Introduction

This document describes how to configure custom events in AppDynamics using the REST API and connect them to health rules for automated alerting.

Prerequisites

- Access to an AppDynamics SaaS or on-premises Controller instance
- Permissions to create and manage events, health rules, and policies
- Controller version 21.x or later
- Notification channels (email, SMS, or third-party integrations) configured
- Basic understanding of REST APIs and the AppDynamics user interface

Requirements

Ensure you meet these requirements before starting:

- AppDynamics Controller version 21.x or later (for the latest event and alert features)
- REST API access enabled for your Controller
- Notification channels (email, sms, or integrations) configured for alert delivery

Components Used

- AppDynamics Controller
- AppDynamics Agents
- Notification Channels

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Background Information

In a world of increasingly dynamic cloud-native architectures, proactive monitoring is essential to ensure system resilience and reduce mean time to resolution (MTTR). AppDynamics offers robust observability capabilities, including the ability to create custom events and alerts that help operations teams detect anomalies faster and respond with precision.

Out-of-the-box metrics are critical but modern systems often require context-specific observability. Whether you are integrating CI/CD pipelines, custom automation tools, or external systems, injecting custom events into AppDynamics ensures:

- Unified visibility across system and business metrics
- Real-time detection of application-specific anomalies
- Reduced manual intervention through automated actions

Sometimes it make sense to create custom events to monitor specific aspects of your application. This article is to guide you on how to create custom events via REST API in AppDynamics controller and how to set up an alert based on the custom event.

Configure

This section covers the step-by-step process to create custom events and configure alerts in AppDynamics Controller.

Configurations

Step 1: Create Custom Events via REST API

Custom events can be generated using the AppDynamics REST API. This is useful for integrating external systems, custom scripts, automation framework, or third-party tool:

Example API Call:

```
POST https://<controller-url>/controller/rest/applications/<application_id>/events?severity=ERROR&summa
```

Key Parameters:

