Introduction

This document describes how to recover the enable password and the enable secret passwords. These passwords protect access to privileged EXEC and configuration modes. The enable password password can be recovered, but the enable secret password is encrypted and must be replaced with a new password. Use the procedure described in this document in order to replace the enable secret password.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on these hardware versions:

- Cisco 1700 Series Router
- Cisco 1800 Series Router

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Related Products

Refer to Password Recovery Procedures for information on how to recover passwords for related products.

Conventions

Refer to Cisco Technical Tips Conventions for information on document conventions.
**Step–by–Step Procedure**

Follow these steps in order to recover your password:

1. Attach a terminal or PC with terminal emulation to the console port of the router.

   **Use these terminal settings:**
   - 9600 baud rate
   - No parity
   - 8 data bits
   - 1 stop bit
   - No flow control

   Refer to these documents for information on how to cable and connect a terminal to the console port or the AUX port:
   - Cabling Guide for Console and AUX Ports
   - Connecting a Terminal to the Console Port on Catalyst Switches
   - Connect a Terminal to Catalyst 2948G–L3, 4908G–L3, and 4840G Series Switches

2. If you can access the router, type `show version` at the prompt, and record the configuration register setting. See Example of Password Recovery Procedure in order to view the output of a `show version` command

   **Note:** The configuration register is usually set to 0x2102 or 0x102. If you can no longer access the router (because of a lost login or TACACS password), you can safely assume that your configuration register is set to 0x2102.

3. Use the power switch in order to turn off the router, and then turn the router back on.

   **Important Notes:**
   - In order to simulate this step on a Cisco 6400, pull out and then plug in the Node Route Processor (NRP) or Node Switch Processor (NSP) card.
   - In order to simulate this step on a Cisco 6x00 with NI–2, pull out and then plug in the NI–2 card.

4. Press Break on the terminal keyboard within 60 seconds of power up in order to put the router into ROMMON.

   If the break sequence does not work, refer to Standard Break Key Sequence Combinations During Password Recovery for other key combinations.

5. Type `confreg 0x2142` at the `rommon 1>` prompt in order to boot from Flash.

   This step bypasses the startup configuration where the passwords are stored.

6. Type `reset` at the `rommon 2>` prompt.

   The router reboots, but ignores the saved configuration.

7. Type `no` after each setup question, or press Ctrl–C in order to skip the initial setup procedure.

8. Type `enable` at the `Router>` prompt.

   You are in enable mode and should see the `Router#` prompt.

9. Type `configure memory` or `copy startup–config running–config` in order to copy the nonvolatile RAM (NVRAM) into memory.

   **Important:** Do **not** type `copy running–config startup–config` or `write`. These commands erase your
startup configuration.

10. Type `show running-config`.

The `show running-config` command shows the configuration of the router. In this configuration, the `shutdown` command appears under all interfaces, which indicates all interfaces are currently shut down. In addition, the passwords (enable password, enable secret, vty, console passwords) are in either an encrypted or unencrypted format. You can reuse unencrypted passwords. You must change encrypted passwords to a new password.

11. Type `configure terminal`.

The `hostname(config)#` prompt appears.

12. Type `enable secret <password>` in order to change the `enable secret` password. For example:

```
hostname(config)#enable secret cisco
```

13. Issue the `no shutdown` command on every interface that you use.

If you issue a `show ip interface brief` command in privilege EXEC mode, every interface that you want to use should display up. For example:

```
Router#show ip interface brief
```

14. Type `config-register <configuration_register_setting>`. Where `configuration_register_setting` is either the value you recorded in step 2 or 0x2102. For example:

```
hostname(config)#config-register 0x2102
```

15. Press `Ctrl-z` or `end` in order to leave the configuration mode.

The `hostname#` prompt appears.

16. Type `write memory` or `copy running-config startup-config` in order to commit the changes.

**Example of Password Recovery Procedure**

This section provides an example of the password recovery procedure. This example was created with a Cisco 2600 Series Router. Even if you do not use a Cisco 2600 Series Router, this output provides an example of what you should experience on your product.
