3.1 -> 3001:11:0:1::1)
    ref_count = 1, usecount = 0, flags = 2,
    rt_flags = 0

!--- This command displays detailed information about NAT-PT events.

Troubleshoot

There is currently no specific troubleshooting information available for this configuration.