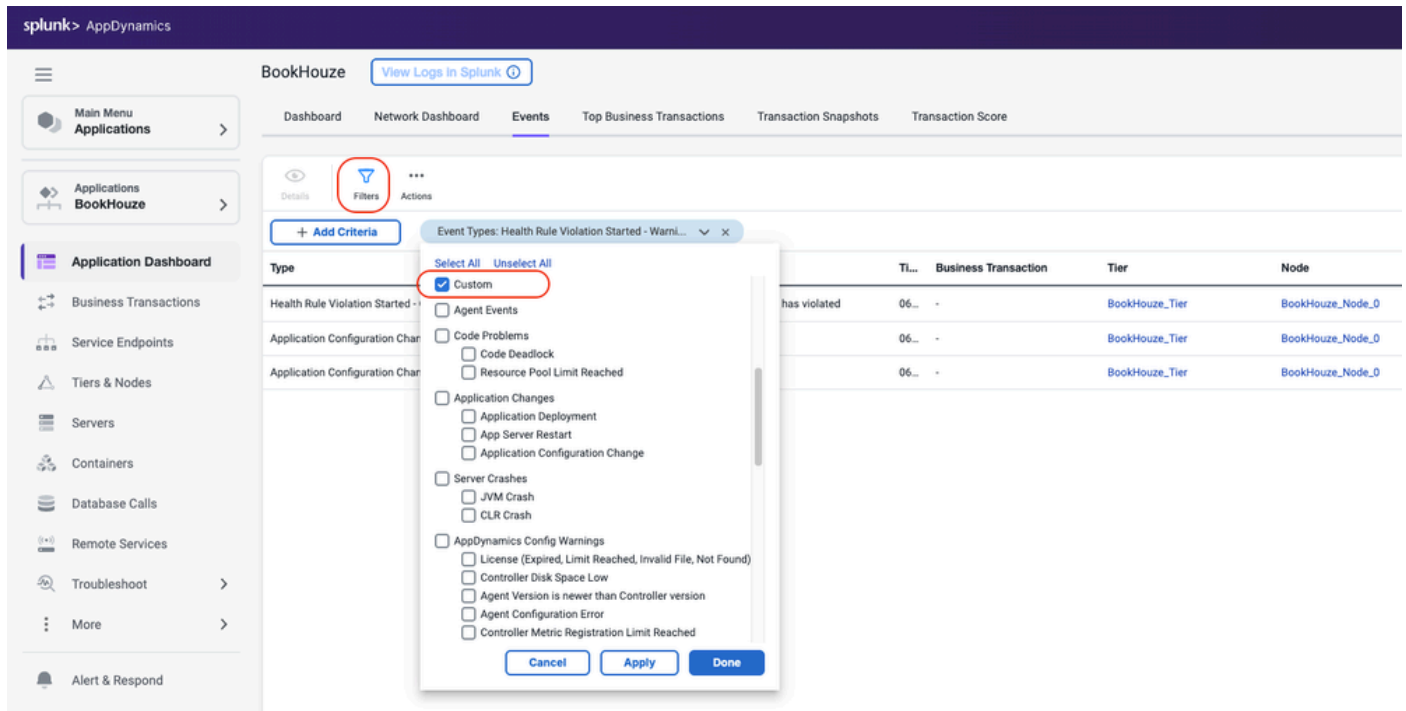

- Replace **<controller-url>** and **<application_id>** with your Controller details.
- Required parameters:
 - severity (INFO, WARN, ERROR)
 - summary (short description)
 - eventtype (must be CUSTOM)
 - customeventtype (your custom event type label)
 - comment (optional detailed message)

A successful request returns an event ID confirming creation

Example : "Successfully created the event id:550346816"

Visibility Tip: Do not forget to enable the Custom filter in the Events UI to view your injected events.

Step 2: Filtering and Monitoring Custom Events

- In the Controller UI, navigate to the **Events** section.
- Use **Filter by Custom Events** to add your event type or properties.
 - You can specify key/value pairs for more granular filtering.
 - Use **All** for AND logic (all properties must match), or **Any** for OR logic (at least one property matches)

This allows targeted tracking and investigation of injected events across your application.

Step 3: Configuring Alerts: Actions, and Policies

Actions:

- Specify what happens when a custom event is triggered (such as send email, sms, or invokes a webhook):

Type	Policies or Email Digests that execute this Action
Email	
Email	
Email	
HTTP	
HTTP	
Email	
Custom Email	
HTTP	
HTTP	

Edit Email Action

Add Custom Event Filter

Find Custom Events matching these criteria:

Custom Event Type

Properties (Optional)

[Learn more about custom events](#)

Health Rule Violation Started - Critical, Health Rule Violation Continues - Critical ...

Fire when events occur on ANY objects

- In the policy **Actions** tab, add a new action and select the custom action you created:
- Save the alert: After you have configured the alert, click **Save** to create it:

Once you have created the alert, it triggers whenever a custom event matching the specified criteria is

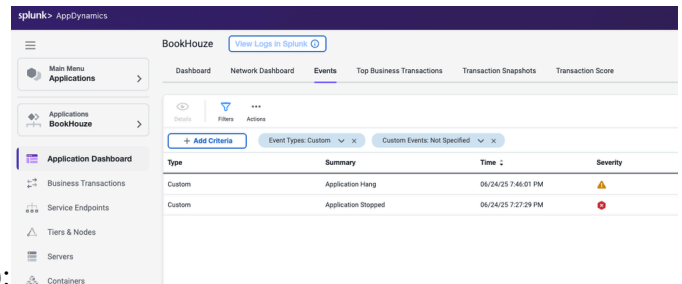

generated in the controller.

