Introduction

The ip unnumbered configuration command allows you to enable IP processing on a serial interface without assigning it an explicit IP address. The IP unnumbered interface can "borrow" the IP address of another interface that is already configured on the router. This conserves network and address space. For more information on the ip unnumbered command, refer to Understanding and Configuring the ip unnumbered Command. This document illustrates two Open Shortest Path First (OSPF) routers connected by an unnumbered serial link.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

This document is not restricted to specific software and hardware versions.

Conventions

For more information on document conventions, see the Cisco Technical Tips Conventions.

Configure

In this section, you are presented with the information to configure the features described in this document.
Note: To find additional information on the commands used in this document, use the Command Lookup Tool (registered customers only).

Network Diagram

This document uses the network setup shown in this diagram:

![Network Diagram]

Configurations

This document uses these configurations:

- Router 1.1.1.1
- Router 2.2.2.2

<table>
<thead>
<tr>
<th>Router 1.1.1.1</th>
</tr>

router ospf 2
    network 6.0.0.0 0.255.255.255 area 0
end

Verify

This section provides information to confirm that the configuration works properly.

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only). This allows you to view an analysis of **show** command output.

- **show ip ospf database** Displays a list of the Link State Advertisements (LSAs) in the link state database. This list shows only the information in the LSA header.
- **show ip ospf database [router] [link−state−id]** Displays the content of the Router LSA (Type−1 LSA) in the database. Router LSAs are produced by every router. These fundamental LSAs list all of the routers' links, or interfaces, along with the states and outgoing costs of the links. They are flooded only within the area in which they originate.

Examine the OSPF Database

To see how the OSPF database looks when it is given this network environment, look at the output of the **show ip ospf database** command.

```
r2.2.2.2# show ip ospf database

OSPF Router with ID (2.2.2.2) (Process ID 2)

Router Link States (Area 0)

<table>
<thead>
<tr>
<th>Link ID</th>
<th>ADV Router</th>
<th>Age</th>
<th>Seq#</th>
<th>Checksum</th>
<th>Link count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.1.1.1</td>
<td>1.1.1.1</td>
<td>254</td>
<td>0x8000001A</td>
<td>0xA6FA</td>
<td>2</td>
</tr>
<tr>
<td>2.2.2.2</td>
<td>2.2.2.2</td>
<td>253</td>
<td>0x80000017</td>
<td>0x4858</td>
<td>2</td>
</tr>
</tbody>
</table>
```

```
r2.2.2.2# show ip ospf database router 1.1.1.1

OSPF Router with ID (2.2.2.2) (Process ID 2)

Router Link States (Area 0)

LS age: 279
Options: (No TOS-capability, DC)
LS Type: Router Links
Link State ID: 1.1.1.1

!--- For router links, Link State Id is always the same as the advertising router (next line).

Advertising Router: 1.1.1.1

!--- This is the router ID of the router which created this LSA.

LS Seq Number: 8000001A
Checksum: 0xA6FA
Length: 48
Number of Links: 2

Link connected to: another Router (point-to-point)
```
This line shows that this router (1.1.1.1) is a neighbor with 2.2.2.2.

(1) Neighboring Router ID: 2.2.2.2
(2) Router Interface address: 0.0.0.12

In the case of unnumbered link, use the MIB II IfIndex value. This value usually starts with 0.

Number of TOS metrics: 0
TOS 0 Metrics: 64

This is the OSPF cost of the link that connects the two routers.

Link connected to: a Stub Network

This entry represents the Ethernet segment 4.0.0.0/8.

(1) Network/subnet number: 4.0.0.0
(2) Network Mask: 255.0.0.0
Number of TOS metrics: 0
TOS 0 Metrics: 10

This is the OSPF cost of the Ethernet segment.

r2.2.2.2#show ip ospf database router 2.2.2.2

OSPF Router with ID (2.2.2.2) (Process ID 2)

Router Link States (Area 0)

LS age: 295
Options: (No TOS-capability, DC)
LS Type: Router Links
Link State ID: 2.2.2.2
Advertising Router: 2.2.2.2
LS Seq Number: 80000017
Checksum: 0x4858
Length: 48
Number of Links: 2

Link connected to: another Router (point-to-point)
(1) Neighboring Router ID: 1.1.1.1
(2) Router Interface address: 0.0.0.10
Number of TOS metrics: 0
TOS 0 Metrics: 64

Link connected to: a Stub Network
(1) Network/subnet number: 6.0.0.0
(2) Network Mask: 255.0.0.0
Number of TOS metrics: 0
TOS 0 Metrics: 10

---

Calculate the Shortest Path

This section calculates the shortest path tree from the perspective of Router 2.2.2.2.

Router 2.2.2.2 looks in its own LSA and sees that Router 1.1.1.1 is a neighbor. It then looks at Router 1.1.1.1's
LSA to verify that 1.1.1.1 sees 2.2.2.2 as a neighbor. If both routers see each other as neighbors, they are considered reachable. The routers then install routes for any stub networks listed in their neighbor’s LSA.

In this example, Router 2.2.2.2 installs a route for 4.0.0.0/8 in its routing table because Router 1.1.1.1 lists 4.0.0.0/8 as a stub network in its LSA. This is seen with the help of the `show ip route ospf` command.

```
  r2.2.2.2# show ip route ospf
  O  4.0.0.0/8 [110/74] via 4.0.0.1, 00:06:01, Serial0/1/0

  r1.1.1.1# show ip route ospf
  O  6.0.0.0/8 [110/74] via 6.0.0.2, 00:06:16, Serial2/1/0
```

**Troubleshoot**

There is currently no specific troubleshooting information available for this configuration.