Verify

- Post a test custom event via REST API:

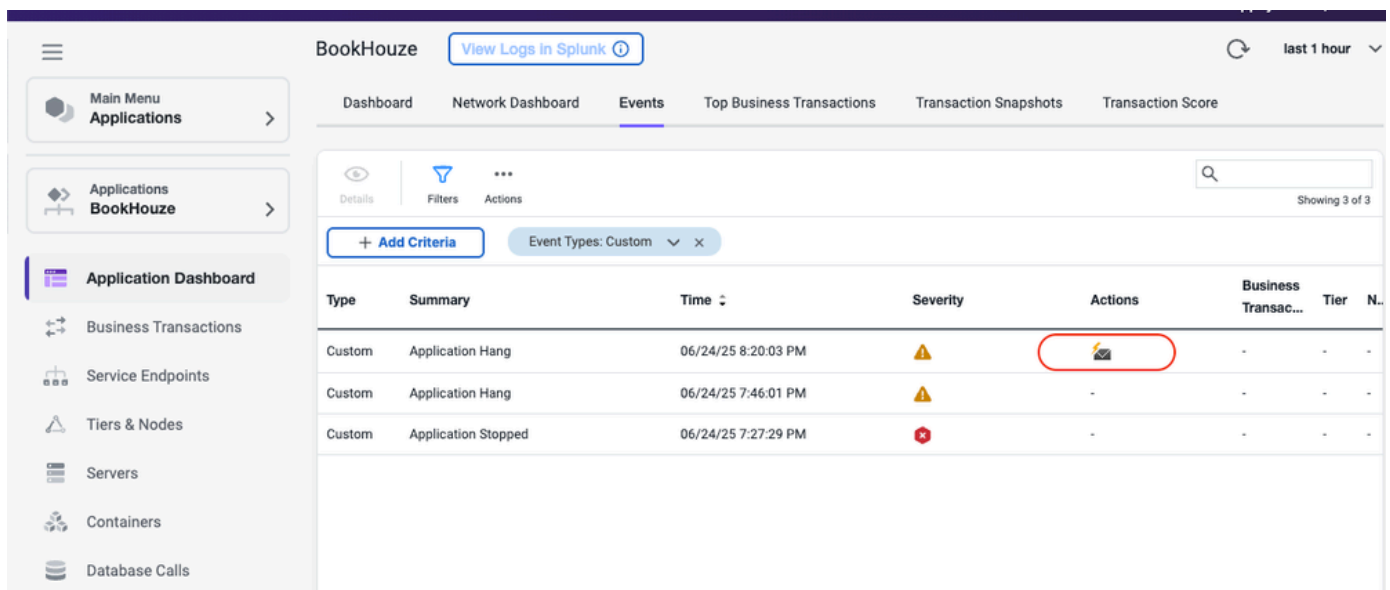

```
root@localhost bin $ curl -X POST --user 'root@localhost:12345678' -H 'Content-Type: application/json' -d '{"severity": "WARN", "summary": "Application Hang", "eventtype": "CUSTOM", "comment": "Please_start_application"}' https://localhost:8080/appdynamics.com/controller/rest/applications/2014/events?severity=WARN&summary=Application+Hang&eventtype=CUSTOM&comment=Please_start_application
```

Enter host password for user 'root@localhost:12345678':
Successfully created the event id:550355301

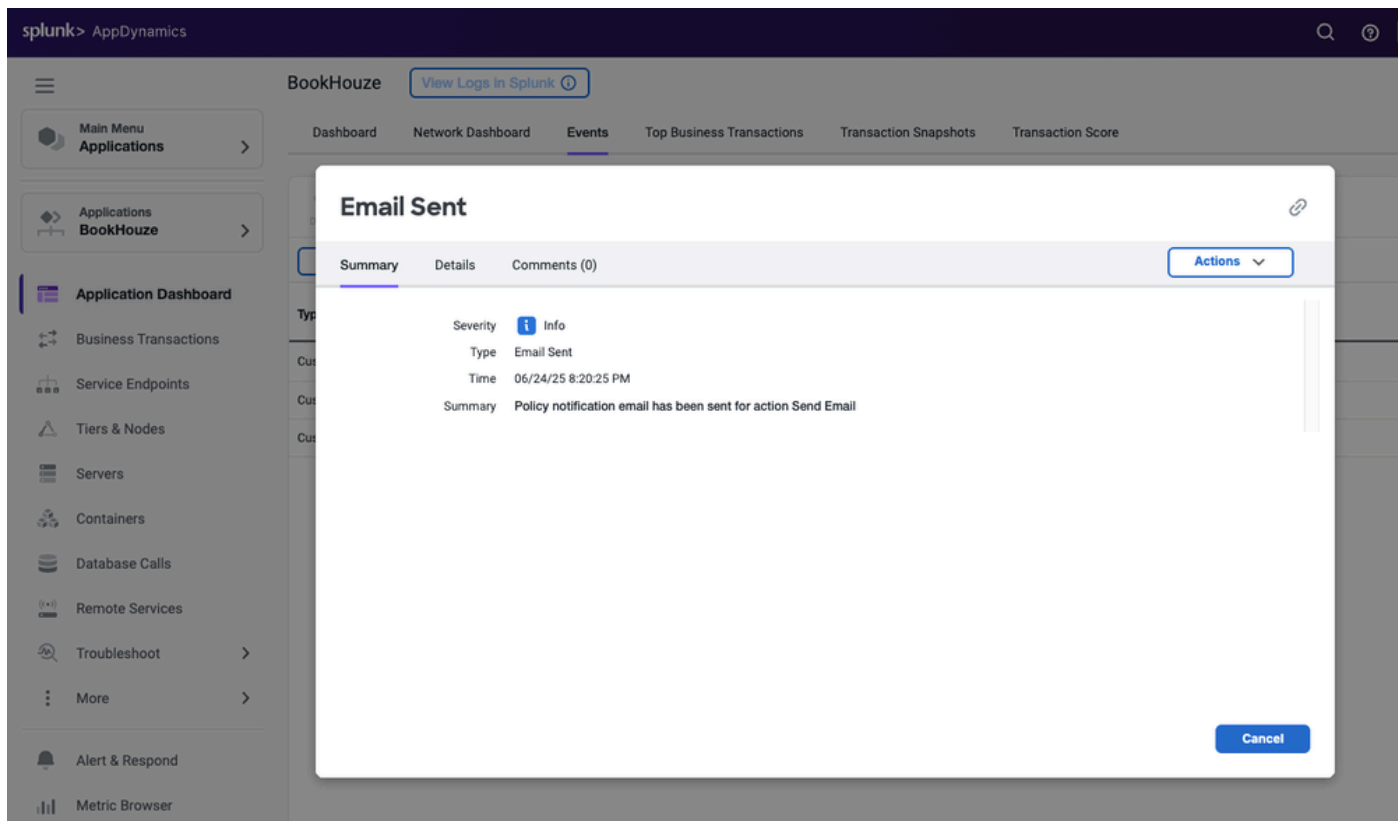

Type	Summary	Time	Severity
Custom	Application Hang	06/24/25 7:46:01 PM	Warning
Custom	Application Stopped	06/24/25 7:27:29 PM	Error

- Confirm visibility in the **Events** UI (check filters):
- Validate that **Action** is triggered for the custom Event:

Type	Summary	Time	Severity	Actions	Business Transac...	Tier	N..
Custom	Application Hang	06/24/25 8:20:03 PM	Warning		-	-	-
Custom	Application Hang	06/24/25 7:46:01 PM	Warning	-	-	-	-
Custom	Application Stopped	06/24/25 7:27:29 PM	Error	-	-	-	-

- Validate delivery through the configured notification channel:

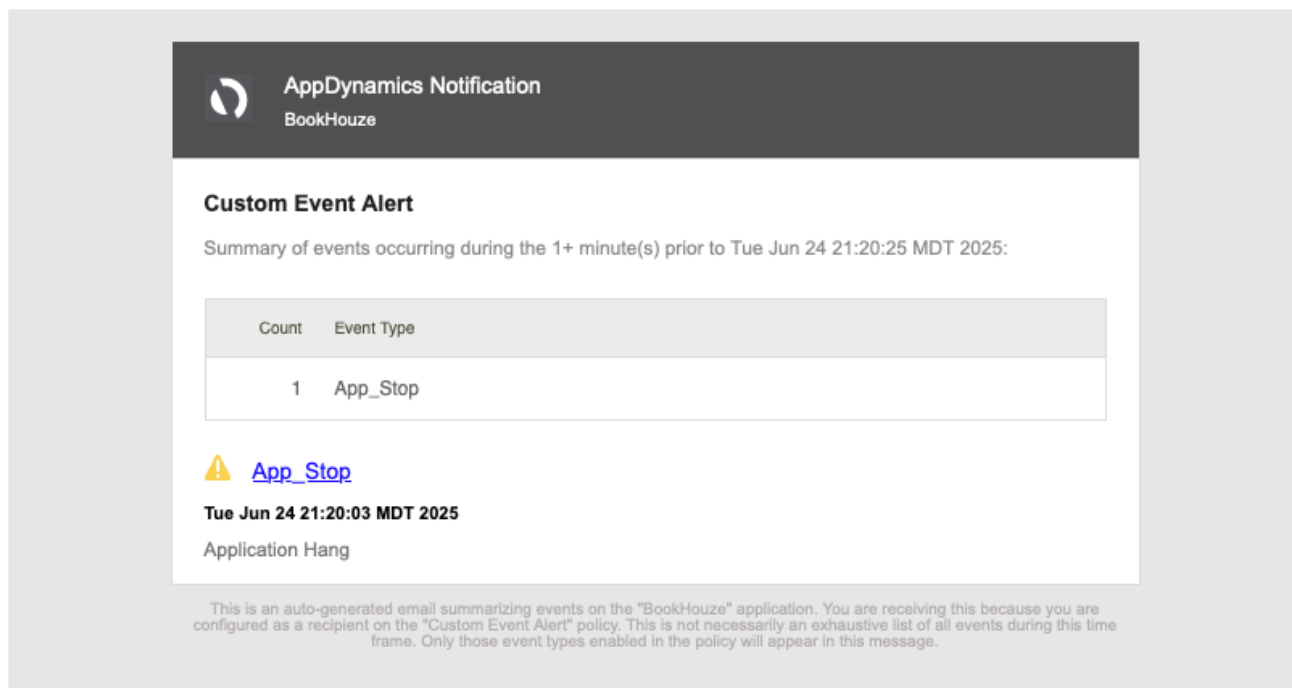

Warning events detected for Custom Event Alert!

Troubleshoot

Issue	Troubleshooting Steps
Event Not Visible	<ul style="list-style-type: none"> • Ensure the Custom filter is eventtype enabled in the Events UI • Double-check eventtype and customeventtype parameters in your API call.
API Errors	<ul style="list-style-type: none"> • Common error: “Event summary is not specified.” Always provide a summary in your request • Verify authentication and application ID in the API call.
Alert Not Triggered	<ul style="list-style-type: none"> • Confirm the health rule and policy are correctly configured. • Check notification channel setup (email/sms server configuration).
Custom Event Limits	<ul style="list-style-type: none"> • Controller has limits on custom event schema count and event size. • Review documentation if posting large volumes or complex schemas

Conclusion

Custom events and alerting in AppDynamics offer a powerful way to enrich your observability strategy. Whether you are integrating with CI/CD tools, external services, or just extending visibility into key workflows, these capabilities ensure faster detection and resolution of issues before they impact users. Start leveraging custom observability intelligence to elevate your monitoring from reactive to predictive.

Need Further Assistance

If you have a question or are experiencing issues, please reach out to [AppDynamics Support](#) and include details such as error messages, configuration information, or relevant logs to help expedite troubleshooting.
